A complete volume of the Botanical Magazine under the editorship of Dr. W. B. Turrill and dedicated to Lord Aberconway appeared during the year. The coloured plates were printed for the first time by a colour gravure process. A Revised List of Tulips Names, a provisional Check List of Delphinium Names and an illustrated volume dealing with New Plants of the Year, which received awards in 1948, were also published in 1949 by the Royal Horticultural society.

In Paris the great flower exhibition of the Société Nationale d’Horticulture was held during May for the first time after the war and attracted large exhibits and many visitors. The Chelsea Flower Show and the Northern Summer show at Southport were held as usual and the exhibits and attendance at both was even greater than before.

The results of horticultural research in the subject of virus diseases attracted much attention during the year and the Masters Memorial lectures delivered by Dr. Kenneth M. Smith at the Royal Horticultural society dealt with this subject (see Journal of the R.H.S., vol. 74, parts 11 and 12). Entomological research was carried on at Wisley during the year into the effects of some of the newer synthetic insecticides—such as DDT, BHC, HETP and the substance still known as E.605—upon a range of horticultural pests and comparative trials were carried out with different smoke generators, aerosols and continuous phase aerosols against a number of glass house pests (see Journal of the R.H.S., vol. 74, part 10).

Further developments were recorded during the year in the adaptation of machinery for garden use. Although the majority of these machines were still more suitable for the market gardener than the amateur with a small garden, attempts were made to produce machinery suitable for the latter’s use. Special advances were made in the use of electricity for driving small mowing machines and hedge cutters.

The John Innes Horticultural institution completed in 1949 its move from Merton to Bayforbury near Hertford and good progress was made with the establishment of its extensive collections and in the building of new greenhouses. The institution’s cytological and genetical work had become increasingly important in horticulture. A permanent collection of rose species was being formed there under the aegis of the Ministry of Agriculture’s scheme; and collections of dahlias and chrysanthemum species were being formed at Wisley.

Sir Ronald G. Hatton retired from the directorship of the East Malling Research station and Dr. F. R. Tubbs succeeded him. W. C. Moore succeeded C. T. Gimingham as director of the Ministry of Agriculture Plant Pathology laboratory at Harpenden. Prominent horticulturists who died during the year included Sir Frederick Moore, formerly director of the Glasnevin botanic garden; Charles Musgrave; Alister Clark of Australia; C. R. Radcliff of Tasmania; W. B. Cranfield and Lieut. Colonel Stephenson Clarke.

The Victoria Medal of Honour was awarded in 1949 by the council of the Royal Horticultural Society to M. C. Allwood, E. Ballard, E. R. Jones, Canon H. Rollo Meyer and Dr. John Ramsbottom. (P. M. Sr.)

United States. Record-breaking cold weather on the Pacific coast ushered in the year 1949, with heavy damage to citrus
and other commercial crops and to ornamentals. Arizona had a 50% loss in oranges and grapefruit. Vegetables and especially the cabbage seed crop in the Pacific northwest were hard hit. Montana and some other western states and most of the eastern states suffered severely from drought throughout the season after May.

Despite weather conditions, the apple crop was very large throughout the country—the largest since 1939. Wholesale prices fell off sharply, and growers were faced with inadequate storage facilities.

Insect pests continued to take their toll, amounting to an estimated $95 million. Grasshoppers overran parts of the west but excellent control was finally found in chlorodene and toxaphene, new spray materials. The European corn borer continued to spread throughout the west and remained a serious pest in the east. However, DDT was found very effective. DDT also proved a boon to the apple growers of the northwest, reducing the number of spray applications from six, or even eight, to three. Chlordane proved as successful as DDT in controlling the Japanese beetle and was cheaper. Experts expected it, when applied to grass and watered in, to be effective for two or three years. Parathion was a new insecticide widely experimented with and found to be very effective in controlling orchard mites, pear psylla and certain scales. The citrus black fly appeared in Mexico as a serious threat, and U.S. scientists worked with the Mexican government to check its spread. Gladolius growers felt that they had found a control in Spargan for the fusarium disease (a rot).

A large increase in the number of wild deer became a problem in several states, notably New York and Maine. The use of coated vegetable seeds by commercial growers increased, reducing the amount of labour needed for thinning.

The All-American gold medal award went to the new rose, Fashion, which was also awarded the gold medal of Bagatelle, France, and the gold medal of the British Rose society. It was the first rose of the floribunda type to win the all-America award.

Netherlands bulb growers began shipping early, and lower prices prevailed, so that some Maine farmers began experimenting with Dutch bulbs as a supplementary crop. (See also Botanical Gardens; Botany.) (E. I. F.)

HOSPITALS. The new regional boards and hospital management committees appointed in Great Britain under the National Health Service act had become operative on July 5, 1948, and were, therefore, six months old at the beginning of 1949. The reshuffle of personalities and responsibilities soon led to numerous projects for the improvement of the hospitals, especially as the former authorities had been reluctant to incur expenditure upon services that were shortly to become the responsibility of the exchequer. Many hospitals had been short-staffed during the preceding years, and postwar shortages had limited repairs and replacements. When, therefore, the first budgets were submitted to the minister of health early in 1949 it was found that the cost of the hospital specialist and ancillary services had risen from £87 million, as estimated when the National Health Service bill was before parliament in 1946, to no less than £170 million. In March the minister called for economy in terms which meant that many of the estimates would have to be severely pruned and there was much consternation in hospital circles. Although this call for economy was later modified, it was widely felt that the level of expenditure thus fixed was inadequate, and would not permit of the quality of service the public expected from the national health service. The wisdom of these cuts in the estimates (as they were popularly known) was hotly contested throughout the summer months. There seemed little doubt that the former methods of financing the hospitals had masked the full extent of the real need for expenditure. Thus it was found that in many hospitals greatly improved arrangements were desirable in the out-patients department and in the systematic handling of medical records, but that changes could not be effected without increased staff and expenditure. Payment of doctors who had formerly given their services gratis, better pay and shorter hours for nurses and domestic workers and revised scales for many grades of technicians and administrative staff all played their part in increasing the bill to a level which startled parliament and the country.

The hospital management committees to whom the day-to-day control of the hospitals was entrusted by the act showed a strong sense of independence and a desire to manage their own affairs without too much control from the regional boards. This was widely regarded as a healthy sign; difficulty arose, however, from the financial system, which, although based upon budgets prepared by the hospital management committees themselves, lacked any objective standard by which the estimates could be assessed. Estimates were therefore liable to be pruned both by the regional and by the ministry under pressure of the need for economy, and the hospital management committees felt their work was frustrated by what they considered to be unwise interference. The lack of a proper system of costing was among the matters discussed when evidence was given before the select committee on estimates on the administration of the national health services (report published by H.M.S.O., London, May 1949). It was pointed out that these difficulties were due to the retention of an obsolete system of hospital accounts, which did not provide for departmental analysis of expenditure and consequently made it impossible for the ministry to allot each hospital management committee a round sum and to allow it discretion to spend this amount as it wished. Many felt that the success or failure of the new system largely depended on solving this problem. In the absence of a solution the tendency to bureaucracy, already serious, would be bound to increase and the sense of independence among the hospital management committees would be gradually undermined. The new pattern of administration at the hospital management committee level, although partly modelled upon that of the former voluntary hospitals, was in many cases operated by men drawn from other forms of public service, and the respective functions of the hospital management committees, of the lay administrator and of the medical and nursing staff were in the early months often imperfectly understood. The training facilities provided by the Institute of Hospital Administrators were in great demand and towards the end of the year King Edward's Hospital fund announced its intention to establish in London a small residential staff college for hospital administrators where refresher courses could be offered, and where a small group of new entrants to the field could receive a systematic training. This college would be in some ways comparable with the several university schools of hospital administration in the United States, and would be the first attempt in Great Britain or in Europe generally to establish a college solely concerned with hospital administration.

It had, of course, been expected that the abolition of all charges (except in the relatively few pay beds reserved for private patients) would lead to an increased demand for accommodation. In the big cities there was very heavy pressure on accommodation during the winter months of 1948-49. In London, the emergency bed service was unable to admit some 3,500 patients but it was noticeable that nearly all of these were elderly; i.e., aged 60 or over. Much of the difficulty was to be attributed to the success of recent medical discoveries which have lengthened the expectation of life and created a special problem for the hospitals. A number of hospitals set up special “geriatric” departments for dealing with the aged on more active lines than had been customary in the past,
and voluntary bodies such as King Edward's Hospital Fund for London and the Nuffield Corporation for the Aged took steps to provide special homes to receive elderly persons who could not otherwise be discharged from hospital. The increased call upon hospitals also affected the out-patient attendances; although no official figures were available, it was known that at some of the large London teaching hospitals out-patient attendances had increased by well over 100,000 a year in the first year of the new service.

These momentous changes in the hospital system in Great Britain continued to attract great interest in the United States of America and in many other countries. They figured largely in discussions at the International Hospital congress held in Amsterdam, Holland, from May 30 to June 3 by the newly reconstituted International Hospital federation (president: Dr. Rene Sand of Belgium). Discussions at the congress showed that the need for some form of regional grouping of hospitals was recognized in almost all countries; thus, in France, hospitals were being surveyed and classified with the object of developing a regional plan in some ways similar to that in operation in Great Britain; in Norway, hospitals were being organized in some 20 regions; in Denmark they were already grouped in some 18 regions and in Italy, too, under the new constitution, there were to be hospital regions. Sir E. Rock Carling (Great Britain) expressed the belief that a general hospital should serve some 250,000 inhabitants and the view seemed to be held generally that a single hospital should not exceed 700-800 beds. (For a brief account of the congress, see *Lancet*, June 18, 1949.)

**Canada.** During 1949, the development of most interest was the National Health programme which provided extensive financial assistance for hospital construction and education of personnel, and special grants for tuberculosis, mental care, cancer control, general public health and other special services. Since April 1, 1948, projects for the construction of 15,000 additional beds had been approved.

The other major development in Canada was the inauguration on Jan. 1, 1949, of the Hospital Insurance service in British Columbia. This was a state-sponsored insurance plan covering practically all citizens. In many respects the plan was similar to that which had begun in Saskatchewan two years earlier. In both cases hospitals were being paid their approximate costs, and in both instances reasonably satisfactory arrangements between the hospitals and the government were established. In both provinces, however, costs rose beyond anticipated figures and premiums had to be increased to subscribers, with a goodly portion of the cost being still absorbed by the province.

**United States.** A new peak in the construction of hospital facilities was reached during 1949. The first of the 1,000 construction projects approved for federal aid since passage of the Hill-Burton act in 1946 were completed. Construction expenditure approved under the act by Nov. 1, 1949, totalled $640 million and involved 35,000 general hospital beds alone. An amendment to the act, passed by congress during 1949, extended the programme until June 1955 and doubled the annual federal contribution to $150 million.

The shortage of nurses and other hospital staff eased during the year. Many hospitals introduced training programmes for practical nurses and other semi-skilled staff. Wage levels and employment conditions remained about the same as in 1948. Non-profit general hospitals in 1949 averaged 173 employees for each 100 patients, as compared with 161 per 100 patients in 1948.

A survey of the American Hospital association showed that hospital patients were paying an average 83% of the actual cost of hospital care they received. The remaining 17% was met through gifts, payments from government and charitable agencies, or comprised hospital deficits. It was estimated that from 1945 to 1948 general hospitals in the United States supplied almost $700 million worth of hospital treatment for which patients did not pay directly.

The organization of the Commission on Financing Hospital Care was begun by the American Hospital association. This two-year study would investigate the costs of providing adequate hospital services in the United States and determine the best systems of payment for such services. Like the previous Commission on Hospital Care, the new study would be financed and operated independently of the association, under 27 commission members representing a cross-section of the U.S. public.

The outstanding event of the year in hospital prepayment plans was the establishment of the National Blue Cross association. This was a stock insurance company to underwrite excess insurance for individual Blue Cross plans in the enrolment of national accounts. In its first five months of operation, the Inter-Plan Service Benefit bank paid almost $200 million to hospitals for about 25,000 patients cared for by host plans outside the area of their home plans. By the end of 1949, it was expected that more than 35 million individuals would be members of Blue Cross plans in the United States and Canada. These were enrolled through more than 560,000 individual, commercial organizations and similar groups. At least 61 million persons in the United States had hospital prepayment coverage of some sort. (See also Nursing.)

**HOTELS, RESTAURANTS AND INNS.** In Great Britain 1949 was another difficult year for hotels, restaurants and inns, financially and otherwise, and the exceptionally fine spring and summer did not attract additional business sufficient to make up for the continued decline in public spending.

Costs of conducting establishments increased all round; the most severe burden arose from the regulations of the Catering Wages act, 1943. As regards licensed residential premises, after prolonged representations by the employers (many of the more experienced employees as well were anxious as to the ultimate effects), an amending order was issued giving certain reliefs. These did not, in the judgment of the proprietors, go far enough to restore flexibility to a wage structure of permanent application, to permit more normal services to be renewed and maintained. Heavy payments for overtime, spreadover, etc., often left managements with no option but to reduce services to an inconvenient minimum, not conducive to the best hotel or innkeeping standards.

The order applicable to unlicensed premises, which was pending at the end of 1948, was not made. Proposed regulations were issued and strenuously opposed by the establishment concerned—between 70,000 and 80,000 private hotels, boarding and apartment houses. These regulations were seen to be as complicated and rigid as those for licensed residential premises and even more difficult to work, bearing in mind the smaller staffs and less organized methods used in a great many of the premises affected. A new set of proposals were issued, less onerous but still regarded as unnecessarily restrictive. An order giving effect to these, subject to final amendments in the light of representations made, was expected to become operative in 1950.

Two matters of major importance to hotels, restaurants and inns which should be mentioned were: (i) 1949 was notable for another substantial increase in the number of visitors from overseas, particularly from America; the Travel association stated that there were some 560,000 tourists, earning for Great Britain £55 million—a record; (ii) on the other side of the picture there was an exodus from Great Britain on a considerable scale; many persons wishing to visit the continent again after the long war years and especially...
as hotels and restaurants there were able to offer more attractive meals.

Indeed, in Britain, establishments at the end of the year, were still subject to the severe rationing regulations of the war period almost in their entirety. The greatest disappointment was that the minister of food did not see his way to remove, or at least modify, the Meals in Establishments order, with its 5s. maximum and complicated build-up, where applicable, of a house charge, charges for meals served in private rooms, dancing and cabaret and service.

The most satisfactory feature perhaps was the continued recognition by the government of the important place that hotels, restaurants and inns occupied in the national economy, ranking first again among the major industries as dollar earners. Greater readiness to assist establishments was therefore understandable. For instance, the Licensing act, 1949, created new permitted hours during which alcoholic liquor could be served until 2.30 A.M., where dancing or cabaret entertainment was provided. Establishments in Westminster were quick to take advantage of this—a praiseworthy effort on the part of all concerned to revive London's night life, which it was felt overseas visitors would specially appreciate.

The government-appointed British Tourist and Holidays board, with its separate hotel and tourist committees, continued to work to attract more overseas visitors and to assist the industry to cater for them. One of its activities was a hygiene campaign amongst catering establishments. The recently formed National Council for Hotel and Catering Education set up an Hotel and Catering institute, with the object of creating professional status for hotel keepers and caterers, properly trained and certificated. In November, the International Hotel association held its third annual congress in London, the British Hotels and Restaurants association acting as official host.

(H. C. Ce.)

United States. Three spectacular developments during 1949 were the opening of the new Shamrock Hotel in Houston, Texas, on St. Patrick's Day, the acquisition of the Waldorf-Astoria in New York by the Hilton interests, and the continued extravagant expansion of resort hotel construction at Miami Beach, Florida, in an otherwise uneventful year in the hotel industry.

In general, the industry did little to redeem its record of being traditional, complacent and ultra-conservative, in comparison with other heavy capital enterprises. Little real progress was made in one of its most perplexing problems, cost control and accurate cost accounting though one hotel began to search for an actuarial mathematician to see if some simple formulae could be evolved to give management quick and concise data. Neither was much imagination shown in the expenditure of many millions of dollars on rehabilitation. There were attempts to compromise between modern and traditional architecture and decoration, without achieving the best points of either. Except at Miami Beach none of the smaller hotels constructed during 1949 took much advantage of the immense strides in architecture; and even in that area very little appeared that was truly notable except in lavishness. Architects specializing in hotel design did some creditable work but were apt to repeat their motifs and methods.

Financially, 1949 saw a continuation of the trends evident in preceding years. Room occupancy was down in varying amounts in various areas, the national average decline being about 4 to 5%, according to preliminary estimates. In spite of increased competition and decreased occupancy rooms did not become cheaper.

Restaurant receipts showed varying tendencies, usually according to the efficiency of the management; but beverage and bar business continued the decline begun in 1946. While occasionally prosperous, night clubs in hotels were increasingly difficult to operate on a profitable basis and so-called "supper spot" attractions decreased in box office appeal as well as in salaries.

Wages, taxes and some food costs increased during the year; rehabilitation, except for labour, was not quite as expensive; net profits were down to an extent not yet revealed at the close of the year, but not to an alarming degree: the margin between revenue and overhead expenses, however, still decreased. (See also TOURIST INDUSTRY.)

HOUSING. Against a background of growing anxiety with regard to the national economy as a whole, Great Britain in 1949 proceeded with its housing programme with the utmost energy. By the end of June, 684,045 new homes, of which 526,897 were permanent and 157,146 were temporary had been erected in the United Kingdom under the housing programme which began immediately after the general election of 1945. Additional homes were also provided by the reconditioning of service camps, the conversion of larger houses into smaller units and other ways so that by Nov. 1949 more than a million families in the United Kingdom had been moved from overcrowded houses into modern, well equipped and comparatively spacious new homes.

The actual work of construction gained momentum with the years and whereas, in 1945, 3,014 houses were built, in 1948, 227,616 were built. In 1949 the building industry in the United Kingdom was building 100 houses for every single house built in 1945, and the monthly production figure now rose to something like 25,000 houses a month. On June 30, 1949, 190,486 permanent houses were under construction, while tenders for an additional 63,867 had been approved. Despite the stringency of the economic position and the determination of the government to reduce expenditure wherever possible, no great cut in housing expenditure was even contemplated and certainly no substantial diminution of the number of houses to be constructed would have found favour either with the government, with parliament or with the people. Nevertheless the government adopted the policy recommended by the Royal Commission on Population that a larger proportion of smaller houses should be provided to meet the modern tendency towards the small family. It was a commonplace criticism of the performance of the British building trade worker that before 1939 three building trade workers produced three houses a year, whereas after 1945 three building trade workers produced only two houses a year. There was some force in this criticism, but it would have been grossly unfair to the building trade worker, whose work was often impeded by the uneven delivery of essential materials to the site of building operations, not to acknowledge the fact that in making this three to two comparison, one was not comparing like with like. The average house in Britain before World War II had a floor area of 830 sq. ft. The standard postwar house in Britain had 1,090 sq. ft. of floor area. The 775,000 seriously damaged war houses used labour and materials sufficient to build over 100,000 new houses; the 139,887 houses which had been so badly damaged by bombs as to be completely uninhabitable were restored, while new dwellings were provided for 118,770 families by the conversion of existing buildings. When it was urged, as it frequently was, that the building industry could do more, it should have been remembered that in Scotland, for example, the master builders informed the government that the programme which the government had set them was straining the resources of the industry to the absolute limit.

Legislation was passed during 1949 extending state housing beyond the housing of the working classes, to meet the needs of every section of the community, and empowering local authorities to grant loans up to 90% of &pound;5,000 for private house purchase or building.
In addition to all the houses built by the state and the local authorities after 1945, private enterprise built 88,046 houses in the United Kingdom, of which 4,058 were in Scotland. The government had consistently taken the view that houses should be built by local authorities for letting and not for sale. They granted discretion to local authorities to give permission for a fifth of the houses on their housing programme to be built by private enterprise for sale and owner occupation. When the decision to devalue the pound was taken in Sept. 1949 and a programme was launched to save £250 million on the expenditure side of the national revenue, the government decided to suspend, at least temporarily, permission to build houses for private sale. This did not mean that private enterprise and the private building contractor were debarred from taking an active part in the work of housing re-construction. On the contrary, nearly all the houses built in Britain in 1949 at any time after World War II (with two exceptions: (a) a small number of houses built by local authorities who had their own Public Works department and who employed the method known as “direct labour,” and (b) houses built by the Scottish Special Housing association) were built by private building contractors who had successfully tendered for the work to the local authority.

The government continued to give special priority to coal miners and to agricultural workers. In allocating houses to tenants, local authorities were under a statutory obligation to consider the housing needs of the families concerned; but they now had the additional responsibility of considering also the economic needs of the nation; and in accordance with this policy, by the end of June 1949, 30,528 mining families and 18,418 agricultural workers’ families had been re-housed in homes built by local authorities. This did not mean that in mining and agricultural areas local authorities were encouraged or even permitted to embark upon unlimited new contracts.

During the year the aluminium house, which had made a significant contribution to the temporary housing programme, made an essentially equal one to the permanent programme; and in the towns it was common to see a complete house being hauled through the town in four sections ready to be erected on the site, thereafter for immediate occupation. These houses, built on the conveyor belt system in factories, were complete in every way. They were not mere skeleton houses, for the sections included the cooking range, the kitchen sink and the bath and lavatory. They could be erected in a few hours on prepared sites and, by June 1949, 15,573 aluminium bungalows had been completed. Another factory-built house made under government auspices was that designed by Sir Edwin Airey, a two-storied house composed of concrete blocks and posts; some 20,000 of these houses were allocated to local authorities.

Housing costs remained very high and a house which would have cost £400 before the war cost £1,500 or more. There was a large inflationary element in this price, although during 1949 there was a downward tendency.

Commonwealth. In the dominions, particularly in New Zealand and Australia, the housing shortage remained acute, nor was it likely to be solved until these dominions, who were pursuing a strong immigration policy, could attract a substantial force of trained building labour from the United Kingdom. This in turn was held up by the acute shortage of shipping.

In the African colonies, housing needs were greatly accentuated by the rapid rise in native populations and by the many new industrial enterprises which had been started after World War II. The groundnuts scheme in British East Africa gave rise to a number of ambitious housing projects both for the European municipal staff and for the African workers. In Nigeria, where indigenous forest trees were being converted into sawn timber or into plywood in one of the most modern factories in the world, the pressure on housing accommodation was so great as to produce an extremely difficult social problem, not only of overcrowding but of high rents for sub-standard accommodation in appalling slums. After three years of frustrating delays the timber company secured all the necessary permissions and acquired the land for what promised to be a model housing estate for 2,000 workers. At Takoradi in the Gold Coast, where timber wharfs and a vast extension to the harbour were being built, the government showed more forethought and a model village of some 500 houses was being constructed on a site at Sekondi, overlooking the Atlantic surf, in advance of the requirements of the workers who would be engaged on the harbour construction. In Zanzibar where a rapid attack was being made on the slum problem, a simple expedient was meeting with great success. People who were living in poor houses were enabled to buy sets of concrete pillars, each measuring 10 ft. by 6 in. square, for a nominal sum. These formed the main structural supports of a house and were then filled in by the occupant himself with mud or with a mixture of mud and cement.

When European standards were applied to the re-housing of colonial peoples the cost of housing was almost as high as in the United Kingdom. Many people felt that it is impossible to impose European standards and designs was not such a good policy as to adapt the indigenous materials and standards to modern requirements and in the Gold Coast, for example, although the government tended to favour the permanent structure of brick or concrete, there was a strong feeling among many of the Gold Coast Africans, that a policy of using "stabilized swish" would be more economical and would tend to a quicker solution of the problem. "Swish" is simply the name for the traditional indigenous mud form of building; "stabilized swish" is a mixture of mud and cement.

Europe. In Europe the apparently insoluble housing problem created by war devastation was, nevertheless, being tackled with great energy. In France, in the Normandy area where the fighting after D day was fiercest, vast reconstruction schemes were carried out; and, although the first emphasis was naturally on essential social services, considerable headway was made in providing new homes.
utter devastation in which a few families, nevertheless, contrived to live in single basement rooms that here and there had survived the general ruin, considerable housing projects had been and were being carried out. In the meantime every make-shift expedient was being adopted and many multi-storied air raid shelters were now being used as dwelling houses, with one family to each tiny cubicle. In spite of the appalling overcrowding which existed in these shelters, the disease rates were remarkably low and no epidemic of any kind had yet taken place. In Poland the policy of reconstruction of war-devastated Warsaw was carried out at almost incredible speed and a complete new city was far advanced. In Switzerland the housing projects carried out by the cantons and the municipal authorities continued to be models for the rest of the world. It was a standard practice in Swiss housing schemes to provide a basement for each house, which was not used for living accommodation but which contained a washing and laundry room equipped with mechanical washing machines and other labour-saving devices, a store room for fruit and vegetables and a work room for the man of the house. In Switzerland houses were built for owner occupation, usually on the co-operative principle. A member of the co-operative paid a sum of about £100 towards the cost of constructing his house and the rest of the money was borrowed. He was then granted a lease of his house for 40 years and during that period he paid off the mortgage; although the house was leasehold he had the right to bequeath it in his will and at all times had the right to sell the house. But if he decided to sell he had to sell it to the co-operative itself. A feature of the Swiss housing scheme was that each housing project had as its centre a kindergarten, again a model of graceful, human and elegant building, staffed by trained teachers and with ample garden and playing accommodation. (G. McA.)

United States. Work was started on more than 1 million new family dwelling units of all types, exclusive of farm housing, in the U.S. during 1949. After lagging behind the 1948 monthly totals up to the end of June housing construction figures rose sharply to establish new records for each of the last six months of 1949 and a record total for the year. The previous record of 937,000 units established in 1925 was exceeded by more than 60,000 units.

Contributing factors in this increase were lower residential construction costs, the easing of mortgage financing, a substantial increase in the production of rental units and a greater emphasis on the lower-cost house. By Aug. 1949 residential construction costs were reported by the Housing and Home Finance agency to be at the lowest level for 20 months and almost 8% below the Oct. 1948 peak, as measured by the Department of Commerce national index. The Bureau of Labour Statistics calculation of the average cost of producing privately financed one-family houses, begun in June 1949, amounted to $7,675—exclusive of land, site improvements, selling expense, profit and other non-construction items—as compared with a June 1948 estimate of $8,050. The comparable figure for 1940 was $4,075.

The availability of mortgage funds, which had been shrinking since the autumn of 1948, particularly with regard to G.I. (servicemen) home loans carrying a maximum 4% interest rate, received a powerful impetus in July. The secondary market for G.I. and F.H.A. (Federal Housing administration insured) mortgages was increased by 50% when Congress gave the Federal National Mortgage association (more popularly known as Fanny May) an additional $500 million for the purchase of such mortgages. Fanny May's previous limit of $1,000 million was almost exhausted when congress acted.

At the same time, congress extended F.H.A.'s authority to insure 90% mortgages on rental housing under Title 608 which undoubtedly contributed substantially to the rise in the construction of apartments. The 1949 building of rental units consisted 25% of the record home building total and was the highest for any year since the 1920s. In the first 10 months of 1949, F.H.A. received applications for mortgage insurance on rental projects totalling 198,194 flats as compared with 53,597 in the same period of 1948.

On July 15, 1949, President Truman signed the Housing act of 1949 marking the end of a bitter struggle between the
supporters and opponents of public housing which had raged over a four-year period, throughout one presidential and two congressional election campaigns. The act greatly expanded the programme for government-financed and subsidized housing for low-income families, initiated a plan and authorized substantial funds for federal aid to communities in rebuilding slum and other blighted areas and provided federal loans and grants for farm housing.

The main feature of the new law was the public housing section which authorized the construction of 810,000 dwelling units for low-income families over a six-year period and provided grants of up to $308 million annually for 40 years to bring rentals down to within the financial means of such families. With some modifications, the law of 1949 extended the U.S. Housing act of 1937 under which 191,000 dwelling units for low-income families had been built. The 1949 act set a cost limit of $1,750 a room for public housing constructed under its provisions which might be increased by not more than $750 in areas where the cost of construction was especially high.

By the end of the year the Public Housing Administration had approved preliminary loans to 227 cities to start planning 10,000 units in the public housing units. Between 60,000 and 80,000 units were scheduled for construction in 1950 with full programmes of 135,000 to 150,000 to be built annually in the years from 1951 to 1955.

Even before the new public housing programme was enacted, attention turned to the housing needs of families with incomes above the limits set for public housing but not sufficiently high to enable them to rent or buy housing in the open market. Union labour groups joined with housing, civic and welfare organizations to urge for such families a programme of co-operative housing aided by low-interest, long-term government loans. A bill embodying this programme was introduced in the 1949 session of congress but made little headway.

The first substantial step in moderating wartime controls was taken with the enactment by congress of the Housing and Rent act of 1949. Controls were continued until June 30, 1950, but with two important modifications: municipalities or entire states could be released from federal rent control by the action of their governing bodies; and landlords could be granted increases in rent where it could be proved that they were not receiving a fair operating return. From April 1, when the new law became effective, to Dec. 9, four states, Nebraska, Texas, Arizona and Utah, as well as a number of municipalities, were released from control by this procedure. The Federal Housing expeditor released others on his own initiative so that just before the end of 1949 a total of 2,587,000 family dwelling units had been released. In the case of two localities, this action resulted in such large rent increases that the communities requested the re-establishment of controls. From April 1 to Sept. 30, a sufficient number of rent increases had been granted under the fair operating return formula to affect 352,037 dwelling units. The increases averaged 19%.

The Lustron prefabricated steel house, into which the government had put $37.5 million in R.F.C. (Reconstruction Finance Corporation) loans, became a congressional storm centre in mid-summer and was in arrears on repayments at the year's end. Further R.F.C. loans were cut off following the congressional inquiry.

Housing research received considerable impetus with the passage of the Housing act of 1949 and the formation under its provisions of a Division of Housing Research as one of the major components of the Housing and Home Finance agency. An initial budget of $2,533,000 was allocated. (See also BUILDING AND CONSTRUCTION INDUSTRY; LOCAL GOVERNMENT; TOWN AND COUNTRY PLANNING.) (H. M. P.)

HUNGARY. A people's republic of southeastern Europe bounded on the W. by Austria, on the N. by Czechoslovakia, on the E. by Rumania, and on the S. by Yugoslavia. Area: 35,893 sq. mi. Pop.: (1938 est.) 9,021,000; (1945 est.) 9,165,000. Languages (1947 est.): Hungarian 92.9%; German 5.1%; Slovak 0.8%; Serbo-Croat and Slovene 0.6%; Rumanian 0.2%; Religions (1947 est.): Roman Catholic 65.6%; Greek Catholic 2.5%; Calvinist 20.8%; Lutheran 6%; Greek Orthodox 0.4%; Jewish 4.3%; Chief towns (1941 census): Budapest (cap., 1,164,963; [Dec. 31, 1948 est.] 1,058,288); Szeged (136,752); Debrecen (125,933); Miskolc (109,433); Kecskemét (87,269); Pécs (78,512). Chairman of the presidium of the National Assembly, Arpád Szakasits; prime minister, István Dobó (q.v.); ministers of foreign affairs in 1949: László Rajk (see OBITUARIES) and (from June 10) Gyula Kállai.

History. A new Five-Year plan, to replace the Three-Year plan ending in 1949, was announced at the beginning of the year. Its aims were summarized in a speech by the Communist party's chief economic organizer, Ernő (Singer) Gero, in a speech on April 13, 1949. Total investment over the five years 1950-54 was to be F.35,000,000, six times the amount invested in the Three-Year plan. Slightly less than half was to go to industry, and about one-third to agriculture and communications. Total industrial output in 1954 was to be 80% higher than in 1949 and 130% higher than in 1938. Output of iron and steel was to be nearly doubled during the five-year period, raising to 5 million tons in the last year. Aluminium output, based on Hungary's rich bauxite deposits, was to be doubled, and there were to be great increases in electric power, building and chemicals. In agriculture the use of artificial fertilizers was to be trebled and it was hoped to increase crop yields by an average of 27%. Mechanization of agriculture was expected to release cattle used as draught animals and so to raise the milk output by a quarter.

Official figures during 1949 gave the expected percentage figures of production, showing that the Three-Year plan targets had been exceeded considerably ahead of time. It was, however, admitted that results in some branches of industry were not as good as the all-round figures. The impression of independent western observers was that considerable progress had been made and that living conditions a

* Excluding the so-called Bratislava bridgehead (see CZECHOSLOVAKIA).
substantially improved during 1949. Whereas the conditions of the Czech workers had deteriorated, those of Hungarian workers were much better than in 1947.

Collectivization of agriculture was the avowed aim of policy, but was cautiously pursued. The Five-Year plan did not specify what proportion of agriculture should be collectivized by 1954. In August there were 550 collective farms in Hungary. In March 1949 the Communist leader Mátyás (Roth) Rákosi (q.v.) warned against both right-wing and left-wing "deviations." The former consisted in excessive tenderness to medium and wealthy peasants, leading to a neglect of the interests of the poorest peasants who were the natural allies of the proletariat. The latter consisted in indiscriminate attack on all but the poorest peasants. This merely drove the medium peasants, whose friendship to the traditional Leninist-Stalinist doctrine should be secured, into the arms of the kulaks. Pursuit of the left-wing deviation was liable to unite the majority of the peasantry against the government. Hungarian Communist periodicals quoted with disapproval cases of mob violence against kulaks or alleged kulaks which had made the government unpopular. (See also Peasant Movement.)

The year opened with the conflict between the government and the Roman Catholic Church, centred round the trial of Cardinal József Mindszenty. The cardinal, arrested in Dec. 1948, was accused of treason, conspiracy with foreign enemies of the republic and offences against the currency laws. The specific charges in the published indictment for the most part amounted to talk hostile to the government, which in western countries would not be regarded as treason. Of the cardinal's obstinate hostility to the regime and determination not to trust the government's promises from the first days in 1945, there had never been any doubt: and events had to a large extent justified both the obstinacy and the distrust. The trial opened on Feb. 3. The cardinal confessed that he was "essentially" guilty of the offences with which he was charged, declared that he felt an agreement between Church and government to be essential and hoped that his person would not stand in its way. He was sentenced to life imprisonment. At the parliamentary elections in May the hierarchy did not object to Catholics going to the polls. But the conflict remained as irreconcilable as before. Elections were held on May 15. Unlike the Hungarian elections of 1945 and 1947, those of 1949 were of a truly "popular democratic" type: 95% of the electorate was declared to have voted (see Elections).

The new parliament adopted a new constitution, closely modelled on those of the "people's democracies" and the Soviet Union. On Aug. 23 the National Assembly elected the presidium of the people's republic (21 members) of which Arpad Szakasits was the chairman.

A purge of the United Workers' party was carried out in the first months of 1949: 17% were removed from full membership but many of these were allowed to remain as "candidates." The sensation of the purge was the "unmasking" of László Rajk, a prominent Communist and former minister of the interior, as a nationalist deviationist and agent of the "western imperialists." With him were arrested a leading left-wing Social Democrat intellectual, Pal Jusztrics; the former head of the Communist party's cadres section, Tibor Szönyi; the former chief of the political section of the general staff, Lieut. General György (Oesterreicher) Palfy, and the former counsellor of the Yugoslav embassy in Budapest, Lazar Brankov. The trial, which opened on Sept. 16, was above all an indictment of the Tito regime in Yugoslavia. Brankov gave evidence that already during the war Tito was working for the British secret service against the Soviet Union. Rajk confessed to all the accusations, including that of having worked for the political police of the prewar Horthy dictatorship and of having gone to fight in Spain for the republic merely in order to undermine the anti-fascist movement and help the Axis. The incredibility of the charges, contradictions between the alleged facts and willingness of the victims to confess on all points, made the Rajk trial much more similar to the Moscow trials.

Cardinal József Mindszenty seen during his trial in Budapest, Feb. 1949. He was found guilty and sentenced to life imprisonment.

László Rajk, former foreign minister, during his trial on charges of treason in Budapest, Sept. 1949. He was found guilty, sentenced to death, and hanged on Oct. 15.
ICE HOCKEY—ICELAND

of 1936-37 than any of the other "conspiracy" trials that had so far been staged in eastern Europe. It was therefore a landmark in the development of both the political system of the "people's democracies" and of Soviet policy towards Yugoslavia.

(H. S.-W.)

Education. (1949) Schools: elementary 1,432 and general 4,770, pupils 1,220,000; secondary 388, pupils 83,000 Universities (8) and institutions of higher education (8), students 28,000 Illiteracy (1941-6 0%.

Agriculture. Main crops ('000 metric tons, 1948): wheat 1,579, maize 3,201; barley 696; rye 780, oats 332, sugar, raw value, 153; rice 39, potatoes 2,699; tobacco 23; linseed 6 Livestock ('000 head, May 1948) pigs 2,499, cattle and buffaloes 1,804; sheep 591, hogs (Feb. 1949) 569

Industry. Fuel and power. Coal and lignite ('000 metric tons, 1948) 10,613, natural gas ('000 cu. ft., 1947) 3,560,000, crude oil ('000 metric tons, 1947) 570. Raw materials ('000 metric tons, 1947) iron ore, metal content, 244, pig-iron 304, steel ingots and castings 596; baustie 340, manganese ore 50. Manufactured goods (1947) cotton piece-goods (million m.) 126, cotton yarn ('000 metric tons) 21, wool yarn 6.0; cement 199

Foreign Trade. (1948) Imports 1,975 million forints, exports 2,956 million forints

ICE HOCKEY. The 1948-49 season was the best season recorded with attendances showing a considerable increase over 1947-48. The senior English competitions included eight teams with the re-entry of the prewar club Earls Court Rangers. The prewar international tournament was resumed with the entry of the Racing club team from Paris. The Autumn cup was won by Wembley Monarchs with Harringay Racers as runners-up; the international tournament by Wembley Monarchs with Nottingham Panthers as runners-up; and the major competition, the National league, by Harringay Racers with Streatham as runners-up.

In Scotland the Autumn cup was won by Fyfe Flyers with Falkirk Lions as runners-up; the Canada cup by Falkirk Lions with Fyfe Flyers as runners-up; and the National league by Fyfe Flyers with Falkirk Lions as runners-up.

The 1948-49 season showed progress in the development of purely British players and for the first time a special Northern Amateur tournament was organized at Durham. Nine Scottish teams and six English teams competed and Dunfermline Royals won the trophy.

The 1949-50 season started in September and attendance figures showed a considerable increase over the previous season. Harringay Greyhounds dropped out of the English competitions but the remaining seven teams anticipated playing 50% more home games than previously. (J. F. A.)

United States and Canada. The Toronto Maple Leafs became in 1949 the first team in history to capture the Stanley cup three straight seasons when it routed the Red Wings of Detroit, Michigan. Placed only fourth in the regular National Hockey league, Toronto furnished a major upset by beating the circuit's title winners in four games.

Although Detroit had won the regular league race by a good margin, it was hard pressed in the semi-finals for the Stanley cup, and in the final series Toronto stopped the Wings by 3-2 in an overtime period, 3-1, 3-1 and 3-1.

Toronto reached the last round by halting Boston's Bruins, four games to one. The Leafs triumphed 3-0, 3-2, 3-1 and 3-2, Boston taking only the third contest, which was decided at 5-4 in overtime.

Montreal's Canadians carried Detroit to seven games in their semifinals. Detroit, however, got off to a fast start in the deciding meeting on its home ice to win, 3-1, for the right to face Toronto in the cup finals. (T. V. H.)

History. Iceland seemed to discard, almost painlessly, her characteristic caution when the invitation to join the North Atlantic treaty was accepted by the Althing on March 30, 1949, only 10 Communist deputies voting against 37 in favour (2 abstained). However an Icelandic mission to Washington (March 13-19), led by the Conservative minister of foreign affairs, Bjarni Benediktsson (q.v.), had included Eysteinn Jonsson, the Agrarian (Progressive) party air minister, and Emil Jonsson, the Social Democratic minister of trade, and discussions on the treaty had been held within the framework of Benediktsson's statement that his government would not allow foreign military bases on their territory in peace-time. On his return the foreign minister declared that the country's attitude was understood in view of their complete disarmament and it was clear that no national army nor other forces were contemplated as a result of this new step.

At the first meeting of the Council of Europe, Iceland, which had been prevented by provisions in its constitution from sharing in the council's foundation, was among the countries invited (Aug. 8) to join the original 10 powers and was allotted 3 representatives. Inter-Scandinavian co-operation and consultation were also expressed in various forms during 1949.

The Icelandic Trade Union federation, despite its large Communist element, decided to withdraw from the World federation at the same time as the Danish, Norwegian and Swedish sister organizations. On Sept. 12-13 the foreign ministers of the same four states met in Copenhagen and adopted a common policy about several points on the U.N. general assembly agenda and on the problem of South Schleswig (see DENMARK), the Icelandic minister in London later accompanying the Norwegian and Swedish ambassadors to the British Foreign Office (Nov. 2) to support Denmark's case.

Economic conditions caused rising anxiety in 1949. Foreign dollar and sterling reserves were nearly exhausted, two summer herring seasons had gone badly, export industries faced financial difficulties, queues were long and even necessities, especially textiles, scarce. Imports had been cut down but exceeded exports in value by Kr.55 million between January and June (total 1948 excess: Kr.61 million). Although wages were pegged to the cost of living, which still rose, there were strikes on trawlers, among transport workers and also among unskilled workers (June); some trades were over-filled, others short of labour. Inflation threatened to bring, in spite of heavy taxes, higher tariffs and new sacrifices. It was the Agrarians who finally insisted on the recall of the Althing from its summer recess or a general election; and the other two coalition parties preferred the second alternative (see ELECTIONS).

As it proved impossible to form another coalition Olafur Thors formed a Conservative minority government on Dec. 6.

The president of Iceland was elected "by acclamation" for a third term of four years on June 20, with the support of Conservatives, Agrarians and Social Democrats, the Communists neither opposing nor supporting his candidate.
ICE SKATING—IMMIGRATION AND EMIGRATION

Lutfur Gudmundsson wrote and produced Iceland's first film drama. The play *The Golden Gate*, by David Stefansson, ran for over 100 performances in Reykjavik, and in Gathorne-Hardy's translation was well received in Edinburgh.

**Education.** Schooling from 7 to 14 is compulsory, but children may be educated in private schools or home. The compulsory age for the age from where children are very difficult. Besides an elementary and a day or boarding school in every district, there were (1946) 10 state and 2 private secondary schools. In 1948 there were 356 students at the University of Iceland.

**Politics and Government.**

**Agriculture and Fisheries.** Agricultural products were subsidized, but the flight from the land continued, with about 1,000 of Iceland's 6,500 farms deserted (a third during the last six years) and 58% of the population living in towns. Fish and herring have been the basis of the economy; the exploitation of fisheries, irrigation schemes and plant and animal-breeding research continued, and the emphasis was shifted from sheep-breeding to dairy farming. Giant-hot houses for vegetables and flowers built near natural hot springs did well and tomatoes were flown to London for sale. The main livestock (1947-48 est.) were 18,000 head of cattle, 540,000 sheep and 60,000 horses.

In 1949 (Jan.-July) 187,233 metric tons of fish were landed in Iceland (Jan.-July 1948, 277,456); fish exported scd, in fishing vessels, weighed 75,492 tons (Jan.-July 1948, 78,056), in cargo vessels 9,534 (Jan.-July, 1948, 7,132), fish frozen 67,190 (Jan.-July 1948, 65,815) and fish used for oil 103,041 (Jan.-July 1948, 101,000).

**Industry.** The first 4-year plan completed, the second (approved by parliament, Oct. 1948) provided for an investment of Kr. 542,8 million, mainly in harnessing numerous waterfalls; power stations would cost Kr. 700,000, when power would be 60,000 horse power, and when available it would run projects planted for cement, artificial fertilizers and the refining of herring oil.

**Foreign Trade.** (1947 est.) Imports (Jan.-June 1949) 206,042 tons, (Jan.-June 1948, 208,472), exports 151,029 (Jan.-June 1948, 198,770). The largest supply countries in 1949 were: Great Britain, the U.S., Denmark and Venezuela. The best customers countries were Great Britain, Germany, Italy and the Netherlands.

**Transport and Communications.** Iceland has no railways, but in 1948 there were 6,268 km. of highways, 5,500 motor cars, 21,472 lorries, 262 buses and 570 motor cycles. Under the new 4-year plan, 12 new trawlers would be added to the restored fishing fleet, and Kr. 70 million would be spent on freighters, to bring much increased foreign trade. (1947 over Kr. 50 million was paid out for freight on foreign ships).

**ICE SKATING.** During the season 1948-49, there was no opportunity to hold outdoor speed skating championships in England but a full programme of championships and competitions on indoor ice took place. The British amateur championships in the international style of figure skating were held at the Wembley rink; the winner of the ladies' title was Jeannette Altlegw, and of the pairs, Mr. J. and Miss J. Nichols. The events for professionals, held at Brighton, were won by H. Alward (men's), June MacDonald (ladies') and F. Leemans and Miss E. Collins (pairs).

The European championships in figure skating were held at the Ice palace, Milan, in Jan. 1949; the men's title was won by E. Rada (Hungary), the ladies' by E. Pawlik (Austria) and the pairs' title by the Hungarians, E. Kiraly and Miss A. Kecseky. The world championships for these events were held in Feb. 1949 at Velodrome d'Hiver, Paris. R. Button (U.S.A.) successfully defended his title, the ladies' championships was won by A. Vrazanov (Czechoslovakia) and the pairs' title by the European champions mentioned above. Jeannette Altlegw (Great Britain) was third in both the European and world ladies' championships. The European championships in speed skating was held at Davos and was won by S. Farstad (Norway) and the world championship, held at Oslo, was won by K. Pajor (Hungary). (E. G. Cs.)

A list of United States title winners follows: Button, senior men; Sherman, senior women; Karol Kennedy and Petie Kennedy of Seattle, Washington, senior pairs. Los Waring of Baltimore, Maryland, and W. H. Bainbridge of Washington, D.C., gold danes; Vera Brignall and Edith Cook of New York, silver dance team; Sonya Klopfer of New York city, junior women; Richard Dwyer of Los Angeles junior men; Tenley Albright of Boston, novice women; and Hugh C. Graham of Tulsa, Oklahoma, novice men.

Three titles fell to Ray Blum, veteran competitor: from Nutley, New Jersey, in men's speed skating. (T. V. H.)

**IMMIGRATION AND EMIGRATION.** Great Britain. Movement of United Kingdom citizens out of, and of aliens into, the United Kingdom continued throughout the year. As a result, a small percentage of the emigrants failed to settle, and consequently returned home. How many of the immigrants would remain permanently could not be determined. During the period Jan. 1946-Jan. 1949 some 278,000 British emigrated to Canada, Australia, New Zealand, South Africa and Southern Rhodesia, while more than 4,000 aliens also left Britain. Some 140,000 British were registered as desiring to emigrate, and about 11,000 Poles were undecided as to whether to stay or move on.

By the middle of 1949 the number of foreign workers brought in for special labour needs totalled 200,000, and a further 13,000 were considered necessary for Britain's labour force. Fifteen thousand five hundred of the 200,000 were displaced persons from central Europe brought in under operation "Westward Ho" and about 9,000 were women who had come in under the "North Sea scheme," for nursing and domestic services and textile work. The last named alien workers were due to return home in 1951-52.

Germany. The refugee problem in Germany was a question not of refugees as defined by international convention, but of German nationals expelled from Czechoslovakia and the eastern territories under the Potsdam agreement. The population situation was aggravated by the steady influx amounting to an average of 28,000 persons a month crossing the borders between the eastern and western zones of occupation.

In addition to the outward movements under the British Ministry of Labour schemes already mentioned, the United States made administrative arrangements to accept 28,000 immigrants from Germany; these were to include 14,000 Volksdeutsche, 7,000 occupation brides and 7,000 unclassified immigrants.

**Australia**, with an immigration figure which aimed at bringing the population up to 20 million agreed to accept 12,500 displaced persons yearly, offering them the possibility of attaining Australian citizenship after five years' residence. The displaced persons included Poles, Balts, Czechs, Yugoslavs, Rumanians and Sudeten Germans. The figure set for migration from Great Britain to Australia for the year 1949 was 70,000 and more transport was made available for this purpose. Welcoming the 100,000th postwar settler from Britain A. A. Calwell, the Australian immigration minister, said he looked forward to receiving millions of other Britons to assist the future development of the commonwealth.

**Canada** expected a total immigration of 100,000 to include 20,000 from Great Britain. The government accepted 500 Estonians from Sweden and, in order to balance the French-Canadian population, made special, but not very successful, efforts to secure immigrants from France.
New Zealand in a humane gesture offered to accept 1,000 of the displaced persons, to include 200 children, 300 single women (mainly for work in hospitals), 50 mothers or widows and 80 elderly persons.

South Africa slowed down immigration from Great Britain but began to accept Germans from Germany.

Within the British Commonwealth there were also minor movements like the move of 400 British subjects from Malta to Cyprus. The question of the under-population of the West Indian colonies had been raised, and the suggestion was made that some 100,000 immigrants, not necessarily European, should be brought in.

Israel. The British mandate over Palestine ended on May 14, 1948. Up to that time there was limited immigration, though the numbers were often exceeded by means of illegal entries, not all of which could be estimated and allowed for in permits for succeeding periods. In the unrest and warfare which rent Palestine before and after the withdrawal of the mandatory power some 600,000 Arabs were driven from, or left, their homes and villages.

On June 9, 1948, the Israeli foreign minister announced that the new government did not envisage "any measure preventing or delaying the entry of Jewish immigrants to Israel irrespective of age or sex." The number of immigrants in that same month was 1,133. In July 1948 it was 12,687. For the remaining months of 1948 the average monthly figure was 15,507. In 1949, the total number of admissions was 239,171. The immigrants came from not less than 43 different countries of origin, the largest contingents being from Turkey, Tunisia, Morocco and Algeria (these last three countries grouped together), Poland and Czechoslovakia, with large numbers in the early months of the year from Bulgaria and Rumania.

United States. There were about 88 million admissions into the U.S. during the year ending June 30, 1949. Almost 97% of these, however, were of citizen and alien border crossers, many of whom made frequent crossings.

Arrivals and departures during 1948 and 1949, exclusive of border crossers, crewmen and agricultural labourers, were as reported in the Table.

The continued economic prosperity of the United States and the disturbed political situation in many other countries were factors that led to further increases in immigration to the United States. Immigrant aliens admitted for permanent residence numbered 188,317—the largest number since 1930. The total authorized immigration quota for all countries—153,929—was 73.4% filled, 113,046 quota immigrants being admitted to the United States. Included in the number of quota immigrants admitted were 39,734 displaced persons, who were admitted under the Displaced Persons act of 1948.

The principal countries from which immigrants came during the year ending June 30, 1949, were as follows: Germany 23,844; Great Britain 19,050; Poland 23,744; Italy 11,157; other European countries 60,506; Canada, including Newfoundland, 21,515; Mexico 7,977; West Indies 6,518; South America 2,639; Central America 2,493; Philippines 1,068; Asia 5,287; Africa 737; Australia and New Zealand 620; other countries 1,180; total 188,317, of whom 113,046 were quota immigrants.

Aliens admitted for a temporary stay and resident aliens returning from abroad numbered 447,272. The decrease from 476,006 temporary admissions in the previous fiscal year was due largely to the smaller number of visitors for pleasure who came to the United States during the year.

There were 430,089 aliens who departed from the United States. Of these 24,586 were emigrants, or aliens who left a permanent residence in the United States for residence elsewhere; 22,354 resident aliens and six treaty traders planned to return to the United States after a temporary sojourn abroad, and 383,143 aliens admitted for temporary periods departed for residence abroad. (See also ALIENS; REFUGEES.)

(W. B. Ml.)

INCOME AND PRODUCT: see NATIONAL INCOME.

INDIA, DOMINION OF. A self-governing member of the Commonwealth of Nations in southern Asia comprising 9 provinces, 12 centrally administered areas and 9 Indian states' unions. Area: c. 1,243,886 sq. mi., including Kashmir.* Pop.: (1941 census) 320,387,000, (1948 est.) 342,114,000. As a result of the partition of the Indian sub-continent in Aug. 1947, by the end of 1948 nearly 5,363,000 non-Moslems entered India and about 6,599,000 Moslems migrated to Pakistan. Languages fall into two main groups: Aryan or northern (Hindustani or Hindi, Marathi, Punjabi, Gujarati, Bengali, etc.) and Dravidian or southern (Telugu, Tamil, Kanarese, etc.); on Sept. 14, 1949, the Indian Constituent Assembly decided to retain English as the official language of the union, to be displaced by Hindi in Devanagari script within 15 years. Religions: mainly Hindu, with Moslem, Christian, Sikh, Buddhist, Parsee, Jewish and other minorities. Chief towns (1941 census): Delhi (cap. 521,849); Calcutta (q.v.) (2,108,891); Bombay (1,488,883); Madras (774,811); Hyderabad (739,159); Ahmadabad (591,257); Cawnpore (487,324); Amritsar (391,010); Lucknow (387,177). Governor-general, Chakravarti Rajagopalachari; prime minister and minister for external relations, Pandit Jawaharlal Nehru (q.v.); deputy prime minister and minister of the interior, Sardar Vallabhbhai Patel (q.v.).

History. The principal event of the year from the political point of view was the conference of Commonwealth prime ministers held in London in April. They came to the unanimous decision that, after becoming a sovereign independent republic in Jan. 1950, India would continue in the interests of world peace to be a full member of the Commonwealth of Nations. The King would remain the symbol of the free association of its independent member nations and, as such, the head of the Commonwealth. This solution of a delicate problem met with general approval. Dr. Rajendra Prasad, president of the Indian Constituent Assembly, expressed the general opinion of the country when he said: “We wish to remain on the freindliest terms with Great Britain, so long as our sovereignty and independence of action are not affected in any way . . . I am personally satisfied with the formula which has been evolved.” This result was looked on as a diplomatic success for Pandit Nehru and Clement Attlee. Under existing arrangements, India would be proclaimed an independent sovereign republic on the next Remembrance Day, Jan. 26, 1950. India would be known in future by the ancient Hindu name of Bharat.

Other important changes were made in the draft constitution. The village panchayats or councils were to be organized as units of self-government, and the zemindars or landlords were to be gradually expropriated, with due compensation, in order to bring about direct relationship between the state and the cultivators. The judiciary and the legislature were to be separated and appeals to the Privy Council abolished. Communal representation in the legislatures and representation for religious minorities were rejected on the grounds that they were opposed to the conception of a secular state and that the fundamental rights of all citizens guaranteed by the new constitution were so conclusive as to render them superfluous. A prolonged and often bitter controversy on the adoption of a national language and numerical system was ended by a resolution favouring the retention of English for the next 15 years as the official language of the Indian union, after which it would be replaced by Hindi. “English,” declared Pandit Nehru, “must continue to be a most important language in India, which a large number of people would learn, and perhaps learn compulsorily.”

The Integration of the States. The absorption of the princely states reached its final stage under the forcible direction of Sardar Patel. It took three forms: mergers with adjacent provinces, grouping with other states and conversion into centrally administered areas. The two great Maratha states of Kolhapur and Baroda, with a population of 17-5 million and an area of about 100,000 sq. mi., were merged into the province of Bombay. Twenty-five, including the leading Moslem state of Bhopal, became centrally administered areas, while the bulk of the rest, covering an area of approximately 235,000 sq. mi. with a population of 37-5 million, were integrated into nine unions or groups, each under a raj pramukh or prince president. The most important of these was the Union of Greater Rajasthan, the rulers of which were the flower of the ancient Hindu aristocracy, dating back to pre-Moslem times. The unification of these proud and independent princes was an outstanding achievement in itself. The Maharaja of Bikanir became raj pramukh for life, while the venerable Maharana of Udaipur retained his position as titular head. In the far south, Travancore and

Cochin were integrated into a single unit. India’s constitution, as applicable to the states, was accepted by Mysore.

All this involved radical changes in the status of the states and their rulers. Sweeping administrative reforms, including the integration of finances, were effected; the provinces and states were placed on an equal footing with the centre, and the states’ forces were merged with the Indian army. The princes became constitutional rulers, and the limitation of their privy purses meant that their courts were shorn of much of the pomp and ceremony traditionally associated with them. Those who found themselves able to move with the times found ample scope for public service.

The Exception: Hyderabad. Hyderabad remained under the occupation of an Indian military force under General J. N. Chowdhury, assisted by a civil administrator, and the ultimate fate of the once premier Indian Moslem state was still undecided. Moslem rule was clearly doomed, and it seemed likely that Hyderabad would ultimately be partitioned, the eastern districts becoming part of the Telugu-speaking Andhra Desha, and the Maratha and Kanarese portions joining up with the Central Provinces and Bombay. General Chowdhury’s task was not an easy one. He had to cope with outbreaks of violence on the part of Hindu mobs directed against Moslem officials in outlying districts and, what was more important, with serious Communist risings on the Madras border. Kazim Razvi, the Razakar leader, arrested in Sept. 1948, was put on trial for abetment of murder. On Nov. 24 the Nizam signed an instrument of accession to the Indian union, subject to its subsequent ratification by a representative assembly.

The Kashmir Dispute. In Kashmir, the year opened brightly with the announcement that a truce had been arranged. No one was more relieved than the members of the two armies, who had engaged with deep distaste in a fratricidal conflict.
with their old comrades in arms. Representatives of the United Nations Conciliation commission arrived in March, and visited the heads of the two governments at New Delhi and Karachi for consultation, and a distinguished U.S. naval officer, Admiral Chester W. Nimitz, was appointed plebiscite administrator. Proceedings were to be carried out in three stages: first, a cease-fire was to be proclaimed and the troops were to be withdrawn behind agreed lines; then law and order were to be restored and invaders who had crossed the border during the disturbances ejected; finally a plebiscite was to be held.

Each side, however, was deeply suspicious of the other and unwilling to forego the military advantages that it had gained, and matters were further complicated by authorized violations of the truce and by irresponsible utterances on the part of political leaders and the press. The main obstacle in the way of an agreement was the uncompromising attitude of the Indian government. Pandit Nehru and his advisers persisted in their claim that the maharaja, Sir Hari Singh, had legally acceded to the Indian union, and that Sheikh Abdullah was ipso facto the head of the government. On these grounds the government of India demanded the disbandment of the Azad forces (the Kashmir resistance movement) and reserved four seats for representatives from Kashmir in the Indian legislature. The government of Pakistan on its part declared that this was prejudging the issue. The question of expelling the two million Sikh and Hindu refugees as well as the tribesmen before holding the plebiscite had been evaded.

Trygve Lie's claim for the settlement of the Kashmir question as a success for United Nations was clearly premature, and matters reached such a deadlock by the end of August that President Truman and Attlee, in the interests of the peace and stability of the sub-continent, sent letters to both governments appealing to them to agree to the United Nations' proposals and accept Admiral Nimitz as arbitrator. The president pointed out that the only section likely to benefit from unrest in such areas as Kashmir, Indonesia and Indo-China was the Communists. Even when these difficulties were overcome, there remained the problem of carrying out a free and impartial plebiscite in a wild and mountainous country with a scattered and mostly illiterate population. The alternative of partition as the only lasting solution did not come up. On Sept. 17, Pandit Nehru announced that after due consideration the government of India rejected the United Nations' Kashmir commission's proposal for arbitration.

Communism. The Communist challenge remained the outstanding problem for the Indian government. The methods employed were the familiar ones of sabotage, arson and looting, and the chief aims of the Communists were the capture of the trades unions and the dislocation of the transport system by systematic attacks on the railways and other means of communication, regardless of the misery that this would inflict upon the masses. A mass rising planned for March 5 was forestalled by prompt and resolute action. One of the main storm centres was Calcutta, where unemployment was heavy. The government was forced to amend the labour laws with a view to preventing strikes in essential services. Matters became so alarming in August that Pandit Nehru made a series of tours in the worst affected areas, and this had a calming effect. But the movement was not confined to the cities, and in Bombay and Madras and adjacent districts of Hyderabad it assumed the proportions of an agrarian revolt, on lines only too familiar in Burma and
Malaya. Landlords and money lenders in outlying districts were killed, and the lands redistributed among the peasants.

Trade and Commerce. Despite these handicaps, considerable industrial progress was made. India in 1949 had seven air transport companies, operating 27 internal schedule services. Orders for 500 locomotives were placed in Canada and other countries, and more than 22 Indian ships, aggregating 150,000 tons, were plying between India, America and the United Kingdom. Large sums were spent by the Ministry of Rehabilitation on evacuation and relief, and steps were taken for the large-scale manufacture of prefabricated houses. It was decided not to import cereals, except in cases of emergency, after 1951, and a food production commissioner was appointed to co-ordinate work between the provinces. A number of multilateral river projects were under execution, the most important being the Damodar valley scheme.

The financial state of the country was generally sound, but in order to carry out her ambitious programme, India, like other countries, had to raise foreign capital, which could only be done by buying less and exporting more. For this reason India decided to follow sterling in devaluing the rupee, 7½% of her trade being with countries in the soft currency area. Lasting progress was impossible until agreement, especially on the drapier's dispute, had been reached with Pakistan, and the disproportionate military expenditure thereby drastically curtailed. In October and November, Pandit Nehru paid visits to the U.S., Canadian and British governments. It was supposed that his main object was to discuss financial and political problems arising out of the devaluation of the pound and the Communist threat. In October India was elected to the U.N. Security council.

Agriculture and Fisheries. Main crops (1948 in '000 metric tons): wheat 5,434; barley 2,528; maize 1,757; rice 28,748; cotton (ginned) 444; jute 368; tea 248; cottonseed 830; wool (greasy basis) 24; linseed 370; sesame 356; rapeseed and mustard 794; groundnuts 5,122; sugar (raw) 4,986; coffee 16. Livestock (1945, in '000 head): cattle 136,369; sheep 37,731; pigs 3,704; horses 556; asses 1,130; mules 44; goats 46,469; buffaloes 40,610; camels 655. Fisheries: total catch estimated at 700,000 tons annually.

Industry. Fuel and power: coal (1948, in '000 metric tons; 1949, six months, in brackets) 30,301 (15,996); electricity, (1948, in million kwh.; 1949, six months, in brackets) 4,579 (2,416); petroleum (1947) 66,314 (38,000, respectively); salt (1947) 5,232 (4,000, respectively). Raw materials (1948, in '000 metric tons; 1949, six months, in brackets): pig iron 1,487; steel ingots and castings 1,222 (671); rubber 15.7 (5.1); iron ore 2,450; superphosphates 21.7; aluminium 3.4; antimony 0.34; copper 5.9; lead 0.7; sulphuric acid 1.1; caustic soda 2,370; caustic soda 4.4; soap ash 2.9. Gold (1948, in '000 fine ounces) 171.7. Manufactured goods (1948, in '000 metric tons; 1949, six months, in brackets): cotton yarn (in '000 metric tons) 654 (318); cotton fabrics (miles million) 3,960 (1,624); rayon fabrics (miles million) 104.2; cement ('000 metric tons) 1,524.

Foreign Trade. (Million rupees) Imports: (1948) 5,188; (1949), six months 3,386. Exports: (1948) 4,228; (1949, six months) 1,973. Principal imports (per cent of total imports, 1948): machinery and vehicles 24%; grain pulse and flour 13%; raw cotton 12%. Principal exports (per cent of total exports, 1948): jute manufactures 35%; tea 15%; cotton manufactures 10%. Main sources of imports (1948): United Kingdom 29%; United States 20% and Burma 4%. Main destinations of exports (1948): United Kingdom 23%; United States 17% and Japan 11%.

INDONESIA, REPUBLIC OF THE UNITED STATES OF. The republic of the United States of Indonesia (Republik Indonesia Serikat) came into being on Dec. 27, 1949, when Queen Juliana of the Netherlands signed the charter of the transfer of sovereignty of the territories of the Netherlands East Indies (with the exception of New Guinea [area: 152,089 sq. mi.]) to the Indonesian people. The republic consists of seven participating states (negara) and nine independent political units (daera). Total area: c. 583,000 sq. mi. Total pop.: about 70 million. Capital: Jakarta or Batavia (pop., mid-1949 est., 1,200,000).

President of the republic, Ahmed Sukarno (q.v.); prime minister and minister of foreign affairs, Mohammed Hatta; Netherlands high commissioner, Dr. H. M. Hirschfeld.

The seven negara of the republic are: the Indonesian Republic, proclaimed Aug. 17, 1945, capital, Jokjakarta (Djokjakarta); East Indonesia (Negara Indonesia Timur) comprising Celebes, Bali, Lombok, Sumba, Sumbawa, Flores, Halmahera, Timor and the Moluccas, proclaimed Dec. 1946, capital, Makassar; West Java (Negara Pasundan) proclaimed Feb. 26, 1948, capital, Bandung (Bandoeng); East Java (Negara Djawa Timur) proclaimed Dec. 3, 1948, capital, Surabaya (Soerabaja); Madura (Negara Madura) proclaimed Feb. 20, 1948, capital, Pamekasan; East Sumatra (Negara Sumatera Timur) proclaimed Dec. 25, 1947, capital, Medan; South Sumatra (Negara Sumatera Selatan) proclaimed Aug. 30, 1948, capital, Palembang. The nine daera are: Central Java, Banka, Billiton, Rionuw, West Borneo, Great Dayak, Bandjar, South East Borneo, East Borneo.

For the history of Indonesia in 1949 see NETHERLANDS OVERSEAS TERRITORIES.

President Ahmed Sukarno attending to his wife's head-dress at a reception in Jakarta, Dec. 1949.
INDUSTRIAL HEALTH. Industrial Legislation. The National Insurance Industrial Injuries act 1946 came into force on July 5, 1948. The comprehensive act, by including workmen's compensation, both for injury and prescribed industrial diseases, had an important bearing on industrial medicine and probably represented the most advanced progress in industrial legislation on the statute books of any country in the world. The administrative machine of the Ministry of National Insurance which now dealt with matters relating to injury and industrial disease in place of the legal procedure necessitated by the former Workmen's Compensation act worked smoothly and fairly.

Under the National Insurance act 1948 increased benefits were paid during sickness and it was anticipated that there would be some slight increase in sickness absenteeism as a result. This was confirmed in the registrar general's Quarterly Report (Jan.-March 1949) which showed substantial changes since July 1948. The report stated that in the September quarter of 1948 the sickness rate for all adults was 29% higher; and in the December quarter 26% higher, than for the corresponding quarters of 1947. There was evidence to show, however, that the rate declined during the latter months of 1949.

The 1948 Factories act introduced, for the first time, provisions for the medical care of young persons in industry. This was an important step forward and meant that young persons between the ages of 15 and 18 could not only be examined on their entrance into industry as had been the case before the passing of the act, but would also have a further examination once a year. These examinations took place either in the factory or at the surgery of the Appointed Factory Doctor, a title new in English law; and it was anticipated that they would assist the correct placement of young persons in their proper jobs and in the detection and correction of minor disabilities which might become greater and more disabling in later life.

Industrial Health. The Pneumoconioses. In the Annual Report for 1948 of the chief inspector of factories reference was made to the incidence of the pneumoconioses—using the term generally—and it was shown that there were 885 deaths during the year from asbestosis and from silicosis and pneumoconioses. This large number of deaths illustrated only too dramatically the medical, social and industrial magnitude of this problem. A Medical Research council team working under the direction of C. M. Fletcher at Cardiff was doing much to solve some of the major conflicting difficulties which had surrounded the aetiology of this disease. The Medical Research council reports already published indicated the size of the task confronting this committee and the latest information would appear to be that the heavy incidence of the disease in the anthracite mines of south Wales was due not necessarily to the quality of the dust produced but rather to the quantity produced and inhaled by all—and it was cogently pointed out that investigations into the social significance of this disease in so far as tuberculosis was concerned had yet been made; but it was held by some observers that the massive changes found in the lungs of anthracite miners in the latter stages of the disease were often tuberculous; and the effect of this upon the family of the miner and his co-workers would be of the greatest significance.

Cancer of the Lung. For many years the high incidence of cancer of the lung amongst the Schneeberg miners has been well known. Before World War II, J. Grosse of I. G. Farbenindustrie and his co-workers reported on an undue incidence of this disease amongst men engaged on the grinding and refining of mono-chromates in Germany. W. Machle and F. Gregorius of America reported in 1949 on comparable incidence amongst chrome workers in six factories in the United States, and their findings were strictly comparable with those of Grosse in so far as they showed that the men engaged in the grinding and refining of mono-chromates alone were affected, whereas those engaged solely on the manufacture and purification of bi-chromates were not affected.

The considerable and steady increase in the incidence of cancer of the lung had been noted throughout all industrial countries during the previous 20 years. The relationship of cancer at this site to asbestosis and silicosis was well demonstrated by Dr. E. R. A. Merewether in the Annual Report for 1947 of the Factory department of the Ministry of Labour and National Service. Of the 235 deaths from asbestosis which occurred between the years 1942 and 1946, inclusive, cancer of the lung or pleura was found to be present in 31 cases (13 2%), an incidence of statistical importance. Comparison was made in the report between the incidence of cancer in asbestosis and silicosis and an analysis of 6,884 deaths due to silicosis demonstrated cancer of the lung or pleura at post-mortem in only 1 32%. Although there was a disparity between the number of cases of asbestosis and silicosis, the low incidence in silicosis was a matter of medical importance.

Beryllium Poisoning. Increasing interest was taken in the complex study of beryllium poisoning both in Europe and America, after the original paper by Van Orslo and others in 1943, an extensive literature had grown up on this subject. There were differences of opinion as to the pathological properties of the various compounds but it was well known that the beryllium-containing phosphors possessed harmful properties. These pathogenic materials, if inhaled into the lung, could produce either an acute inflammatory condition—a pneumonitis—from which recovery might take place, or the more serious state of a granulomatosis of the lung. In addition to the pulmonary changes which might follow inhalation, the beryllium-containing phosphors might produce, if introduced into the skin or possibly other surface tissues, a comparable state of granulomatosis. Three cases of sub-cutaneous granuloma due to injury with the glass of a fluorescent tube were reported by R. S. Greer and others, and special precautions would need to be taken in industry with the use of these powders and with the disposal of broken fluorescent tubes. More recently, J. N. Agate reported on a case of pneumonitis in a beryllium worker in Great Britain. (A. J. Ar.)

United States. The year 1949 was marked by tendencies toward co-operation between labour, management, government and the affected professional groups to accelerate existing programmes and avoid duplicated effort. The Public Health service of the Federal Security agency appointed an advisory board of representation from these major groups to give advice and guidance in the expanding services provided by its division of industrial hygiene. The first meeting produced resolutions advocating intensified research, testing and education, field service, and greater interest in medical care plans for industrial workers, in the occupational effects of atomic energy, occupational-disease reporting and air pollution. The division also completed an intensive investigation of the "smog" (fog and industrial smoke together) disaster at Donora, Pennsylvania. No single substance was incriminated but rather an accumulation of several atmospheric contaminants, the evidence pointing particularly to sulphur dioxide and particulate matter. The report called attention again to the unsatisfactory state of knowledge about the toxicological effects of mixed irritant gases.

Reduction in industrial accidents assumed new importance through a conference called by President Truman, attended by the leading technical experts who prepared detailed plans for progress. The Bureau of Labour Standards in the Department of Labour undertook the leadership in this
The demand for qualified industrial physicians stimulated greater interest in training. The American Medical association also approved the first hospital for resident training in occupational medicine. Surveys were completed of industrial medical education provided by medical schools and schools of public health for undergraduate and postgraduate instruction. Many physicians were expected to qualify for special certification by the newly created American Board of Preventive Medicine and Public Health. The Journal of Industrial Hygiene and Toxicology, after several decades of independent publication, was merged with Occupational Medicine, to be published by the American Medical association as Archives of Industrial Hygiene and Occupational Medicine.

The American Academy of Compensation Medicine assumed major significance as a means toward improved medical service to injured workers. Legislation in South Carolina, New Jersey, West Virginia, Nevada, Delaware, Rhode Island and Utah emphasized the trend toward general rather than schedule coverage for occupational diseases. New York amended its workmen's compensation act to provide disability benefits for non-occupational sickness, a significant departure from practices in several other states where this form of administrative responsibility had been assigned to unemployment bureaux. Indiana became the 41st state to adopt legislation authorizing a second injury fund. (See also ACCIDENTS.) (C. M. Pn.)

**INFANTILE PARALYSIS.** The number of recorded cases of poliomyelitis in England and Wales in 1949 was estimated at 5,800—second only to 1947. Six hundred people died of the disease throughout the year, an average of 0.0014% of the total population. The incidence of poliomyelitis was also unusually high during 1949 in Austria, France, Germany, India and New Zealand.

An outbreak of considerable medical interest occurred in the winter of 1948-49 among the Eskimo population in the Chesterfield area just west of Hudson's bay. There was an especially high mortality and paralytic rate (estimated at 5% and 14%, respectively, of the entire population in the Chesterfield area). The infecting agent was identified by laboratory tests as poliomyelitis virus, and it appeared to have been transmitted by clinically healthy human carriers. A progressive increase in the number of cases of poliomyelitis recorded in the United States during 15 years reached a peak in 1949. The average number of cases per year for the period 1935-39 was 6,784; for 1940-44, 10,885; and for 1945-49, 24,800. The epidemic of 1949, totalling almost 45,000 cases, covered most of the country, whereas previous epidemics were more limited geographically, and the affected areas tended to shift from year to year.

In the United States, a virus unknown previously was identified and proved responsible for a human disease so closely resembling the milder types of poliomyelitis that physicians were unable to distinguish between the two diseases. The virus is called the Coxsackie virus, named after the village in New York where it was first isolated by G. Dalldorf and G. Sickles in 1948. In addition to human beings, this virus is infectious for immature mice and hamsters, but not for adults of the same species. Several distinct types of virus from the point of immunity were found, none identical with any of the known types of poliomyelitis virus. It was isolated from flies, from sewage and from numerous human cases presenting symptoms of non-paralytic poliomyelitis. In 1949 there was no published report of its isolation from any human paralytic case on which concomitant tests for poliomyelitis virus were clearly negative. Poliomyelitis and Coxsackie viruses had been found simultaneously, however, in stools from the same patient.

A major difficulty in the preparation of poliomyelitis vaccines was the necessity of using infected monkey spinal cord as the source of virus. This limited the material available; entailed a danger of inducing an allergic inflammation of the recipient's own nervous tissues; and involved technical difficulties in the treatment of the material with agents designed to inactivate the virus without destroying its power to stimulate resistance. A possible solution of these problems was found in the successful growth of poliomyelitis virus in cultures of non-nervous human tissues. Two antigenically distinct types of poliomyelitis virus were so cultivated, in tissues from the limbs and intestines of stillborn human infants. One type of virus was carried through a series of stages in cultures of skin from the prepuce of boys.

A systematic testing of poliomyelitis viruses was started in 1949 and scheduled for completion by 1952. While several hundred viruses were available, each isolated from a different human patient, the only property these were definitely known to possess in common was that each had produced typical symptoms and pathology of poliomyelitis in a susceptible animal. Their relationships to each other were still for the most part undetermined. Thirty viruses that were studied in 1949 all fell into three groups. An animal rendered immune to a virus in any one group was similarly immune to all others of the same group but not to the viruses of the other two groups.

Further research provided convincing proof that the paralytic consequences of human poliomyelitis could be minimized by a period of rest in bed during the early pre-paralytic stages of the disease. Additional evidence was also advanced to show that the chances of developing poliomyelitis are heightened by pregnancy and by removal of the tonsils and adenoids during a time when the virus is prevalent in the community. (See also EYE, DISEASES OF; EPIDEMICS; NERVOUS SYSTEM.) (H. M. Wr.)

**INFANT MORTALITY:** see VITAL STATISTICS.
INönü, Ismet, Turkish army officer and statesman (b. Izmir, Turkey, Sept. 24, 1884), after Kemal Atatürk's death was unanimously elected president of the republic by the Grand National Assembly on Nov. 11, 1938, and re-elected in 1942 and 1946. (For his career see Encyclopedia Britannica and Britannica Book of the Year 1949.)

According to the statutes of the government Republican People's party adopted in 1939, Ismet İnönü was also "the permanent supreme leader" of the party. In the statutes revised by the congress of Nov. 1947, he was not mentioned; it was stated that the president general of the party is elected by the congress and specified that if the president general is elected president of the republic, he delegates his party functions to the vice-president general. General İnönü was re-elected president general of the R.P.P. but immediately transferred his powers to the vice-president general, Hilmi Ural. At Ankara on May 19, 1949, he declared that "all the damage and exhaustion of armed conflict are implied in a war of nerves (against Turkey), except the loss of life and destruction of buildings." He expressed the conviction that the struggle for power in Turkey would remain extremely constitutional. "The Turkish nation," he said, "overcomes victoriously the dangers of a democratic regime; the country enters a period in which she will profit by its blessings."

INSURANCE. Results published during the year 1949 in Great Britain disclosed further expansion in premium income and considerably improved trading. An analysis of the accounts showed that in 1948 the total premium income from fire and accident insurance combined, for 24 representative British offices, rose by £27,122,000 to £244,224,000, and produced an underwriting surplus of £15,313,000, equivalent to 6 3/4% of the premiums. Marine premiums were higher by £5,329,500 at £33,382,000, and trading results were favourable. Unfortunately, taxation at home and abroad falling heavily on profits obstructed the very necessary strengthening of additional reserves.

Total new ordinary life sums assured in 1948 was only slightly below the record figure of £500 million attained in 1947. During 1949, much new business was brought in by the growing popularity of "family protection" assurance and staff pension schemes, but it was evident that the economic pressure on salaries and incomes would leave its mark upon the total new business production for the year.

The high level of new business attained by the industrial life offices, which was a feature of 1946 and 1947, was not repeated during 1948, the total new business of eight leading industrial companies, at £188,692,000, being £28,174,000 less than in 1947. It was anticipated that increased national insurance contributions would have at least a temporary restrictive effect upon the flow of new business, and this in a year of decline in the general level of savings proved 1949 one of consolidation rather than of spectacular progress.

Fire losses in the United Kingdom were again heavy in 1949, the experience in farming risks being exceptionally severe owing to an abnormally dry summer. The high rate of fire wastage was viewed with concern not only as a financial loss to underwriters but as a permanent and absolute loss of national capital, and the Fire Protection association was actively employed in its endeavour to abate this serious feature. The trend of insurance values was to higher levels, consequent upon the continued inflation of values, and coverage against consequential losses following industrial fires was in increased demand. Overseas claims attributable to politically disturbed conditions, such as incendiarism on the Malayan rubber estates, continued to weigh heavily on the business, and China, an important war field for British insurers, was practically closed for effective operations at mid-year. Elsewhere, an excessively nationalistic approach by certain countries to the insurance business again proved a disturbing feature.

Motor premium income was well maintained, but the high cost of repairs, especially in respect of cars of new design, combined with the heavy sums awarded as damages for personal injuries, rendered trading results variable and delicately poised. Burglary and baggage insurance showed good progress and a generally improved claims experience. Many sought the cover provided by employers' liability insurance. Accidents that formerly would have been met under the Workmen's Compensation act were made the subject of common law claims against the employer, and doubts were expressed as to the adequacy of the rates charged for the cover granted. Property-owners and general third-party liability, personal liability cover, plate glass insurance, fidelity guarantees, the insurance of boilers, and personal accident protection all remained in good demand.

Diminution of marine premium income arising out of the removal of the Combined Marine surcharge and the effects of the amendment to the Joint Hull Underwriting understanding were more than offset by the increased sterling value of a considerable portion of the premium income following the operation of the new exchange rates during the last quarter of the year. Major casualties included the loss of the Royal Mail liner "Magdalena" at a cost to underwriters approaching £3 million — a sum greater than any ever before known in the history of single losses. The very high value of new liners, together with increasing replacement costs, created special underwriting problems, but the totals were successfully absorbed. Theft, pilferage and non-delivery problems received serious attention by port and other authorities, but world-wide losses from these causes continued to be heavy.

Insurance interests built up by the British insurance industry in the U.S. gave the devaluation of sterling against the dollar special significance and presented underwriting and accountancy problems of some magnitude to British insurers. With about 65% of British overseas insurance business derived from U.S. operations, the new rate of exchange would enhance very considerably the sterling equivalent of the U.S. trading figures in world-wide published accounts. Conversely, there existed the necessity of providing the increase in sterling equivalent of the unexpired risk and outstanding loss reserves.
INTERIOR DECORATION

Plans for the nationalization of the industrial assurance companies and societies—including ordinary life assurance, fire, accident and general business transacted by these institutions—were replaced towards the end of the year by a proposal that industrial assurance should be conducted on the principle of "mutual ownership." Under this modified plan the proprietary companies in the field of industrial assurance would be owned by the policy holders themselves instead of by private shareholders. The outline of the plan left many important questions unanswered, and insurance spokesmen expressed concern lest world-wide repercussions of acute controversy in this country might prove detrimental to the insurance industry as a whole.

P. S. V.

United States. At the end of 1949, nearly 85 million persons owned about $234,000 million of life insurance protection in the legal reserve life insurance companies of the United States and Canada. This was only slightly in excess of one year's income of the United States and Canadian peoples. The premiums paid in 1949 for life insurance and annuities exceeded $7,000 million.

Payments made to policy holders and beneficiaries by United States and Canadian companies in 1949 reached a new peak of over $3,400 million. If the increases in reserves held to assure payment of future benefits are included with payments to policy holders and beneficiaries, then over $7,000 million was paid or credited in 1949 to United States and Canadian families by the legal reserve companies of the two countries. In 1949, new life insurance issued exceeded $25,000 million for the third year in succession. The net increase in life insurance outstanding was about $14,000 million.

During 1949, the assets of United States and Canadian legal reserve life insurance companies increased by about $4,000 million to reach $637,000 million, of which approximately 93% was held by United States companies. At the year end United States companies held over $23,000 million of corporate securities and nearly $13,000 million of mortgages, these two categories of investments together represented about 60% of the assets of U.S. legal reserve companies.

The holdings of United States government securities declined again in 1949 but such securities still totalled about $15,000 million at the end of the year (L. A. L.)

Fire Insurance. The premium income of private companies in the United States showed a smaller increase in 1949 than in the two previous years, with earned volume estimated at $2,750 million, but the total fire wage for the year dropped over $40 million below the 1948 figure. The companies, generally, made a profit in addition to their increased equities in the unearned premium reserve, whereas many had underwriting losses on fire insurance in each of the four years which preceded 1948.

Marine Insurance. The year 1949 witnessed a substantial drop in the total marine premiums written in the United States, but underwriters expected that the loss experience would be better than in the previous year. The world shortage of dollars; the small extent to which U.S. companies participated in the insurance of Economic Co-operation Administration shipments and the sale to foreign owners of a large number of government-owned vessels all contributed to a reduced volume of premium writings. (X.)

Hospital, Medical and Surgical. Inclusion by U.S. labour unions of health and welfare demands in contract negotiations, notably in the steel and automotive industries, was probably the most significant development in this field during 1949. Acceptance by management of the principle of company-paid welfare benefits provided a new stimulus toward increased pre-paid health service through private channels. Industrial co-operative and other miscellaneous programmes covered, at the end of 1949, about 66 million persons for hospital benefits, 37 million for surgical benefits, and 14 million for medical benefits (See also National Insurance; Social Security, U.S.) (A. G. S.)

INTERIOR DECORATION. It was generally evident during 1949 that, four years after the end of World War II, the supply of house furnishings to the home market in Great Britain had improved considerably. Rationing with its attendant system of docketing and priorities was discontinued. Some of the controls exercised by the Board of Trade over the allocation of raw materials and the design of finished products were either relaxed or wholly lifted. Shortages were still apparent but the position had changed slowly from an absolute dearth to a relative abundance, although the export market remained an over-riding first consideration. This was a satisfactory state of affairs as far as it was evidence of a recovery from war and consequent scarcities. Satisfaction was tempered, however, by realizing that the goods available were limited by a narrow range of choice. The prospective purchaser of new house furnishings was able to buy from the utility ranges or from manufacturers' new and stock designs. If his means were modest he had no alternative but the former because the price was controlled. There was little promise of high adventure in buying utility ware but there was fair certainty of finding sensible and unpretentious articles. In furniture a new phase was discernible which was spoken of as freedom of design. This meant that manufacturers were allowed to produce their own designs provided that such designs conformed to the Board of Trade specifications which exempted them from purchase tax. Unhappily this freedom, with some outstanding and praiseworthy exceptions, resulted in a noticeable deterioration of design standards. First, in an attempt to vary uniformity, superficial differences were added which disfigured the simplicity and spoiled the restraint of the original controlled designs. Then a tendency to look back towards 1939 caused replicas of cheap and undistinguished prewar furniture to make an unwelcome re-appearance in showrooms. Thus, although freedom of design meant a wider variety, it was a diversity which for the most part was degraded by indifferent standards of craftsmanship and invention. Carpets and floor coverings, curtains and upholstery fabrics in the utility ranges offered no more than an adequate choice of pattern, colour and texture with, here and there, a design of real distinction. In crochetery there was a drab monotony mainly due to a ban on the sale of decorated china to the home market. The only exceptions to the rule were export "seconds," a term used to describe items of crockery which for one reason or another were inferior to the quality required for export. The restricted variety of furnishings available in utility ranges represented that which was produced in the largest quantity and which was bought by the greatest number of householders. But it was only in those goods which were made regardless of price control and those made for export that the full scope of British furnishing designs was evident.

Throughout 1949 the importance of good design in all forms of house furnishing was emphasized and reiterated time and again in public speeches, in the press and on the wireless. The Council of Industrial Design continually urged the value of good design in promoting business. In the furnishing trades there was a freer acceptance of the idea that in acutely competitive world markets good design was no less irresistible than good salesmanship, but whereas there was general acquiescence about its desirability there were widely different approaches to its production.

In the carpet and pottery trades, for example, markets had been built up on the production of old and intricate designs executed with unsurpassed skill, designs which had become familiar because of an easily recognizable pattern or shape.
and renowned for the technical excellence of their manufacture. Since very few designs had been produced the problem in these trades was the re-animation of old designs so that without loss of identity they were a more immediate expression of modern living. By contrast the textile industries displayed every sign of using their traditionally high reputation as a spur to further development. In their products they showed versatility in the use of new processes and materials, originality in the output of new patterns and textures and a good standard of design informed by a lively understanding of present-day requirements. A great deal of the credit for this alert attitude was due to the work and influence of the Cotton Board Colour, Design and Style centre and to the Rayon federation. From the furniture trade, disregarding that section which contented itself with the reproduction of antiques, there came a number of interesting designs which also showed some knowledge of contemporary needs in the fact of their smaller scale and lighter construction and in their experimental use of new shapes and materials.

In spite of an awakening interest in design there were no discernible trends in 1949 to suggest the development of a postwar style of household furnishing. It seemed that the ultimate emergence of such a style depended on the extending influence of the Council of Industrial Design whose valuable work of raising the standards and correlating the various aspects of interior design continued intensively throughout the year.

(F. W. W.-S.)

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.

Activities of the International bank expanded greatly during 1949 along two main lines: in the volume of actual loans which the bank granted; and in the substantially increased amount of technical assistance and other services which the bank rendered to its member countries. The bank, from Jan. 1 to Dec. 1, 1949, made a total of 11 loans aggregating $206,600,000. The majority of these loans were for the purpose of assisting in the economic development of member nations.

Latin America. The bank made two loans to agencies of the Mexican government for electric power development. The first loan, of $24,100,000, was made to finance purchases by Mexico's Federal Electricity commission of equipment needed for constructing generating stations, transmission lines and distribution systems in various parts of Mexico. A second loan, of $10 million, was made to assist in financing a programme for expansion of electric generating and distribution facilities. Both loans were guaranteed by the Mexican government.

The bank made a loan of $75 million which was guaranteed by the government of Brazil, to the Brazilian Tracton, Light and Power Company, Ltd., a Canadian corporation, to finance most of the foreign exchange costs of the four-to-five year programme for expansion of hydro-electric power and telephone facilities of the company's Brazilian subsidiaries. A loan of $5 million was granted to the Caja de Credito Agrario, Industrial y Minero to finance the purchase of modern agricultural machinery. This loan was guaranteed by the Colombia government.

Europe. The bank made a loan of $16 million to Belgium to finance imports of equipment for the construction of two privately-owned steel mills and a power plant in the industrial district of Liége. A loan of $12,500,000, which was guaranteed by the government of Finland, was made to the Bank of Finland for reconstruction and modernization of woodworking industries, electric power development and expansion of production of limestone powder used in agriculture. Another loan of £15 million was granted to the Finance Corporation for National Reconstruction (Herstelbank) of the Netherlands for 24 projects involving reconstruction or modernization of Dutch industry. This loan was guaranteed by the Netherlands government.

Loans of $2,300,000 and $2,700,000, respectively, were made to Finland and Yugoslavia for the purchase of timber-producing equipment in order to develop the production and export of timber in those countries.

Asia. The bank extended its first credits to a member country in Asia when it granted two loans to India. The first loan, of $34 million, was made to assist in financing a broad programme of railway improvement. A second loan, of $10 million, was for the purchase of heavy agricultural machinery needed for the reclamation of weed-infested lands and for clearance of jungle land.

General. These lending operations brought the total loans made by the bank from the time it began operations to Dec. 1, 1949, to $731,600,000.

The increased tempo of the bank's activity in 1949 was not confined to the granting of loans. As the year ended, the bank was actively investigating additional projects in about 20 member countries.

At the request of its members, the bank sent about 30 missions to member countries. While the functions of these missions necessarily varied in each particular case, they included mainly the following: examining specific projects proposed for bank financing; assisting a member country in drawing up an over-all development programme suited to its needs; and making a comprehensive survey of the general economic situation in a member country and assisting in designing measures for improving its financial stability.

The bank engaged in no direct borrowing operations during 1949. It further developed, however, another type of marketing technique, begun in 1948, by selling from its loan portfolio securities issued to it by borrowers under its loans. During the year the bank sold, with its guarantee, to institutional investors in the United States the $16 million of bonds received in connection with its loan to Belgium, and the last $3,900,000 of mortgage notes received in connection with its loans to four Dutch shipping companies.

The bank's operations for the fiscal year ended June 30, 1949, resulted in an excess of income over expenses of approximately $10,600,000. The total excess of income over expenses since the bank began operations to Sept. 30, 1949, amounted to about $16,800,000.

Membership in the bank was increased to 48 countries with the admission of Thailand. In addition, applications of Liberia and Haiti were approved by the board of governors, subject to completion of necessary formalities.

At its annual meeting held in Washington, D.C., in September, the board of governors approved the bank's fourth annual report. This report stated that an outstanding feature of the year was the increased attention given to the problem of economic development. It described the bank's objectives in this field as essentially the same as those announced by President Truman in the Point Four programme.

On July 1, 1949, Eugene R. Black assumed office as president of the bank, succeeding John J. McCloy (g.v.). (See also International Monetary Fund.) (E.R.Bk.)

INTERNATIONAL COURT OF JUSTICE. On April 9, 1949, the International Court of Justice gave its final decision in the Corfu Channel case between the United Kingdom and Albania. It held that Albania was responsible under international law for the explosions that occurred in Albanian waters on Oct. 22, 1946, resulting in the loss of one British destroyer and damage to another with heavy loss of life.

On two other questions raised by the agreement between the parties under which the court was proceeding; i.e., as to whether the acts of the Royal Navy in those waters (1) on
Oct. 22 and (2) in sweeping the waters on Nov. 12, 1946 (to determine the nature of the explosions), constituted a violation of Albanian sovereignty, as contended by Albania, the court decided the first question in the negative and the second one in the affirmative. Money damages were not allowed, the court concluding that its declaration constituted in itself sufficient satisfaction to Albania. The court issued an order fixing time-limits for the submission of written observations regarding damages claimed by the United Kingdom.

On July 1, 1949, the Albanian agent filed with the court a submission of observations that under international law signed by the two agents on March 25, 1948, the court had solely to consider whether Albania was obliged to pay compensation for the damage done on Oct. 22, 1946, and was not thereby authorized to fix the amount of the compensation or to ask Albania for information on the subject. Albania refused to appear at the hearings held on Nov. 17.

On Nov. 19 the court designated Rear-Adm. J. B. Berck and G. de Rooy, both of the Royal Netherlands navy, as a committee of experts to examine the figures and estimates filed by the United Kingdom covering loss of the destroyer "Saumarez" and damage to the "Volage." Their report was filed on Dec. 1 and was promptly communicated to the parties, which was given until Dec. 10 for submission of written observations.

On Dec. 6 the United Kingdom government stated that, inasmuch as the experts had concluded that the claim submitted by it might be taken as a fair and accurate estimate of the damage sustained, it did not wish to make further observations.

On Dec. 10, shortly after expiration of the time-limit, the Albanian government filed, with the court, a letter stating that it desired to make observations in the form of direct questions to be put to the experts in a session of the court, or, in the alternative, to be given until Dec. 23 for the filing of written observations. The court declined to accede to this request and on Dec. 15, by a vote of 14 to 2, decreed that Albania should pay to the U.K. the sum of £843,947.

Advisory Opinion. The general assembly on Dec. 3, 1948, asked the court for an advisory opinion as to:

(1) Whether in the event of an agent of the United Nations suffering injury in the performance of his duties in circumstances involving the responsibility of a state, the United Nations, as an organization, had capacity to bring an international claim against the responsible government for repair in respect of damage caused (a) to the organization, (b) to the victim or to persons entitled through him?" 

(2) How, in the event of an affirmative answer to point 1 (b) just stated, action by the organization was to be reconciled with such rights as might be possessed by the state of which the victim was a national?

The court gave its opinion on April 11, 1949. It was unanimous in answering question 1 (a) in the affirmative. Eleven judges answered question 1 (b) in the affirmative and four were of opinion that no such capacity existed. They thought that under international law such claims were to be dealt with between the state responsible for the injury and the state of which the victim was a national.

On the second part of the question; i.e., as to how action by the United Nations under point 1 (b) was to be reconciled with such right as might be possessed by the state of which the victim was a national, the same 11 judges were of the opinion that since the organization, in bringing a claim for damages caused to its agent, could do so only by basing the claim upon breach of obligations due to itself, respect for this rule should usually prevent a conflict between its action and such rights as the agent's national state might possess; and that in this fashion "reconciliation" between the claims would be effected. This, they said, "must depend upon circumstances applicable to each particular case, and upon agreements to be made between the organization and individual states."

Pending Cases. At the close of the year 1949 the following cases were pending: Colombia v. Peru, a question of asylum and safe-conduct involving a Peruvian national who was given refuge in the Colombian embassy in Peru; Great Britain v. Norway, involving the extent of Norwegian territorial waters inside which fishery interests may be reserved exclusively for Norwegian nationals; France v. Egypt, relating to the application of certain Egyptian decrees to French nationals and their property. There were requests by the U.N. general assembly for advisory opinions on: the interpretation of provisions of petro-treaties between certain allied and associated powers; the right of the Council of European and Rumania; whether the general assembly might admit states to membership in the United Nations without a favourable report from the Security council; and the status of territory of South West Africa over which the Union of South Africa was given a mandate by the League of Nations. (See also International Law.) (G. H. H.)

INTERNATIONAL LABOUR ORGANIZATION. The 32nd session of the International Labour Organization conference met at Geneva, Switzerland, June 8-July 2, 1949, with 550 accredited delegates and advisers from 50 member states. Five conventions and four recommendations were adopted. Three conventions—the right to organize and collective bargaining; protection of wages; and labour clauses (public contracts)—completed the second discussion of subjects begun at previous sessions. Two conventions—fee-charging employment agencies and migration for employment (revised)—were revisions intended to facilitate wider ratification by giving alternative choices in their application.

In addition to these five conventions, the conference adopted the partial revision of three maritime conventions and the four recommendations—labour clauses in public contracts; the protection of wages; migration for employment (revised); and vocational guidance. This made a total of 98 conventions and 87 recommendations adopted in 30 years with more than 50 conventions in force.

The report of the director-general (D. A. Morse) stressed the intensification and expansion of L.I.O. work as a complement to its deliberative and legislative functions.

The report was debated for nearly 12 days—more than half the working hours of the conference—by 95 speakers, and its unique feature was an assessment of world affairs from the three-fold point of view of governments, employers and workers the world over. The new emphasis on operational activities and the wider participation of members in the ratification of conventions, regional activities, etc., were unanimously approved.

The application of conventions and ratifications was debated as a matter of major concern at the conference. The total number of ratifications registered was 1,011 as reported by the conference committee in June, later increased to 1,039 (October); but the gain in both 1948 and 1949 was only about 35. The committee of experts said that reports of what had been done after the ratification of conventions and with the recommendations were too few and too late. Both committees and the director-general said that, making due allowance for postwar conditions, this situation was critical and they united in an appeal to the member states for loyalty and a greater sense of obligation.

The conference adopted a budget of $5,987,526 for 1950. This was about $800,000 more than for 1949. The increase was due chiefly to operational activities in the field of manpower, technical training and migration.

The governing body held three sessions, the 108th and 109th at Geneva in March and June, and the 110th in Mysore, India, in Dec. 1949, in connection with the postponed Asian Regional conference in Ceylon. The body appointed its own...
tripartite manpower committee for Europe, Asia and Latin America, and arranged for both separate and joint meetings. It also authorized the office to convene employment service experts in various regions and established an I.L.O. field office on technical training in Asia. In response to the request of the U.N. Economic commission it authorized the office to assist countries to develop systems for the training of supervisors and instructors within industry and to convene a tripartite meeting of experts from European countries. Assistant director-general G. A. Johnson was appointed treasurer, and Wilfred Jenks, present legal adviser, and Luis Alvarado of Peru assistant directors general.

The fourth conference of American states members of the I.L.O. met in Montevideo, Uruguay, from April 25-May 7. It dealt with the life and work of indigenous workers, conditions of employment of agricultural workers, industrialization and the efficiency of the labour force in Latin American countries, particularly with respect to training and health conditions. (S. McC. L.)

INTERNATIONAL LAW. In 1949, most international jurists emphasized the co-operative rather than the federalistic character of the world community, stressing the phrase "sovereign equality" of states in article 2 of the United Nations charter. Some, however, interpreted the growing recognition of the status of the individual as a manifestation of a movement toward world federalism. Broad interpretations of the veto and the reservation of domestic jurisdiction in the U.N. charter convinced some that state sovereignty had been little curtailed by new institutions and principles. Others, noting the development of regional security arrangements, foresaw a period in which such arrangements would dominate the world community.

The Status of International Organizations. The International Court of Justice gave an advisory opinion in April 1949, at the request of the general assembly, holding that the United Nations had an objective personality entitling it to make claims, as would a state, against any state, whether a member or not, responsible for injury to its agents. The opinion was requested in connection with the assassination of Count Bernadotte in Israel and, following the opinion of the United States assembly, instructed the secretary general to present suitable demands for reparation.

During the year there was much discussion of the authority under international law of the United Nations to interfere in civil wars and to recognize new states. The issue was raised by the action of the U.N. in the Indonesian controversy and in this instance the U.N. successfully asserted its authority.

The limitations which the domestic jurisdiction reservation in the charter (article 2, para. 17) imposed upon the United Nations in dealing with controversies were also involved in the South African refusal to observe repeated assembly resolutions requesting it to put the formerly mandated territory of South West Africa under trusteeship and to respect the human and treaty rights of Indians living in South African territory. Juristic opinions differed on the issue of whether a state could withhold a matter from U.N. action by declaring it to be "essentially domestic" while others held that U.N. agencies themselves were free to assume that no matter was in the domestic category if it concerned a subject put within the competence of the United Nations by the charter or regulated by international law or treaty. In practice the organs of the United Nations followed the latter interpretation but certain members, resting on the former interpretation, ignored its recommendations.

By admitting new states to its membership and by accepting the credentials of individuals commissioned by revolutionary governments to represent members, the U.N. undoubtedly qualified the "sovereign right" of other members to recognize or not to recognize such states or governments. Juristic analyses indicated that many types of assembly resolutions necessarily had important legal effects even though in form they were merely recommendations. This was formally true of the general assembly's resolution in the autumn of 1948 disposing of the former Italian colonies under authority given by the peace treaty with Italy.

The capacity of the United Nations and the specialized agencies to request advisory opinions of the International Court of Justice gave these organizations a practical status before the court. Jurists suggested that it might be advisable to open the court to contentious litigation by these international organizations although that step has not yet been taken.

The trend of opinion, practice and authoritative decisions was to augment the status and power of international organizations, thus qualifying the status of states. Appreciation that this legal position had not always been acquiesced in by members of the United Nations led to a resolution in the general assembly in Dec. 1949 by a vote of 53 to 5 affirming the obligations of the charter and calling upon the members to co-operate in full with U.N. organs.

Status of Regional Arrangements. Opinions varied concerning the status of regional arrangements for collective self-defence, although the permissibility of such arrangements under article 51 of the U.N. charter was generally acknowledged. The western powers had generally favoured the inter-American arrangement established by the Rio de Janeiro convention of 1947 and the Western Union arrangement established by the Brussels convention of 1948. On the other hand, these powers had been less enthusiastic about the Arab League established in 1944 and had generally opposed the one-sided arrangements concluded by the U.S.S.R. with its satellites in eastern Europe. The North Atlantic pact concluded in April 1949 was criticized on the political ground that it tended to widen the gap between the west and the U.S.S.R. and tended to reduce the security of Asiatic states, and on the juristic grounds that it provided no impartial procedure or clear criteria for determining the aggressor and no workable procedure to indicate whether a decision on this point, made by the parties, was just.

Rights and Duties of States. Under instructions from the general assembly, the U.N. International Law commission approved, by a vote of 11 to 2, (the U.S. and U.S.S.R. representatives joining in the dissent) a Draft Declaration on the Rights and Duties of States originally proposed by Panama. The general assembly voted in November to transmit this document to the members for comment. The instrument was subject to much unofficial criticism by jurists from the point of view both of form and of content, though it commanded considerable support. It constituted an effort to state the basic principles of international law in brief paragraphs similar to instruments approved by the American states in the past.

Many traditional problems of international law were dealt with judicially during the year. The Oksana Kosenkina case,
concerning the Soviet employee who jumped out of a second-storey window to escape Soviet restraint, raised questions of consular immunity. The immunity of national representatives to the United Nations in the U.S. was raised in a case involving speeding by the Chilean representative. U.S. courts held that Valentin Gubichev, an employee of the United Nations and allegedly still attached to the Soviet embassy was not immune from prosecution on charges of espionage in the United States. British courts refused to extradite Gerhard Eisler, a Communist found guilty of contempt of congress for refusing to testify before the Un-American Activities committee partly on the ground that the offence was political.

The trend toward judicial acceptance of executive decisions on matters of immunity, status, privileges, etc., continued in U.S. and British courts but was less evident in continental European courts.

The International Court of Justice handed down an opinion on the merits of the Corfu Channel case in April 1949, finding Albania liable for the destruction of British ships by mines in its territorial waters. The court stated the rule of customary international law that states in time of peace have a right to send their warships through straits used for international navigation between two parts of the high seas without the previous authorization of a coastal state, provided that the passage is innocent. Unless otherwise prescribed in an international convention, there is no right for a coastal state to prohibit such passage through straits in time of peace.

The International Law commission began investigating three topics of international law deemed to demand codification: the law of the high seas, the law of treaties, and the law of arbitral procedure. In connection with the first topic, a whaling convention came into force during the year and several states followed the United States in claiming domain beyond the three-mile limit. By legislation of 1945 the United States had claimed domain in the bottom of the sea as far as the continental shelf. Saudi Arabia claimed six miles, both the bottom of the sea and the sea itself, as had Turkey, Syria and the Lebanon. Most of the Persian gulf states claimed jurisdiction over the bottom of the gulf beyond the three-mile limit, and Jamaica and the Bahamas claimed the continental shelf surrounding these islands.

U.S. courts decided that for certain purposes the U.S. bases in Bermuda were “possessions” of the United States, but Okinawa, though occupied by U.S. forces, was not. Great Britain continued its controversy with Chile and Argentina concerning the Falkland Islands dependencies. These countries had refused to arbitrate the title, but had occupied certain islands which they claimed. During the year the western powers recognized the Korean republic (occupying the southern half of Korea) and gave a certain recognition to the German federal republic including the three western zones of Germany. They retained ultimate power in the occupation statute.

The general assembly in dealing with the former Italian colonies as authorized by the Italian peace treaty decided that Libya should be independent by Jan. 1, 1952, and that Somaliland should be under Italian trusteeship for ten years. It also authorized a commission to go to Eritrea to determine the wishes of the population before June 1950.

The general assembly made several decisions in regard to trusteeships and dependent territories. It asked the International Court of Justice to advise on the status of South West Africa, formerly under mandate. It also limited the right of administering authorities to incorporate trusteeship areas in administrative unions with neighbouring territories and decided that the U.N. flag should fly with the flag of the administering authority in trusteeship areas. The assembly also asserted its competence to consider the political development of dependent territories not under trusteeship. These positions were criticized by some of the administering authorities. The general assembly recommended that Jerusalem be internationalized under the United Nations, but this was opposed by both Israel and Jordan who were actually occupying the city. (See also Trust Territories.)

Human Rights. The Human Rights commission of the United Nations produced a Draft Covenant of Human Rights. This instrument would create legal obligations for ratifying states to observe certain of the rights asserted in the universal declaration and would be implemented by committees competent to investigate and give publicity to violations of the covenant. The covenant was to be considered further by the Human Rights commission at its meeting in 1950. The general assembly failed to take action on the proposed Freedom of Information convention. It did, however, consider the alleged violation of human rights in Hungary, Bulgaria and Rumania and asked the International Court of Justice for an advisory opinion on the obligation of these states to co-operate in the procedure for the protection of human rights set up in the peace treaties. These states had alleged that the matter was within their domestic jurisdiction.

The International Law commission had on its agenda the drawing up of a code on war crimes and other offences against international security along the lines of the Nuremberg charter, and the establishment of an international criminal court. The secretariat had prepared a “Historical Survey of the Question of International Criminal Jurisdiction” and committees were set up to study the matter, but no final action was taken. (See also War Crimes.)

Status of War. The Kellogg-Briand pact, the United Nations charter, the Nuremberg charter and the Nuremberg and other war crimes judgments had made it clear that war, as a condition during which two or more states were equally free to utilize armed force to solve their controversies, had been outlawed. Under these instruments, as interpreted by governments and international tribunals, governments engaged in hostilities must be either lawful defenders, unlawful aggressors, or governments lawfully exercising domestic jurisdiction or participating in international sanctions. They could not be belligerents in the traditional sense. Nevertheless, hostilities might occur and, whatever the name, would require regulation. There was considerable discussion of the “law of war” during 1949. Proposals were made to distinguish “hostile occupation” carried on after unconditional surrender of an enemy, “pacific occupation” carried on in an allied country during hostilities and “peaceful occupation” carried on in time of peace from “belligerent occupation” carried on in enemy country during hostilities. The prevalence of these varied types of occupation rendered the subject important. Regulation of aerial bombardment, submarine warfare and the taking of hostages was urged. Improvement in the 1929 convention for the treatment of the prisoners of war was also considered necessary. (See also International Court of Justice.)

INTERNATIONAL MONETARY FUND. The principal spheres of activity of the International Monetary Fund during 1949 related to the establishment and revision of par values and exchange rates, exchange transactions, exchange restrictions, multiple currency practices, gold policy and admission of new members. As in the past, the fund provided the machinery for continuous international consultation and co-operation on these varied problems.

With the admission of Thailand the membership of the fund increased to 48 members. Thailand’s quota in the fund was established at $12.5 million, bringing the total aggregate quotas up to $8,046.5 million, compared with $8,034 million on Dec. 31, 1948, and $7,921.5 million as at Dec. 31, 1947.
The use of the fund's resources continued to be governed by the same general policies as in previous years. Exchange transactions with members were submitted to the tests of the various criteria set forth in the fund's Articles of Agreement. As a general rule, countries receiving assistance from the Economic Co-operation administration could request the purchase of U.S. dollars from the fund on certain cases. This table summarizes the fund's exchange transactions during the year 1949.

| Table I.—Exchange Transactions of the International Monetary Fund, 1949 |
|------------------------|------------------------|
| **Country**             | **Sales of** |
|                        | **U.S. dollars** |
| Austria                | 37,500,000 |
| Yugoslavia              | 9,000,000 |
| India                   | 31,680,000 |
| Ethiopia                | 3,000,000 |
| Australia               | 20,000,000 |
| Bulgaria                | 3,000,000 |
| Ethiopia                | 300,000 |

In addition, the fund sold 6,136,000 U.S. dollars against gold. Important developments for the fund were the beginning of transactions in which member countries of the fund repurchased some of their own currencies with gold and U.S. dollars. The first country to engage in such a transaction was Costa Rica, which in May repurchased the equivalent of $874,000 in its own currency from the fund. In subsequent months similar transactions were carried through by Belgium and Yugoslavia. On Nov. 30, 1949, the fund held the equivalent of $1,450,560,000 in gold, plus $5,353,629,000 in currencies of member countries, of which $1,289,336,000 represented U.S. dollars.

The year 1949 saw many changes in the par values of member countries. In addition to the establishment of an initial par value for the Yugoslav dinar in May and a new par value for the Mexican peso in June, there were also changes in the par values of a number of member countries. These began on Sept. 18 when the United Kingdom proposed, and the fund concurred, in the change of the par value of sterling. Within a few days 13 member countries, not including their non-metropolitan areas, changed their par values.

| Luxembourg              | Dec. 23 |

The member countries which had not yet established par values with the fund at the end of 1949, because it was felt that their domestic conditions did not warrant their adoption, were Austria, China, Finland, Greece, Italy, Poland and Uruguay; neither did Thailand, which as already stated had joined the fund during the year, have an established par value. France continued as in 1948 not to have a par value agreed with the fund. In addition to the establishment of new par values and changes in established par values, a number of member countries in consultation with the fund took important steps to change their exchange rates or their existing systems. These changes did not, however, involve changes in par values. Among the countries which made such changes were Austria, Finland, France, Greece, Portugal, Paraguay and Uruguay. These changes usually involved considerable simplification of the exchange rate structure. In France, the new system established uniform exchange rates for all transactions in every currency; however, this rate was not fixed but instead, would vary in accordance with the rate quoted from time to time on the Paris free market.

During 1949, questions relating to external sales of gold at premium prices and gold subsidies were a matter of discussion with a number of member countries; e.g., Belgium, Canada, Southern Rhodesia and the Union of South Africa. The fund reviewed and decided to maintain its previous policy with regard to external transactions in gold at premium prices.

The fourth annual meeting of the board of governors of the International Monetary fund was held in Washington, D.C., in September. At this meeting the governors considered a proposal of the Union of South Africa to permit, under specified conditions, the sale, by the government of any member, of newly-mined gold in any market at such premium prices as might be ruling in that market. After discussion it was agreed that this resolution be referred to the executive directors of the fund for a study of the relevant considerations and for a report to the board of governors. At this conference it was decided to admit Haiti to membership of the fund, with a quota of $2 million and to extend the period in which Liberia might accept membership of the fund.

The activities of the fund involved continuous consultation and advising with member governments, and the maintenance of close contacts with the other international agencies. The fund worked together with a number of these agencies in connection with President Truman's Point Four proposal. (See also International Bank for Reconstruction and Development.)

INTERNATIONAL TRADE. Preliminary figures for the first nine months of 1949 indicated an increase in the value and the volume of international trade, at an annual rate, above that of 1948, and a decline in world export prices. However, the unbalanced state of the trade of the rest of the world with the United States and the shortage of dollar exchange continued to be a cause for common concern. Although increased effort was made by the rest of the world to reduce the high degree of dependence on purchases from the United States, declining exports to the United States and increased imports from that source resulted in trade deficits in the first and second quarters of the year which were larger than the deficit during any quarter in 1948; but considerable improvement took place in the year in the unbalanced situation in the third and fourth quarters.

Import and export exchange controls were universally maintained in 1949 and many countries intensified them, limiting dollar imports to the most essential goods and trying to divert their purchases as far as possible from the hard currency to soft currency areas. Various policies were adopted to encourage exports to the United States but the decline in economic activity in that country in the middle of the year was reflected in lower import figures. Declining currency reserves were halted by a wave of currency devaluations beginning with the devaluation of the pound sterling on Sept. 18, 1949, which carried with it devaluation of the currencies of the sterling area with the exception of Pakistan. This change was followed by a general readjustment of most European and several Latin American currencies.

The stringent world dollar exchange situation was partially alleviated by continued loans and grants. A large part of international trade continued to be financed in this manner.
Many countries sought to overcome the principal obstacle to trade—currency convertibility—by resorting increasingly to bilateral agreements and barter arrangements. Although increased restrictions on imports were characteristic of the period, the effort to lower tariffs and other trade barriers was continued. At the Annecy conference ten countries seeking accession to the General Agreement on Tariffs and Trade negotiated with each other and with the original contracting parties to the general agreement. The results of the negotiations were contained in the Annecy Protocol of Terms of Accession to the General Agreement on Tariffs and Trade, which was presented at U.N. headquarters on Oct. 10, 1949, for signature by the 33 countries concerned.

**United Kingdom.** The value of the merchandise trade of the United Kingdom continued to reach record levels in the first nine months of 1949. Exports totalled £1,315 million compared with £1,150 million in the same period of 1948. Imports showed an 8% increase in value over 1948, reaching £1,680 million in the first nine months of 1949. The volume of exports for Jan.-Sept. 1949 averaged 48% above the 1938 level. This compared with an average of 36% above prewar for 1948 and 9% above prewar for 1947. Retained imports were still held below the 1938 volume, though they were greater than in any postwar year. For the first nine months of 1949 they averaged 87% of the level for 1938. In the year 1948 imports were 81% of the prewar level.

The trade deficit with the United States which had narrowed encouragingly in 1948 widened again in the first nine months of 1949 when imports tended to rise and exports fell off sharply. This situation, together with a worsening of the dollar position of the other sterling area countries and a shrinkage of the sterling area gold and dollar reserves, caused a financial crisis which led to devaluation of the pound sterling in Sept. 1949.

Britain's trade deficit with its other major dollar creditor, Canada, was larger than that with the United States in 1948, but in the first nine months of 1949 it had lessened appreciably. British exports to Canada continued to rise in 1949, while imports from that area fell slightly.

About 50% of Britain's exports went to sterling area countries in the first nine months of 1949 compared with 42% in 1938. The dollar area (the United States, Canada, and the "American Account" countries) received about 9% in 1949, but took 11% in 1938.

Canada. Canadian foreign trade continued at a high level during the first nine months of 1949 with exports valued at $2,146 million and imports valued at $2,073·9 million.

Exports were $12·2 million less than during the corresponding period in 1948, while imports were $150·6 million greater, reaching a level higher than any ever before attained for a similar period. The volume of both imports and exports (i.e., value with the price factor eliminated) was far greater than before the war. For 1948 the import volume index (1938–100) was 181; the export volume index was 173.

Exports of Canadian merchandise to the United Kingdom were $9·8 million greater than during the first nine months of 1948, and imports from that country were $23·4 million greater. The export balance (taking into account re-exports) in the trade with the United Kingdom dropped from $389·2 million to $288·4 million. In the trade with the United States, comparing the same periods, exports to the United States decreased by $16·6 million and imports increased by $147·9 million despite continued exercise of comprehensive import controls. The import deficit in the trade with the United States for Jan.-Sept. 1949 amounted to $431·7 million, $169 million greater than the deficit for the corresponding period in 1948, but $286·5 million less than the deficit during the nine months period in 1947.

In spite of increased imports from the United States during...
1949, Canadian gold and dollar reserves to the end of September were held at just about the level recorded for the end of 1948--$985 3 million compared with $997 8 million. This level represented a marked increase from that of $501 7 million recorded for the end of Dec. 1947. The steadiness in 1949 was partly related to the better balance of trade with European and sterling areas. The important factor, however, was "off-shore" purchasing in Canada by European Recovery programme countries using dollars allocated to them. Some $450 million in payments was reported in this connection in 1948; more than $300 million in such payments was anticipated for 1949. Canada financed some exports to the United Kingdom by permitting the resumption of withdrawals from the United Kingdom loan account to the amount of $10 million per month.

**Australia and New Zealand.** During the fiscal year ended June 30, 1949, exports from Australia amounted to £547 million, 33% greater than the value of exports during the fiscal year ended June 30, 1948; imports into Australia during the same period amounted to £4415 million, 22% greater than the value of imports during the preceding year. Greatest increases occurred in exports to the United Kingdom, Italy, France and the U.S.S.R. and in imports from the United Kingdom, Indonesia and Sweden. Exports to the United States declined from £35 million to £32 million; imports from the United States dropped from £66 8 million to £41 5 million.

* Including re-exports
† Metropolitan territories
‡ General imports

Exports from New Zealand amounted to £NZ147 8 million during 1948 compared with £NZ129 4 million during 1947. Imports in 1948 valued at £NZ128 million were at about the same level as in the preceding year. As in the case of Australia, New Zealand's principal export surpluses continued to be sold to the United Kingdom under long-term contracts.

* Preliminary figures

**Union of South Africa.** In 1949 the government of the Union of South Africa took further steps to arrest the continued decline in the country's gold and foreign exchange resources resulting from the unbalanced state of its trade. In March 1949, the union government expanded the list of prohibited imports and, from July 1, 1949, extended its import and exchange controls to cover imports from all sources including sterling countries.

**United States.** Exports from the United States, although still large in 1949, showed a decline for the second consecutive year. After increasing in the first two quarters, largely because of expanded trade with countries participating in the European Recovery programme during the last two quarters of 1948, they declined sharply in the third quarter, somewhat further in the fourth quarter, and showed a drop of about 7% in total value for the year. An estimate on the basis of Jan.-Nov. data, placed the year's total exports at $11,900 million compared with exports amounting to $15,340 million in 1947 and $12,650 million in 1948.

The decline from 1948 was largely the result of the downward trend in commodity prices beginning late in 1948 and continuing in 1949. In terms of quantity (the "value" figure adjusted for changes in the price level), the total export trade for 1949 was approximately as large as in 1948, although in the final quarter of the year it showed a decrease of about 10%, from the 1948 quarterly average.

Imports into the United States decreased in the first three quarters of the year and, despite a marked increase in the final quarter, showed a decline for the year of approximately 7% from 1948. Total imports for 1949 were estimated at $800 million compared with $5,750 million in 1947 and $7,124 million in 1948. Although the lower level of prices accounted partly for the drop in value from 1948, the quantity of imports also showed some reduction.

The downward trend in exports and the rise in imports after the middle of 1949 narrowed the gap between exports and imports to approximately $800 million in the fourth quarter, the smallest quarterly export balance since before the war. At an annual rate, this quarterly balance amounted to $3,200 million compared with export balances of $9,600 million in 1947, $3,500 million in 1948 and an annual rate of $6,000 million in the first nine months of 1949.

**Europe.** During the period Jan.-June 1949 the total value of imports into countries taking part in the European Recovery programme amounted to $10,110 million, an increase of 5% over the 1948 half-year average; the value of exports
from the E.R.P. countries during the same period amounted to $9,900 million, 16% above the 1948 half-year average. The expansion in exports further narrowed the export-import gap. The trade deficit for the six months was at an annual rate of $6,300 million, compared with a deficit of $7,500 million in 1948. The 1949 trade deficit in terms of real prices was comparable with the 1938 deficit and the ratio of exports to imports was 76% compared with 75% in 1938. The export-import ratio in 1948 was 69%, and in 1947 it was 58%.

The heavy dependence of E.R.P. countries upon the United States as a source of imports showed no indication of decline for the group as a whole during the first six months of 1949 compared with the previous year. Of total imports into E.R.P. countries during this half-year period, 18 4% came from the United States, compared with 18 2% in 1948. The situation became all the more difficult because of the falling off in exports to the United States during the first half of 1949 and the trade deficit with the United States grew progressively larger.

The trend of European trade in 1948 and the first half of 1949 indicated a rise in volume of trade within Europe as well as with the outside world. Imports into E.R.P. countries from Eastern Europe in the first half of 1949 were about the 1948 level, but exports to Eastern Europe increased, bringing the trade between the two groups of countries more nearly into balance.

In Sept. 1949 the United Kingdom and many of the European countries devalued their currencies in an effort to improve their trade position with the dollar area. It was recognized that the long-term effects of devaluation would be exceedingly complex and that it would be some months before they would be clearly apparent.

In the autumn of 1949 a systematic attempt was made to deal with the problem of intra-European trade restrictions. At the recommendation of the O.F.C. (Organization for European Economic Co-operation) council in Paris each participating country removed quantitative restrictions from a substantial portion of its import trade originating in member countries. Licenses for commodities for which quantitative restrictions were removed were to be either abolished or granted automatically.

**Middle East.** In the middle east the foreign trade of most countries remained at high levels during 1949. Egyptian trade was greater in the first half of the year than during the first half of 1948. The foreign trade of 'Turkey was brought more nearly into balance, largely as a result of an increase in exports. Israel's trade showed some expansion, but commercial activity with neighbouring countries was still restricted. The foreign trade of Lebanon and Syria continued at a low level. Iraq's exports and imports were less than in 1948 and strict control was exercised over imports to hold down the adverse balance. Persia's trade position improved as a result of increased exports in the early part of the year.

**Southern Asia.** While the foreign trade of southern Asia (India, Pakistan and Ceylon) was at a very high level during the fiscal year 1948-49, being about one-fifth more than in the previous year, a sharp drop occurred in the fiscal year 1949-50. The official import trade of India during the year 1948-49 amounted to $1,563 million while exports were valued at $1,254 million, resulting in an import balance of $309 million. Pakistan also had an import balance of $72 million, as imports were reported to be $330 million and exports $58 million. These figures, covering only seaborne trade, do not reflect the overall trade between the two countries. It has been estimated that more than 75% of India's imports from Pakistan and about 40% of India's exports to Pakistan were by land trade rather than seaborne.

The trade impasse between India and Pakistan was brought to a crisis in September when the Indian rupee was devalued, while the value of the Pakistan rupee was retained. Disparity between the two currencies resulted in virtual cessation of trade between the two countries.

During the first nine months of 1949, imports into Ceylon totalled $237 million while exports from Ceylon totalled $229 million and the import balance amounted to $8 million.

**Far East.** The steady southward movement of hostilities in China accelerated the deterioration of that country's foreign trade. Civil strife in Burma, Indo-China and Indonesia interfered with production of rice, rubber, copra, coal, sugar and other exportable commodities upon which those countries depended for foreign exchange.

The foreign trade of Thailand (Siam) showed some expansion in 1949 over the previous year. Rice exports almost reached prewar levels and rubber exports exceeded prewar quantities.

Malaya, principal dollar earner of the sterling area, experienced a trade deficit in 1949 which exceeded that of 1948. Imports increased, while exports of tea and rubber on which the economy of the country depended declined, causing much concern.

The volume of Japan's foreign trade in 1949 increased over that in 1948 but the adverse trade balance was only slightly less than in the preceding year. On April 25, 1949, a single rate was established for the Japanese yen.

**Latin America.** Available statistics indicated a decrease in the foreign trade of the Latin American republics in 1949 from the record levels attained in 1947 and 1948. However, the 1949 trade was still at a high level compared with prewar years. The lower value of imports in 1949 showed the effects of intensified import and exchange controls. The heavy import demand characteristic of the postwar period continued but, because of the shortage of gold and dollar exchange reserves, most Latin American countries limited dollar imports to the most essential commodities. Among the factors in the lower value of imports in 1949 were declines in prices of a number of export commodities and uncertainty caused by devaluation of European currencies.

United States statistics showed a drop of 12% in U.S. exports to the Latin American republics in the first nine months of 1949 compared with the corresponding period in 1948. Imports from Europe increased notably in those republics which had large export markets in Europe. Trade with Europe was facilitated by a growing number of bilateral agreements, barter transactions, and compensation agreements planned to overcome difficulties caused by the convertibility of currencies. (See also Business Review; European Recovery Programme; Exchange Control and Exchange Rates; International Bank for Reconstruction and Development; International Monetary Fund, Tariffs.) (T. C. Bl.)
the commission at the request of the Treasury set up an investigating committee consisting of two or three of its members to ascertain whether certain claims merited consideration by the commission. Dec. 31, 1949, was fixed as the final date for lodging claims. Claims were heard in public at Somerset house, London.

**Principal Awards Made from Nov. 9, 1948, to Nov. 12, 1949**

**Investments Abroad.** No statistics, official or otherwise, had been compiled after World War II about the outstanding capital amount of British investments abroad. The annual official publication *National Income and Expenditure of the United Kingdom* contained, however, figures indicating the annual net change in the total, and also the amount of dividends, interest and rent received from abroad by Great Britain and corresponding amounts paid on foreign investments in Great Britain. In 1948 foreign leading to Great Britain and sale of British foreign assets exceeded British investment abroad by £120 million compared with £630 million in 1947, £380 million in 1946 and £70 million in 1938. These figures were not arrived at by direct information about capital movements but indirectly from the size of the deficit of the British balance of payments for those years. From information arising from the operation of exchange control there were now means for ascertaining the actual amounts of investment and disinvestment abroad without relying on indirect calculations, but no use was made of these facilities.

The total of dividends, interest and rent received by Great Britain on investments abroad in 1948 was estimated at £162 million, compared with £153 million in both 1947 and 1946 and £205 million in 1938. Simultaneously the total of dividends, interest and rent paid by Great Britain to overseas investors increased from £37 million in 1938 to £97 million in 1946, £120 million in 1947 and £122 million in 1948. Thus the net receipts from overseas investments amounted to only £40 million in 1948, compared with £168 million in the last prewar year. There was evidence that, during 1949, the declining trend of net receipts continued, owing to liquidation of British foreign assets. Great Britain continued to invest abroad, especially in the colonies, but a large part of these new investments, such as the amount expended on the groundnut scheme in Tanganyika, had not begun to yield any income.

The annual report of the Council of Foreign Bondholders reported no additional defaults on British-held foreign loans in 1948. The total capital amount of the loans under complete default was nearly £500 million in 1949. More than a quarter of this amount was due from countries whose economies had become disrupted by enemy occupation and about two-fifths was owed by Austria, Germany and Japan. Debt settlements were negotiated with Italy, Bulgaria and Chile. Italy undertook to make full payment of all arrears incurred between the outbreak of World War II and the conclusion of the peace treaty (with the exception of the Italian share of the guaranteed Austrian League of Nations loan which remained in default). The Bulgarian government agreed to the resumption of partial payments of coupons from 1940. Chile resumed the payment of interest at reduced rates rising from 1.5% for 1948 to 3% from 1954 onward. A sinking fund payment of 1% was also provided.

During 1949 the position and prospects of British investments abroad underwent a considerable deterioration. Apart from the three countries named, defaulting debtors did not show increasing willingness or ability to meet their liabilities. Owing to the unsatisfactory outlook for receiving payments from Germany, the government introduced the Distribution of German Enemy Property bill under which German assets taken over by the government were to be distributed among British claimants. The dividend derived through this distribution was not expected to be substantial.

The outlook became particularly unsatisfactory as far as the large British investments in China were concerned, owing to the victory of the Communists over the Nationalist government during 1949. Judging by experience with various European debtor countries under Communist regimes, the prospects of obtaining any substantial payments on the large loans to China or on British capital invested in industrial or commercial undertakings were not very promising. Compensation paid or even promised on nationalized British assets in eastern European countries had so far been negligible. No compensation had been received from Burma, partly owing to the disturbed state of the country due to civil wars, and partly owing to left-wing pressure favouring repudiation.

Devaluation of sterling did not affect the sterling value of the foreign loans held in Great Britain, since practically all of them were issued in terms of sterling without any gold or currency clause. Investments representing tangible assets tended to continue to appreciate nominally owing to the rising trend of prices in many foreign countries. There was a noteworthy rise in the sterling value of South Africa and other gold mining shares as a result of the increase in the price of gold in terms of the currencies of the gold-producing countries.

The liquidation of British assets abroad in payment for the current trade deficit continued in 1949 but not on as large a scale as in 1948. The sale of the Leopoldina railway and the Great Western of Brazil railway was negotiated. Repatriation of foreign securities through individual purchases in relatively small amounts by residents in debtor countries continued.

**Foreign Investment in Great Britain.** There was no large-scale influx of American or other private capital into Great
Great Britain during 1949. Although elaborate provisions were made in the European Recovery programme to facilitate the investment of American capital in British industries, the exchange guarantee facilities offered by the United States government were not made use of to a noticeable extent. The British government undertook not to discriminate against American capital in the granting of licences for the erection of factories. Notwithstanding this and the elimination of the transfer risk through the exchange guarantees American enterprise showed little keenness in opening branch factories in Great Britain. This reluctance was due in part to fears of unfair competition by nationalized industries through the latter being favoured by the government. Although the government undertook to pay fair compensation for nationalized American industrial firms, the risk of working at a loss owing to such competition acted as a deterrent.

Another consideration that tended to discourage American enterprise was the prospect of economic difficulties in Great Britain arising from lack of dollars to pay for raw material imports. The possibility of the termination of American assistance at the end of the Marshall aid period was viewed with concern, and American industrial interests preferred to await developments before committing themselves. Although there was much discussion about American investment in a large scale in British colonies, no actual progress was made.

During 1949 Great Britain continued to receive Marshall aid, part of which assumed the form of a dollar loan. On the other hand, part of the South African gold loan of £80 million granted in 1948 was repaid. The Canadian dollar loan was drawn upon to the extent of $27 million.

The repayment of sterling balances accumulated during World War II by overseas countries continued on a large scale. During the first nine months repayments amounted to £206 million. It was generally admitted that the speedy liquidation of these war debts at a time when Great Britain’s trade balance continued to show a big deficit contributed largely towards the aggravation of the country’s dollar difficulties. For it was assumed that a large proportion of the goods exported to the sterling area and financed with the aid of sterling released from wartime balances could have been exported to the dollar area or the hard-currency countries. Or, in the absence of the large exports arising from war debt repayment, the manpower and raw materials used in the production of goods needed for such exports could have been used for the production of goods needed by the dollar area or other hard-currency countries.

The realization of these considerations during the financial talks in Washington in Sept. 1949 led to a resolution that the United States and British governments should examine jointly the ways in which the former could assist in the liquidation of wartime balances. Pending the outcome of these discussions, two important changes in the British government’s attitude towards these balances became evident. The prime minister and other ministers urged industrial firms, in public statements, to divert their exports, as far as possible from the sterling area to the dollar area. British exporters were exhorted by the government, in the interests of the dollar drive, to refuse orders from holders of released wartime sterling balances in order to be able to accept orders from the United States and Canada.

The other important change of policy was announced by the Chancellor of the exchequer who informed the House of Commons that the government did not intend to obtain a drastic scaling down of the sterling balances by presenting to the countries holding them counterclaims for services rendered to them by Great Britain during World War II and that the government did not seek to re-open negotiations on existing temporary agreements with holders of sterling balances, which were concluded before the aggravation of Great Britain’s dollar problem and under which the repayments of these war debts would have to continue for some time on what was subsequently recognized to be an excessive scale.

**United States Investments Abroad.** The flow of U.S. capital to foreign countries that was resumed at the end of World War II continued in diminished volume during 1949 and contributed to raise the value of U.S. investments in foreign countries (and international organizations) to approximately $31,700 million on Sept. 30, 1949—an increase of about $200 million over Dec. 31, 1948. Unlike previous years, when loans by the United States government dominated, the bulk of new foreign investments accounting for this increase was made by the private sector of the economy whose investments, including the reinvested earnings of subsidiaries in foreign countries, accounted for about $650 million of the $1,200 million of government and private capital investments abroad during this period. However, the effect of new investments on the total value of U.S. investments abroad was offset by the devaluation of leading foreign currencies during Sept. 1949 which may have had the effect of reducing the value of U.S. investments abroad by roughly $750-1,000 million.

Direct investments accounted for $370 million of estimated private capital outflows during the first nine months of 1949 together with an additional $370 million of reinvested earnings, while the only foreign borrowing in the United States of any consequence involved a $100 million government of Canada bond issue.

From the published data it appeared that the outflow of U.S. direct investment capital in 1949 would fall below the record of almost $800 million set during 1948.

Early in 1949 interest in U.S. private foreign investments was stimulated by the fourth point of the inaugural address of President Harry S. Truman, who called for increased American technical assistance and productive investments in under-developed areas. The primary purpose of this programme was to help the peoples of economically under-developed areas, who comprise a large part of the world’s population, in their efforts to develop their human and natural resources, to increase their productive capacities and to raise their standards of living.

During 1949, the president requested congress to authorize an experimental programme in order to guarantee newly invested private capital in undeveloped countries. The capital would have to contribute to the economic development of such areas and would be guaranteed against risks related to foreign investments, other than ordinary business risks. Outstanding among such risks proposed for a programme of government guarantees were those of (1) non-convertibility of returns derived from the investment, including capital, and (2) loss through seizure, confiscation, or expropriation, without prompt, adequate and effective compensation. Ordinary business risks, such as those encountered by a business operating in the United States were not included in the proposed programme.

**Foreign Investments in the United States.** The value of foreign investments in the United States was practically unchanged during the first nine months of 1949 and stood at approximately $17,000 million at the end of September. The general ability of citizens of other countries to retain American assets in the face of continuing balance-of-payment deficits with the United States was an evidence of the success of the European Recovery programme in rendering aid to foreign countries. The effectiveness of this aid had been apparent in an increase in foreign short-term balances in the United States during the last half of 1948 and the first quarter of 1949, following the serious decline that began with the termination of lend-lease aid in 1945. However, banking
and other short-term claims of E.R.P. countries on the United States again declined in the second quarter of 1949 as a financial crisis developed, particularly in the United Kingdom. Following the devaluation of the pound sterling and the currencies of other leading countries in mid-September there was some evidence of a recovery in short-term claims on the United States.

According to preliminary figures of the U.S. Department of Commerce, the devaluation of the pound in Sept. 1949 was preceded by losses of short-term banking claims on the United States and sales of gold to that country of about $29 million in the first quarter and $269 million in the second quarter of the year. During the third quarter, the loss amounted to $237 million. At the close of September, British short-term banking claims on the United States were about $439 million as compared with $546 million nine months earlier.

The decline in total foreign short-term banking claims on the United States in this period aggregated $165 million. After Great Britain, the declines were largest for the republic of the Philippines ($140 million), China ($92 million) and Italy ($48 million). However, the Italian loss of about $100 million in the third quarter of the year merely reflected the shift of that sum to gold, purchased from the U.S. Treasury. Increases were largest for the following countries: Japan ($80 million), Canada ($52 million) and the Netherlands ($43 million). The Canadian acquisition of United States funds reflected the flotation of $100 million of Dominion of Canada bonds in the United States during the third quarter of the year.

Foreign countries and international organizations made net purchases of approximately $86 million of the long-term securities of United States corporations and bonds of the U.S. government during the first nine months of 1949. Such acquisitions were in contrast to the general experience of earlier years when countries in Europe and Asia sold substantial holdings of U.S. stocks and bonds largely as a means of meeting their balance of payments deficits on current account.

If changes in the holdings of American securities by the International Bank for Reconstruction and Development were excluded from foreign acquisitions during the first three quarters of 1949, it appeared that over all purchases and sales by foreign countries of American securities were in approximate balance, although the experience varied from country to country. Net purchases by the International Bank in this period were securities issued by the United States government.

Countries participating in E.R.P. purchased about $35 million of stocks and bonds according to data published by the U.S. Treasury Department although, if trading for Swiss account is eliminated, transactions for other E.R.P. countries were about in balance during the first nine months of 1949. Since it was known that several E.R.P. countries were in great need of dollars during this period, particularly in the second and third quarters, the absence of large liquidations of U.S. securities suggested that certain countries had probably exhausted their holdings of readily marketable securities. This may have been the case for France and the Netherlands. These two countries, as well as others, had been aided earlier by the U.S. Treasury in identifying the U.S. assets of their nationals which had not been reported to them and had presumably liquidated such security holdings as had been revealed by the Treasury. Nationals of the United Kingdom had sizable holdings of securities, although the choice of these was still pledged with the Reconstruction Finance corporation as collateral for a loan granted to England in 1941 and were therefore not available for sale.

Of the countries receiving assistance from the Economic Co-operation administration of the United States, Switzerland engaged in the largest volume of transactions of U.S. stocks and bonds during the first nine months of 1949 and on balance purchased about $36 million. The acquisition reflected the relatively sound economic position of that country strengthened by its wartime neutrality, although a portion of Swiss security purchases presumably were for residents of other countries for whom Switzerland acted as a banking centre.

United Kingdom purchases in this period of $12 million of securities were probably for the account of non-British subjects since the exchange control system of that country would presumably not have permitted the use of scarce dollars for portfolio investments. The Netherlands sold about $15 million of U.S. stocks and bonds, continuing the programme begun in 1948 of liquidating its nationals' dollar holdings. In that year $78 million of Netherlands assets were sold. France had followed a similar programme during 1948 liquidating about $72 million of American securities, although in 1949 changes in French holdings of United States securities were negligible up till September and appeared to consist of switching from holdings of shares to investments in bonds.

Italy and Belgium made small security purchases in the latter period.

As a result of transactions and small rises in the quoted prices of stocks and bonds, the value of foreign-held U.S. portfolio securities increased by about $192 million during the first three quarters of 1949. About $106 million of the rise reflected security price increases and the balance, the previously mentioned combined net purchases of foreign countries and international organizations.

The latest report available during 1949 on the activities of the Office of Alien Property of the United States related to the fiscal year ended June 30, 1948. On the latter date, the office held title to former enemy property in the United States with a value of $340 million and held another $3 million of assets in safekeeping or under supervision. In addition, the annual report of the organization stated that about $61 million of vestible property had not been seized (seized) by June 30, 1948. From its inception in March 1942 to that date, the office and its predecessor organization had received about $125 million from the sale and liquidation of business and personal property it had taken from enemy aliens. (See also Balance of Payments)

IRAN: see Persia.

IRAQ. Independent Arab kingdom of Mesopotamia, bounded by Syria, Turkey, Persia, the Persian gulf, Saudi Arabia and Jordan, watered by the Tigris and Euphrates. Area: 168,040 sq. mi. Pop.: (1935 official est.) 3,560,456; (Oct. 1947 census): 4,794,449. Religions (approximately): Moslem 91%, Shahs' Arabs 45%, Sunni Arabs 15%, Sunni Kurds 25%, Shirah Persians 3%, Sunni Turks 25%, etc.; Christians 5%, falling into the main groups (a) Roman Catholics of Chaldean, Syrian and Armenian rites, the strongest community (c. 100,000) being Chaldean, (b) Greek Orthodox and (c) free churches (Syrian Jacobite, Gregorians, Armenian, etc.); Jewish 2-5%; others 1 5% (Yezidi, Sabaeans, etc.). Languages: Arabic 67%, Kurdish 25%, Persian 3%, Turkic 25%, others 3%. The Sunni Arabs are the ruling class. Chief towns (pop. est. 1946): Baghdad (cap., 832,927), Mosul (279,361), Basra (181,814), Ruler, King Faysal II (born May 2, 1935); regent, Prince Abdulilah (q.v.); prime ministers in 1949, General Nuri Pasha as-Said (q.v.) and (from Dec. 10) Ali Jawdat al-Ayyubi.

History. On Jan. 6 the government of Muzahim Amin al-Pachachi resigned and was succeeded two days later by one headed by Nuri Pasha as-Said, who at once sent messages to other Arab governments announcing the determination
of Iraq to continue action to free Palestine and strengthen the Arab League (q.v.).

On Feb. 14-15 Yusuf Salman Fahad, secretary general of the Communist party of Iraq, and three other Iraqi Communist leaders were sentenced and hanged after conviction by a court martial of activities aimed at destroying the foundations of the state and instigating elements of the Iraqi armed forces to join their subversive organization. A number of further arrests of Communists and others was subsequently reported.

The cabinet was re-shuffled on March 18, Abdullah Haifiz being replaced at the foreign ministry by Dr. Fadi Jamali, who as Iraqi minister in Cairo had been due to attend the meeting of the Arab League council there on March 17 but had been urgently summoned to Baghdad instead. In a press conference on March 22 he stated that Iraq continued to support the Arab League while envisaging certain changes in its organization. It was unfortunate that the enforced absence of the Iraqi delegate from the first two sittings had been interpreted as a change of attitude by Iraq. The chargé d'affaires who attended the last session on March 21 had not received his instructions from the cabinet sooner owing to the cabinet changes.

The prime minister's visit to Syria (q.v.) on April 16, followed by the statement that Iraq and Syria would stand together against aggression, was connected by many with the press reports that credited him with a plan to unite Syria with Iraq under King Faysal II and a council of regency. This was known as the "fertile crescent" plan, in distinction from the Greater Syria plan of King Abdullah of Jordan. In a parliamentary statement of May 3, the Iraqi foreign minister said his country's foreign policy was based on maintaining the independence and safety of Iraq according to the principles of the Arab revolt. The recent coup d'état in Syria was a domestic affair, but Iraq would welcome unity with Syria if Syria desired it. Iraq's attitude to the Arab League was based on its charter. He accused the secretary general of the League of having "given himself authority" which was not his by right. (This was believed to have been prompted, among other things, by Azzam Pasha's visit to Husni ez-Zaim the day after Nuri Pasha's visit and the dictator's subsequent repudiation of all plans of union). Iraq, he said, favoured revision of the statutes so as to curtail the powers of the secretariat and to encourage bilateral alliances among the member states.

In a foreign policy statement of June 1 the prime minister told the Iraqi Senate that he would send Muzahim Amin al-Pachachi to Cairo to discuss Iraqi-Egyptian differences. With Great Britain, he said, it was necessary to negotiate a new treaty; but Iraq preferred to participate in a general pact grouping the Arab independent powers, like the North Atlantic treaty. They had been opposed in 1920-21 to the division of the Arab countries into Lebanon, Syria, Iraq and Palestine and regarded the division as exclusively imperialist. It was therefore surprising that the unification of these regions today should be called an imperialist project.

On June 14 the foreign minister accompanied the Regent on a week's visit to Tehran. The Regent also visited London to see his nephew King Faysal, who was at school at Harrow, and on July 16 called on Ernest Bevin. Later the prime minister went to London, where he was received by Mr. Bevin on Aug. 20. The resumption of oil pumping through the pipeline to the Haifa refineries was discussed both with him and with the oil companies; but no agreement could be reached and oil pumping had still not been resumed by the end of the year. On his way back to Iraq he had meetings in Alexandria with Hussein Sirry Pasha, whom he assured on Aug. 5 that Iraq did not intend to force any form of a Greater Syria plan on other Arab states.

It was officially announced in Baghdad on Aug. 28 that while in London Nuri Pasha had secured loans totalling £10-5 million, of which £3 million were from the London market for the Iraqi state railways, £4-5 million from the International bank for reconstruction schemes up to 1952 and £3 million free of interest from concessionary oil companies.

In August the report was published of the Irrigation Development commission under F. H. Haigh recommending schemes which it was estimated would double the irrigated land of Iraq. The additional 16 in. pipeline from Kirkuk to Tripoli was completed and oil began to flow on Aug. 1.

The Iraqi forces in Palestine were withdrawn during March and April and the Iraqi military government in the Jenin-Tulkarm area handed over to the Jordanian authorities. Iraq was not represented at the Palestine armistice negotiations at Rhodes, where Jordan negotiated on its behalf, nor at the meeting with the U.N. Conciliation commission in Lausanne.

On Nov. 7 Nuri Pasha resigned and on Dec. 10 a coalition government was formed under the premiership of Ali Jawdat al-Ayyubi. (C. Ho.)

Education. (1946-47) Schools: elementary, 1,057, pupils 143,070, teachers 5,672; intermediate and secondary 151, pupils 26,424, teachers 1,174; technical 48; colleges: 7,756; students 3,644 (excluding the Engineering college); institutions of higher education 10.

Agriculture. Main crops ('000 metric tons, 1948): barley 588; wheat 327; rice 370; dates (1947) 305; tobacco (1949) 4; cotton 1. Livestock (1949) sheep 8,000; cattle 1948) 866; asses 435; horses (Dec. 1945) 198. Wool production ('000 metric tons, 1948-49) 11.

IRELAND

**Foreign Trade.** (1948) Imports ID46 million; exports, including oil, ID20 million. Principal imports: cotton piece-goods, iron and steel, machinery and sugar. Principal exports: oil, dates, wood and cereals. Main sources of supply: United Kingdom 43%, United States 7%, Italy 6%. Main destinations of exports (excluding oil): India 19%, United Kingdom 17%, United States 13%.

**IRELAND, NORTHERN:** see NORTHERN IRELAND.

IRELAND, REPUBLIC OF: An independent republic covering five-sixths of an island to the west of Great Britain. Area: 26,601 sq. mi. Pop.: (1946 census) 2,953,452; (Oct. 1948 est.) 3,023,000. Language: English c. 76%, Erse (Gaelic) c. 24%. Religions (1936 census): Roman Catholic 93%, Episcopalian 4.9%, Presbyterian 1%, Methodist 0.3%, Jewish 0.1%, other 0.3%. Chief towns (1946 census): Dublin (cap., 506,635); Cork (75,361); Dun Laoghaire (44,689); Limerick (42,987); Waterford (28,332). President, Seán Thomas O’Kelly (q.v.); prime minister, John A. Costello; minister of external affairs, Séan MacBride.

**History.** It might seem unimportant that the Irish government celebrated New Year’s day by announcing that white bread of a prewar standard would once again be allowed in the shops. True, the bakers received this offer with stony refusals, claiming that the 75% extraction flour was too dear, but the gesture was typical of the government’s efforts to return to a state of life unrestricted and decontrolled. John A. Costello’s inter-party government, largely composed of the “conservative” Fine Gael, reiterated in the words of its minister for industry and commerce, Daniel Morrissey, that it “intends to preserve the system of private enterprise in industry.” That such a policy was possible in 1949 was perhaps due to the fact that large wage increases granted after the Emergency Powers “standstill order” was repealed in March 1949 had raised the earnings index to a point almost exactly level with the cost of living index. Retail prices remained constant for over a year. And so, although the prices of clothing and of whisky rose during 1949 when they were de-restricted, though interest rates rose as banks tried to draw in the horns of credit, there was comparatively little labour trouble in the republic. The January dockers’ strike in Dublin’s deep-water port and a six-week strike in the freight department of Córas Ionpair Éireann (Irish Transport company), during August and September, caused some inconvenience but were not indicative of any deep unrest. The unions, indeed, were in more trouble with each other than with the employers. In July arrangements for a conference between the Congress of Irish Unions and the Irish Trade Union congress (which was affiliated to the British T.U.C.)—a conference which was to discuss their amalgamation—were broken off when the two bodies failed to agree on preliminary conditions.

The government’s outstanding problem was to curb inflation while embarking on the most expensive investment schemes the country had ever experienced. A ten-year housing scheme was expected to cost £100 million; another £17 million was to provide hospital accommodation for a further 2,540 beds; James Dillon, minister for agriculture, announced a project to reclaim 4 million ac. of unproductive land in ten years at a cost of £40 million. Yet all the signs were not pointing to inflation. In the seven months ending in June 1949 savings bank deposits increased by over £2 million and there was also a big recovery in savings certificates. But John Costello pointed out in November that current savings might not be enough to finance the capital investment to which his government was committed and stated that Irish sterling assets in the United Kingdom, whose net total was then about £225 million, might have to be transferred for use at home.

Side by side with the government’s believers in private enterprise and in state enterprise, marched the cabinet’s left wingers, believers in state welfare; and they found the going harder. After some delay and much toil William Norton, minister for social welfare and leader of the Irish Labour party, produced in October his White Paper on compulsory insurance. The scheme was planned to cover every person over the age of 16 who worked for an employer, though the position of state employees was left uncertain. Male workers were to contribute 3s. 6d. a week, female 2s. 6d. and employers a similar amount. Unemployment and disability benefit would be at the rate of 24s. for a single man, 36s. for a married man with an addition of 7s. for each of two children under 16. Retirement pension (24s.), widow’s pension (24s.), maternity and death benefits were included. Norton stated
that the government intended to go through with this scheme, though there were rumbles of opposition—especially from the clergy—both on the general ground that such social security saps the worker’s initiative and on the particular ground that the White Paper did not appear to cover a large proportion of the population. Meanwhile Noel Browne, Clann na Poblachta (Republican party), minister for health, continued to prepare a scheme for state medicine, while the Medical Association of Ireland, unable to extract any details of the plan, gathered their strength to oppose what they feared would be the worst.

Politically the drama of the year was the declaration of an independent Irish republic one minute after midnight on Easter Monday, though what should have been heroic history showed signs of tragi-comedy. The six counties of Northern Ireland ignored the declaration, the Anglo-Irish Treaty greeted it with a distant leader on "China’s Dilemma," but King George VI sent a message of goodwill to the new republic whose focal point of inspiration was hatred of his crown. Many of Costello’s Fine Gael supporters, strong lovers of the British connection, were left desolate in the belief that Costello had given way to the Republican views of Seán MacBride, minister for external affairs. But MacBride said the whole idea was Costello’s and so left the public more amazed than jubilant or indignant. From Belfast Sir Basil Brooke announced that this step must perpetuate partition, and he seemed in part confirmed when in May the British parliament passed the Irish act which, while it allowed the citizens of the republic the same rights as those of the Commonwealth, guaranteed the special position of Northern Ireland and so long as the majority of its people wished to preserve it. The Irish act provoked unanimous indignation in the south and a large protest meeting was held in Dublin.

Finanacially, the republic had a good year. For the first six months of 1949 exports were up 36% and imports down 15% against the comparable figures for 1948. It seemed that the republic’s adverse trade balance, which in the postwar years had been running at £90 million to £100 million a year, might be cut to about £70 million, and this—bearing in mind invisible exports, chiefly earned by the tourist industry—would bring the balance of payments near to equilibrium. Agriculture was expanding after a number of stagnant years, the volume of domestic exports for the first six months of 1949 increased by 32% over the figures for the 1948 period. (But there was still a long way to go if prewar standards were to be reached; in Jan.-June 1949, for instance, 202,000 cattle were exported, 50,000 more than in the same period the previous year; the equivalent figure in 1938 was 296,000.) Wheat production per acre was increasing, the export of eggs reached a value of £5 million and bacon exports were resumed towards the end of the year for the first time since the war. As for industry, which together with services was producing an output valued at about two-thirds that of Irish agriculture, Morrissey pronounced himself satisfied. Unemployment had slightly decreased. One problem, especially in view of the protected government works, was the continued inability of Bord na Mona (Fuel board) and the Electricity Supply board to get men to work on schemes that would take them away from their homes. There was also a serious shortage of skilled building workers and a campaign was begun to attract Irishmen in Britain back to Ireland.

The Irish theatre lost much by the death of George Shiel on Sept. 19; it gained little in new works, the best of which were Bugle in the Blood by Bryan MacMahon and In Sand by Jack B. Yeats. In sport, Ireland once more won the Triple Crown both for rugby football and hockey; and Harry Bradshaw, of Kilkenny, only lost the British open golf championship after a play-off with Bobby Locke.

The republic, in fact, could look back on 1949 with some confidence. Tourists continued to flood in with their welcome money (on a single Friday in July over 10,000 arrived from Britain). E.C.A. headquarters considered that the government had prepared realistic and ambitious plans for the recovery and development of the country. The budget reduced income tax to 6", and 6d. in the pound. Sentimentalists regretted that the last visit of a pope to Ireland was in July. The papal nuncio mourned Dr. Douglas Hyde (see Obituaries), first president of Eire, who died on July 12. But the country looked forward with some cheerfulness to 1950 and Costello’s government, which at the time of its creation many had thought a shaky makeshift, consolidated its position by winning a seat from Fianna Fáil in a November by-election in West Donegal and could face the future with spacial confidence. (R. Kn.)

Education (1947-48): Schools elementary 4,946, pupils 44,132, teachers 12,772; secondary 404, pupils 43,780; universities (National and Trinity college) students 7,202, professors and lecturers 558.

Agriculture. Main crops: (‘000 metric tons, 1948) wheat 416, oats 805, barley 103, rye 5, potatoes 3,528, flax 3,6 livestock (‘000 head June 1948) cattle 3,921, sheep 2,058, pigs 457, horses 421; poultry 20,045; Fishers total catch (1948) weight 20,725 metric tons, value £15,466; Food production (‘000 metric tons, 1948; six months, in brackets): butter co-operative creameries only 28,8 (12,6); meat 20,0 (12,0); eggs 2,000 (1,200).

Industry. (1947) Persons employed in industrial establishments 183,444; Fuel and power (1948, 1949, six months, in brackets): coal (‘000 metric tons) 177, manufactured gas (million cu. m.) 144-0 (72,6), electricity (kwh) 7,689 (4,725); Textiles (1947 = 100, 1948, 1949, six months, in brackets): 130 (134); Manufactured goods (1947) distilled spirits (‘000 proof gal.) 1,501; stout, porter, ale and beer (‘000 barrels) 1,485, woolen and worsted issues (‘000 sq yd.) 6,345, cotton piece goods (‘000 sq yd.) 5,884, boots and shoes (million pairs) 5, cigarettes (‘000 lb) 9,023.

In 1948 54% of total imports were supplied by the United Kingdom, and 87% of total exports in 1948 went to the United Kingdom.

Transport and Communications. Roads (1949) 49,071 mi. Licensed motor vehicles (Dec. 1948) cars 60,653, commercial vehicles 36,535; Railways (1948) 2,440 mi., freight (net ton-mi) 132 million; Shipping (1948) total tonnage 43,663; Air transport (Aer Lingus, 1948) flights 11,908, mi flown 2,542,783, passengers flown 180,470, cargo carried 1,080, mail 70,700; Telephones (1946) subscribers 55,426.

Weights and Measures. (1948) 255,000.

IRON AND STEEL. During 1949 the iron and steel industry of Great Britain lived under the shadow of impending change. It could not be said that the government’s decision, announced in November, to postpone until after the general election the operation of the bill to nationalize the industry made any vital difference to the outlook. For some time it had been apparent that state control would be not a working reality until after the election and that, in fact, the future shape of the industry would be left to the voters. The government’s decision did at least bring to an end what had developed into a battle over the bill between the two houses of parliament. In May the bill passed its third reading in the Commons. A Conservative motion to reject it was defeated by 333 votes to 203. Before it came up for detailed discussion in the House of Lords, Lord Salisbury presented what was called "an ultimatum" from the Conservative peers: either the government should agree to postpone the operation of the act until the country had pronounced judgment on it at the general election; or the Conservative peers would compel the government to carry it under the
procedure of the new Parliament act, designed to limit to one year the power of the Lords to delay legislation. To this Lord Addison, for the government, gave a non-committal reply and in June the Conservative and Liberal peers joined in carrying a group of amendments which postponed operation of the bill until Oct. 1, 1950, and the vesting date until July 1, 1951. The date selected by the government for the transfer of assets to the state had been May 1, 1950. On July 26 the bill was back in the Commons, with 60 amendments. Of these the government accepted 23, on the ground that they did not interfere with the government’s general intention. But the minister of supply said that the government did not intend to accept any significant change and the delaying amendment was rejected. In due course, the Lords restored it and on Nov. 16, the Commons considered the Lords’ reasons for insisting on the amendments with which the Commons had disagreed. The minister said that May 1, 1950, could no longer be the date of transfer. Even if the bill became law under the new Parliament act, the government would have so to rush the preliminary steps required to make May 1 the take-over date as to jeopardize the successful launching of the scheme. The government therefore proposed that the bill should become an act immediately, but that vesting day should be changed from May 1, 1950, to Jan. 1, 1951. It was also proposed that the minister should not appoint any member of the Iron and Steel corporation (to which the securities of the scheduled companies were to be transferred) before Oct. 1, 1950, but that other provisions, dealing with the disposal of iron and steel works and the dissipation of assets prior to the date of transfer, should come into effect immediately the royal assent was obtained. These government amendments were agreed to by the Commons and the future of the industry was left, as had been anticipated, to the decision of the electorate. The bill received the royal assent on Nov. 24.

Meanwhile, interim authority passed wholly into the hands of the Ministry of Supply. The Iron and Steel board came to an end of its own volition.

Outside parliament the steel manufacturers’ case against nationalization was repeatedly stated. Sir Ellis Hunter, president of the British Iron and Steel federation, proposed a stronger Iron and Steel board rather than complete state control, arguing that it ought to be possible to develop successful co-operation between the state and private enterprise.

In their policy booklet, The Right Road for Britain, published in July, the Conservatives promised to scrap the nationalization plan and to appoint a body, representing the government, management, labour and consumer, to supervise prices and development within the industry.

The production side of the industry appeared to be undisturbed by all this political argument. Looking back on a year in which 14,877,000 tons of crude steel of all qualities had been produced—more than in any previous year—the industry was set new targets for 1949. The economic survey issued by the government stated this aim as “the maximum output the industry can achieve with the material it can obtain,” adding that in the most favourable circumstances this should be between 15½ and 15¾ million tons of ingot steel. Similarly, the revised monthly export targets announced by the Board of Trade in March raised the figure for iron and steel from £16½ million a month to £104½ million. In March, steel production reached a new record with an output of steel ingots and castings equivalent to an annual rate of 16,269,000 tons. The industry beat this in May, lifting the annual rate to 16,409,000 tons. The actual output for 1949 was 15,533,000 tons of steel, a total which exceeded the top limit set by the government.

| Oct. | 237 | 184 | 307 |
| Nov. | 249 | 187 | 313 |
| Dec. | 249 | 186 | 291 |

Imports of iron ore into the United Kingdom rose steadily until August, when they reached 950,800 tons compared with a monthly average in 1948 of 722,900 tons. It seemed probable that the total would be about 500,000 tons more than in 1948. Two million tons of scrap, mainly from Germany, also helped the raw material supply in 1949. It was felt, as in the case of iron ore, that future supplies depended on the possibility of American competition and on German readiness to go on exporting. The British steel industry went ahead with the development of new blast furnaces to reduce their dependence on imported scrap.

Imports of iron and steel were higher than in 1948 and the total held was increased by about 500,000 tons during the year. Devaluation raised the cost of these imports a great deal; the American price became nearly double the home price for a ton of steel and it seemed likely that in future imports would be cut. (See Table II.)

| TABLE II.—STEEL SUPPLIES AND CONSUMPTION (Million ingot tons) |
|-------------|-------|-------|
| Supplies | 1938 | 1948 | 1949 |
| Production | 10-4 | 14-9 | 15-6 |
| Imports | 1-0 | 0-5 | 1-1 |

| Total | 11-4 | 15-9 | 17-2 |

After discussions between the industry and the government, the industry’s development plan, drawn up in 1946, was revised during the year to increase the productive capacity
in 1953-54 from 16 million ingot tons to 18,500,000 ingot tons a year. This was to be done partly by expanding the capacity of projected schemes but mainly by keeping in operation plants which, because of the greatly increased cost of new plant, could be considered as having a longer economic life than had been anticipated. It was estimated that the revised capacity would be enough normally to produce 17,500,000 ingot tons. Actual work on the plan proceeded during the year and new plant, blast furnaces and ore-unloading and treatment plant were brought into operation.

An increase in loans undertaken by the Finance Corporation for Industry was due mainly to extra finance for the steel industry, since it was felt that the possibility of nationalization made it impracticable for many companies to raise money for the development plan on the ordinary capital market.

On March 30 the minister of supply announced in the House of Commons that, although the subsidies to meet the excess cost of imported finished steel and the import duties on pig iron and steel would be continued, as from April 1 the remaining subsidies would cease, with an estimated saving to the exchequer for the year 1949-50 of about £25 million. The increase in cost to the industry was reflected in higher prices. This change in price also took into account the results of a review of the price structure on which the Iron and Steel board had been engaged since the autumn of 1947. Even after devaluation, British home trade prices still compared favourably with those of other producing countries and were far below those in the U.S.

was expected to be supplemented by a drop in demand for ore because of a coal shortage.

In 1949 blast furnace output was maintained during the first five months at 10% above the 1948 average rate but sagged from June to September and dropped sharply in the fourth quarter. Output up to the end of November was 48,430,195 short tons of pig iron and 545,433 tons of ferro-alloys, a total of 48,975,628 tons. These figures did not include the output of ferro-alloys in electric furnaces.

The 1948 U.S. steel output was exceeded only in the years 1943-44, and fell short of the war peak by a little more than a million tons. In 1949, production declined sharply in each succeeding quarter but the average monthly output did not fall below that of 1948 until July. Heavy reductions were recorded in the last quarter, especially in October because of a coal shortage, and the total for the year was 77,668,000 tons. (See also Metallurgy.)

ISLAM. The social and political instability characteristic of the world after World War II did not fail to have grave repercussions upon the cultural evolution of Islam in 1949, especially as it was also suffering from its own troubles. Thus the defeat of the Arab League (q.v.) in its war against Israel produced a sharp reaction of public opinion in Egypt, Iraq, and Syria. The situation of Pakistan was seriously affected by its conflict with India over Kashmir. Soviet political activities created disquietude among Moslem countries. It was only at the end of 1949 that Indonesia came to an agreement with the Netherlands.

Further cultural progress nevertheless was achieved, especially in the sphere of public instruction and of the emancipation of women—the latter especially in Syria, the first country of the middle east to grant the franchise to women. The progress of public instruction was noticeable in Pakistan, where central and provincial authorities opened some 1,500 new schools of all kinds. Urdu, the official language of Pakistan, became the medium of instruction in a degree college. No less interesting were the results of the cultural activity of the Arab League. For instance, it undertook a systematic publication of ancient Arabic manuscripts and the publication of a bulletin dealing with the intellectual life of Arab countries. In Egypt an interesting tendency towards specialization in the rural primary schools deserved attention: from the very beginning the child was initiated in the art of agriculture and rural handicrafts. All Moslem countries, especially Turkey, Egypt, and Pakistan, sent more of their students abroad, chiefly to Great Britain and the U.S. The re-establishment in Turkey of theological education in its universities contributed to the intensification of religious life.

On Feb. 18-19, 1949, the 5th International Moslem Congress took place at Karachi affirming once more the unity of Islam. On Sept. 11-16 an Islamic Cultural Congress assembled at Tunis; unfortunately the restrictive measures taken by the French authorities prevented the Moslems from abroad being present. From Nov. 25 to Dec. 10 the first Economic congress met at Karachi of all Moslem countries and was attended by 300 technical experts, economists and industrialists.

In 1949 an International Islamic committee was founded at Karachi. At the end of the year Chaudhury Khaliqazaman, president of the All-Pakistan Muslim league, suggested the creation of a confederation of Moslem states under the name of Islamistan, the capital of which should be in Persia. He toured the middle east and in Iraq and Persia met with a warm reception for his views. (A. MJD.)

BIBLIOGRAPHY. H. A. R. Gibb, Mohammedanism (Oxford, 1949)

The author, professor of Arabic at the University of Oxford, gives the following estimates of the number of Moslems: Pakistan and India 90 million, Malaya and Indonesia 55, Arab-speaking populations in western Asia 15, Egypt and Sudan 17, north Africa 16, Persia 15, Afghanistan 12, Turkey 18, Asian U.S.S.R. and China 30, Moslem States in Africa 24, Balkans and European U.S.S.R. 3—total 295 million.

ISLE OF MAN: see MAN, ISLE OF.

ISRAEL. A Jewish republic in Palestine, with undefined frontiers, was proclaimed on May 14, 1948, at Tel Aviv. According to a partition plan adopted on Nov. 29, 1947, by the general assembly of the United Nations, the state of Israel was to cover 5,579 sq. mi. (with Negev); but this area was reduced to 2,124 sq. mi. (without Negev) by Count Folke Bernadotte, the U.N. mediator, in his plan dated Sept. 16, 1948. After armistices concluded with all the neighbours during 1949 the de facto area of Israel was estimated at about 7,800 sq. mi. According to a census of Nov. 8, 1948, this area had a population of 782,000, including 713,000 Jews; one year later the million mark was reached. Chief towns (pop. Dec. 1949 est.): Jaffa-Tel Aviv (q.v.) (cap. over 300,000); Haifa (150,000). President, Dr. Chaim Weizmann (q.v.); prime minister, David Ben-Gurion (q.v.); minister of foreign affairs, Moshe Sharett (q.v.).

History. This was a year of solid progress for the young state of Israel, whose independence had been proclaimed on May 14, 1948. By the beginning of 1949 the government was in control of practically the whole area over which it claimed jurisdiction with the exception of the Negev, the southern part of the country. Here lighting was taking place along the Egyptian frontier in the Gaza district and Israeli forces were actively consolidating their positions to the south and east. Egyptian opposition was rapidly overcome and by Jan. 13 armistice talks opened at Rhodes, under the auspices of the United Nations' acting mediator, Dr. Ralph Bunche. Relations with Great Britain, on the other hand, which had been strained ever since the outbreak of hostilities with the Arab states suffered a fresh set-back as a result of two events. On Jan. 8, Israeli forces shot down five Royal Air Force fighter planes which were carrying out a reconnaissance over the battle area near Rafah and about the same time it was announced that Great Britain had despatched reinforcements to Aqaba, on the Red sea coast, because of the grave concern felt over the Palestine situation. For a short while the relations between the two countries remained tense. The incident of the aircraft, however, was smoothed over and, in spite of the fact that Great Britain kept a watchful eye on developments at the head of the Gulf of Aqaba and sent a considerable force to the Transjordan coast, the Israeli army was allowed to occupy the coastal strip, known as Elath, to which it considered itself entitled under the terms of the United Nations proposals.
The first general election in Israel, to a Constituent Assembly, was held on Jan. 25. Twelve parties competed for the 120 seats. The total number of voters was 782,000 including 69,000 non-Jews (Moslems and Christians). The result was an outright victory for the Israeli Labour party, known as Mapai, which gained 46 seats (see ELECTIONS). The government that was formed contained most of the leaders who had previously composed the provisional administration and was a combination of Mapai, the Religious Front, Progressives and Sephardim. On Feb. 16, Dr. Chaim Weizmann was elected first president of Israel.

Although it had been proclaimed that the primary task of the Constituent Assembly would be to adopt a constitution, the Knesset (assembly) found itself confronted with so many and such urgent tasks that comparatively little time was devoted to this subject; but an interim or small constitution was adopted immediately before the president was elected. The most pressing task with which the government had to deal was the assimilation of the thousands of immigrants who had arrived in the country. The government had set themselves the objective of doubling the population in four years, which was interpreted by Ben-Gurion, the prime minister, as the admission of 750,000 immigrants during that period. In 1949, 239,171 immigrants arrived in Israel, an average of 18,260 per month.

Economically, the situation had to be faced that the country's natural resources were extremely limited and it was obliged to depend upon imports for a large proportion of its food supplies, nearly all its industrial raw materials and the majority of its manufactured goods. With the oil refineries at Haifa and the potash works on the Dead sea virtually closed down, Israel was left with its orange crop as its sole important visible export. It was not surprising, therefore, that a serious inflationary situation was produced and when the finance minister, Eliezer Kaplan, introduced his budget on June 14 he stressed the importance of bringing down the cost of living, increasing production and restricting imports. Severe measures were taken to attain these objects and an austerity regime, modelled on that in Great Britain, was adopted which had the effect of holding inflation in check. When the pound sterling was devalued in September Israel immediately followed (although it did not technically belong to the sterling area) by reducing its pound from $3 to $2.80. The economy of the country was strongly supported by world Jewry, which, through the activities of various affiliates of the Zionist organization, raised many millions of dollars for the purchase of goods, afforestation and development schemes, educational and cultural activities. In addition, a credit of $100 million was granted by the Export-Import bank in January and commercial agreements were negotiated with many other countries, including Great Britain.

Considering the difficulties which confronted the state at its birth, the progress that was made in the field of foreign affairs was striking. Recognition, either de jure or de facto, by many countries had been reluctant to grant in the first months following the declaration of independence, became general for practically all the nations of the world with the exception of the Arab and most of the Moslem countries. Great Britain granted de facto recognition on Jan. 29. A further success was Israel's admission to the United Nations on May 11, when it obtained 37 votes in the general assembly against 12 with 9 abstentions. Soon afterwards Moshe Sharett, the foreign minister, declared that the basis of Israel's foreign policy was fidelity to the United Nations, independence of either of the two world blocs, a desire for peace and stability and co-operation with the Arab states in the common development of the middle east. The conflicting demands of west and east created problems, both internally and externally, which were similar to those with which all the smaller countries in the peripheral areas of the two great political blocs were obliged to deal. In the case of Israel its predicament was accentuated by the fact that its major source of economic support lay in the governments and Jewish communities of the west, whereas her principal reservoir of immigration remained in Soviet-controlled Europe. The dilemma was accentuated during the second half of the year by the increasing obstacles that were placed by satellite governments in the way of emigrants wishing to leave eastern Europe, which led to the adoption of the policy...
of encouraging Jewish emigration from the middle east and north Africa.

Armistice agreements were concluded with all the neighbouring states and relations with the Arab countries generally improved slightly though they were far from reaching normality. The U.N. Conciliation commission, which was set up in Dec. 1948, made many attempts to convert the armistice agreements into a peace settlement but without success. The main stumbling block in these negotiations was ostensibly the question of the Arab refugees, whom the Arab states demanded that Israel should bring back to their homes and of whom Israel declared that it could not take more than 100,000 and that this concession was subject to the signing of a general peace settlement. In its interim report the U.N. Economic Survey Mission for the Middle East stated that the total number of destitute refugees was 652,000.

A question which had given rise to much discussion during the year and on which the Vatican had expressed strong opinions was that of the future of Jerusalem (q.v.) and the holy places. The Conciliation commission proposed a plan which was placed before the autumn session of the U.N. general assembly and envisaged a permanent international regime for Jerusalem, dividing it into Arab and Jewish demilitarized zones, the boundary of which would follow approximately that suggested in the partition resolution of Nov. 29, 1947. It was explained that the plan did not propose a complete separation of the area from the political life and authority of the adjoining states. The scheme was bitterly opposed by the government and people of Israel and also by the kingdom of Jordan, which was equally concerned. Nevertheless, when the matter came up for discussion at the general assembly, an Australian-sponsored resolution, based on this proposal but giving the suggested international authority even greater powers, was carried on Dec. 9 by 38 votes to 14 with 7 abstentions. The means whereby the scheme was to be carried out was left to the Trusteeship council to devise but not before the assembly had voted $8 million for the plan.

(D. F. K.)

Education. Jewish education, private and public systems (1946-47): kindergartens 487, pupils 17,318, teachers 755; elementary schools 349, pupils 71,531, teachers 3,772; secondary schools 40, pupils 12,349, teachers 747; training colleges 11, students 1,495, teachers 191; trade schools 31, pupils 3,993, teachers 446; religious schools 70, pupils 5,523, teachers 364; schools for defectives and orphans 9, pupils 635, teachers 86. Hebrew university pupils (1946-47) 1,097. Non-Jewish education, public system (1948-49): elementary schools 44, pupils 6,677, teachers 146; secondary schools 1, pupils 411, teachers 11.

Agriculture and Fisheries. Main crops (in '000 metric tons, 1947-48): wheat 15.5; barley 9.0; oats 0.6; maize and durra 6.0; hay 32.0; legumes 2.0; melons 7.0; straw 22.0; potatoes 31.0; fresh vegetables 47.5; grapes 9.2; bananas 8.5; (1948) oranges and tangerines 183; grapefruit 36; lemons 9. Livestock (1948): cattle 32,650, sheep 17,995, donkeys 2,290, mules and horses 4,591, laying hens 990,756, chickens 905,141, pullets 442,739, ducks 22,214. Fisheries: total catch (1947-48): weight 2,650 metric tons; value £1,185,000.

Industry. Electricity (million kwh, 1949) 260. Manufactured goods (in metric tons, June-Dec. 1948): salt 4,980,000; refined oils 3,788; margarine 3,304; soap 2,622; cement 45,326; flour 29,084; beer (in litres) 3,669,748; wine (in litres) 2,441,038.

Foreign Trade. ('000 £) Imports: (July-Dec. 1948) 23,870; (1949) 98,300. Exports: (July-Dec. 1948) 1,410; (1949) 10,600.

ISTANBUL, as Byzantium, former capital of the Roman empire in the east for more than eleven centuries, and, as Constantinople, former capital of the Ottoman empire until 1922, is still the largest city of modern Turkey. Pop.: (1940 census) 793,949, including about 100,000 Greeks, 53,000 Armenians, 47,000 Jews and 28,000 other non-Moslems: (1945 census) 860,558.

After many years of vigorous service as vali, or governor-mayor of the province and city of Istanbul, the election in autumn 1949 of Dr. Lütfi Kirdar as deputy for Manisa confirmed the rumours of his coming departure. He was succeeded as vali by Dr. Fahreddin Kerim Gokay, a distinguished nerve specialist, head of the lunatic asylum of Istanbul. On taking over he stated that, while he would continue the building and housing policy of his predecessor, his chief aim was to improve living conditions in the ancient city.

In October an exhibition of Turkish industries was held, which was thronged through the month. It was understood that this would be an annual affair, but without international character.

Two disasters marked the year. In the spring an explosion in the centre of the city destroyed a factory and many buildings, causing grave loss of life. The factory was owned by Nuri Pasha, brother of the famous Enver Pasha. Enquiry revealed that safety regulations had been ignored and that explosives were being manufactured there. The first official action was to order the removal of all dangerous factories outside the city. The second disaster was an explosion and fire on board the "Corum," a Turkish vessel, just before sailing for the Black sea. From burns, suffocation and panic 56 persons were killed and 23 seriously injured.

The new radio station in Istanbul was inaugurated by the president of the republic on Nov. 19. It was a 150-kw. medium-wave station.

(358. LaBr.)
ITALIAN COLONIAL EMPIRE. Under this heading are grouped the former four Italian provinces of Libya, the former military territory of Libyan Sahara, and the colonies of Eritrea and the Italian Somaliland. The total area of these territories is 918,937 sq. mi., and the total population (1948 est.) 3,262,600. Certain essential information on the constituent parts of the former Italian colonial empire is given in the table.

History. During 1949 the fate of the former Italian colonies remained as an international bone of contention until late in the year. Power politics were pursued in the matter with less hesitation; but in spite of the steady support of Latin America in the United Nations Italy's hope of returning to Africa dwindled. The main reason for this was the increase in the influence and claims of the Arabs as a whole, as also of native African nationalism.

Owing to the failure to arrive at any solution of the problem in Sept. 1948, the whole matter came before the political committee of the United Nations at Lake Success on April 6, 1949. At first the great powers put each forward only a slight modification of their respective proposals of the previous autumn. The U.S.S.R., that is to say, continued to advocate United Nations trusteeship for ten years as a preface to independence, while the French supported Italian trusteeship. On the other hand the British and Americans wished the British to be the trustees in Cyrenaica at least. There was now agreement on one point alone and that was that concessions of some kind must be made to Ethiopia in Eritrea.

At this point Ernest Bevin and Count Carlo Sforza unexpectedly put their heads together and produced fresh proposals according to which the Italians were to take over the trusteeship of Tripolitania in 1951 while the British remained in Cyrenaica and the French in the Fezzan, but the whole of Libya was to become independent at the end of ten years. The Italians were to be the trustees also in Somalia, and Eritrea was to be divided up between Ethiopia and Anglo-Egyptian Sudan. The United Nations looked slightly askance at this tête-à-tête method, and the Bevin-Sforza proposals were rejected by one vote in the U.N. general assembly on May 18.

While this rejection was resented in Italy the proposals themselves raised a storm in Libya; the Moslems of Tripolitania declared that they would fight to the death rather than allow the Italians to return and they demanded the unity as well as independence of Libya. This thirst for Libyan unity was not placated by the next British step in Cyrenaica. On June 1 the British chief administrator announced to the national congress at Bengasi that the United Kingdom agreed to the formation of a Cyrenaican government under the Emir Idris el Senussi who was thereupon invited to Britain to discuss further measures to be taken. The Emir arrived in London on July 15 and, after his return home, the Cyrenaican constitution was enacted on Sept. 18 and Cyrenaica became autonomous; in future the country would manage its own internal affairs although its external relationships would remain under British control. A National congress which had met at Tripoli on Aug. 24 to choose a delegation for the autumn U.N. assembly meeting again insisted that Libya should be united as well as independent.

It was the French who were most discontented by the rising Arab tide, for Libyan unity would expel them from the Fezzan and Libyan independence would disturb the already uneasy atmosphere in neighbouring Tunisia. When the United Nations met once again at Lake Success in Sept. 1949 the French were, however, left behind, while the other powers competed in a race to catch up with Libyan aspirations. The British and Americans advocated independence for Tripolitania in from three to five years, while the Russians proposed the immediate independence of all the former Italian colonies and the evacuation of Libya by the British within three months. The Italians themselves now backed Libyan unity and supported the independence of Tripolitania where they suggested that there should be elections for a constituent assembly within six months. The Italians also pressured for the unity and independence of Eritrea.

Meanwhile former Italian Somaliland, which the four powers had all but consigned to Italian trusteeship in 1948, was the scene of commotion. The African Somalis, like the Arabs in Libya, were now determined upon unity and independence too; and in Aug. 1949 declarations to this effect were made by the Somali Youth league and other nationalist organizations. This would mean the union of Somalia with French and British Somaliland, a plan which the British had considered at one moment in 1948. While the U.N. political committee was debating at Lake Success a crowd of some 2,000 Somalis assembled in Mogadishu on Oct. 5 and threatened the local Italians. They were dispersed by order of the British military authorities; two rioters were killed and three died of wounds, and a British officer and six Native constables were injured.

On Nov. 12 the U.N. political committee accepted the

* The political units listed were in 1949 under British trusteeship pending ultimate decision by the United Nations assembly concerning disposal of the pre-1940 Italian colonial empire.
† In 1934 Libya was divided into four provinces. By a decree of Jan. 9, 1939, these provinces (213,821 sq. m.) were incorporated in the national territory of Italy. The territory of Libyan Sahara (465,362 sq. m.) was not affected by this decree. Under British military administration Libya was divided into Tripolitania (provinces of Tripoli and Misurata) and Cyrenaica (provinces of Bengasi and Derna), and the eastern part of Libyan Sahara (Fezzan) was divided between British and French military administrations (223,153 and 19,300 sq. m. respectively; total pop. 50,000).
‡ The areas given here are those before the annexation of Ethiopia by Italy. A decree of June 1, 1936, established the colony of Italian East Africa comprising Ethiopia, Eritrea and Italian Somaliland. The greater Eritrea (66,166 sq. m.) included three northern provinces of Ethiopia and the Ethiopian Ogaden was assigned to the greater Somaliland (270,972 sq. m.). These new Italian colonies were then placed under British military administration.

ITALIAN COLONIAL EMPIRE
drafting committee’s proposals on all the former Italian colonies and on Nov. 21 the general assembly agreed to the end bloc. Thus, last it was settled that:

(1) a unified Libya should become independent by Jan. 1, 1952; in the interim period administration was to be carried on by a U.N. commissioner with an advisory council of the representatives of Egypt, France, Italy, Pakistan, the U.K. and the U.S. and four representatives of the local population.

(2) Somalia or former Italian Somaliland was to come under Italian trusteeship with a three-power advisory council (Colombia, Egypt and the Philippines) for ten years and during that period be prepared for independence.

Only in the case of Eritrea was a decision once more postponed for a year in order that a U.N. commission of enquiry might once again attempt to ascertain the wishes of the Eritrean peoples.

ITALIAN LITERATURE. Italian writing during 1949 continued prolifically. It also continued to be predominantly neo-realistic or impressionist, searching after truth in the worst of the mêlée. The forms most in use were still the novel and short story. Elio Vittorini published his Le donne di Messina, another novel along his accustomed lines but generally felt to be less successful than his predecessors. Two shorter stories together entitled Prima che il gallo cant i by Cesare Pavese were much admired, though the majority of critics considered the most important novel of the year to have been Vitaliano Brancati’s Il bell’Antonio. The subject of Brancati’s book was the overwhelming success of an extraordinarily beautiful young man among the women of a provincial town in Sicily; the hero is then revealed to be impotent. The whole story takes place towards the end of the fascist period and Brancati did nothing to neglect the satirical scope which his subject offered.

One of the many prizes awarded for literary achievement went to an autobiographical novel called La memoria by G. B. Angioletti. Another prize, the Premio Versilia, was awarded in the first place to Ugo Moretti for a novel called Vento caldo. Towards the end of the year the ever fertile Alberto Moravia (q.v.) brought out his L’amore conjugal, a volume of short stories some of which had been published before; meanwhile the translation of his novel, La bella Romana, was published in England as The Woman of Rome. Giuseppe Raimondi’s Giuseppe in Italia was a great deal less modernist; indeed it echoed the extreme, almost precious, literary tones of the days of the Rondò.

During the year there was a considerable harvest of drama. Massimo Bontempelli brought out a play called Venezia Salva based on Otyaw, but it was felt to be unsatisfactory. On the other hand three well-known novelists published plays which made a great impression: Yo, el Rey by Bruno Ciocognani; Lunga notte di Medea by Corrado Alvaro; and L’alba dell’ultima sera by Riccardo Bacchelli. Bacchelli’s play was based on the theme of a new Faust-like figure who, however, rejects the evil temptation of atomic knowledge; it was produced at the Venice festival in the autumn but with obvious difficulty; its admirers praised it for its literary and philosophic quality rather than for its success as drama.

The most outstanding poetry of the year was contained in Salvatore Quasimodo’s La vita non è sognò, though the second Viareggio prize went in part to Libero de Libero for his Banchetto.

The first Viareggio prize went to Stato e chiesa negli ultimi cent’anni by Arturo Carlo Jemolo, for the particular quality as well as the importance of his book were immediately recognized. The author, a historian of the Left, undoubtedly made an illuminating analysis of a burning question which more than ever coloured the political scene. Gabriele Pepe brought out his Medioevo barbarico in Europa, while Benedetto Croce’s unfailing productivity was emphasized by the publication of La letteratura italiana del Settecento and Varietà di Storia letteraria e civile. Another idealist philosopher of some note, Manlio Ciardelli, published his Natura e storia dell’idealismo attuale while Remo Cantoni, a Marxist existentialist opposed to Jean-Paul Sartre, brought out an essay on Kierkegaard called La coscienza inquieta.

ITALY. A republic of southern Europe, bounded on land by France to the northwest, by Switzerland and Austria to the north and by Yugoslavia to the northeast. The country includes not only the whole of the Apennine peninsula, but also the large Mediterranean islands of Sicily and Sardinia as well as a number of smaller islands. Area: 116,235 sq. mi., excluding Venezia Giulia, Zara and the islands (2,843 sq. mi.) ceded to Yugoslavia, the five small areas in the Alps ceded to France (397 sq. mi.) and the free territory of Trieste (q.v.). Pop.: (April 21, 1936 census): 42,993,602; (mid-1948 est.) 46,110,000. Language: mainly Italian, but in Venezia Tridentina there were c. 210,000 German-speaking Tyrolese and c. 10,000 Romansch-speaking Ladins; in the area east of Udine there were c. 11,200 Slovenes, and the population of Val d’Aosta (c. 6,600) was French-speaking. Religion: mainly Roman Catholic (99.6%). Chief towns (pop., Jan. 1, 1948 est.): Rome (q.v.) (cap., 1,613,660); Milan (1,277,013); Naples (995,257); Turin (719,528); Genoa (657,634); Palermo (470,780); Florence (377,203); Bologna (329,964); Venice (308,677). President, Luigi Einaudi (q.v.); prime minister, Alcide De Gasperi (q.v.); minister of foreign affairs, Count Carlo Sforza (q.v.).

History. During 1949 the predominantly Christian Democratic government led by Alcide De Gasperi continued in office. The smaller groups contained—Liberals (meaning a small, strongly conservative party), Republicans and moderate Socialists—all being anti-clerical, criticized cabinet policy fairly openly. The moderate Socialists led by Giuseppe Saragat, who was deputy prime minister and minister of the
mercantile marine, were indeed constantly on the verge of resigning. On Oct. 31 they made up their minds to do so, because the other anti-Communist Socialist groups might be ready to try to reunite the Socialist party if the Saragatian were not actually members of a clerical administration. On Nov. 7, De Gasperi deputied their posts temporarily to other ministers, evidently not taking the resignations very seriously. By the end of the year there were still no signs of a real reunion between the Saragat Socialists and the Socialist followers of Giuseppe Romita and of Ignazio Silone, so that the traditional Socialist party remained divided and impotent.

All other regional elections, contrary to earlier intimations, were postponed until 1950, but the first elections to the regional assembly of Sardinia—to which a generous autonomy had long been promised—were held on May 8. The island is poor and backward, and some surprise was created by the fall in the Christian Democratic vote as compared with the general election of April 18, 1948, while the Communist vote was considerable. In fact the Christian Democrats obtained 22 seats in the Sardinian assembly, while the Communists gained 13 and 6 others went to two small groups allied with them. The votes lost by the government party seemed mostly to have gone to the M.S.I. (Movimento Sociale Italiano, the new Fascist party) and even more to the monarchists. The latter still had many followers in the south and in the islands, and ex-King Umberto had encouraged them by sending messages in which he dwelt upon the traditional ties of Sardinia with the house of Savoy.

When the Christian Democratic party conference was held at Venice at the beginning of June one of its favourite topics of discussion proved to be a demand that the government coalition should be replaced by a homogeneous cabinet which, it was claimed, would be able to make a clearer appeal to the public. De Gasperi, however, continued on his way; and in the next few months the position of the government appeared to be consolidated by a number of factors. For instance the cabinet showed considerable activity in the way of putting forward projects for fiscal and tariff reform, for the revision of social legislation and the restriction of the right to strike. The housing plans of the minister of labour, Amintore Fanfani, began slowly to materialize and in the Chamber of Deputies in September he was able to state that L. 20,000 million had been invested in housing for workers and that more was to follow.

The activities of the vigorous Christian Democratic minister of the interior, Mario Scelba, also contributed, perhaps, to the strengthening of the government’s position. In a speech at the Communist centre of Siena on April 3, he heralded an anti-Communist police drive, denouncing go-slow tactics and spasmodic strikes as illegal. The Siena speech was followed by others and the police proceeded often to handle strikers so roughly that moderate opinion felt some uneasiness.

Communism and Trade Unions. In the course of the summer irritation and fatigue due to Communist agitation, combined with fear of the police and fear of unemployment, reduced Communist influence very considerably in the industrial north of Italy. On July 13 the Papal threat of excommunication against Communism made a further contribution to this tendency (see Roman Catholic Church). The disruption of the Communist-dominated C.G.I.L. (Confederazione Generale Italiana del Lavoro or General Confederation of Labour), which had begun with the establishment of the “free” or Catholic L.C.G.I.L. (Libera Confederazione Generale Italiana dei Lavoratori) in Sept. 1948, continued; and in June 1949 the Republican and anti-Communist Socialist labour groups also broke away to form the Italian Federation of Labour (F.I.L.). There was a fairly general and justified fear that jobs, whether offered by the government or by private employers, would not be given to those who remained in the C.G.I.L. Thus, while at the end of 1948 the local C.G.I.L. organization in the province of Turin had counted 296,000 members, by Sept. 1, 1949, the number had fallen to 252,000; in the province of Milan the fall in

*The name of the Communist newspaper “Unità” spelt out by girls during a large scale circulation drive in Florence for the newspaper in Sept. 1949.*
membership was relatively greater. At the national conference of the C.G.I.L. at Genoa early in October its secretary general, Giuseppe Di Vittorio, admitted losses in the north, and since June 1947 the loss of about 800,000 members altogether, but at the same time he claimed that the C.G.I.L. had gained sufficient ground in other parts of the country to keep its membership figure up to five million. When the L.C.G.I.L. congress was held in Rome early in Nov. 1949, its secretary general, Giuliolo Pastore, claimed a membership already reaching 1,300,000.

**Peasant Movement.** While Communist influence was weakening particularly among the highly skilled workmen of the northern industrial triangle, it remained fairly steady in central Italy, where many peasants were prosperous and agricultural industries flourished; at the same time it continued to grow in the very poor districts of southern Italy which had never been industrialized and where it was scarcely known before 1948. The problem of the extreme south had lain dormant for many years, but by 1949 it had become critically acute and of this the Communist party was not slow to take advantage. The increase of the population was greatest in the south where the difficulty of emigration was thus particularly felt. The peasants became aware of the huge private estates which had belonged to their owners with neglect; this meant that there was neither work, land nor food for the great mass of would-be agricultural labourers who were forced to live in misery crowded together in poor towns. No real change in land-tenure had been made since mediaeval times and the cry for agrarian reform rose from all parts of Italy; but it was in the south that reform was desperately needed, especially in Calabria where the effects of deforestation and soil erosion were more catastrophic than elsewhere.

On Easter Sunday (April 17), after many vague promises, De Gasperi gave an interview to the press in which he outlined a specific plan for land reform. The plan proposed that nearly 8,000 owners of big landed properties should be compelled to sell portions of their land varying from a fifth to a half. Only the most profitable land, not the largest most neglected estates, was, it seemed, to be affected. The land liberated in this way was to form a land pool out of which small peasants and labourers were to be supplied. All more technical details were to be worked out later. This project was not well received, and the months dragged on and nothing further developed. Meanwhile the labourers who, even in the north and centre, were badly paid and could seldom get employment all the year round, became understandably impatient and there was a serious agricultural strike for some weeks which was settled towards the end of June. The long drought, followed by floods and devastation in the autumn, brought great suffering, especially in the south, and at the end of October there were clashes near Crotone in Calabria between the police and unarmed peasants who had squatted on the land. (In 1944 a decree had permitted squatting in neglected land although more recently squatters had frequently been punished.) Public opinion reacted strongly in favour of the peasants, and on Nov. 20–21 De Gasperi toured Calabria where no Italian prime minister had ever been. The peasants’ co-operatives were promised some of the land they claimed and money for improvements was guaranteed. Similar disturbances took place in Sicily (where the situation was complicated by the apparently invincible brigand Salvatore Giuliano) and in November in the San Severo wine-growing district of Apulia. Experts felt afraid of the piece-meal offers of land made by the government when, as they believed, an all-over solution of the problem was required.

**Improved Economic Position.** While agrarian unemployment was increasing there was some improvement with regard to industrial unemployment in the summer of 1949. Though

in a country crammed with unregistered workers, small sweatered industries and casual seasonal employment statistics could easily mislead, it was worth while to record that at the end of July 1949 there were nearly 470,000 less registered unemployed than at the end of July 1948, while about 200,000 more people had come on to the labour market as the population grew: there were, into the bargain, some 100,000 Italians whose contracts in Switzerland had been ended. Towards the end of the summer the Doxa institute (a public opinion survey organization) asserted that 42% of all Italian families had an average income of L. 22,000 a week or $965. Internal prices continued fairly stable during 1949 and in September, thanks in part to the excellent grain harvest, it was possible to announce an average 10% reduction in the price of bread from the middle of October.

The financial policy of the government continued to be very cautious though in the spring a little more play was allowed by a reduction of the official rate of discount from 5% to 4 1/2%. Exports reached their highest postwar level during the first six months of 1949 and the adverse balance of trade was at times eliminated. After June things became more difficult owing partly to the contraction of the world market. The problem of the constantly increasing sterling balance in Italy, which had reached the figure of £70 million by September, was sharpened by sterling devaluation which practically spelt a partial British default. But the Italian government had been fortunate in the acquisition of a considerable quantity of gold in the U.S. before Sept. 18 and this, of course, rose in value. The lira was left to find its own value against the dollar and steadied at a rate which implied a devaluation of not quite 10%. The government congratulated the country and itself upon the steady confidence shown which was undoubtedly an achievement to emphasize within two-and-a-half years of the financial crisis of the spring of 1947. The outlook for exports had, however, darkened very seriously by the end of the year. A basic reason for this was the excessive cost of industrial manpower; and this was due, as much as to anything, to the short-sightedness of the Italian industrialists who had spent their postwar profits heedlessly, making no attempt to replace worn-out plant or to expand their industrial potentialities.

Insofar as Italy’s storms were weathered in 1949 the chief factor undoubtedly was the supply of Marshall aid, and the news that the 1949-50 allocation was to reach only $407 million was unwillingly received. It should be added that the steady reconstruction of Italy’s mercantile marine with the consequent reduction of the charges for freight had made a far from negligible contribution to the country’s economic health. A seamen’s strike at Genoa, Naples and Venice (and also at Trieste) in September caused some dislocation but no irreparable harm.

One promising event for Italy’s economic future, though its effects were scarcely felt by the end of 1949, was the discovery in June of coal at a small Emilian town called Corte Maggiore just south of the Po. More immediately important, because upon a larger scale, was the organization of the natural gas around Ferrara and at Lod in Milan. It was impossible to guess how far these new fuel supplies would be able to replace Italy’s coal imports in the future, but that it should become less dependent upon foreign coal was in itself an epoch-making event.

**Foreign Policy.** There was no change in Italian foreign policy in 1949. The foreign minister, Count Sforza, had been associated in his youth with attempts to improve relations with the Yugoslavs and he followed up Tito’s difficulties with Moscow by friendly expressions and the extension of commercial relations with Yugoslavia. In August he led the Italian delegation to the Council of Europe at Strasbourg but a good deal of sympathy was felt in Italy for drawing closer
its ties with the other countries of western Europe. A considerable section of the Italian press continued, especially after the abortive Bevin-Sforza proposals and until after the Mogadishu incident in October (see ITALIAN COLONIAL EMPIRE), to attack Great Britain as the obstacle in Italy's colonial path. It also criticized British behaviour in the matter of European co-operation, particularly after the devaluation of sterling. Economically Italy continued to lean heavily upon the United States. The Franco-Italian customs union did not bear much fruit because the two countries produced so much the same; but more hope was entertained of a wider union to include Benelux, a union which came to be referred to as "Finebo." Although the Soviet veto still excluded Italy from the U.N. it was included in western European strategic planning. But most of all during 1949 her cultural links with the rest of the world were developed afresh, to some extent culminating in the P.F.N. club meeting and the Giovanni Bellini exhibition in Venice in the autumn. Events of this kind helped to bring Italy's tourist traffic in 1949 back to the scale of 1938.

Education. (1946-47) Elementary schools 37,131, pupils 4,703,228, teachers 144,485, secondary schools 5,799, pupils 594,037, teachers 82,673; technical schools 957, pupils 134,969, teachers 13,721; universities and institutions of higher education 27, students 180,134, professors and lecturers 6,625. Illiteracy (1931) 21.6%.

Industry. Fuel and power (in '000 metric tons, 1948; 1949, six months, in brackets): coal 972 (579), lignite 907 (400), natural gas (in million cu m) 117 (90), manufactured gas (in million cu m) 1,524 (791); electricity (in million kwh) 22,692 (8,606); crude oil (in '000 metric tons) 9 2 (4.4). Raw materials (in '000 metric tons 1948; 1949, six months, in brackets): iron ore, metal content 543 (257), pig iron 126 (250), ingots and castings 2,124 (1,001), lead 26 8 (13-1), zinc 26 4 (12.4)

Foreign Trade. (Million lire) imports, (1948) 847,200, (1949, six months) 475,400, exports, (1948) 570,000, (1949, six months) 312,500.

Transport and Communications. Roads (1948) 105,800 m. Licensed motor vehicles (Dec 1948) cars 206,773, commercial vehicles 211,636. Railways (1948): 13,000 m., passenger-mi. 13,260 million; freight carried 37 million tons. Shipping (July 1949) : number of merchant vessels 3,500, upwards of 2,100,000 tons; cargo transport (1948) m. flown 5,348,600, passengers flown 190,640; cargo carried 1,568,000 tons; air mail carried 189,000 tons. Telephones (1948-49): subscribers 751,900.

IVORY COAST: see FRENCH UNION.

JAFFA-TEL AVIV. Capital and largest city of Israel. Pop. (1949 est.): 300,000. The town consists of two distinct parts: the old city of Joppa which was renamed Jaffa (pop. in 1939, 77,400 [52,700 Moslems, 24,700 Jews] and in 1946, 101,850) and Tel Aviv, an all-Jewish city founded in 1909 (pop. [1939] 130,300, [1946] 183,200). Tel Aviv became the capital on May 14, 1948, when Israel was founded. On Dec. 26, 1949, the Knesset (parliament) was moved from Tel Aviv to Jerusalem although the seat of the government remained in Tel Aviv.

On Oct. 5, 1949, the Israeli government officially announced the merging of Jaffa and Tel Aviv. The new city was known as Jaffa-Tel Aviv and its combined population of 300,000 made it one of the largest cities in the middle east. The new town which has 4,000 Arabs would have a central council for the purposes of administration. Israel Rokach, mayor of Tel Aviv, who was attending the International Conference of Mayors in Switzerland at the time of the announcement, expressed surprise at the decision being taken by the government without consulting the local councils. The Rosh Pash maintained monthly distribution of foodstuffs to the Arab population; but during the summer the Arab Emergency committee ceased to function owing to lack of funds and because of grievances against the Israeli authorities. The committee was not considered representative of the Arab community.

Work began on the building of a new road at a cost of £600,000. This was the first road in Israel to be seven metres wide. In September a new railway terminal was opened when the first passenger train arrived from Haifa. The large influx of new inhabitants to Tel Aviv caused a considerable strain on the already overcrowded houses and flats. A town planning exhibition held in Tel Aviv in November revealed that to house each newcomer upon arrival it would be necessary to complete one flat every eight minutes. The municipal elections, due to be held early in 1950, there were 135,000 persons on the voting register.

(X.)

History. The constitution, introduced in Nov. 1944, for a five-year trial period, became due for review. The House of Representatives agreed on these proposals: the Executive Council should consist of one official, two nominated and eight elected members; the Legislative Council should not be permitted to hold up legislation for more than six months; and a candidate for the House of Representatives should be able to stand for any constituency in the island. The last proposal was immediately accepted and brought into force; the others remained subject to consideration. A general election was held on Dec. 20. The Labour party led by W. A. Bustamante secured 17 seats and the People's National party led by Norman Manley, 13.

In February the government passed the Pioneer Industries (Encouragement) law, granting substantial concessions in regard to exemption from income tax, tonnage tax and customs duty in connection with the establishment of new industries. There was a spate of industrial and other economic development. The shares of a £1.2 million Caribbean Cement company were issued; construction of the factory was due to start at an early date and production was scheduled to commence by the beginning of 1951. The West Indian Sugar company's new factory at Monymusk, one of the largest in the British Commonwealth, began operations in April. Plans for an industrial estate in western Kingston were well under way. Jamaica Welfare, Ltd., which, since its foundation in 1937, had done much valuable welfare work, was wound up and handed over to a new Social Welfare commission with a civil servant as chairman.

(J. A. Hu.)
JAPAN. An island nation in the western Pacific, under Allied military occupation following its defeat and surrender in 1945. In accordance with the Cairo and Potsdam declaration, Japan was stripped of its former overseas possessions and reduced to the following four main islands:

<table>
<thead>

According to Oct. 1, 1940, census the population of Japan proper was 73,114,308. On June 30, 1948, the total population was estimated at 80,170,815, a gain of 7,761,804 since Oct. 1, 1945. Net repatriation to Japan contributed 5,934,928 of the increase; natural growth the remainder. On Sept. 1, 1949, the population was estimated at 82,466,181. Chief towns (first figure, Oct. 1, 1940, census; second figure, 1946 est.): Tokyo (cap., 6,778,824; 3,442,106); Osaka (3,252,340; 1,293,501); Nagoya (1,328,084; 719,382); Kyoto (1,089,726; 914,655); Yokohama (968,091; 706,557); Kobe (967,234; 443,844); Hiroshima (343,968; 77,000).

Language: Japanese. Religions: Buddhist, Shintoist and Christian (in 1933 there were 191,000 Roman Catholics and 249,000 members of other denominations).

Supreme commander for the Allied powers: General Douglas MacArthur (q.v.). Allied council for Japan (an advisory body in Tokyo): William J. Sebald (U.S.), deputy for the supreme commander, chairman; General Chu Shih-ming (China); Lieutenant General William R. Hodgson (who late in 1949 succeeded Patrick Shaw as representing jointly the U.K., Australia and New Zealand); Lieutenant General Kuzma N. Derevyanko (U.S.S.R.). The policy-making body is the Far Eastern commission sitting in Washington under the chairmanship of Maxwell M. Hamilton who on Dec. 8, 1949, succeeded General Frank R. McCoy (U.S.), and comprising the representatives of Australia, Canada, China, France, India, Netherlands, New Zealand, Philippines, United Kingdom and the U.S.S.R. On Nov. 17, 1949, Burma and Pakistan were added to the 11 members of the commission. Emperor, Hirohito (q.v.); prime minister and minister of foreign affairs, Shigeru Yoshida (q.v.).

History. Inter-Allied negotiations looking to the conclusion of a peace treaty remained deadlocked over questions of procedure. The United States, with the support of several other powers, proposed that all members of the Far Eastern commission participate in the settlement. The Soviet Union insisted on a preliminary negotiation of major issues by the United States, the Soviet Union, the United Kingdom and China. Meanwhile U.S. policies in Japan were denounced as anti-democratic and imperialistic by Soviet representatives on the Far Eastern commission (Alexander S. Panyushkin) and the Allied council. They were defended by the U.S. government as fully consistent with basic occupation objectives of disarmament and democratic reform. The Soviet Union was accused in turn with failure to live up to its Potsdam pledge to repatriate all Japanese prisoners of war. Some 95,000 were reported shipped back to Japan in 1949. In May the Russians had stated that this number would complete their repatriation programme; but Japanese records showed 377,000 still unaccounted for in Soviet areas. The United States pressed for an impartial investigation. Lieut. General Derevyanko, Soviet representative on the Allied council in Tokyo, walked out of the meeting of Dec. 21 when the question was placed on the agenda.

The United States retained the preponderant position in administering occupation policies within the framework of the Far Eastern commission's basic post-surrender policy for Japan. Except for a token British Commonwealth force, the occupation troops remained wholly American, comprising four infantry divisions plus the far east air force. Civilian relief supplies furnished by the U.S. armed forces to Japan
JAPAN 365

(including Okinawa) totalled $410 million in the year ending June 30, 1949. They had amounted to $1,265 million in the four years since V-J day.

A move to grant the Japanese greater autonomy in managing their own affairs was made in August when General MacArthur announced the reduction of military government supervision of civil affairs at the prefectural and local level. In the economic realm, however, the year was marked by tightened pressure on the Japanese government to retrench its finances and revive production and exports. A Washington directive of Dec. 1948 called on the supreme commander to “direct the Japanese government to carry out an effective economic stabilization programme.” Subsequently, detailed proposals for balancing the budget, reforming the tax structure and stabilizing prices and wages were put forward by the U.S. authorities. The latter also made clear their opposition to labour strikes disrupting key industries.

The emphasis in occupation policy thus shifted towards economic recovery and away from the punitive and reform measures of earlier years. In May the United States unilaterally halted interim reparations deliveries of industrial equipment to China and other Pacific nations. As the Far Eastern commission was still unable to agree on a final reparations programme and the United States was increasingly concerned to conserve Japanese assets for recovery, the prospect of any further deliveries seemed remote. In August it was announced that the programme to break up excessive concentrations of economic power in Japan was virtually completed. This suggested that the original aims had been scaled down considerably. The agrarian reform meanwhile moved into its final stage. Over 5 million acres of farm land had been purchased from former owners and resold to small farmers, while rent ceilings and written contracts had been instituted on the 10% of Japan’s cultivated area still farmed by tenants.

Domestic Affairs. The Democratic Liberal party, headed by Shigeru Yoshida, won a sweeping victory in the national Diet elections of Jan. 23. Campaigning on a platform of “free enterprise” and anti-Communism, Japan’s right-wing party gained a working majority of 264 out of 466 seats in the House of Representatives. Premier Yoshida thus continued in office through the year. The centre parties, the Democrats and Social Democrats, suffered heavily from the corruption and internecine strife revealed in their earlier coalition governments. In the 1949 elections they dropped to 68 and 49 seats respectively. Symptomatic of the polarization taking place in Japanese politics, the Communists showed a marked accession of strength, increasing their seats from four to 35. (See ELECTIONS.)

Despite the general swing to the right, and the lesser drift from the centre to the left, no stable pattern of political parties had yet emerged in postwar Japan. Premier Yoshida, spokesman of the old-line bureaucracy and large business interests, continued his efforts to draw the Democratic party into a merger which would create a Conservative bloc of preponderant strength. On the left also there were manoeuvres to form some more stable coalition. The Communist party campaigned vigorously against the policies of the Yoshida government, especially in the labour field. They also attracted support from the workers for its overtly Nationalist and anti-occupation propaganda. Towards the close of the year, however, it appeared that they had lost ground in their stronghold, the trade unions. Anti-Communist “Democratization leagues” had drawn large numbers of workers away from Communist leadership and the latter’s attempt to stage a strong labour offensive against the government proved ineffectual. Communist influence among Japan’s 2-5 million employees in government offices and enterprises was also weakened by the purging of many party members and sympathisers in the course of the government’s campaign to dismiss surplus employees from its payrolls. The strongest organized force in Japanese politics continued to be the conservative bureaucracy, allied at various points with business interests and commanding strong support in rural regions. Only the presence of Allied authority prevented a sharper and perhaps more violent clash between the right and left.

National politics in Japan continued to be dominated by the issues of economic stabilization and reconstruction. Under persistent pressure from Allied headquarters, the Diet approved Japan’s first balanced budget since 1930. A series of Allied directives brought a sharp reduction in government subsidies, the suspension of deficit loans from the Reconstruction Finance bank, large scale dismissals of public employees, slashes in public investment, the relaxation of commodity controls and far reaching plans for tax reform. On April 25 the yen was officially pegged at 360 to the U.S. dollar, as a further step in the return to normal trading. Agricultural harvests were good; and industrial output increased 46% from January to October.

Late in the year the authorities announced that monetary stabilization had been achieved. Symptomatic was the marked decline in the black market and the stability of prices and wages through 1949. It appeared that the problems of inflation might be superseded by deflationary pressures. Men complained that the austerity programme had brought about a crippling shortage of funds and mounting stockpiles. This was accentuated by the lag in making available counterpart funds—the yen proceeds of U.S. relief funds to finance industrial expansion. Labour unrest was widespread, especially over the dismissal of some 200,000 public employees and the government’s policy of no wage increases. The Japanese economy, moreover, still continued to be heavily dependent upon American aid. Exports failed by a wide margin to cover import requirements of food and raw materials, even though living standards remained far below prewar levels. The “balanced economy” projected for 1953 by the Economic Rehabilitation Planning commission called for exports of $1,500 million to support a standard of living 10% below that of 1930-34. This was three times the actual level of exports in the year ended June 1949.

Education. During the occupation the school system was purged of those teachers who were charged with being nationalistic and militaristic, and all school books containing such material were scrapped. In 1949 there were 2,489,000 students enrolled in the schools, more than 25% of those of school age. In the universities, there was a shortage of about 110,000. About 19 million pupils were enrolled in about 50,000 elementary, secondary and technical schools. There were also imperial universities and 39 other institutions of higher education with teaching staffs of about 4,000 and 51,000 students.

Food and Agriculture. Some improvement in Japan’s food position was achieved in 1949. The index of agricultural production (1934-38 = 100) was 83 in 1947-48 and 95 in 1948-49. For the fourth postwar year, however, Japan was unable to provide sufficient food from her own resources for its expanded population, or to assure equitable distribution to the cities. Food imports totalled 2,489 million metric tons in the year ending June 1949 and were expected to equal if not exceed this figure in the fiscal year 1949-50. Production of rice and rice substitutes was as follows in the calendar years 1948 and 1949:

Table 1—Agricultural Production (1,000 metric tons)

High food prices remained a major problem for urban workers, who were still forced to devote 60% of their total family expenditure to food. By the end of the year, average national consumption was put at about 2,000 calories per person daily. But the official ration supplied only 1,348 calories, and the remainder had to be purchased in the open market at two to three times the official prices. With heavy food imports still financed by U.S. funds, Allied headquarters turned down the request of the Japanese government to raise the basic rice ration above 2-7 go (0 88 dry pints).
Manufacturing and Mining. Industrial activity in Japan rose steadily from Nov. 1946 to March 1949. Thereafter it showed a tendency to level off, reflecting deflationary pressures in domestic and export markets. In Sept. 1949 the index of industrial output stood at 53% of the 1937 level, a rise of 40% from the 1948 average. Based on 1932-36 as 100, the September indices were as follows: general industrial activity 93-2; utilities 64-1; mining 106-2; manufacturing 75-5; metal products 111-7; metals 87-6; chemicals 77-4; and textiles 75-5. Employment in Japanese industry, transport and the distributive trades was estimated in Aug. 1949 to be about the same as Oct. 1947. However, production, however, and hence prices were hardly more than 50% of prewar levels. This situation bred continuing discontent and unrest among Japanese workers, some 6-7 million of whom were now organized in trade unions.

Production of basic commodities was as follows (monthly average):

JAWA

The capital of former Palestine, revered as a Holy City by Christians, Muslims and Jews alike, during 1948 and 1949 was divided by a demarcation line between Israel and the Hashemite kingdom of Jordan. An armistice was negotiated in March and some progress was subsequently made towards establishing a normal life on both sides of this demarcation line which divided the Arab-held old city, with its population of about 30,000, from the new city, of the Jewish population was about 100,000. No-man's-land areas were eliminated within the city limits, reducing the possibilities of tension and incident.

Administratively, the new city was part of the state of Israel. It had a Jewish mayor, Daniel Auster, and a district representative, Avraham Bergmann, appointed by the Tel Aviv government. Jerusalem remained the headquarters of the Jewish agency, which was responsible for immigration and settlement of Jews in Israel. It was the seat of a number of Israeli government departments, including the Ministry of Religious Affairs and the post office. It was also the headquarters of the Supreme Court of Israel. A special session of the Knesset was held there after the elections in February; and in many ways the government was at pains to stress the city's inseparable connection with the state of Israel.

The old city was administered by a governor, appointed by King Abdullah of Jordan. It contained practically all of the traditional Holy Places. On the Jewish side of the line, the church of Dormition on Mount Zion, which contains the tomb of the Virgin, was restored to Dominican use. The Jews obtained access to the traditional tomb of David, from which they had been barred for centuries, and it has to some extent taken the place of the Wailing Wall in the old city as a place of religious veneration. The Cenacle, supposedly the scene of the Last Supper, which is also on Mount Zion, remained in the custody of a Moslem family.

A special committee of Israeli and Jordan representatives set up under the armistice agreement made little progress in clearing up outstanding points of issue concerning Jerusalem. The Israelis offered the use of the direct road to Bethlehem in exchange for unrestricted access to Mount Scopus (seat of the Hebrew university). Meanwhile the old city remained without electricity because the power station of the Jerusalem Electricity company was on the Israeli side of the city. Other points of issue were the restoration of the water-supply, the opening of the Latrun road and apportionment of the contents of the Rockefeller Museum of Palestine Antiquities. Some in the pumping-stations were still under Arab control and Jewish Jerusalem was dependent on an emergency pipe-line, which was being enlarged.

Other points of issue were the restoration of the water-supply, the opening of the Latrun road and apportionment of the contents of the Rockefeller Museum of Palestine Antiquities. Some in the pumping-stations were still under Arab control and Jewish Jerusalem was dependent on an emergency pipe-line, which was being enlarged.
Both Israel and Jordan opposed an Australian-sponsored plan approved by the general assembly of the United Nations on Dec. 9, 1949, to place Jerusalem and its environs, an area of 100 sq. mi, including Bethlehem, under permanent U.N. control as a corpus separatum.

On Dec. 26 the Knesset (parliament) was moved from Jaffa-Tel Aviv (q.v.) to Jerusalem. The seat of government remained at Jaffa-Tel Aviv. (See also ISRAEL; PALESTINE.)

JESSUP, PHILIP C., U.S. lawyer and diplomat (b. New York city, Jan. 5, 1897), was educated at Hamilton college, Clinton, New York, Yale university and Columbia university, where he received his doctor’s degree in 1927. He taught international law at Columbia, becoming Hamilton Fish professor of international law and diplomacy in 1946. In 1929 Jessup was assistant to Elihu Root at the conference of jurists on the Permanent Court of International Justice. He also lectured at the Academy of International Law at The Hague and in 1930 was legal adviser to the U.S. ambassador to Cuba. From 1924 to 1944 he was assistant director of the Naval School of Military Government and Administration and at the same time lectured in a similar school for the army. He was assistant secretary general to the U.N.R.R.A. conference in 1943 and the U.N. Monetary and Finance conference at Bretton woods, New Hampshire, in 1944. On Jan. 3, 1948, President Truman appointed him deputy U.S. representative on the “little assembly” of the U.N. general assembly and in May appointed him deputy representative on the Security council. In Dec. 1948 he was granted the personal rank of ambassador. On Feb. 10, 1949, he was given a new position as ambassador-at-large for special assignment to international meetings requiring an experienced representative of high rank. He represented the United States in the initial discussions that led to the ending of the Soviet blockade of Berlin and was one of the United States advisers at the Council of Foreign Ministers in Paris in May and June. In July he was appointed to direct a review of U.S. diplomatic policy towards the far east. Jessup was a member of the U.S. delegation to the fourth general assembly which opened at Flushing Meadow, New York, on Sept. 20.

JET PROPULSION AND GAS TURBINES. During 1949 steady improvement in turbo-jets and turbo-props was made and new gas turbines for industrial purposes were put in hand.

Great Britain. Turbo-jets. To establish turbo-jets’ inherent reliability, the de Havilland Goblin 2 (3,100 lb. maximum sea-level static thrust) which had been previously subjected to a 500 hr. bench test simulating repeated fighter sorties, received a normal overhaul and ran a similar 500 hr. test. After a second overhaul, 210 hr. to the same schedule were achieved before minor failure. No thrust loss occurred throughout and only 61 man-hours’ maintenance was necessary. The Air Registration board’s civil approval was granted to Goblin 3 (3,350 lb.m.s.l.s.t.) and military version, Goblin 4 (3,500 lb.m.s.l.s.t.) was announced. Goblins continued to engine Vampires in many countries; including Vampire 6 ground attack fighter-bomber and the D.H.113 derivative, the first jet night-fighter.

Four Ghost 45 turbo-jets (5,000 lb.m.s.l.s.t.) contributed...

He also lectured at the Academy of International Law at The Hague and in 1930 was legal adviser to the U.S. ambassador to Cuba. From 1924 to 1944 he was assistant director of the Naval School of Military Government and Administration and at the same time lectured in a similar school for the army. He was assistant secretary general to the U.N.R.R.A. conference in 1943 and the U.N. Monetary and Finance conference at Bretton woods, New Hampshire, in 1944. On Jan. 3, 1948, President Truman appointed him deputy U.S. representative on the "little assembly" of the U.N. general assembly and in May appointed him deputy representative on the Security council. In Dec. 1948 he was granted the personal rank of ambassador. On Feb. 10, 1949, he was given a new position as ambassador-at-large for special assignment to international meetings requiring an experienced representative of high rank. He represented the United States in the initial discussions that led to the ending of the Soviet blockade of Berlin and was one of the United States advisers at the Council of Foreign Ministers in Paris in May and June. In July he was appointed to direct a review of U.S. diplomatic policy towards the far east. Jessup was a member of the U.S. delegation to the fourth general assembly which opened at Flushing Meadow, New York, on Sept. 20.

JET PROPULSION AND GAS TURBINES. During 1949 steady improvement in turbo-jets and turbo-props was made and new gas turbines for industrial purposes were put in hand.

Great Britain. Turbo-jets. To establish turbo-jets' inherent reliability, the de Havilland Goblin 2 (3,100 lb. maximum sea-level static thrust) which had been previously subjected to a 500 hr. bench test simulating repeated fighter sorties, received a normal overhaul and ran a similar 500 hr. test. After a second overhaul, 210 hr. to the same schedule were achieved before minor failure. No thrust loss occurred throughout and only 61 man-hours' maintenance was necessary. The Air Registration board's civil approval was granted to Goblin 3 (3,350 lb.m.s.l.s.t.) and military version, Goblin 4 (3,500 lb.m.s.l.s.t.) was announced. Goblins continued to engine Vampires in many countries; including Vampire 6 ground attack fighter-bomber and the D.H.113 derivative, the first jet night-fighter.

Four Ghost 45 turbo-jets (5,000 lb.m.s.l.s.t.) contributed
o the prototype of the de Havilland Comet, Britain's first jet-propelled passenger liner, predicted to cruise at 500 m.p.h. at 40,000 ft. and intended for trunk routes of Britain's airways corporations. On a test flight this aircraft flew from London airport to Castel Benito, Libya, just under 1,500 mi., in 3 hr. 23 min. and came back in 3 hr. 15 min. The round trip average of nearly 450 m.p.h. was 100 m.p.h. faster than the fastest air liner in service. Specific kerosene consumption of 1-06 lb. thrust/hr. was quoted and development to higher thrusts was pursued. The de Havilland fighter-bomber prototype, Venon, also mounted a Ghost engine. Sweden received licence to manufacture Ghosts additionally to Goblins.

The Rolls-Royce effort on centrifugal compressor turbojets was concentrated on the Tay, a double-sided impeller similar to the Nene (5,000 lb m.s.l. s.t.) and of same diameter out capable of passing 20% more air. Licence to build Tays, additionally to Nenes, was acquired by Pratt and Whitney of U.S.A. Nenes propelled the Vickers Supermarine 510 and Hawker P.1052, aerodynamically improved versions of Attacker and Sea Hawk, respectively. A novel Nene application was in a high speed flow aerodynamic research wind tunnel; air was drawn through the working section by simple suction and passed through sector action.

Derwent 5 (3,600 lb.m.s.l. s.t.) continued in Gloster Meteor variants. A specially equipped Meteor remained in flight 12 hr. by refuelling ten times and demonstrated the potentiality of jet fighters to maintain standing patrols or act as bomber escorts. A Derwent also powered the Avro 707 delta-wing research aeroplane. Belgium received licence to build Derwent 5s. Also under development by Rolls-Royce was an axial compressor type Avon, reported to be the world's most powerful turbo-jet. It was officially stated that an early variant delivered 6,000 lb. sea level static thrust. Avons powered Britain's first jet bomber, English Electric Canberra, of performance comparable with contemporary jet fighters. A special Avon-engined Meteor was stated to have climbed nearly 40,000 ft. in four minutes.

The Armstrong-Siddeley Adder (1,100 lb. m.s.l.s.t.), turbojet version of Mamba, approached flight stage. This firm disclosed the development of the Sapphire but published neither design nor performance details. A noteworthy extension to the jet propulsion principle, released after several years of development, was exhaust reheat, a method of thrust augmentation for turbo-jets for take-off, climb and combat purposes. Additional fuel injected into the exhaust stream was vaporized; combustion was initiated by a spark and supported by oxygen contained in the excess air which had been introduced into the engine to cool the combustion products to a temperature unharmful to turbine blades. Flame stabilizers within enlarged jet pipe promoted flow conditions necessary for efficient combustion. Use of variable area fan nozzle enabled engine operating conditions and reliability to remain unaltered. Full scale tests demonstrated sea level static thrust gains of 28%—48% at a cost of 24% loss of normal thrust with reheat equipment inoperative. The highest reheat combustion efficiency reported was 91% at 40% thrust augmentation with kerosene consumption of 6 lb./lb. thrust/hr. increase. In altitude flight thrust gains were considerably greater. Recognized disadvantages were high reheat fuel consumption, high temperature of reheated jet and mechanical complication of variable nozzle and additional weight.

De Havilland published details of their 5,000 lb. thrust Sprite rocket motor for take-off and emergency jet propulsion.

**Turbo-props.** The first turbo-prop in quantity manufacture was the Armstrong-Siddeley Python required for Westland Wyvern 2 torpedo-strike fighter for the Royal Navy. A Python was selected to type approval test at 4,110 maximum equivalent h.p. Armstrong-Siddeley's smaller turbo-prop was developed up to Mamba 2 (1,420 m.e.h.p.) which made initial flights in the Armstrong-Whitworth Apollo, Handley-Page Marathon 2 and converted Dakota civil aircraft. Tests started of the Double Mamba which consisted of two Mamba units, side-by-side, with their individual reduction gears replaced by independent gearing in a common casing, driving two co-axial propellers in opposite directions. It was found that one half engine could run whilst the other half and its related propeller remained stationary. Power output was 2,840 m.e.h.p. at sea level with kerosene consumption of 258 gal. per h.r. Net dry weight was 2,000 lb. In competition with Mamba, the Rolls-Royce Dart was type tested at 1,365 m.e.h.p. and developed towards higher powers for the Vickers Viscount. It was the first turbo-prop civil aeroplane granted the Air Registration Board's airworthiness certificate. Another combination of identical units was Napier's Coupled Nataid, designed to drive one centrally mounted counter-rotating variable pitch propeller through reduction gearing and clutches such that either unit could be stopped for fuel economy when cruising.

The Bristol Theseus completed type test at 2,500 m.e.h.p. and enabled the Handley-Page Hermes 5, a four-engined airliner prototype, to take preliminary flights. The Proteus, (3,500 m.e.h.p.), in single form, flew experimentally and the Coupled Proteus, for the Saunders-Roe Princess civil flying boat and second Brabazon airliner, ran initial tests.

Propeller control systems were under development to suit the starting and flight characteristics of turbo-props. Experiments with ducted fan gas turbines ceased. Among cartridge-operated gas turbine starters tested was the Plessey design with two 5 in. diameter contra-rotating turbines, rotated at 45,000 r.p.m. to drive the main engine rotor through reduction gearing and engagement clutch. Weight with two cartridges was 50 lb. and maximum energy output was 50,000 ft.lb. The relative merits of a wide range of aircraft turbine fuels were under practical examination. Aviation kerosene remained the normal flight fuel.

**Power-generating, Marine and Locomotive Gas Turbines.** Additional to the Gas Turbine Collaboration committee, inaugurated in 1941 to foster aero-gas turbines exclusively, the independent Industrial Gas Turbine Development committee was formed to encourage commercial gas turbines and to make recommendations to interested organizations and government departments. Employment of gas turbines to improve efficiencies of industrial plants, including blast furnaces, chemical production processes and oil-refining equipment was under active investigation by British industry.

For power-generation, Metropolitan-Vickers continued to operate their 2,000 kw. peak load experimental set and proceeded with the manufacture of a 15,000 kw. open cycle plant for Trafford park, Manchester, power station. Under construction was a 1,750 kw. continuous load set to run on natural gas and a 1,750 kw. oil fired stand-by set for the Metropolitan Water board. A set of equal power from Brush Electrical Engineering company and a 1,875 kw. set from English Electric were also ordered by the M.W.B. C. A. Parsons progressed with the construction of open cycle sets for the British Electricity authority and the National Gas Turbine establishment. Ruston and Hornsby ran an open cycle gas turbine intended for power generation at their own works. Designed as a general purpose long-life plant, it comprised a 13-stage axial compressor which supplied twin combustion chambers through a contra-flow tubular heat exchanger. A two-stage turbine drove the compressor and an independent two-stage power turbine rotated a 750 kw. alternator through 4:1 reduction gearing. When operated at 1,340°F. maximum gas temperature at 4:1 pressure ratio, designed maximum output was 1,070 b.h.p. Plant thermal
efficiency was estimated at 24% at full load and 18½% at 40% load. Without heat exchanger, maximum output was expected to be 1,250 b.h.p. with thermal efficiency of 17½%. Plant weight complete with alternator was 214½ tons. The 500 b.h.p. experimental open cycle set at John Brown’s completed under 1½ hr. running before conversion to the closed cycle system. The 12,000 kw. closed cycle plant for the North of Scotland Hydro-electric board was in manufacture but would not be operable before autumn 1950. The designed full load thermal efficiency was 32%. In design was a 700 kw. closed cycle continuous operation gas turbine for utilization of waste heat in exhaust gases from coal-gas retorts.

The Metropolitan-Vickers F.2 type experimental set in a motor gun-boat was the only marine gas turbine in use. It had completed over 400 hr. running. British Thomson-Houston proceeded with manufacture of a 1,200 s.h.p. open cycle marine set of 20% thermal efficiency for the tanker “Auris” and Rolls-Royce progressed with the main components for machinery to replace steam turbines of 8,000 s.h.p. in an escort vessel. The largest British marine set under construction was designed by English Electric to give 6,600 s.h.p. at 5,600 r.p.m. A marine auxiliary plant of 1,000 kw. was in design by W. H. Allen. Britain’s first locomotive gas turbine nearied completion at Metropolitan-Vickers. Of 2,700 h.p., it was designed to give a rated continuous tractive effort of 29,000 lb. Preliminary tests were expected early in 1950. Rover had on test an automobile gas turbine similar in lay-out to the earlier 100 h.p. unit but with a designed output of 200 h.p.

For industrial plants, experiments with fuels heavier than gas oil and diesel fuel were pursued and progress was made towards the satisfactory combustion of pulverized coal. Peat-burning experiments were initiated.

Commonwealth. In the Commonwealth, Canada continued tests of the Avro (Canada) Chinook (2,600 lb.m.s.l.s.t.) and announced the Orenda, a larger axial compressor type turbojet. No details were released. Cold climatic tests of aero-gas turbines, including anti-icing and de-icing methods, were continued by the National Research council in collaboration with British Ministry of Supply. The Avro (Canada) C.102 jetliner made preliminary flights powered with Rolls-Royce-built Derwent 5 turbojets. Australia built Nenes under licence for Australian-built Vampire fighters. (R. H. St.) France and Belgium, the building of aircraft gas turbine engines on the continent came from two countries, France and Sweden, notably the former. At an exhibition held in Paris, several French aircraft gas turbine engines were shown. The larger engines, all of single shaft design, incorporated axial flow compressors designed for a pressure ratio of approximately 4:1. Both propeller and pure jet types were included; the outputs of the former ranged from 1,450 h.p. to 3,000 h.p., and of the latter type the thrusts were of the order of 4,800 lb. with specific fuel consumptions of between 1-1 and 1-2 lb. per hr. per lb. thrust, all these figures referring to take-off conditions. The organizations exhibiting such engines included the Société Nationale d’Étude et de Construction de Moteurs d’Aviation, and the Société de Constructions et d’Equipements Mécaniques pour l’Aviation. The Société Rateau was developing a jet engine of some 2,900 lb. take-off thrust, in which a proportion of the total air-flow, after some compression, by-passed the main components and mixed with the hot exhaust formed from the remaining air-flow. At the exhibition the firm of Turbomeca showed a small engine, incorporating a centrifugal compressor and delivering 140 h.p. A jet version of the same engine was also displayed.

News of two Swedish jet engines was made known, one comprising a two-stage centrifugal compressor, annular combustion chamber and four-stage turbine, the other being of the axial flow compressor type.

So far as marine, locomotive and stationary plants were concerned, reported progress was mostly confined to Swiss firms. The Brown-Boveri gas turbine locomotive was in regular scheduled service, and up to the middle of the year, the firm’s 13,000 kw. and 27,000 kw. double-compound power generating sets installed at Bernau completed 3,000 hr. and 500 hr. running respectively. The same firm began manufacture on two simple sets of 4,000 kw. output for southern Persia, intended to burn natural gas. Of the 1,000 kw. set, built by Maschinenfabrik Oerlikon, various grades of fuel were tried, including a very heavy rec. fuel, and it was reported that the ash deposits had not proved troublesome. Erection had started on the Escher-Wyss 12,500 kw. double-compound closed cycle power generating set for Paris. The semi-closed cycle engine of 7,500 h.p. intended primarily for marine use and built by Sulzer Brothers underwent trials, and construction proceeded on a similar engine of 20,000 kw. output for power generation in Switzerland.

From Denmark came news of the designing of a marine gas turbine engine of approximately 3,000 h.p., working to an open cycle. The high pressure portion of this engine was built and was ready for testing in July. Some firms in Holland collaborated in the building of an experimental marine gas turbine engine of 2,500 h.p.

United States. In the U.S. few new aircraft gas turbine engines were announced during the year, and the development of existing types continued. The firm of Pratt and Whitney, engaged on their production model of the British Nene engine developed it to pass a 150 hr. qualification test. The latest engine reported in the Westinghouse 24C series was rated at a take-off thrust of 3,200 lb. In addition to their simple jet engines, the Allison division of the General Motors corporation was reported to be developing a twin propeller turbine engine of some 5,500 h.p. take-off rating and incorporating axial flow compressors. With other organizations, development of existing propeller and simple jet engines proceeded, and in the aircraft field emphasis appeared to be laid on the axial compressor type of engine. The small engine of the Boeing corporation, rated between 100 h.p. and 200 h.p. and incorporating a centrifugal compressor, still, however, commanded interest.

Research in the U.S. on gas turbine engines was given prominence and subjects singled out for special mention included investigations into the fundamental processes of combustion, experiments in after-burning and water-alcohol injection for thrust boosting of jet engines, research on the heat-resisting-strength properties of mixtures of ceramics and metals, and on turbine blade cooling.

Work on ram jets was prosecuted vigorously and it appeared that most of the experimental work was carried out with ram jets of 20 in. diameter, but larger ones were reported probable. A test vehicle powered by a 20 in. ram jet attained a flight Mach number of 2.7.

In the marine, locomotive and power generating fields, reported progress was continued mostly to plants designed for locomotive use. The General Electric company’s 4,800 h.p. locomotive engine successfully continued its test running and underwent its first public track run in June. Tests were carried out on this engine using a heavy residual fuel and mention was made of a possible conversion to pulverised coal-burning. Some details were given of the Westinghouse and Elliot engines, both gas turbine-electric, the former of 2,000 h.p. output employing a simple cycle with a multi-stage axial flow compressor and turbine. The output of the latter engine was given as 3,750 h.p. employing a single shaft design with a two-stage centrifugal compressor. Mention was made of the Allis-Chalmers 4,100 h.p. locomotive engine, again of the gas turbine-electric type with the prime mover working on a simple heat exchange cycle. This engine was eventually

Current census figures of the Jewish population of the countries of the world were practically non-existent. The table is based upon the most reliable information available; but it must be emphasized that the figures are estimates only.

The total Jewish population of the world was thus something over 11 million, compared with a little under 17 million in 1939. The striking fall in numbers, in a world in which the population as a whole had increased rapidly, was due almost entirely to the slaughter of some six million Jews by the Germans during World War II.

Apart from the movement towards Israel, mentioned above, there was also a not inconsiderable migration of Jews from Europe to North and South America and Australia. A large proportion of these immigrants had been displaced persons who had been living under the care of the U.N. International Refugee organization (see REFUGEES) which had sponsored their transfer to various countries of settlement. When the state of Israel was established there were over 146,000 Jews who were being looked after by the I.R.O., but by the end of 1949 the main problem of Jewish displaced persons in Europe had been solved—for the gates of Israel had been opened wide to receive all Jews who could make the journey. In general, the exodus would have been far greater if freedom of movement had not been denied to the Jews in the Soviet-dominated countries and in certain Arab countries, notably Iraq and Egypt, but from all these small numbers made their way surreptitiously either to western Europe or to Israel.

(J. D. K.)

JOHANNESBURG. The largest city and biggest industrial, commercial and gold mining centre in the Union of South Africa, Johannesburg also ranked as second largest hub of population in the African continent. Area: 89-6 sq. mi., one of the biggest in the Commonwealth of Nations under the control of one local authority. Pop. (June 30, 1949, est.): 839,154 including 343,192 Europeans, 452,310 Natives, 16,802 Asians and 26,850 Euro-Africans. The total value of land and buildings was estimated (1949-50) at £217 million.

Although progress was made during 1949, it was considerably hampered by financial stringency. At the request of the Union government the city council pruned estimates of capital expenditure drastically. Approved building plans were also much reduced. Although 57,000 Native dwellings were needed, the municipality, necessarily, stopped all housing developments, except those for which commitments had already been made. In November the city floated a new loan of £3 million at 34%.

During the year S. P. Lee was mayor, being succeeded in November by J. Mincer. The city council contained 33 representatives of the United party, three Labour members, one Independent and five Nationalists. The first two freemen of the city were elected during 1949. In November the council invited Field Marshal J. C. Smuts to become a freeman in 1950. The city was seeking a charter to give it greater powers within its own boundaries.

Including the public library and the municipal art gallery, the cultural assets of the city were estimated to be worth £750,000.

(W. R. GN.)

JORDAN, HASHMITE KINGDOM OF THE. Independent Arab kingdom of the middle east bounded by Israel (west), Syria (north), Iraq (east) and Saudi Arabia (southeast and south). Area (excluding Arab Palestine): 34,750 sq. mi. Pop. (est. 1947): 400,000. Capital: Amman (pop. 60,000). Arab Palestine, which was occupied by Jordanian troops, covers approximately an area of 5,000 sq. mi., with a population of about one million. Languages (former Transjordan): Arabic 97%, Circassian 2-5%.

NOTE: In each of the following countries the Jewish population was estimated to number less than 1,000: Albania, Burma, Dominican Republic, Dutch Guiana, Guatemala, Kenya, Luxembourg, Northern Rhodesia, Pakistan and Panama.

Including 10,000 refugees.

1 This is the figure given by Dr. J. Faitlowitch, executive director of the American Pro-Palestine committee.

2 Including about 10,000 refugees.

3 This is the figure which was given in the American-Jewish Year Book 1947-48 and was generally accepted as authoritative although the comparable figure in the American-Jewish Year Book 1948-49 was 4,500,000.
Religions (former Transjordan): Moslem 91% (chiefly Sunni); Christian 8.5% (chiefly Arab-speaking Greek Orthodox). King, Abdullah Ibn Hussein (q.v.); prime minister, Tawfiq Pasha Abulhuda.

History. Transjordan was accorded diplomatic recognition by the United States on Jan. 31, 1949. The government announced on June 2 that Transjordan had changed its name to the Hashemite Kingdom of the Jordan and that foreign missions in Amman and the U.N. had been asked to use the new style in all correspondence and documents.

On Jan. 8 it was announced that in response to a request from the government under the Anglo-Transjordan treaty of March 15, 1948, a British force had been sent to Aqaba. The government early in March informed the British minister that Israeli forces moving southward to the gulf of Aqaba had penetrated Jordanian territory at one point and were withdrawn, and on March 12 reinforcements arrived for the British detachment at Aqaba. In March it became known that the British subsidy for the Arab Legion had been increased from £2 million to £3 million. On May 4 it was announced that an interest-free loan of £1 million had been granted by Britain for development work in connection with the repatriation of refugees.

A cease-fire agreement with Israel was signed at Rhodes on March 11, and an armistice agreement on April 3. The terms provided that the Arabs should retain the territory then held except that control of the Hadera-Afula road and the Lydda-Haifa railway line (except at Tulkarm) should pass to the Israelis. Partially demilitarized zones were to be established along the demarcation lines. By agreement with the Iraqi and Egyptian governments, Jordan in April took over the occupation and administration of the Jenin-Tulkarm and Hebron-Bethlehem areas which had hitherto been Iraqi and Egyptian zones of occupation respectively. The de facto accession to the territory of Jordan of those parts of Palestine occupied by its troops, which had been anticipated by the kingdom's change of name, did not receive formal recognition from any power during the year. The government was reshuffled on May 3, the Foreign Ministry and two other ministries being given to Palestinians. On April 26 three Palestinian Arabs and a Jordanian were sentenced to death for conspiring against the life of the King.

King Abdullah on April 10 issued a statement on the coup d'état in Syria (q.v.) which said that Jordan's policy was one of co-operation with Syria until the Arab states had expressed their verdict on the Greater Syria and Arab unity moves impelled by events in Palestine. Despite the hostile statements of Husni ez-Zaim, Ruhi Bey Abulhadi was sent to Damascus on May 20 on a good-will mission. At the army day parade on May 24, at which Syria, Lebanon, and Iraq were represented, the King reviewing the Arab Legion called on them to "follow the tradition of the first Moslem armies and regain their glory . . . by implementing the fundamentals of the last revolt . . . . General Arab unity must follow." Jordan was one of the states which, by a demarcation agreement (on Aug 20) the Syrian government of Hashem Bey Alassi, to whom the King telegraphed his congratulations on Aug. 15.

The King visited Tehran on July 28 and on Aug, 7 it was announced that agreement had been reached between Persia and Jordan for a treaty of friendship and collaboration. On Aug. 18 he arrived in Britain as a guest of the government. He was accompanied by his son, Prince Naif. The prime minister was also in London at the same time, having arrived in July; so was the British minister, Sir Alec Kirkbride. King Abdullah visited Spain on his way home.

On Aug. 26 the Jordanian minister in London announced that a firm of British irrigation engineers had been employed to make the best use of the water available to the kingdom from the Jordan and Yarmuk rivers, and were now engaged in drafting practical schemes of irrigation for the Jordan valley in so far as it lies within the kingdom of the Jordan. Press reports said that it was planned to irrigate 75,000 acres at a cost of some £10 million. A law was enacted in September to replace the Palestine currency which had hitherto been legal tender with a new currency administered by a Jordan Currency Board in London.

JUDAISM. The chief problem in 1949 was the continuing restoration of Jewish religious life in countries where it had been destroyed under the German occupation. In Germany, Jewish religious life went on consolidating itself, notwithstanding much active resentment among former nazis, which was expressed in the desecration of synagogues and Jewish cemeteries. In 1949 there were about 20,000 Jews in Germany, organized in nearly 100 Jewish communities. Although a few former German rabbis had returned from England and America there was a severe shortage of qualified rabbis. A noteworthy event was the issue of messages of good wishes to the Jews in Germany by the president of the republic of West Germany, Dr. Theodor Heuss, and by the chancellor, Dr. Konrad Adenauer. Symbolic too was the publication in 1949 of 1,050 copies of the Babylonian Talmud, printed in Heidelberg, the first copies of the Talmud printed on German soil since Hitler had thousands of copies of the Talmud burned on the bonfires of books.

In Poland, which before World War II had the largest Jewish community in Europe, over 3,500,000 members, there were in 1949 less than 90,000 Jews. There were 70 organized Jewish religious communities under the Vaad Hakehilloth, which provides for the maintenance of the synagogues, Jewish religious schools, Kosher slaughter houses, cemeteries, etc. There were complaints of interference by the Communist-dominated Jewish central committee, especially in education. The Polish government promised to grant the Jewish religious communities complete autonomy and independence from the Jewish Central committee. A great difficulty in Poland as in Germany was the shortage of qualified rabbis and teachers, and the Vaad Hakehiloth opened special courses for training them. There was much uncertainty during 1949 about the right of Jews in the Soviet Union to observe their religion and to provide Jewish religious instruction for their young. Similar uncertainty existed in Czechoslovakia, Hungary and other eastern European countries.

The Jewish communities of France, Belgium and Holland re-established themselves almost on prewar lines, and there was much religious activity and expansion among them. France particularly was becoming a centre of revived Jewish religious and cultural life.

Much attention was paid during 1949 to Jewish religious development in the state of Israel. It was noted with satisfaction that the synagogues were crowded on the New Year and Day of Atonenment, and that the prime minister, David Ben-Gurion, and members of his cabinet attended the
synagogue services. There was some talk of a revival of the Sanhedrin, a world-wide authoritative rabbinical body, centred in Israel. The idea was opposed, however, by most orthodox rabbis throughout the world, on the ground that Jewish tradition was against such centralization.

In the United States of America, with the largest Jewish community in the world, there was an increasing Jewish religious interest and efforts were made to bring into the synagogues the large numbers of "unaffiliated Jews."

In Great Britain a few rabbis and ministers accepted the opportunities offered them by the rich and expanding Jewish community of South Africa. Some sections of Anglo-Jewry complained of South Africa's drain upon the Anglo-Jewish ministry, but others saw it as a natural strengthening of the ties between the Jewish communities of the homeland and of the dominion. The chief rabbi, Israel Brodie, who conducted a pastoral tour during the year to the smaller communities in the British Isles, to strengthen their religious life and their contacts with larger communities.

An item of interest was the appointment of Rabbi Solomon Gaon as Haham of the Spanish and Portuguese congregation, the original Jewish community in the United Kingdom. It was the first appointment to this ancient office since the Haham Dr. Moses Gaster retired in 1918. (J. LWH.)

**JUDICIARY, BRITISH.** The principal changes during 1949 in the composition of the English judiciary followed the deaths, within three days of each other, of two of the lords of appeal in ordinary, namely Lords Uthwatt and du Parcq (see OBITUARIES). The former became a judge of that division in 1941 and was elevated to the House of Lords in 1946. Lord du Parcq had become a judge of the King's Bench division in 1932, was raised to the Court of Appeal as a lord justice in 1938 and like Lord Uthwatt was elevated to the Lords in 1946.

These two vacancies in the House of Lords led to a widespread re-shuffle of judicial appointments. Lord Greene, whose health had not been good and whose duties as master of the rolls and ex-officio president of the Court of Appeal involved a good deal of administrative work, exchanged that post for appointment as a lord of appeal. The other of the two vacancies in the supreme tribunal was filled by the promotion direct from the Chancery Bar of Sir Cyril Radcliffe, K.C., who served in the war as director general of the Ministry of Information. Thus two Chancery lawyers now held places formerly filled by one Chancery and one Common lawyer.

Lord Justice Evershed was promoted to be master of the rolls at the early age of 49, which post he combined with the chairmanship of the Committee on the Practice and Procedure of the Supreme Court. Mr. Justice Jenkins was promoted from the Chancery division to the vacant place in the Court of Appeal, and H. O. Danckwerts was raised to the bench in his stead.

In Scotland H. W. Guthrie, K.C., became a senator of the College of Justice, and Lord Thomson, the lord justice-clerk, became chairman of the Central Advisory committee set up by the lord chancellor to make recommendations for the appointment of justices. In July, Lord Moncrieff, a former lord justice clerk, died (see OBITUARIES) (W. T. WS.)

**JUDICIARY, U.S.** The Supreme Court suffered the loss of two of its members during 1949—Associate Justice Frank Murphy who died on July 19 and Associate Justice Wiley B. Rutledge who died on Sept. 10. They had served since 1940 and 1943 respectively.

President Truman appointed Thomas C. Clark, of Texas, the then attorney general of the United States, and Sherman Minton, of Indiana, a judge of the United States court of appeals for the 7th circuit and formerly a United States senator, to succeed Justice Murphy and Justice Rutledge.

During the 1948 term 1,434 cases were disposed of, a record only exceeded by the 1,520 in the 1946 term. In the opinion of the court, 90% of the cases did not merit disposition by full opinion, as was indicated by the fact that only 147 cases were covered by the 114 signed opinions rendered. Ninety dissenting opinions were written and 35 decisions were carried by a vote of 5 to 4. In addition there were 36 concurring and separate opinions. As at the preceding term the government was a party to slightly more than 50% of the cases decided by written opinion, approximately 70% being in its favour.

The United States Supreme Court was composed at the end of 1949 of the following members (dates indicate year appointment was confirmed by the senate): chief justice. Frederick M. Vinson (1946); associate justices, Hugo L. Black (1937), Stanley F. Reed (1938), Felix Frankfurter (1939), William O. Douglas (1939), Robert H. Jackson (1941), Harold H. Burton (1945), Thomas C. Clark (1949) and Sherman Minton (1949). (H. B. WY.)

**JUGOSLAVIA:** see YUGOSLAVIA.

**JUTE.** Realizing that manufacturing costs in the industry were appreciably increased by the jute tribunal award late in 1948, the Indian mill owners hoped to offset this disadvantage eventually by increased production; but early in Jan. 1949, they saw that, because of the short supply of raw jute, they would have difficulty in operating at full capacity for the remainder of the 1948-49 jute year. After long discussion, it was decided to curtail output during the second half of 1949 by closing the mills for one full working week in every month from July. Receipts of raw jute by the mills during the period July-Sept. 1949 had declined to 38% of normal purchase and production by 53%, resulting in a reduction in stocks by the middle of September to only 642,000 bales, representing slightly over one month's normal work (500,000 bales) and thus the mills had no basis for forward trading on which they depend.

By working normally, the jute mills would have consumed 1,250,000 bales of raw jute whereas, by working shortened hours, consumption would only be 1,050,000 bales, thus saving 200,000 bales without losing export trade. During the closed week all workers received involuntary unemployment benefits amounting to half normal earnings plus Rs. 2 a week food concession and festival holidays with pay.

Restriction of production and other measures taken by India, including an increase of 100% in the export tax on raw jute shipments from Calcutta, the banning of raw jute exports and a rigid reinstatement of the export quota system on jute goods to hard currency areas, strengthened the price structure of jute goods; India further ensured the safety of her export markets by putting a control on selling prices of finished goods and allowing brokers and merchants a minimum of 5% profit.

Fresh problems were created for the jute industry by the devaluation of the pound, followed by the Indian rupee but not by the Pakistani rupee. The result was that jute mills outside the dollar areas paid more for raw jute whilst trying to furnish finished goods to hard currency areas at lower prices. Dundee, the largest manufacturing centre after Calcutta, also suffered from Pakistan's decision not to devalue. A steadily improved supply situation in Great Britain during the earlier months of 1949 had enabled the restriction on raw jute consumption, which had automatically controlled working hours in the spinning and manufacturing centres, to be relaxed, and a reduction in prices of Dundee yarns and manufactures was also about to come into force, when Pakistan
decided not to devalue and the Board of Trade immediately revoked its new schedule of prices. Stocks of raw jute held in Great Britain were estimated to be sufficient to last for seven months at the restricted consumption rate and, in order to make supplies last even longer, a further restriction on production was forecast.

These moves by India and Dundee were aimed against Pakistan, since no raw jute was being bought, in the hope that Pakistani growers would be forced to sell at prices more favourable to manufacturers. The Pakistani government, however, fixed a minimum price at which raw jute could be sold which, although comparing favourably with prices quoted in 1948 for the hard currency areas, was much higher for the sterling areas and was consequently unacceptable.

The longer India and Dundee could hold out without purchasing raw jute from Pakistan the better their chances of forcing Pakistan to revise its prices or else to devalue its currency. But compromise was probable since, even with Pakistan's best forecast of 5.5 million bales and India's 2.9 million bales, there was still a shortage of 1.6 million bales on the minimum of 10 million bales of raw jute required to bring down prices.

Important British exports such as carpets and jute and commodities packed and baled in jute might be hindered if the Dundee industry became short of raw material; and India, the greatest importing and consuming country, exporting to the U.S. over $150 million worth of jute goods annually, feared that, unless Pakistan reduced its raw jute prices, jute goods might prove themselves out of the dollar markets where alternative packing materials were available (G H S.).

**JUVENILE DELINQUENCY.** Indications that the peak of juvenile delinquency was not reached in 1948 was borne out by figures published in Great Britain in 1949 and study of figures in Germany and the U.S.A. revealed similar trends. The plight of European economy, the breakdown of currency and the disintegration of family life owing to mass migration remained contributory causes. Despite the efforts of governments, the International Refugee organization and other bodies, adolescent flotsam and jetsam of World War II was still stealing, begging, wandering and often resorting to violence and depravity. Even in countries saved from the worst ravages of war juvenile delinquents of 1949 were those affected by the adverse factors of war during their most formative years.

In Great Britain, Appendix 2 of Criminal statistics, 1947, revealed an alarming increase in the number of youthful offenders over the years 1938-48 as is shown in the table.

A disquieting aspect of the steadily rising figures was the more serious and adult nature of crimes committed.

1949 was notable for attempts to focus public attention on juvenile delinquency and to secure support for both preventive and reformative measures. Three of the most notable of these efforts were:

2. In Holland the scheme of opening short term camp schools for delinquents or potential delinquents was extended to include 28 camps under the control of the extra scholastic education department of the Ministry of Education.

3. In Great Britain conferences were held at national and local levels. At the first of these the home secretary and the minister of education met representatives of the churches, local authorities, magistracy, teachers and voluntary organizations. Attention was drawn to the steep rise in the figures in the first part of 1948 as against the same period in 1947. Bad housing, lack of recreational facilities, lack of parental control and breakdown of family life were regarded as causes secondary to growing materialism and a decline in religious standards. Psychological investigations and research as envisaged in the Criminal Justice act, 1948, (Section 77) were discussed and a conference on the scientific study of juvenile delinquency was called by the relevant bodies. Recognition that the funds and buildings necessary for the full implementation of the Criminal Justice act were not readily forthcoming affected these deliberations. There was a resultant sharpening of that constant dichotomy of viewpoint on crime, punishment versus re-education. A demand for scientific research and treatment was countered by a hardening of opinion concerning the alleged leniency of magistrates and a demand for increased severity.

Increased publicity seemed to result in widespread concern, acceptance of the need for scientific investigation and growing disillusionment to dismiss juvenile delinquency as merely evidence of either psychological disorder or an inevitable evil of post war society.

**JUVENILE EMPLOYMENT.** The important Employment and Training act of 1948 was not passed until the closing stages of the summer session of that year; most of the business of bringing it into operation had therefore to be done during 1949. In consequence 1949 was essentially a period of adjustment and reconstruction. The new National Employment council was put into its stride, as were the Scottish and Welsh Advisory committees. Local education authorities were preparing and submitting their schemes under the act, and it was gratifying to note that many local authorities that hitherto not accepted responsibility for a juvenile employment service now elected to do so. Many of them studied the methods employed by those local authorities who had long been administering this service, with a view to taking advantage of their experience. Among the various changes and adjustments there was one of nomenclature; in accordance with the terminology prescribed in the act, the old expression "juvenile" was discarded and the service became known as the youth employment service.

When the act was passed the Ministry of Labour issued a development leaflet in which it summarized the aims of the youth employment service as follows: (a) to suggest types of employment to individual boys and girls that would provide the best opportunities for their capacities and interests; (b) to help them to find suitable openings; and (c) to keep in touch with them until they reached the age of 18. In the well established services this work was being done in many ways and with an agreeable absence of formality. The counter, aptly described in the *Ince report* as "a psychological barrier" lost its significance; and the relationship between adviser and applicant became intimate and human.

Although the act vested the minister of labour with substantial powers and provided, through the National Youth Employment council, for central planning and co-ordination, it operated locally through youth employment committees; and the function of the service was essentially advisory with
vocational guidance as its lynch-pin. Before World War II
the dominating consideration in the juvenile employment ser-
vice was "finding jobs," but when the prewar figure of
70,000 insured unemployed juveniles dropped to 7,000, the
two crucial questions became those of guidance to the school-
leaver selecting his employment and of helping hard-pressed
industries to solve their labour problems. The needs of
industry were to some extent met by the important provisions
for training included in the act, and industrialists themselves
were releasing more young workers every year for part-time
technical education. It became more generally recognized
that, if full employment continued, there would be a scarcity of
juvenile labour for several years; and industry, guided by
working party reports, faced up to the problem of how to
make the best of the limited supply available. (W. O. L. S.)

United States. According to monthly estimates of the
U.S. Bureau of the Census, 1,970,000 14- to 17-year-old boys
and girls were employed full-time or part-time in April
1949. This was only a very slight decrease from the number
in April 1948 (2,040,000). During school months in 1949
one out of every four boys and girls in the United States
in this age group was employed.

Important amendments passed by Congress in 1949 to the
1938 child labour provisions of the Fair Labour Standards
act—the Wage and Hour law—broadened them to protect
children in the transport, communications and other
interstate industries, and gave children employed in agricultural
jobs the law's full protection during school hours for the
district in which the child was living while he worked. For
the first time an effective bar against agricultural employ-
ment which competed with schooling became possible.

Maine, Tennessee and Alaska materially strengthened their
juvenile employment standards during 1949, so that 22 states,
together with Puerto Rico and Alaska, now had a basic
16-year minimum age for employment. Tennessee set a
minimum age for employment at any time in any manufact-
uring or mechanical establishment and in bowling alleys,
and raised from 14 to 16 the minimum age for employment
during school hours in any gainful employment except
agricultural or domestic work. Maine set 16 as the minimum
for employment at any time in any manufacturing or mechani-
establishment and in bowling alleys, hotels and places of
amusement. It retained 15 as the minimum for any work
during school hours and set a minimum of 15 for employ-
ment at any time in stores and in catering establishments.
Both states improved provisions with regard to the 18-year
minimum age for hazardous occupations and hours of work
standards. The new Alaska juvenile employment law
established a 14-year minimum age for general employment
outside school hours and, under authority of the act, the
commissioner of labour set a minimum age of 16 in a number
of occupations and a minimum of 18 for a considerable
number of hazardous occupations.

KARDELJ, EDWARD, Yugoslav politician
(b. Ljubljana, Slovenia, Jan. 27, 1910). A teacher by pro-
fession, he was imprisoned for Communist activities from
1930-32. Upon release he fled to Moscow and from 1934-37
was professor of the history of the Communist movement
at the University of Sverdlovsk (formerly Ekaterinburg).
He returned to Yugoslavia before World War II and in
the summer of 1941 helped to organize partisan resistance
in Slovenia. In Nov. 1943 he was elected first vice president
of the A.V.N.O.J. (Anti-Fascist Council of National Liberation
of Yugoslavia). On March 7, 1945, he entered Tito's govern-
ment as deputy prime minister and minister for the
Constituent Assembly. He was also member of the executive
committee of the People's Front of Yugoslavia and of the
Politburo of the Yugoslav Communist party. At the end of
Sept. 1947 he attended the meeting at Wilczë Gora, Poland,
at which the Cominform was set up. On June 28, 1948, he
was denounced by the Cominform but on Aug. 31 Tito
appointed him foreign minister. He led the Yugoslav dele-
gation to the 4th general assembly of the United Nations
which, on Oct. 20, 1949, elected Yugoslavia as a non-
permanent member of the Security council.

KAYE, DANNY (DAVID DANIEL KOMINSKY), U.S.
talent (b. Brooklyn, New York, Jan. 18, 1913). At the
age of ten he had acquired a facility at entertainment,
especially through his expressive hands, his "mugging"
(face-making) and his adoption of a peculiar half-singing,
half-reciting style that eventually came to be known as
"git-gat-gittle."

He attended a high school in New York and then became
an entertainer at a summer camp in the Catskills near New
York city. At the end of four seasons at the camp, punctuated
by winters during which he vainly sought theatrical work
on Broadway, he joined a dancing team in vaudeville and
was booked on a tour of Asia. On his return to the U.S.
he spent some time as a night club entertainer, then was
invited to a summer camp for actors near Stroudsburg,
Pennsylvania, where he and Sylvia Fine (whom he married
in 1940) developed his stage routines into Straw Hat Revue
which moved to Broadway for a successful run. He began
to star in night clubs and on the stage, among his featured
tales being those in Lady in the Dark (1941) and Let's Face It.
He won even greater fame in films such as The Kid from
Brooklyn and The Secret Lives of Walter Mitty.

Kaye made his first appearance in Britain, almost
unnoticed, in 1938. In both 1948 and 1949, however, he made
successful tours of the United Kingdom. In 1948 he took
part in a command performance; in 1949 his six-week run
in London was sold out before it began.

KELLY, SIR DAVID VICTOR, British diplomat
(b. Sept. 14, 1891), was educated at St. Paul's school and at
Magdalen college, Oxford. He served in France during
World War I and in 1919 entered the diplomatic service,
subsequently serving in Buenos Aires, Lisbon, Mexico city,
Brussels and Stockholm. After a period at the foreign office,
1931-34, he was in Cairo, 1934-38. In 1940 he was appointed
minister to Switzerland and on Jan. 1, 1942, was promoted ambassador to Argentina. In May 1946 he was transferred to Turkey and in 1949 succeeded Sir Maurice Peterson as ambassador to the Soviet Union. He arrived in Moscow on June 24 and on June 30 presented his letters of credence to Nikolay Shvernik, chairman of the praesidium of the Supreme Soviet. He was received by Joseph Stalin on July 18.

KENYA: see British East Africa.

KHURI, BISHARA KHALIL EL, Lebanese statesman (b. Rishmaya, Lebanon, 1890?), member of an ancient family of Christian (Maronite) Arabs, studied law at the French university at Beirut. (For his early career see Britannica Book of the Year 1949.)

On Sept. 21, 1943, he was elected president of the republic. On May 27, 1948, he was re-elected for a further six years, as from Oct. 1949, when his first term would have expired. On Sept. 21, 1949, he was sworn in for his second term. Speaking in Beirut on Oct. 1, he said in his second inaugural address that the Lebanon would endeavour to effect union among Arabs and would continue her adherence to the Arab League covenant. On the same day five opposition parties published a declaration that they considered President Khuri's second term "illegal."

KIM IR SUNG (Kim Il-song), Korean Communist leader (b. near Pyongyang, 1913). Born as Kim Sing-choo, during World War II he adopted the name of a famous guerilla leader who was supposed to have died in action. Until 1945 he was at Yanan, seat of the Chinese Communist government, as secretary general of the Korean Communist party. After the occupation of northern Korea by the Soviet army he moved to Pyongyang where on Sept. 6, 1945, he was instrumental in proclaiming a people's republic. For the time being the Soviet authorities recognized his government only as the Korean People's Interim committee. Three years later, however, when the formation of a central Korean government under Communist control appeared remote, "elections" of a Supreme People's Assembly were held in northern Korea and a government of the Korean people's republic, with Kim Ir Sung as prime minister, was formed on Sept. 2, 1948. On March 17, 1949, in Moscow, he signed with Andrey Vyshinsky a 10-year agreement for economic and cultural co-operation.

KOLAROV, VASIL, Bulgarian politician (b. Shumen, Bulgaria, July 16, 1877), teacher by profession, joined the Bulgarian Social Democratic party in 1897 and six years later was one of the organizers of its "narrow" or revolutionary wing. In 1913 he was elected deputy to the Bulgarian Sobranie, and again in 1920. When in 1919 the "narrow" Social Democrats re-organized themselves as the Bulgarian Workers' (Communist) party (Bulgarska Rabotnickata Partia), he became its secretary general. He attended all the Communist congresses from 1920, two years later was elected a member of the executive committee and in 1926 became secretary general. In Sept. 1923 he was sent by the Kremlin to Bulgaria to organize with Gheorghi Dimitrov (see Obituaries) an uprising which, however, failed; escaping to Moscow, he remained there for more than two decades, becoming a Soviet citizen. He returned to Bulgaria in Sept. 1945. He was a member of both Sobranies elected in Nov. 1945 and Oct. 1946. As provisional president of the republic (Sept. 1946-Dec. 1947), in Nov. 1946 he appointed his old friend Dimitrov prime minister, and in Dec. 1947 assumed the duties of minister of foreign affairs in the second Dimitrov cabinet. When Dimitrov died on July 2, 1949, Kolarov was neither among the few prominent Communists who went to Moscow to bring the body back to Sofia nor did he attend the burial ceremonies in the Bulgarian capital. On July 20 the Sobranye unanimously elected him prime minister and foreign minister but he was not present. On Aug. 6 the cabinet was reconstituted and Vladimir Poptomov succeeded Kolarov as foreign minister.

KOREA. A peninsula extending from Manchuria southward 600 mi. between the Yellow sea and the Sea of Japan; for 11 mi. it borders the U.S.S.R.; the rest of the boundary is with Manchuria. Total area: 85,225 sq. mi. Total pop. (1949 est.): 29,238,600. The 38th parallel N., chosen in 1945 to separate Soviet and U.S. forces accepting the surrender of Japanese troops, remained as the artificial but rigid division between Korean governments organized in each zone. The south has 44% of the area, but its population (Sept. 1949 est.) of 20,188,600 was more than twice that of the north (1949 est.: 9,050,000). Chief towns in the south (pop., May 1949 est.): Kyongsong or Seoul (cap., 1,446,049); Pusan (473,619); Taegu (313,705); Inchon (265,767). In the north: Pyongyang, the northern capital (pop., 1949 est., 450,000). Religions: Buddhism, Confucianism and a unique eclectic religion Chondo-kyo; in 1938 there were 500,000 Korean Christians. South Korea: president of the republic, Dr. Syngman Rhee (q.v.); prime minister, Lee Bun Suk. North Korea: chairman of the presidium of the Supreme People's assembly, Kim Du Bon; prime minister, Kim Ir Sung (q.v.).

History. During the year Korea continued to be a divided land. The 38th parallel, the boundary between the U.S.-aided Republic of Korea in the south and the Soviet-sponsored Democratic People's Republic of Korea in the north, was the scene of numerous border skirmishes. On Jan. 1, President Harry S. Truman announced formal recognition of the Republic of Korea by the United States; on Jan. 30 the first ambassador from the northern regime was received in the U.S.S.R. Both republics claimed suzerainty over all of Korea. The year was marked by solidification of the internal positions of each in their zones.

The Republic of Korea in the south, which is called Tai Han Min Guk (Great Han People's Country), had a tumultuous year. The National Assembly, for example, adopted on June 2 a resolution calling for dismissal of the entire cabinet; later five members of the assembly, who filed a petition with the U.N. Commission on Korea, were arrested on the order of President Syngman Rhee. Problems of local security made officials fearful and the police, organized on a national basis, were given wide powers which they exercised on occasion very harshly. A Korean army officer assassinated Kim Koo, former president of the Korean provisional government, a rightist who bitterly opposed the division of the country. Sporadic outbreaks occurred, possibly under instigation from organizers from the north, but these were quickly quelled. An important forward step was taken when an administration-sponsored land reform programme was enacted; this would enable over a million farmers to purchase their land from Korean landlords, following a pattern established by the American military authorities in distributing former Japanese-owned land. President Rhee, after a conference with Generalissimo Chiang Kai-shek (q.v.) on Aug. 7-8, issued an appeal for a Pacific pact for security purposes but it had lukewarm reception.

The U.S. army, which had occupied southern Korea after the surrender of Japan, was withdrawn during the first half of the year, the last troops embarking in July. Under treaty provisions a small group of 500 U.S. army officers and men remained to aid in the training of Korean security forces. American economic aid continued on a large scale and with strict American supervision. An E.C.A. programme calling
It called for an increase in agricultural land sown, building of irrigation works, increase in grain production and in livestock.

The whole pattern of developments during 1949 thus showed a further widening of the cleavages between north and south Korea. The situation, especially along the 38th parallel, was grave. Both regimes were being bolstered by outside aid. Troops in the north were estimated at 200,000 men, and in the north the Korean constabulary numbered about 60,000 and the army about 150,000. Though in both areas there was some increased economic development, the lot of the common man was insecure and unhappy.

Education. A group of U.S. educators worked with Korean teachers in south Korea in revising the rigid system which had been established by the Japanese. The mass teaching of hankul, the dialect script, was started after the war and the literacy rate was rapidly increasing; in the south the rate in 1949 was 66% of those over 13 years of age. In the north the claim was made that 1,740,000 pupils were enrolled in 4,327 primary and secondary schools and that 11 institutions of higher learning had been established.

Agriculture. Rice is the most important agricultural product; 1948 production in the south was estimated at 2-5 million metric tons. Other products were (in metric tons): barley (352,393), naked barley (212,789), wheat (89,912), and rye (18,886). Fish and marine products were estimated at 300,000 metric tons in 1948. Production of crops was aided by fertilizers imported with E.C.A. aid; 600,000 tons were imported in 1948-49.

Industry. Production goals for 1948 announced for manufacturing in the north were claimed to have been attained in 1949 (in metric tons): pig iron 9,000,000; chemical fertilizers 332,000; salt 150,000; rayon yarn 1,440. Communist officials made statements at the end of the year that showed that industrial production had evidently been lagging considerably. The north Korean action in cutting off the power supply normally furnished to the south seriously hampered manufacturing there. Industrial facilities in the south were mostly chemical plants, food processing and textile factories and light consumer-goods industries such as rubber shoes, bicycle tires, etc. All of these were reported in 1949 to have had a considerable increase in production.

The major mineral resources are found in the north where iron, coal, gold and many other ore deposits were exploited by the Japanese. In the south anthracite coal production was limited. 714,150 tons were mined in 1948 and monthly production reached a peak of 97,918 tons in April 1949. Bituminous coal, mainly used for transport facilities, was imported from Japan (967,903 tons in 1948). In 1944 south Korea was the world's leading producer of graphite (103,000 metric tons); production in 1948 was one-seventh of that amount.

Foreign Trade. Trade on a barter basis between the north and south was stopped in the spring, though clandestine trade continued. In the south, foreign trade was largely restricted to essential imports of food, petroleum, fertilizers, coal and raw materials for industry.

Finance. In south Korea the value of the won maintained its low level of 1948; the official rate of exchange was U.S. $1 = 450 won; however, in Sept. 1949 curb rate was U.S. $1 = 1,900 won. Measures slowing down the rate of inflation were not effective; rice prices, for example, were nine times as high in Aug. 1949 as in Aug. 1945; cotton cloth prices were 100 times as high. The Bank of Korea note issue used in the south increased from 8,700 million won in Sept. 1945 to 49,100 million in Sept. 1949. The 1949-50 budget in the south called for 57,322 million won for general expenditures and 166,111 million for special expenditures. In the north the figure was 19,763 million won for general expenditures, an increase of 45% over the year before.

LACROSSE. In England, 1949 saw recruitment to old clubs, new ones founded and expansion in public interest in men's lacrosse. The annual North v. South match at Lord's was the best for many years; a splendid struggle resulted in a draw. Cambridge won the annual university match against Oxford. A new high level was reached in the United States; more universities, colleges and schools were playing the
game than ever before. A successful North v. South game at Troy, New York, resulted, for the first time since 1943, in a win for the South. The U.S. navy and John Hopkins university were awarded co-possession of the United States inter-collegiate championship. Expansion was handicapped in Australia by lack of equipment due to the dollar shortage. There was a successful season throughout the continent. Popularity of women’s lacrosse in England continued unabated, a record number of colleges, schools and clubs being affiliated to the All England Ladies’ Lacrosse association. At the invitation of the United States Ladies’ Lacrosse association an All England team toured the U.S. during March and April. They won all their matches including a final game against an All American ladies’ team in New York.

LATVIA. From Jan. 18, 1919, to Aug. 5, 1940, when it was annexed by the U.S.S.R., Latvia was an independent republic. The British, U.S. and many other governments, however, had not granted de jure recognition to this annexation. Area: 25,395 sq. mi. Pop.: (Jan. 1939 est.) 1,994,500, (Jan. 1946 est.) 1,630,000. The reduction is explained by the evacuation of the German minority (c. 50,000) in 1939–40, by Soviet deportations in 1940–41 (c. 34,000), by the murder by the Germans of some 90,000 Jews, by the fact that about 65,000 Latvians fled to Germany when the Soviet armies returned and by a second wave of Soviet deportations in 1945 (about 105,000). Chef towns: Riga (cap., pop. 1939 est., 393,210); Iecpaja (1935 census, 57,098). Daugavpils (1935, 45,160) Chairman of the presidium of the Supreme Soviet of the Latvian S.S.R., August M. Kirchensteins; chairman of the Council of Ministers, Vils T. Iacvs.

History. At the congress of the Latvian Communist party in Jan. 1949, J. E. Kalinberzs and P. Litvinov, secretaries general, reported that the party had 31,203 members and candidates, 55% being civil servants, 38% workers and 7% peasants. Of the 69 members elected to the central committee 30 had Russian names and among the 13 high dignitaries of the party only 5 were Latvians.

Many speakers at the congress emphasized that the total population of Latvia was over two million, which would suggest that by then the Russians numbered over 350,000. Latvians who escaped to Sweden in March reported that a new wave of deportation was in progress according to a plan prepared by S. N. Kruglov, Soviet minister of home affairs (M.V.D.), and V. S. Abakumov, Soviet minister of state security (M.G.B.) and director of all Soviet camps of forced labour. This plan concerned not only Latvia, but also Estonia and Lithuania (qq.v.). Persons selected for deportation included political prisoners under investigation or arrest; families of persons accused of espionage, participation in the underground movement and contacts with foreign countries, former professional soldiers, officers and non-commissioned officers, with families; former civil servants; former teachers and professors with families; priests and members of religious organizations; and members of the free professions with families. Altogether about 70,000 were said to have been deported from Latvia. In August Major General Alfons A. Noviks, Latvian minister of state security, and Major General August P. Eglish, Latvian minister of home affairs, were awarded the Order of the Red Banner “for the successful execution of a special assignment of the government of the U.S.S.R.” (Ivestia, Aug. 25, 1949). Contrary to Soviet promises in 1944, on the eve of the second occupation, collectivization was enforced during 1949 with ruthless determination. In the spring of 1947 there were only four kolхозes (collective farms); a year later their number had increased to 189, and on July 21, 1949, V. T. Lacs announced that there were 3,879 kolхозes, embracing four-fifths of the arable land. But the sowed area in the spring of 1949 amounted to only 1.9 million hectares against 2,239,000 hectares in 1939, and milch cows numbered 380,000 against 890,200 in 1939.

The number of industrial workers in 1949 was 118,000— one-fifth more than in 1938. According to an article by J. E. Kalinberzs, about 5,000 Russian technicians—one-fourth of the total—helped to manage Latvian industries. F. Dalgav, chairman of the State Planning commission, reported that by April 1949 only about 1,500 industrial plants had been rehabilitated—one-fourth of the plants which existed in Latvia in 1939. Nevertheless, on Nov. 6, 1949, Kalinberzs and Lacies reported in a telegram to Stalin that the total industrial production was double what it had been in 1940.

Education. According to V. T. Lacs, the total number of pupils in all schools in 1949 was 40,000 more than in bourgeois Latvia. (In 1939...

there were 1,895
elementary schools with 229,825 pupils and 114 secondary schools with 25,225 pupils.

(K. SM.)

LAW AND LEGISLATION, Public Law in Europe and the Commonwealth. In this field the most important developments of 1949 were the adoption by the Parliamentary Council of the basic law for the federal republic of Germany, and by the Constituent Assembly of India of a constitution based on a draft prepared by its drafting committee under the chairmanship of Dr. B. R. Ambedkar, together with the finding and acceptance by the Commonwealth conference of the ingenious formula whereby India, although proclaiming her intention of being a "sovereign independent republic" yet remained within the Commonwealth with its "common allegiance to the crown." In Israel, the adoption of a draft constitution was being debated; and, in Pakistan, an agenda was being debated for a conference to establish a constitution.

The basic law for Western Germany was, as its full title implies, founded on a division between the federal union on the one hand and the provinces, or Länder, on the other. In its preamble it declared that "Conscious of its responsibility before God and mankind . . . the German people . . . in certain specified provinces . . . has, by virtue of its constituent power, enacted this basic law of the federal republic of Germany to give a new order to political life for a transitional period."

The preamble claimed, significantly, that the German people had thus acted on behalf of those Germans; i.e., in the Soviet zone, to whom participation was denied and it proclaimed that "The entire German people is called upon to accomplish . . . the unity and freedom of Germany."

The first section of the basic law enumerated a number of basic rights. These ranged from such general statements as that "The dignity of man shall be inviolable" (art. 1) and "Everyone shall have the right to the free development of his personality" (art. 2) to relatively precise statements such as that "Secrecy of the mail . . . shall be inviolable. Restrictions may be ordered only on the basis of a law" (art. 10) and "The dwelling shall be inviolable. Searches may be ordered only by a judge or, in the event of imminent danger, by other authorities provided by law" (art. 13). In their affirmation of equality before the law, freedom of expression of opinion and freedom of assembly, and in their insistence on the sanctity of the family, these articles expressed a reaction against totalitarian ideas which was the most significant feature of this section. In art. 14 and 15 there was, too, an interesting statement of a compromise between individualist and socialist ideas: art. 14 stated that, subject to certain limitations, "Property and the right of inheritance shall be guaranteed," whereas art. 15 provided that "Land and landed property, natural resources and means of production may, for the purpose of socialization, be transferred to public ownership . . . by way of a law which shall regulate the nature and extent of compensation."

Section II regulated relations between the federation and the Länder. It declared that Germany was a democratic and social federal state; it gave the federation power, by legislation, to transfer sovereign powers to international institutions; it provided (art. 28) that "The constitutional order in the Länder must conform to the principles of the republican, democratic and social state based on the rule of law . . . In the Länder, Kreise and Gemeinden the people must have a representative assembly resulting from universal, direct, free, equal and secret elections" and (art. 31) that "Federal law shall supersede Land law": which presumably meant that in the event of conflict or mutual repugnancy federal law should prevail. Section III regulated the com-

position, powers, and duties of the Bundestag: its first clause was particularly important, namely that "The deputies of the German Bundestag shall be elected by the people in universal, free, equal, direct and secret elections. They shall be representatives of the whole people, not bound to orders and instructions and subject only to their conscience." Section IV provided similarly for the Bundesrat, through which the Länder participate in the legislation and administration of the federation. Each Land has between three and five votes in the Bundesrat, according to its population, and its votes are given as block votes, the members being members of the governments of the Länder which appoint and recall them. Section V provided for the election, by the federal convention as there defined, of the federal president and prescribed his term of office, powers and duties. Section VI dealt with the federal government, and provided that the federal chancellor should be elected, without discussion, by the Bundestag on the proposal of the federal president. Federal ministers were to be appointed and dismissed by the federal president upon the proposal of the federal chancellor. The Bundestag might express its lack of confidence in the federal chancellor only by electing a successor with a majority of its members and submitting a request for the chancellor's dismissal to the president.

Section VII covered legislation. It provided that the Länder should have the right of legislation in so far as the basic law did not accord legislative powers to the federation; and then defined two categories of subject, in respect of the first of which the federation had the exclusive right of legislation and in respect of the second of which there was a concurrent right of legislation to be exercised by the federation only when the regulation of the matter by a Land law would not be effectual, or could prejudice the interests of other Länder or of the Länder as a whole, or where the preservation of legal or economic unity demanded federal intervention. Federal legislation is normally passed by the Bundestag subject to a limited power of veto by the Bundesrat. Art. 81 made a curious provision for the enactment of legislation in the teeth of opposition by the Bundestag, should the Bundesrat approve it and the federal president declare a "legislative emergency." Of the remaining sections, it is possible to mention only that which dealt with the administration of justice. Section IX provided for a Federal Constitutional Court, a Supreme Federal Court, federal courts and the courts of the Länder. The Constitutional Court was to interpret the basic law, adjudicate questions relating to the compatibility of federal or land law with the basic law, and other public law disputes between the federation and a Land or between different Länder.

The constitution of India, due to come into force in Jan. 1950, presented certain points of resemblance with the basic law for the federal republic of Germany; but the problem with which it had to deal was in its nature and its history even more complex than that of a constitution for Germany.

A preamble declared the resolve of the people of India to constitute India into a sovereign democratic republic and to secure for all its citizens justice, liberty, equality and fraternity as there defined. Part I provided that India should be a union of the states specified in the first schedule, comprising the former governors' provinces, the former chief commissioners' provinces, and the former Indian states, parliament having the power to add to their number or to alter their boundaries. Part II dealt with the complex problem of citizenship, which it conferred on (a) every person who or either of whose parents or any of whose grandparents was born in the territory of India and who had not made his or her permanent abode in any foreign state after April 1, 1947—a provision which would seem to raise immediately the question whether a country in the Commonwealth is a
“foreign state”); and (b) every person who had his domicile in the territory of India. There was a proviso that such a person must not have acquired the citizenship of any foreign state before the date of commencement of the constitution.

Part III dealt with fundamental rights. Included in these were rights of equality, such as the prohibition of discrimination on grounds of religion, race, caste, or sex, equality of opportunity in matters of public employment, the abolition of untouchability, freedom of speech and the prohibition of the employment of children under 14 in factories, mines or any other hazardous employment; rights relating to religion, affirming that all persons were equally entitled to freedom of conscience and the right freely to profess, practise and propagate religion; and rights to constitutional remedies, that is, to move the Supreme Court for the enforcement of rights provided by the constitution. Part IV had the unusual title of “Directive Principles of State Policy.” These included (art. 31) the imposition on the state of the duty of ensuring that its citizens had adequate means of livelihood; that control of the material resources of the community should be directed to serve the common good; and that there should be equal pay for equal work for both men and women.

Part V was entitled “The Union.” It provided, among other things, for the election of a president by a college consisting of elected members of both houses of parliament and of elected members of the legislatures of the states for a term of five years and of a vice-president who is ex-officio chairman of the Council of States. All executive business was to be done by members of the Council of Ministers in the president’s name. This same part provided for a parliament of two houses: the Council of States, with 250 members, 15 nominated by the president, the rest representatives of the states; and the House of the People, with not more than 500 members directly elected by the voters. The council was not to be subject to dissolution but a third of its members were to retire on the expiration of every second year; the house was to have a term of five years unless it was first dissolved. The council might not interfere with money bills but other differences were to be resolved by joint sitting. Provision was also made for the president to have certain emergency legislative powers; and for a federal judiciary, with a Supreme Court adjudicating both on constitutional and other issues more closely modelled on the United States than on the German system, in which, as seen above, the Constitutional Court was distinct from the Supreme Court. Part IX was the next part of general importance, and provided for relations between the union and the states. Parliament was to have exclusive power with respect to matters enumerated in list I in the seventh schedule; the state legislatures were to have exclusive powers over matters set out in list II; and list III enumerated powers held concurrently.

Such were some of the most important provisions of the constitution of India. There remained to be considered India’s status within the Commonwealth. Nearly all the formal links, including the right of appeal to the Privy Council, were broken; India was a “sovereign independent republic” but she contrived to remain a full member of the Commonwealth. To quote the official announcement made

Mrs. Helena Florence Normanton (left) and Miss Rose Heilbron at the House of Lords. April 26, 1949, when they were sworn in as King's Counsel—the first two women in England to take silk. Mrs. Normanton was also the first woman to practise at the bar, 1922.
by Herbert Morrison in the House of Commons on April 28, 1949: "The government of India have . . . declared and affirmed India's desire to continue her full membership of the Commonwealth of Nations and her acceptance of the King as the symbol of the free association of its member nations and as such the head of the Commonwealth.

United Kingdom Case Law. Consideration is given below to cases of exceptional public interest and to litigation that resulted in the superior courts revising or modifying doctrines that were applied by the courts below: to cases that appear to have arisen from, and to throw light upon, novel developments in social or economic life; and to one or two decisions which, however unexceptionable in law, appear to have raised difficult problems in the spheres of ethics, morality or conscience.

Of the litigation of the first of the above categories, namely that of exceptional public interest, the outstanding example was The Commonwealth of Australia and Others v. The Bank of New South Wales and Others (decision reported in The Times, Oct. 27, 1949). This was an appeal—or rather it was a consolidation of five appeals—to the Judicial Committee of the Privy Council from a majority decision of the High Court of Australia. It arose out of section 46 of the Banking Act, 1947, part of which stated that "a private bank shall not, after the commencement of this act, carry on banking business in Australia except as required by this act," and the effect of which was to nationalize banking in Australia. The High Court of Australia held that this section contravened section 92 of the constitution of the Commonwealth of Australia, which provided that "trade, commerce and intercourse among the states . . . shall be absolutely free." The Privy Council, although affirming the High Court of Australia's decision on this point, decided the appeal in favour of the respondents on a preliminary point, namely that for an appeal to lie in a matter of this sort a certificate of the High Court was required. The duration of this appeal, namely 36 days, constituted a record, at least for the Privy Council.

Two other cases that deserve mention in this category are Krajina v. Tass Agency (1949 2 All England reports 274) and Tumlin v. Hannonford (1949 2 All England reports 327). In the former the Court of Appeal affirmed the decision of a judge and a master setting aside service of a writ for an alleged libel published by the agency on the ground that it was an organ of the government of the U.S.S.R. and as such entitled to sovereign immunity from the process of the English Court. In the latter it was held that the British Transport commission was not a servant or agent of the crown, and its property was therefore as much subject to the Rent Restriction acts as the property of any other owner.

Of the second category of litigation, namely, that which resulted in a superior court revising a doctrine laid down by a lower court, and long accepted as good law, the most important example in 1949 was Hill v. William Hill (Park Lane) Ltd. (1949 2 A.E.R. 452). In this case the appellant had agreed to pay the amount of a bet he had lost in consideration of the bookmakers to whom he was to pay it refraining from reporting him to Tattersalls for non-payment. A majority of the House of Lords, overruling the decision of the Court of Appeal in the well-known case of Hyams v. Stuart King (1908 2 K.B. 696) held that the appellant's promise was to pay money won upon a wager within section 18 of the Gaming act, 1845, and the contract was therefore unenforceable.

R.E.L. v. E.L. (1949 Probate division 211) was an example of the third category of case, arising from, and throwing light upon, a novel social development. It was there held that the fact that a wife petitioner had been artificially inseminated with her husband's seed was no bar to her obtaining a decree of nullity on the ground of his incapacity.

The fourth class of case, where there appeared to be some question of a clash between good law on the one hand and good ethics or good sense was, in the view of some, exemplified by the decision of the House of Lords, affirming that of the Court of Appeal, in Gilmour v. Coat and Others (1949 Appeal cases 426). Following a long line of authority in charity cases, it was held that the necessary element of public benefit was lacking in a gift made to clustered nuns in the belief that their prayers would benefit the world at large; and that the necessary element of public benefit being lacking the gift was not a valid charitable trust. This state of the law was held by some to impose a restriction on one kind of charity that did not well accord with the liberal interpretation of the rules respecting charities where animals were concerned, although here too, of course, the consideration of public benefit was paramount.

United Kingdom Legislation. The chief feature of United Kingdom legislation in 1949 was that, with the enactment of the main social security measures constituting the pillars of what is called the welfare state and all the nationalization measures that formed part of the government's programme, except the Iron and Steel bill, interest centred on legislative measures less ambitious in their scope. Meanwhile, the Iron and Steel bill and the Parliament bill (whose main provision was to reduce the term wherein the House of Lords' veto over legislation passed by the House of Commons remained operative) passed between the House of Lords and the House of Commons in accordance with the procedure laid down by the Parliament act, 1911, the two houses having failed to reach agreement on either measure until, in November, a compromise was accepted in relation to the Iron and Steel bill.

Of measures of a constitutional character, the three most important were the British North America act, the Ireland act and the Juries act. The first of these gave effect to the union of Newfoundland with Canada on the basis of the former's becoming a province of the latter. The second declared that, in accordance with Irish wishes and law, the part of Ireland known as Eire ceased, from April 18, 1949, to be part of the Commonwealth; it proceeded to declare that Northern Ireland remained part of the King's dominions and of the United Kingdom and to affirm that in no event would Northern Ireland or any part thereof cease to be part of the Commonwealth without the consent of the parliament of Northern Ireland—a provision which gave rise to a great deal of controversy in Ireland and, to some extent, in the United Kingdom parliament. Its later sections provided a legal puzzle by declaring that the republic of Ireland was not a foreign country and that the British Nationality act was not affected by the fact that the republic of Ireland was not part of the Commonwealth. The Juries act made provision for the payment to jurors of subsistence and travelling allowances and of a modest compensation for loss of earnings and abolished special juries except City of London special juries in commercial cases.

Of a number of measures of a social character the most important was the Legal Aid and Advice act. Part I of this act provided for a new social service by enabling the cost of legal aid and advice to be defrayed wholly (below a certain income limit) or partly (below a higher income limit) out of moneys provided by parliament in civil matters or proceedings, the scheme being administered by the legal profession itself. Part II provided for improved assistance in criminal proceedings. The operation of Part I was partially, and that of Part II wholly, deferred for economic reasons. The legal Aid and Solicitors (Scotland) act, made broadly similar provision for Scotland.

United States. Administrative Law. The Supreme Court ruled that the right to argue orally before an administrative
agency is not an inherent part of due process. The Federal Communications commission was justified in refusing to hear oral arguments in support of a petition which was considered insufficient to raise a legal issue (FCC v. WJR, 337 U. S. 265). The court also declined to disturb an order of the National Labour Relations board merely because the trial examiner had uniformly credited the board's witnesses and discounted those of the employer. This in itself did not indicate bias, nor did the record of the hearing disclose any (NLRB v. Pittsburgh S.S. Co., 337 U. S. 656). But agencies had carefully to follow prescribed procedures, the court said. An immigrant might not be barred from entering the U. S. because of mental illness unless such a finding was made after strict compliance with Public Health service regulations (U. S. v. Shaugnessy, 336 U. S. 806).

The Supreme Court also gave rulings on the jurisdiction and powers of state and federal agencies in several cases. A Californian travel bureau had been convicted of violating a state statute prohibiting the operation of transport over state highways by carriers who did not hold permits from the Interstate Commerce commission. The travel bureau ingeniously contended that the state law was invalid because it conflicted with the jurisdiction of the commission conferred upon it by Congress under the Motor Carrier act. But the Supreme Court rejected this view. The fact that a state law coincided with a federal law did not render it invalid unless congress had clearly shown the intention of giving exclusive jurisdiction to the federal agency (California v. Zook, 336 U. S. 725). Such exclusive jurisdiction was conferred by congress upon the National Labour Relations board in the matter of certifying the representatives of employees for "collective bargaining" in an interstate industry, according to the Supreme Court, which set aside the certification of a union by the Wisconsin Employment Relations board. Even though the national agency had not assumed jurisdiction, the state board's action was invalid unless and until the national board expressly ceded its jurisdiction (La Crosse Tel. Co. v. Wis. E & R, 336 U. S. 18).

Aliens and Citizenship. The high court reversed a district court judgment denaturalizing August Klapprott, former German-American Bund leader. He had not been given a reasonable opportunity to be heard, the court said. At the time when the denaturalization case came up, he had been ill, impoverished and a prisoner in gaol awaiting trial on charges that were later dropped; and he had not been represented by counsel (Klapprott v. U. S., 335 U. S. 601). The Supreme Court also gave a second chance to an immigrant who had been barred from the U. S. as a mental defective because the report of a medical board did not show that its conclusions were based "upon its medical examination of the alien," as required by Public Health service regulations (U. S. v. Shaughnessy, 336 U. S. 806).

Armed Forces. The Supreme Court considered the jurisdiction and powers of courts-martial in three cases arising out of World War II. The justices all agreed that a naval court-martial did not have the right to try a serviceman for offences committed during a previous period of service. A petty officer, who had rejoined the navy on the day after his honourable discharge, was convicted by a navy court of beating two fellow war prisoners in a Japanese camp in the Philippines. His sentence was set aside as illegal because the navy had lost jurisdiction to try such offences after his discharge (U. S. ex rel. Hirschberg v. Cooke, 336 U. S. 210).

The Supreme Court opened the federal courts to suits by service personnel against the United States under the Tort Claims act for injuries not arising out of their service. Suit was properly brought in a district court to recover damages for the death of one serviceman and injuries to another when the private car in which they were riding was struck by an army truck. Membership in the armed forces did not bar their right of action (Brooks v. U. S., 335 U. S. 901).

Civil Rights. A five-to-four decision of the Supreme Court again illustrated the difficulty of drawing a legal line between the use and abuse of free speech. The court reversed the conviction of Rev. Arthur Terminiello for violating a Chicago ordinance which defines disorderly conduct as including activities which tend to a breach of the peace. The defendant had spoken at a meeting sponsored by Gerald L. K. Smith. He denounced Communists, Russians, Mrs. Eleanor Roosevelt, Henry Wallace and the Morgenthau plan, while praising Franco. A mob of hecklers demonstrated outside the meeting hall, and the defendant was arrested for having stirred up the disturbance through his speech. The trial court ruled that any misbehaviour which stirred the public to anger, invited dispute, brought about a condition of unrest or created a disturbance might be a breach of the peace. But a majority of the Supreme Court disagreed. Justice Douglas said that speech was often provocative and challenging, but that freedom of speech, though not absolute, was nevertheless protected against censorship or punishment, unless shown likely to produce a clear and present danger of a serious substantive evil (Terminiello v. Chicago, 335 U. S. 890).

Criminal Law. Eleven American Communist party leaders were convicted of conspiring to advocate the overthrow of the U. S. government by force in violation of the sedition provisions of the Alien Registration act of 1940. The record of the trial, which lasted nine months, ran to more than 5 million words. Judge Harold Medina not only imposed prison sentences and fines upon the defendants but held their lawyers guilty of contempt of court for persistently obstructive tactics during the trial. Among the important issues to be determined on appeal were the constitutionality of peacetime sedition laws; whether the judge should have instructed the jury to apply the "clear and present danger" test to the defendants' activities; and the leeway to be allowed defence counsel in such trials.

A concurring opinion by Justice Jackson in the reversal of a conviction for conspiracy to violate the Mann act promised to become important when the sedition conspiracy case against the eleven communist leaders reached the Supreme Court on appeal. Loose practice in the use of conspiracy charges, he said, "constitutes a serious threat to fairness in the administration of justice" (Krulewitch v. U. S., 336 U. S. 440).

The first trial of Alger Hiss, former state department official, charged with committing perjury before a grand jury, petered out when the jurors failed to agree. The case arose out of charges made by Whittaker Chambers, formerly a senior editor of Time magazine, before the House of Representatives committee on un-American activities, that Hiss had given him copies of secret documents in 1938, to be turned over to Russian agents. Hiss countered by suing Chambers for defamation, whereupon Chambers produced microfilms of papers alleged to have been handed out by Hiss, who was then indicted for perjury in denying complicity with Chambers in his confessed spy activities. On his second trial, which lasted beyond the year's end, Hiss was found guilty.

In other cases arising out of hearings before the committee on un-American activities, circuit courts upheld convictions of contempt of congress against witnesses who had refused to state whether or not they were members of the Communist party. The Supreme Court dodged one aspect of this issue by dismissing the appeal of Gerhard Eisler, German-born Communist, from a contempt sentence for refusing to testify before that committee. The case was moot, the court said, because Eisler had fled from the U. S. to escape the consequences of this and another criminal conviction (Eisler v. U. S., 338 U. S. 189).
The federal government was unsuccessful in its effort to justify the use of evidence taken from a defendant's hotel room during an illegal search by local police. Even though the search had not been made upon the instigation of the federal agent, the evidence was still tainted with illegality (Lustig v. U.S., 338 U.S. 74).

In three cases the Supreme Court reversed convictions by the courts of South Carolina, Pennsylvania and Indiana which were based upon confessions obtained after long and continuous grilling of the defendants (Harris v. S.C., 338 U.S. 68; Turner v. Pennsylvania, 338 U.S. 62; Watts v. Indiana, 338 U.S. 49).

Labour. Organized labour lost substantial ground under the impact of adverse court decisions. In two sweeping opinions by Justice Black the Supreme Court reversed union attacks on state anti-closed shop laws. The court ruled that the "right to work" amendments to the constitutions of Arizona and Nebraska and a North Carolina statute making it unlawful to deny employment to any person because he was or was not a member of a labor organization did not violate the federal constitution. State laws prohibiting discrimination between union members and non-members did not impair the obligation of contracts nor deny free speech, free assembly, due process or the equal protection of the laws (Lincoln v. F.L. U. v. N.W. I. & M. Co., 335 U.S. 525; A.F.L. v. Am. S. & D. Co., 335 U.S. 538).

Labour scored in two cases before the Supreme Court involving unfair practices. A National Labour Relations board order directing a North Carolina cotton mill to permit the use of a company owned meeting hall in a company controlled town for union organization meetings was sustained (NLRB v. Stowe Spinning Co., 336 U.S. 226), as was also a N.L.R.B. ruling that it was unfair for an employer to put into effect a general wage increase substantially greater than that offered to union representatives during negotiations which had reached an impasse (NLRB v. Crompton-Highland Mills, 337 U.S. 217). In a third case, however, the N.L.R.B. was told it had erred in finding an employer guilty of unfair practices when he discharged employees on demand of a union which had expelled them from membership because they had been active on behalf of a rival union. The employer was carrying out the terms of a closed shop contract (Colgate Co. v. NLRB, 338 U.S. 355).

Taxation. The Supreme Court told the tax court to take a broader view in considering the status of family partnerships for income tax purposes. The tax court had ruled that the entire income from a cattle business run by a Texas rancher and his four sons as partners was taxable solely to the father. In so holding, the tax court had said that division of income among partners should not be recognized as valid unless each partner contributed "vital services" or "original capital" to the common business, phrases which the tax court had culled from the 1946 opinions of the supreme court in the Tower and Lusthaus cases. This was a misconstruction of those decisions, said the supreme court. The concept of a partnership for tax purposes was the same as the common law concept, namely, that the partners really intend "to join together for the purpose of carrying on business and sharing in the profits or losses or both." (Comm'r v. Culbertson, 337 U.S. 733).

The Supreme Court maintained its liberal attitude toward state taxation alleged to be in conflict with the federal constitution. In two opinions the court held that state and local governments could legally tax property intended for exportation as long as it had not entered the "export stream." The export-import clause of the federal constitution conferred immunity from local taxation only upon property actually in the process of being exported. Thus gasoline held in storage for 15 months at Dearborn, Michigan, in tanks marked "For Export Only" was held subject to a city ad valorem tax (Joy Oil Co. v. State Tax Comm., 337 U.S. 286). A cement plant bought by a foreign company for dismantling and shipment to South America remained subject to local property taxes until the dismantled parts were delivered to a carrier for shipment. Intent to export was not enough to bring property within the constitutional immunity (Empresa v. Merced, 337 U.S. 154).

LAWN TENNIS. The U.S.A. once again swept the board in the international lawn tennis season of 1949. They won the challenge round of the Davis cup against Australia by four matches to one, winning the four singles but losing the doubles match, and they won the U.S.A. v. Great Britain international women's match for the Wightman cup by five matches to nil. They won also the men's and women's singles championships at Wimbledon, in Paris (French championships) and at Forest Hills (American championships), and won the women's singles in the Australian championships, none of their leading players competing in the men's singles.

LAWN TENNIS. The U.S.A. once again swept the board in the international lawn tennis season of 1949. They won the challenge round of the Davis cup against Australia by four matches to one, winning the four singles but losing the doubles match, and they won the U.S.A. v. Great Britain international women’s match for the Wightman cup by five matches to nil. They won also the men’s and women’s singles championships at Wimbledon, in Paris (French championships) and at Forest Hills (American championships), and won the women’s singles in the Australian championships, none of their leading players competing in the men’s singles.

1. Mrs. W. Dupont (U.S.A.)
2. Miss L. Brough (U.S.A.)
3. Miss D. Hart (U.S.A.)
4. Mrs. M. W. Bolton (Australia)
5. Mrs. P. C. Todd (U.S.A.)
6. Mrs. B. E. Hilton (G.B.)
7. Mrs. S. P. Summers (S.A.)
8. Mrs. A. Bossi (Italy)
9. Miss J. Curry (G.B.)
10. Mrs. J. J. Walker-Smith (G.B.)

G. L. Paish (Great Britain) and V. Černík (Czechoslovakia) in the second round of the European zone of the Davis Cup at Wimbledon, May 1949.
The outstanding men's singles players of the year were F. R. Schroeder, who won the English men's singles championship at Wimbledon at his first attempt, and R. Gonzales, who retained the American championship, beating Schroeder in the final 16-18, 2-6, 6-1, 6-2, 6-4. Gonzales again beat Schroeder in the final of a tournament in California and then turned professional. On his first appearance as a professional he was beaten by J. Kramer (U.S.A.) by three sets to one at Madison Square Garden.

One of the features of the men's singles championship at Wimbledon was the improved form of F. Sedgman, the new young Australian champion who came within a point of defeating Schroeder. The holder, R. Falkenburg, was beaten by J. Bromwich (Australia) after winning the first two sets, and Bromwich was beaten in the next round, the semi-final, by J. Droby (Czechoslovakia) 6-1, 6-3, 6-2. E. W. Sturges (South Africa) having beaten F. Parker (U.S.A.) in five sets, took Schroeder to five sets in the semi-final. Schroeder beat Droby in the final 3-6, 6-0, 6-3, 4-6, 6-4. Only one Englishman survived more than one round at Wimbledon, C. F. O. Lister, who was defeated in the third round by P. Washer (Belgium) 6-1, 6-1, 6-2. The two leading Englishmen, A. J. Mottram and G. L. Paish, were beaten by C. Cucelli (Italy) and V. Černik (Czecho-Slovakia) respectively.

Mrs. W. Du Pont (U.S.A.) was unbeaten in singles during the year except on one occasion when Miss L. Brough (U.S.A.) defeated her in the final at Wimbledon 10-8, 1-6, 10-8, thus maintaining her title for the second year in succession.

In the American final Mrs. Du Pont defeated Miss D. Hart (U.S.A.) 6-4, 6-1, and in the French final she beat Mme. N. Adamson (France), the holder, 7-5, 6-2. Miss Hart won the Australian championship defeating Mrs. M. W. Bolton (Australia), the holder, in the final.

The most successful British women player of the year was Mrs. B. E. Hilton who reached the semi-final of the American championship with two good victories over Miss G. Moran (U.S.A.) and Mrs. H. Perez (U.S.A.), before losing to Mrs. W. Du Pont. Miss J. Curry became the first English woman to beat either of the two leading Americans when she beat Miss L. Brough 4-6, 9-7, 6-2 in the French championship at Paris. She was beaten in the next round by Mme. A. Bossi (Italy) 6-3, 4-6, 6-3. Four English women, Mrs. B. Hilton, Mrs. J. J. Walker-Smith, Mrs. N. W. Blair and Mrs. E. W. Dawson-Scott, reached the last eight where they all lost to American players.

Great Britain beat Portugal by five matches to nil in the first round of the Davis cup but was beaten by Czecho-Slovakia by four matches to one in the second round at Wimbledon. In this match, A. J. Mottram scored Great Britain's only victory by beating Černik (Czecho-Slovakia). (J. Or.)

United States. The tennis spotlight in 1949 was focused on two outstanding players from California, R. Gonzales of Los Angeles and F. R. Schroeder, Jr., of La Crescenta. Having won the U.S. singles championship once again, Gonzales left the amateur ranks and signed a contract to meet professional champion Jack Kramer in a series of indoor exhibition matches.

In the field for the U.S. championship were the leading players of the world, including E. Sturgess, champion of South Africa and runner-up for the U.S. title in 1948; J. Droby, former Czecho-Slovakian Davis cup star; F. Sedgman, champion of Australia, and his team-mates, J. E. Bromwich and George Worthington; Giovanni Cucelli, Italy's Davis cup hero and his partner, Marcello del Bello; Felicismo Ampon, champion of the Philippines; Robert Abdessalam of France, Naresh Kumar of India; and Ricardo Balbiers of Chile. The other leading U.S. players included the veterans William F. Talbert, Gardnar Mulloy, Frank A. Parker, and Arthur Larsen, Earl Cochell, Herbert Flam, E. V. Seixas, Samuel Match, James Brink and Tony Trabert. During the championship at Forest Hills, New York, Schroeder was awarded the William M. Johnston trophy for good sportsmanship.

Parker, U.S. champion in 1944 and 1945, also played his last year as an amateur and won his second French title in Paris early in the season, a feat accomplished for the first time since that championship was opened to foreign players. The U.S. was challenged by 28 nations for the Davis cup. Italy won the European zone competition and for the first time in history an Italian Davis cup team competed in the U.S. in an inter zone final. Cucelli and Del Bello, however, unaccustomed to grass courts, were unequal to the task of holding off the experienced Australians, American zone winners. Later the U.S. team turned back the Australians in their third successive victory since they won the cup from Australia in 1946. Bromwich and Sidwell, however, captured the U.S. doubles championship at the Longwood Cricket club, Brookline, Massachussets, where they beat their teammates, Sedgman and Worthington.

Women's tennis in 1949 again found U.S. players dominating the international picture, and for the eighth year in succession Mrs. M. du Pont and Miss Brough won the U.S. women's doubles championship. (E. S. Br.)

LEARNED SOCIETIES: see Societies, Learned and Professional.

LEATHER. The leather industry in Great Britain began 1949 with its prices badly out of adjustment. Under the controls governing it, the prices for leathers most in demand were too low, and those for less desirable qualities were too high. Good selections sold readily but stocks of poorer qualities accumulated on tanners' hands.

There was much agitation for greater freedom to price leather more in accordance with demand. Eventually a concession was made under which tanners were permitted to raise the prices of higher grade productions by an amount sufficient to compensate them for actual losses made by selling low grades at prices below the official levels.

Early in 1949 there was a period during which raw material was scarce and there was a general fear of a coming leather shortage, which, however, did not occur as hide imports improved substantially. Stocks of low grade leathers were cleared, though only by means of price concessions.

Thus the over-riding consideration for the industry became the prospect of some measure of de-control. The industry contended that, if the government abandoned its policy of bulk-buying of hides and skins, tanners could then buy on private account to greater advantage, particularly in securing to each tanner the type of raw materials best suited to his production methods. The industry was confident that demand would result within the legal limits of production. Much pressure was brought to bear on the government to make it relax controls. Demand for cheaper leather was insistent and there were threats of an extended use of various forms of rubber soling.

In Sept. 1949, shoe manufacturers were demanding that leather and shoes should be de-controlled; they were confidently predicting that lower prices would follow, despite the fact that while control persisted leather prices were being subsidized to the extent of about £2 million a year out of a profit made by the control on the buying of domestic hides.

The devaluation of the pound upset most price calculations and made it evident that, because most hides and skins had to be imported, dearer leather was inevitable.

A definite announcement was made in Dec. 1949, that on Jan. 1, 1950, the government would hand back to tanners
the buying of a large part of the industry’s raw materials and that government-bought supplies would be sold to the industry at prices about half-way between the price level before devaluation and the current world value.

The year ended with leather prices up by some 10 to 124%. There was also a prospect of still further increases when the full influence of the new exchange rates had had time to make itself felt on the prices of hides and skins. Shoe manufacturers and leather merchants had bought heavily in anticipation of these price increases and were holding fairly large stocks capable of sustaining the full impact of the new price level on the public. But there was much trade anxiety as to what effect the expected leather prices would have on current demand. (C. A. So.)

United States. U.S. leather production continued a slightly declining trend throughout 1949, with the average monthly output of all major types well below that of 1948. With the exception of calf and kip leathers, however, the industry maintained a production pace well above the prewar level. Demand for all leathers continued good throughout the year, and stocks of finished leathers in tanners’ hands remained at very low levels.

There was little change in the stringencies of raw stock supplies in 1949, as imports of hides and skins remained unsatisfactory because of world economic and political conditions. However, the domestic hide and skin supply was steadily improving, and U.S. tanners were each year becoming less dependent upon raw stock imports.

An abrupt decline in market prices caused a large part of the Argentine leather goods to be withdrawn in 1949, and U.S. imports dropped 90% from the 1948 level. As these imports represented, for most part, high-grade raw stock, the lack affected the U.S. industry even more than the statistics indicated.

Although the demand for leather continued to be good during 1949, the industry was alarmed at the tremendous rise in popularity of synthetic materials for purposes for which leather had traditionally been used. Shoe production reports by the Bureau of the Census revealed that synthetics had replaced leather for 35% to 40% of shoe soles and were making heavy inroads in the shoe upper leather market. These materials, chiefly rubber and plastics, were also replacing leather to some extent in the manufacture of handbags and upholstery.

The directors of the Foundation of the Tanners Council Research laboratory authorized a grant to establish and operate a programme for the analysis and testing of various leather substitutes at the council’s research laboratory in the University of Cincinnati. F. O’Flaherty, director of the council’s laboratory, announced the development of a new portable device which measured scientifically the amount of moisture present in hides and leather. Moisture content determined the quality of the finished leather and its workability in the manufacture of leather products. (See also SHOE INDUSTRY.) (R. B. B.)

LEBANON. Independent Arab republic, formerly under French mandate, situated on eastern Mediterranean, bounded by Syria and Israel. Area: 3,475 sq. mi. Pop. (1949 est.): 1,208,000. Religions (1947): Christian 52% (Roman Catholic rites: Maronite 332,900, Greco-Melchite 65,400, Armenian 10,300, Syrian 5,000, Latin 3,100 and Chaldean 1,300; Greek Orthodox 111,500; Gregorian Armenian 60,800; Syrian Jacobite 3,700; Protestant 10,600); Moslem 46% (Sunni 240,000, Shia 214,000; Druze 75,800; others 2%. Language: Arabic is the mother tongue of some 90% of the population, but Armenian, Greek and other languages are also spoken. As in the middle east religious ties are often stronger than racial, Lebanon might be described as a state of minorities, no single rite or sect being in a majority. Capital: Beirut (pop. 247,000); President of the republic, Bishara Khalil el Khuri (q.v.); prime minister, Riad Bey es Sulh.

History. On Jan. 16-19 meetings of Lebanese and Israeli representatives took place on the frontier to discuss an armistice. It received final form on March 20 and was signed on March 23 at Ras an-Naqura.

On Jan. 28 Lebanon, with Syria (q.v.), agreed to allow work on the Trans-Arabian pipeline, interrupted owing to displeasure at American support for Israel, to be resumed. Negotiations with Syria on the one hand and the T.A.P.-line company on the other were completed, for subsequent ratification by the respective parliaments, on Feb. 5.

A treaty of friendship and commerce with Italy was signed at Beirut on Feb. 15. Economic and political relations with Syria deteriorated after March 30. Early in May the prime minister visited Cairo and Baghdad in an attempt to mediate in the dispute between Iraq and Egypt over the Arab League (q.v.) secretariat and the "fertile crescent" plan. On his return to Beirut, he called on May 11 a meeting of the political committee and on May 16 sent a message to the Egyptian prime minister: "I am now very hopeful that all disputes affecting relations between the Arab countries will be settled in a friendly manner."

On June 11, following the arrest of some 300 of its members, the Syrian National party in Lebanon was dissolved by government decree and its headquarters searched and sealed. It was alleged to have made preparations for an armed revolt. Early in July the leader of the party, Anton Saadeh, who took refuge in Damascus and was received by Husni ez-Zaim, staged attacks on gendarmerie posts in Lebanon and scattered groups of his party followers made armed raids from Syria along the frontier. It was reported that the prime minister appealed to Egypt which intervened with Zaim. Saadeh was arrested in Damascus on July 7 and handed over by the Syrian authorities to the Lebanese police. In Lebanon he was summarily tried, sentenced and executed the next morning. On July 16 a military court in Beirut tried 68 adherents of the National Syrian party, of whom 12 were sentenced to death and 53 to terms of imprisonment varying from three years to life. Over 800 others were reported to be in prison. Two days later the government closed the offices of the Phalanges Libanaises (Katayib), making 13 arrests and confiscating arms. (C. Ho.)
LEEWARDS ISLANDS—LEPROSY

Education. (1946-47) Schools: state 631, pupils 53,190; private 815, pupils 65,769; foreign 306, pupils 50,111, universities (1948-49) 2, students 5,110.

Agriculture. Main crops ('000 metric tons, 1947): wheat 50, barley 17; maize 12; potatoes 32; Fruit production ('000 metric tons): grapes (1946) 80, oranges and tangerines (1947) 40; lemons, limes, etc. (1947) 25; olives (1946) 35. Livestock ('000 head, Dec. 1947): cattle and buffaloes 22, sheep 21; horses (Dec. 1946) 8, asses 25. Fisheries: total catch (1948) 1,440 metric tons.

Foreign Trade. (1948, with Syria) Imports £648 million, exports £79 million.

LEEWARDS ISLANDS. British colony consisting of a group of islands in the Caribbean Politically it is divided into four presidencies: Antigua (with Barbuda), St Christopher-Nevis (with Anguilla), Montserrat and the Virgin Islands. Total area: 423 sq. mi. Total pop. (Dec. 1947 est.): 109,274. Governor, Earl Baldwin of Bewdley.

History. Early in 1949 the governor was recalled to England for consultation. Rumour suggested that this was due to complaints from certain Leeward islanders or to a somewhat unconventional attitude he had made to the Legislative Council; these rumours were fed by remarks he made to press correspondents but they were denied in official circles. Now the less the governor’s return was celebrated in the colony with popular acclaim as a victory of the coloured and poorer elements.

It was announced in April that the secretary of state for the colonies had agreed to certain constitutional changes, including the introduction of adult suffrage (subject to a simple literacy test only) at the next election for the Legislative Council, and the removal of the property qualification for a candidate, subject to further examination of the existing arrangements for deposits which candidates were required to make.

The reports of the commission appointed in July 1948 to enquiry into the organization of the sugar industry of St. Kitts and of Antigua were published in November. Each contained a minority report recommending the nationalization of the industry. The majority reports recommended inter alia a vigorous campaign for the improvement of rural housing; government responsibility for housing sugar estate workers; a wages board or council for the industry and a joint consultative assembly for the industry in St. Kitts; a land utilization survey, reconstruction of the cost of living index; review of the wholesale and retail profit margins; and consolidation of basic wage rates, amendments and cost of living bonuses in Antigua. (J. A. H.)

St. Antigua Christopher- Nevis Montserrat Virgin Islands Revenue . $2,207,672* $1,758,170* $439,573* $223,723* Expenditure . $2,577,183* $1,816,029* $591,799* $217,405* Imports . £1,034,929* $4,103,384* $908,540* $254,880* Exports . $465,582* $4,418,877* $416,882* $156,326* 1949 est * 1948 est + 1948 d 1947

LEGISLATION: see Law and Legislation.

LEOPOLD III (LEOPOLD-PHILIPPE-CHARLES-ALBERT-MEINRAD—HUBERTUS—MARIE-MIGUEL DE Saxe-COBURG), King of the Belgians (b. Brussels, Nov. 3, 1901). On Nov. 10, 1926 he married Princess Astrid of Sweden, who died in a motor accident on Aug. 29, 1935; of this marriage were born Princess Josephine-Charlotte, Prince Baudouin (Sept. 7, 1930), and Prince Albert. Leopold acceded to the throne on Feb. 17, 1934, and became the determining influence in Belgian foreign policy: on Oct. 14, 1936, he proclaimed that Belgium would return to a policy of neutrality. After a courageous though vain resistance by the army, of which he was commander in chief, to the German invasion launched on May 10, 1940, the king capitulated on May 28. Against the views of his government, he decided not to leave his country and retired to the castle of Laeken. On Nov. 14, 1940, he paid a visit to Hitler at Berchtesgaden. On Sept. 11, 1941, he married Mlle. Marie Liliane Baelis, and a son, Alexander, was born on July 18, 1942. On June 7, 1944, Leopold left Brussels with his family under German escort for internment at Hirschstein, near Dresden, and from March 6, 1945, at Strobl, near Salzburg. He was liberated on May 8, 1945, by the U.S. 7th army. The Belgian Social Christian party asked for his immediate return, but a section of the Liberals, the Socialists and the Communists advocated his abdication. From the summer of 1945 King Leopold and his family were living at Pregny, near Geneva. Leopold’s insistence on his reinstatement created a deadlock and the situation was not clarified by the result of the Belgian general election of June 25, 1949 (see BELGIUM). It was officially disclosed on Oct. 18 that in a letter to Gaston Eyskens, the prime minister, the king had affirmed that if the number of votes in his favour in the proposed referendum did not reach 55% of the total of valid votes cast he would abdicate in favour of his son Baudouin.

LEPROSY. From all parts of the world reports in 1949 indicated the belief of leprologists that cases of lepromatous leprosy receiving the sulphones showed improvement far beyond that expected from use of other methods. Even though cures were not effected, the patients led a much more comfortable existence and complications were much less pronounced. According to one leprologist the best drugs were diasone and sulphonamide for oral administration and promin for intravenous use. Treatment had not become universally standardized. In some geographic areas the cost of certain sulphones limited their use. Careful clinical and laboratory observations were still needed for patients receiving sulphones.

A summary of the problem of leprosy in the British Commonwealth and outlines for treatment and policy were made in an official memorandum. The problem was still being attacked with increased vigour in the British colonies where there were as estimated 700,000 cases, principally in Nigeria. Isolation was recommended, and persons with leprosy were to be excluded from occupations which permitted others to be exposed to infection. It was the official opinion that leprosy was incurable, but no certain cure had been found. It was recommended that settlements be organized along modern village lines, that restrictions be kept at a minimum, and that patients not actively infectious be allowed to return home periodically. Practically all British colonies maintained settlements for the care of leprosy.

Under the administration of the United States navy a leper colony was being developed on the depopulated island of Timan. It was planned to take cases of leprosy among natives of the 120 islands in that region to Timan for treatment. In keeping with the trend to abolish the word "leper" the institution was given the name "Hansen’s Colony." A young naval medical officer volunteered for a two-year assignment in charge of the colony. At the invitation of the U.S. navy an advisory group of three physicians interested in leprosy visited the west central Pacific area. This group

r b y v = 26
doubted the wisdom of placing the leprosarium on Tinian because it was too far removed from consulting medical services, and because insular isolation was considered an archaic method for controlling the disease. Attempts to cultivate *Mycobacterium leprae* in vitro continued; K. Nakamura of the National Institute of Health in Japan published a method of culture which he initiated in 1930. The ingredients of the liquid medium given specific mention by the author were mucin from the submaxillary gland of the ox, phthiocillin, vitamin B, and vitamin B	extsubscript{2}. Nakamura was convinced that by using material from seven cases of human leprosy definite multiplication of bacilli was obtained, and reported that sub-culturing was successful up to the fourth or fifth transplanting. Since no previously reported method for culturing the leprosy bacillus had withstood the test of time, this new approach would need to be successfully duplicated by other scientists before the results could be accepted by leprologists and bacteriologists.

(C. H. Bo.)

**LIAQUAT ALI KHAN**, Pakistani statesman (b. East Punjab, Oct. 1, 1895), became the first prime minister of Pakistan on Aug. 15, 1947. (For his early career see Britannica Book of the Year 1949.)

In Oct. 1948 he attended the Commonwealth prime ministers’ conference in London, and was also present at the second conference in April 1949. He visited Dublin on May 2, and was received by President Sean O’Kelly and members of the government. He returned to Karachi in May, after visiting Rome, Cairo, Baghdad and Tehran. Inaugurating the council of industries at Karachi on Sept. 8, he exhorted the advanced countries to give “the wherewithal for development” to the under-developed countries, along with technical assistance. In June it was announced that he had accepted an invitation to visit the Soviet Union in November, but by the end of the year this visit had not taken place. On Dec. 10 he accepted an invitation to visit the United States in May 1950.

**LIBERAL MOVEMENT.** Liberal parties continued to manoeuvre precariously between the larger parties assembled under the banners of the welfare state and the Christian revival. In Sweden and Belgium, however, Liberals scored notable electoral successes.

In the elections held on Sept. 19, 1948, to the Swedish Riksdag the Folkpartiet increased its strength from 26 to 57 and supplanted the Conservatives as the second largest party. Professor Bertil Ohlin ascribed his party’s success to the failure of centralized regulation and control to cope with the problems either of the postwar economy or of international collaboration. He described his own party’s programme of progress and the defence of freedom as Social Liberalism, a phrase perhaps borrowed from the Italian political vocabulary of forty years ago. The results suggested that the Folkpartiet gained from the right rather than from the Left.

On June 26, 1949, the Belgian Liberals increased their representation in the Chamber from 17 to 29 and in the Senate from 12 to 24 (both bodies being slightly larger than at the time of the 1946 elections). Liberals also made considerable gains in municipal elections. These gains were proportionately greater than those of the Social Christians, and Socialists and Communists lost ground. As a result Liberals took office in a coalition government under a Social Christian prime minister. The chief feature of the Liberal campaign was a demand for a 25% cut in direct taxation. Senator Roger Motz, Liberal leader, described the Liberal successes as a victory for a policy of opposition to increasing state interference and state expenditure.

In countries governed by coalitions Liberals provided at least a useful measure of support for prime ministers in search of parliamentary majorities. In France Henri Queuille, a Radical, set up a postwar record of 13 months continuous service as prime minister before his resignation in October. In Germany the Freie Demokratische Partei made important contributions, often by way of compromise between the two major parties, to the work of constitution-making at Bonn. One of its leaders, Professor Theodor Heuss (q.v.), was elected first president of the new republic and others joined the government. The veteran Greek Liberal, Themistocles Sophoulis (see OBITUARIES), died during the year; he was succeeded as prime minister of the Greek coalition by Alexandros Dionidis (q.v.), a non-political Liberal.

In Great Britain the Liberal party appeared to make little headway in its struggle to recover from the disaster of 1945, but in the absence of electoral evidence (the party refrained from fighting by-elections) it was not possible accurately to judge its position. The government’s decision not to hold an election until 1950 offered greater possibilities to the Liberal party than to any other, since Labour stood to lose heavily by a further deterioration in the economic position and the Conservatives failed at their annual congress to produce a positive or striking alternative policy. The Liberal party’s aim was to turn this situation to good account by being returned at the polls in 1950, a feat which would be anxiously watched by continental Liberals who regarded a Liberal revival in Britain as an important factor in their own fortunes. A Liberal reverse in Britain in 1950 might indeed prove more serious for continental than for British Liberalism, since the constant and wise refusal of the British parliament to adopt any form of proportional representation gave to the marginal voters of the centre an electoral importance which they did not possess elsewhere. (See also Political Parties, British.)

In Canada the Liberal party under its new leader, Louis S. St. Laurent (q.v.), scored an electoral victory of a size unprecedented in Canadian history.

The annual congress of the Liberal international was held at Deauville in July under the presidency of Salvador de Madariaga. At the same time and place were held the third of a series of meetings of Liberal newspaper editors and a meeting of the newly-formed Committee of Liberal Exiles. (See also Political Parties, British.)

**LIBERIA.** A republic on the west coast of Africa, bounded on the northwest by the British colony of Sierra Leone, and on the north and northeast by the French colonies of Guinea and the Ivory Coast. Area, c. 43,000 sq. mi. Pop. (1949 est.): 1,600,000 (all Negroes), of which approximately 12,000 persons were direct descendants of the original settlers from the United States. Monrovia (pop., c. 12,000) is the capital. English is the official language; the tribal languages are divided into some 26 dialects which stem from Arabic, Bantu and Nilotic language bases. Liberia grants religious freedom to all denominations; nearly all Christian churches have had missions in Liberia for many years. President (inaugurated in Jan. 1944), William V. S. Tubman.

History. Late in 1949 the bridge spanning the St. Paul river and linking Monrovia with the western province was officially opened. Pan American World Airways reinstated international air services which brought Monrovia within 26 hr. of New York city. Also in 1949 tangible steps were taken to open to international exports the Bomi Hills iron concessions, in which Christie-Republic Steel interests were the principal U.S. investment factors. It was estimated that there were more than 50 million tons of rich surface iron ore in the Bomi area.

A corporation code and a maritime code were among the major Liberian legislative accomplishments for 1949. The same year witnessed progress in the nation's principal
industry, the production of natural rubber. Firestone, largest American investor in Liberia by way of its subsidiary, the Firestone Plantations company, increased its Liberian rubber plantations to a total of 78,861 planted acres, of which about 70,000 acres were in bearing at the year’s end. Firestone’s rubber production for the fiscal year ending Oct. 31, 1949, was 5,577,118 Ib.

**Education.** (1949) Schools: government 88, mission 78, private 23, tribal 17. Institutions for advanced education included Liberia college, College of West Africa, Monrovia, and Booker T. Washington institute, Kakata, for the agricultural and basic industrial training of sons of Native chiefs and tribal people.

**Industry and Agriculture.** For 1949, industrial employment, including that of the Firestone Plantations company with approximately 30,000 Native employees, was estimated at 44,800. Agriculture remains the preponderant source of employment, with rice the principal subsistence crop. Rubber is the preponderant export item, with gold, passava fibre, palm oils and kernels, and kola nuts following in that order.

**Finance and Trade.** The U.S. dollar is the monetary unit of Liberia and is supplemented by Liberian fractional coins with the dollar base freely negotable and at par. Revenue receipts for the year ending Aug. 31, 1949, were $3,735,354, an increase of $768,655 over those of the preceding year. External debt (Aug. 31, 1949): $284,000; internal debt (Aug. 31, 1949) $13,527,185; imports $9,104,870, with the United States supplying about 81% of the latter. (C. M. Wl.)

**LIBRARIES.** The special need for scientific and technical information to assist research workers in science and industry increased and set more problems for consideration by all those whose work included the supply of books, periodicals and information. The availability of this material for the increasing number of people in Great Britain who wanted to use it was therefore a major topic of discussion throughout 1949 for many organizations concerned with libraries, education, science, industry and the book trade, particularly the Lord President of the Council’s Committee on Industrial Productivity, the Royal Society, the Library association, Aslib, the United Nations Educational, Scientific and Cultural organization and the National Book league.

One of the most important events of last year was the establishment of an independent organization to provide an official current national bibliography, based on a scheme first drawn up by the Library association. The council of the British National Bibliography was formed in March 1949 and consisted of representatives of the British museum, the Library association, the Publishers’ association, the Booksellers’ association, the National Book league, the Royal Society, the National Central library, the British Council, Aslib and the U.N.E.S.C.O. Co-operating Body for Libraries. The editorial work was to be carried out at the British museum in close proximity to the Copyright Receipt office and the bibliography was to be issued in the form of a weekly book list of all books published in Great Britain, commencing in the first week of Jan. 1950. All books were to be fully catalogued by the Anglo-American rules and classified in accordance with the Dewey decimal classification. There was also to be an annual volume containing the entries for the year, in classified order with appropriate indexes. The British National Bibliography would thus form a central catalogue of the books published in Great Britain as well as a guide to the selection and purchase of books.

Another important event was the establishment of a British National Book centre at the National Central library. This became a new department of the National Central library activities which, it was hoped, would help the better distribution of books and periodicals which became available from time to time as gifts or as superfluous duplicates, by ascertaining the requirements of libraries and meeting them as far as possible. Many institutions had superfluous books which were not needed but which it would be unwise to destroy because experience had shown that other libraries might have been unable to obtain them. The British National Book centre acted as a central bureau in Great Britain to obtain and circulate information regarding redundant books. Its main object was the distribution of books among British libraries but it was co-operating with U.N.E.S.C.O. in encouraging international interchange of books and periodicals and working with U.S. and Canadian book centres operating on similar lines. Many thousands of books and periodicals had already been distributed to British libraries and libraries in Europe.

These important developments, stimulating interest in libraries generally, were a fitting prelude to the celebration of the centenary of the passing of the first Public Libraries bill for England and Wales, which received the royal assent in Aug. 1850. In the public library field much preparatory work had been undertaken in order to mark the centenary in the most effective way possible, the main object being to encourage every library authority to make 1950 a year of assessment and plan for greater development of the library service. In commemoration of the centenary King George VI granted his patronage to the Library association, which was also honoured by the Duke of Edinburgh’s acceptance of the office of president.

Statistics collected by the Library association showed that in the financial year 1948-49 over £1,870,000 or approximately 9d. a head of the population was spent on books for public libraries in Great Britain and Northern Ireland; and the total expenditure on the service, which was available to all but about 50,000 people in the whole of the country, was about £7,705,000 or 3s. 2d. a head of the population. The amount spent was one million pounds more than in 1947-48. The number of books issued from the lending departments of these libraries for home reading was 312 million, about 12 million more than in the previous year. Further attempts to extend the library services to meet the increased demands were of necessity still in the nature of temporary measures. Such measures included the provision of branch libraries in prefabricated huts, converted air-raid shelters, shops and other premises and also the establishment of more mobile libraries to serve urban areas where there was no building suitable for use or no site available.

A most important and interesting development was the establishment, in April 1949, of a full-time library for the patients and hospital personnel in a large general hospital at Southmead, Bristol. The scheme was a joint one, with the hospital management committee undertaking financial responsibility and the Bristol public libraries supervising the service. Opened with a stock of 4,000 volumes, the library was excellently furnished with tables, easy chairs and book display cases, while book trolleys were used to give service to bed-patients in the wards.

A new feature of British libraries, the Recorded Music collections, was further developed. Nearly 50 public libraries now had established collections of gramophone records, which in most cases were available for loan to individuals but, in some places, only to musical clubs, societies and groups. A considerable amount of information about these collections was given in a special number of the Library Association Record, vol. 51, no. 7, July 1949.

The work of restoring libraries which had been damaged during World War II proceeded slowly. The repair of the bomb-damaged music room and bookstacks at the University of London library and work on the completion of the tower were begun. Plans were approved for the rebuilding, on its original site, of the library of the Inner Temple, and in July the King opened a new temporary library adjoining the existing temporary building. The Inner Temple lost many books in the bombing of 1941 but the stock had gradually been built up to 80,000 volumes. At Edinburgh, work was
LIBRARIES

The Radcliffe Science library at Oxford celebrated its bicentenary on April 20 and marked the occasion by a public ceremony and a special exhibition illustrating the history of the library and the life of its founder, Dr. John Radcliffe. At Cambridge, A. F. Schofield, university librarian since 1923, retired and his successor was H. R. Creswick, who was librarian of the Bodleian library, Oxford, from 1945 to 1948 and therefore had the unique distinction of serving as university librarian both at Oxford and Cambridge.

Commonwealth. In Canada steps were taken to establish a national library by the appointment of a committee which would, in the first place, set up a bibliographical centre at Ottawa. In the British West Indies, plans were formulated for regional library services in the eastern Caribbean and Jamaica. A further development in Jamaica was the establishment of a new library for the University College of the West Indies. In Trinidad a bill for the establishment of a central library for Trinidad and Tobago became law in 1949, thus providing for the continuance of a service which began in 1946 with the help of the Carnegie corporation.

Many developments were taking place in Africa; and the formation of a Central African branch of the South African Library association was expected to lead to further progress. A university library was inaugurated at Ibadan in Nigeria and, opening with a stock of 42,000 volumes and periodicals, this was the largest library in west Africa. Microfilm equipment was installed and there were plans for spending approximately £20,000 in the following few years. Steps were taken to establish a library at the University College of the Gold Coast. Further progress could be expected at Makerere College library in Uganda which received a grant of £15,000 under the Colonial Development and Welfare Act.

The Potchefstroom University College library in the Transvaal, South Africa, was destroyed by fire on Feb. 23, a great loss in a country which had been very active latterly in developing its library resources. Help in the difficult problem of the replacement of stock was given by the British Council, which presented 1,700 recent British books.

The library policy of the British Council, a body which had done so much to encourage the setting up of libraries in the colonies, changed. It would no longer "establish or maintain general public libraries" and the process of transferring responsibility to the colonies themselves began.

Europe. U.N.E.S.C.O. continued to encourage the rehabilitation of libraries after World War II and the international and national library associations were active. The 15th session of the International Library committee of the International Federation of Library Associations was held at Basle in July when reports were received from many national associations on the progress of the library movement. In Germany the Bayerische Staatsbibliothek of Munich and the Universitätsbibliothek of Erlangen organized a conference, attended by more than 100 delegates, of the re-established Association of German Librarians. In Czechoslovakia, a mobile library service was introduced in Prague. Based on the Prague Central library, the specially fitted library vans toured and served areas which were without any other library service.

The Norwegian Public Library law, which was passed in Dec. 1947, took effect from July 1949. This law made it compulsory for communities to maintain public libraries. Provision was made for subsidies on local effort and an interesting feature was that public libraries which were so well administered that they could serve as model libraries or those to which study groups were attached could obtain an extra contribution from the government.

A loss to Swedish, and European, librarianship was caused by the death of Dr. Isak Collin, librarian of the Royal Library at Stockholm for many years and an outstanding figure in the International Federation of Library Associations.

(D. C. H. J.)

Regional Co-operation. The Carnegie corporation approved a $500,000 grant to establish a midwest inter-library centre as a depository and bibliographic centre. The 54 college and reference libraries participating in the Farmington plan (complete coverage in foreign book acquisitions) were receiving books from nine countries: Mexico, Norway, Sweden, Denmark, the Netherlands, Belgium, France, Switzerland and Italy.

College and Reference Libraries. The most spectacular acquisition during the year was the private papers of James Boswell (4,000 pieces) by Yale university library.

Public Libraries. A report from the U.S. Office of Education, covering public libraries in towns with populations of over 100,000 showed the following percentage increases since 1945: 45,142,081 volumes (+23%), 9,011,703 borrowers (+11% -25%), 133,283,304 books circulated (+4% -23%), $45,205,992 expenditure, excluding capital outlay (+42-66%). An American Library association midsummer study showed that 736 counties had county libraries. John Defferrari, who in 1947 had given the Boston Public library a $1 million trust fund, added $500,000 to it in 1949.

Costs were the main concern of most public librarians...
during the year; budget increases were largely due to improved salaries. The "book-buying power" of public libraries was set at an estimated $14 million and of all libraries, at $32 million.

Adult services made some progress; sporadic attempts at censoring the collections occurred, but there was opposition in the communities which defended the public libraries' policy of book selection. An improved service to Negroes in the south was reported. The provision of books on medical subjects, sex, marriage, etc., for adult readers was discussed. Group services progressed, the library's role being more clearly defined as one of service rather than leadership. (K. BN.)

**LIBYA:** see ITALIAN COLONIAL EMPIRE.

**LIE, TRYGVE HALVDAN.** Norwegian diplomat (b. Oslo, July 16, 1896), was elected secretary general of the United Nations on Feb. 1, 1946. (For his early career see *Britannica Book of the Year*, 1949.)

In his fourth annual report dated July 7, he described the twelve months ending June 30 as "a year of progress towards a more peaceful world"; there were crises and alarms but "the fear of war has decreased." Fearing a "misunderstanding" of the function of the U.N., might lead "to a succession of acts, or failures to act, that would end by relegating the U.N. to a second-class role in world affairs," he restated the case for the charter and nothing but the charter. Although he mentioned that he was not referring to regional alliances, his report implied some discrete criticism of the western powers. Lie also defended the unanimity principle and expressed the view that it would be advisable for the U.N. to represent all the 14 countries applying for membership of the U.N. His speech at Bergen, Aug. 8, was misinterpreted by Moscow radio as an attack on the North Atlantic treaty. Two days later he pointed out at Oslo that he never said one word either for or against this treaty. He expressed, however, the opinion that regional alliances will not be necessary because "we shall get more peaceful times very soon." Lie added that he was neither the servant of Wall street, nor an agent of Moscow.

History. On July 27 the Security council agreed by nine votes with two abstentions to grant the request of Liechtenstein—which was not a member of the United Nations—to become a party to the statute of the International Court of Justice. On Sept. 12, at Lignières, Berri, France, Prince Heinrich-Marie-Vincenz-Benedikt, heir to the throne of Liechtenstein, married Archduchess Elisabeth-Charlotte, daughter of Charles of Habsburg, the last emperor of Austria-Hungary, and of the Empress Zita, née of Bourbon-Parma.

Finance and Economy. Budget (1948, actual): revenue Fr 3,798,000, expenditure Fr 3,309,047; (1949, est.): revenue Fr 4,266,000, expenditure Fr 4,575,749. Included since 1924 in the Swiss customs and monetary union. Liechtenstein uses Swiss currency. It was believed that a quarter of the principality's revenue came from sales of postage stamps. The main industries are agriculture (chief products being potatoes, corn, wine and vegetables) and textiles.

**Linen and Flax.** The traditional linen trade between Northern Ireland and the United States received a noticeable impetus in the last quarter of 1949 because of the devaluation of the pound sterling. Up to September, reports on the linen business were pessimistic. But, by the end of the year, exports of linens from Northern Ireland to the United States totalled 11,868,000 sq. yd. valued at $2,280,126, an increase of 10% over 1948. Prospects for 1950 were considered bright because of a demand for linen dress fabrics, principally those with new crease-resistant finishes. Prices were estimated to be from 12% to 15% below pre-devaluation levels, but were still four times higher than the average before World War II.

Raw material supplies were of major concern. Central European sources were no longer available to western European weavers and flax-growing was being encouraged in western Europe. In Belfast, in October, the government published detailed plans of a three-year plan for subsidizing flax growing. Spinners agreed to buy a minimum of 4,000 tons of deretted flax and 2,000 tons of rescutched tow during a three-year period; the rest was to be taken by the government.

Prospects was reported in establishing the value of the aluminum ret in flax production; and a modification of the preliminary breaking arrangement in the scutching machine which produced an increased yield of flax was announced. A reduction of temperature and humidity in the wet-sieving rooms was also accomplished; high temperatures and excessive humidity had previously been blamed for poor performance by individual workers and difficulty in securing workers.

Improvements in looms, factory surveys in winding and weaving and improvements in the weaveability of specific cloths were given continued study.

A previous attempt, reported in 1948, to utilize the shuttleless loom, had been followed by a preference for newer types of shuttle-changing and bobbin-changing fully automatic looms as being more adaptable to flax. The shuttle-changing loom was used for light fabrics such as sheers, cambric and aero fabrics. The bobbin-changing loom was widely employed for medium and heavy weight fabrics, such as huck towels. Old loom buildings were remodelled, efforts being concentrated on widening passages to facilitate greater freedom of movement, the use of larger warp beams and the introduction of mechanized equipment for transporting these from the beam storage to the back of the loom. Another improvement was the elimination of overhead motor drive which resulted in better lighting conditions and greater freedom of movement. It was also discovered in 1949 that previous unsuccessful attempts to introduce automatic weaving into linen factories resulted not from any fault of the loom mechanism but from the unsatisfactory condition of the warps produced by the old system of preparation. The inelastic nature of flax yarns called for certain modifications in construction and setting.

Belgium, one of the chief sources of flax, showed, in its 1949 exports of linen and flax, the trend toward substitution of flax yarn for linen fabric. Based on reports for eight months of the year, the average monthly production and export of flax and linen for 1949, in metric tons, compared with the 12-month average for 1948, was as follows:

<table>
<thead>
<tr>
<th></th>
<th>1948</th>
<th>1949</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flax tow</td>
<td>1,011</td>
<td>10,878</td>
</tr>
<tr>
<td>Scutched flax</td>

<tr>
<td>Linnen fabric</td>
<td>2,350</td>
<td>1,475</td>
</tr>
</tbody>
</table>

In France, flax production was running well ahead of
schedule, and was expected to exceed 29,000 tons, compared with 22,000 tons in 1948.

In Canada all flax production was suspended in 1949 except in Quebec and Ontario. Only 7,500 ac. were planted in 1949, compared with 14,116 in 1948 and an average of 24,548 in 1943-47. The only mill spinning flax fibre used tank-retted flax from Belgium. However, even imports were drastically lower in the first six months of 1949 than in the same period of 1948. Belgium and the United States supplied most of the 1,110 cwt., compared with 8,526 cwt. in 1948.

The political and military situation in China created confusion in the United States linen market in October; and it was predicted that no shipments would be received from either central or south China until the situation resolved itself. The Linen Trade association of New York, however, filed a protest with the U.S. secretary of state over the seizure of two U.S. ships by the Chinese Nationalist navy on which there was a substantial quantity of linens bound for the U.S. for 1949 Christmas sales.

Like other textile groups, linen merchants were disturbed in 1949 at the rapid advance made by the Japanese in re-entering world markets. Japan was expected to be shipping large quantities by 1950 of low count cotton fabrics for table use that would seriously compete with linen cloths.

(L. L. BL.)

**LITERARY PRIZES.** Nobel Prize for Literature.

In Nov. 1949, the Swedish Academy of Literature announced that the literature prize for 1949 would not be awarded since none of the candidates considered had received the necessary absolute majority of votes from the adjudicating committee. The leading candidates were Winston Churchill, Georges Duhamel, the French novelist, and Benedetto Croce, the Italian philosopher.

**Great Britain.** The James Tait Black Memorial Prizes were awarded in 1949 to Graham Greene for The Heart of the Matter (fiction award) and to Percy Scholes for The Great Dr. Burney (biography). These prizes, worth about £250 each, were awarded by the professor of English literature in the University of Edinburgh. Two awards were made from the William Heimann Foundation for Literature, administered by the Royal Society of Literature (value up to £200). Both were for poetry: the recipients were John Betjeman for his Selected Poems and Frances Cornford for her Travelling Home. The Carnegie Medal, awarded by the Library association to the British writer of an outstanding book for boys and girls, went to Richard Armstrong for Sea Change. The Rose Mary Crawshay Prize, an annual award offered by the British Academy for a critical or historical work dealing with English literature by a woman of any nationality, was awarded to Rosamund Tuve for an essay on Elizabethan and Metaphysical Imagery. The John Llewellyn Rhys Memorial Prize, the value of which was raised in 1948 to £50, was awarded to Emma Smith for her first book Maidens' Trip. The Tom-Gallant Award, the object of which was to free writers for creative work by providing an income for two years, was given to Olivia Manning for her short story, "The Children." Published in her volume of stories entitled Growing Up. The Alexander Prize, administered by the Royal Historical society, was awarded to E. Drus for an essay on The Attitude of the Colonial Office to the annexation of Fiji. The Blackwell Essay Prize, administered by the University of Aberdeen, was awarded to Alexander J. T. Brown. The Felicita Hemans Prize for Lyrical Poetry, administered by the University of Liverpool, was awarded to W. S. Kyle.

In 1946 the Rockefeller foundation in New York made a grant of 50,000 dollars for Atlantic Awards in Literature, to be given to young British writers of promise whose careers had been interrupted by the war. Grants were awarded by a committee under the chairmanship of Professor Allardyce Nicoll; the aim was to enable the recipients of awards to maintain themselves for about a year and to devote the whole of that time to writing. In 1949 awards were made to Norah Kelsall Cruickshank, Joseph Jacobs, David Paul, John Singer and Peter Norman Ross Yates. These would probably be the last awards to be made since the fund was now exhausted. The committee stated in June that they had received some 600 applications for awards, examined hundreds of scripts and had made 47 awards for poetry, drama, fiction and criticism. They said: "We feel it our duty to declare publicly our belief in the need and usefulness of such help as the Rockefeller foundation has provided, and we are certain that unless something takes the place of Atlantic awards, or the fund is sustained by further substantial gifts, there will be a serious gap left unfilled."

The Somerset Maugham Award, administered by the Authors' society out of a fund placed at their disposal by Somerset Maugham in 1947, provided an annual award of about £250 to be used for foreign travel and was open to British entrants under the age of 30. In 1949 the award went to Hamish Henderson for his book of verse, Elégies: for the Dead in Cyrenaica. The Sunday Times Book Prize, first awarded in 1947 and worth £1,000, was presented in 1949 to Winston Churchill for his war memoirs. In addition two special subsidiary prizes, each consisting of a gold medal and the sum of £100, were awarded to F. Spencer Chapman for The Jungle is Neutral and to Alan Paton for Cry, the Beloved Country. The William Foyle Poetry Prize was founded by the well known London bookseller in 1949 and the first award, the sum of £250, went to Edwin Muir for his volume The Labyrinth. (E. S.)

**France.** Goncourt Prize to Robert Merle for Week-end à Zuydcoote. Théophraste Renaudot prize to Louis Guilloux for Jeu de patience. Femina Prize to Maria Le Hardouin for La Dame de Coeur. Interallié Prize to Gilbert Sigaux for Les Chênes enragés. Denise Claireau Prize to Dominique Aury for the translation of Evelyn Waugh's The Loved One and James Hog's Confessions of a Justified Sinner. Sainte-Beuve Prize: (novel) to Lise Deharme for La Porte d'à côté; (essay) to Claude Mauriac for his book on the surrealist leader, André Breton. Syndicat des Critiques Littéraires Prize to Antoine Adam for his Histoire de la Littérature française au XVIIe siècle. (M. J.)

**United States.** Abingdon-Cokesbury Award, $7,500 to Roland H. Bainton for Here I Stand, a biography of Martin Luther. American Academy of Arts and Letters Award of Merit Medal, medal and cash prize of $1,000 to Thomas Mann. American Historical Association Awards: John H. Dunning Prize, about $100 awarded every two years for the best work on any subject relating to U.S. history, to William E. Livezey for Mahan on Seapower. Anisfield-Wolf Awards, $1,000 each for the best books on race relations, to Alan Paton for Cry, the Beloved Country and to J. C. Furnas for Anatomy of Paradise. Author Meets the Critics Prizes, honorary awards for the best novel of the year and the best non-fiction work of the year, chosen by a majority vote of the working critics and reviewers of the U.S., to Tom Lea for The Brave Bulls and to Robert Frost for his Complete Poems. Bancroft Prizes, "for distinguished writings in American history," $2,000 each to Robert E. Sherwood for Roosevelt and Hopkins and to Samuel Eliot Morison for Rising Sun in the Pacific. Bollingen Prize, $1,000 for the best book of verse by a U.S. author published in 1948, to Ezra Pound for The Pisan Cantos. Harper Prize Novel, $10,000 awarded biennially for a work of outstanding merit in fiction, to Max Steele for Debby. O. Henry Memorial Award Prize Stories, $300 first prize.
LITERARY RESEARCH—LITHUANIA

391

to William Faulkner for “A Courtship”; $200 second prize to Mark Van Doren for “The Watchman”; $100 third prize to Ward Dorrance for “The White Hound.” New York Drama Critics’ Circle Award, given for the best play produced in New York city, to Arthur Miller for Death of a Salesman; for the best foreign play, to The Madwoman of Chaillot, by Jean Giraudoux; for the best musical, to Richard Rodgers and Oscar Hammerstein II for South Pacific. Partisan Review Award, $1,000 for “a significant contribution to literature,” to George Orwell, author of Animal Farm, Nineteen Eighty-Four and other works. Shelley Memorial Award, awarded by the Poetry Society of America for outstanding poetry, to Louis Kent. Wendell Willkie Memorial Award, for “the best book on international relations,” to John King Fairbank for The United States and China. Child Study Award, honorary award of the Child Study Association of America “for a book for young people which faces real problems in their world” to Pearl S. Buck for The Big Wave.

Canada. Governor General’s Awards: silver medals awarded to Hugh MacLennan for The Precipice (fiction); to A. M. Klein for The Rocking Chair and Other Poems (poetry); to Colonel C. P. Stacey for The Canadian Army 1939-45 (academic non-fiction); to Thomas Raddall for Halifax Warden of the North (creative non-fiction). Long Stories, Long FINGERS, MEDAL, awarded by the Royal Society of Canada for achievement of special significance and conspicuous merit in imaginative or critical literature, to John Murray Gibbon. Leacock Memorial Medal for Humour, to Angeline Hango for Truthfully Yours. Tyrrell Medal, awarded by the Royal Society of Canada for research in Canadian history, to Reginald G. Trotter. (R. E. Bs.)

LITERARY RESEARCH. The most valuable aspects of research in 1949 were chiefly concerned not with literary criticism but with its historical and biographical background and with the acquisition of materials for future investigation.

For the mediæval period T. D. Hendrick’s Later Saxons and Viking Art (London) threw new light on, inter alia, the illumination of manuscripts. Documents from the 12th to the 15th century were included in the collection of papers and records acquired by the library of St. Paul’s cathedral. It was, however, in Tudor manuscripts that this collection was specially rich, containing a bound folio of letters from the Privy Council and Archbishop Whigtgut concerning defence against the Armada and other manuscripts relating to Elizabethan ecclesiastical administration.

An abortive design in the theatrical field for one immense amphitheatre in London for dramatic and other entertainments was described more fully than hitherto by Leslie Hotson in Shakespeare Survey 2 (Cambridge); it was licensed by James I and Charles I, but did not pass the Great Seal. F. N. L. Paynter’s selection from The Writings of William Clower (London), an Elizabethan surgeon, contained first-hand testimony to the sovereign’s easying of “the king’s evil,” described by Shakespeare in Macbeth.

Elaborate editions were published of the Cambridge Parnassus trilogy, by J. B. Leishman; of Samuel Daniel’s Tragedy of Philotas, by Laurence Michel (New Haven, Connecticut), and of Peter Hausted’s Senile Oidium, by L. J. Mills (Bloomington, Indiana). F. S. Boas edited from the manuscript prompt copy, with Sir Henry Herbert’s licence, for the Royal Society of Literature, the hitherto supposed lost Restoration play, The Change of Crowns by Edward Howard, which was banned by Charles II.

For the 18th century Norman Ault in New Light on Pope (London) corrected and amplified details in the poet’s biography and printed some of his poems, hitherto unpublished. A. L. Read (The Times Literary Supplement, London, June 17) quoted from 15 newly discovered letters from Sir William Boothby, a book-collecting baronet, to Michael Johnson, Samuel’s father, ordering books or binding (Oct. 14, 1684—Aug. 11, 1685) and proving that Michael had opened the Uttoxeter branch of his Lichfield bookshop by the beginning of 1685. An article in The Times Literary Supplement (Aug. 12) on The Boswell Papers, bought by Yale university from Ralph Isham, analysed the different categories into which they fall and announced that the more than 4,000 items would be published in 40 or 50 volumes.

The most important contribution to the personal story of the poets of the Romantic movement was Contessa Iris Origo’s The Last Attachment (London), throwing new light on the relations between Byron and Teresa Guiccioli from unpublished letters of Teresa. H. W. Hausermann sent to Notes and Queries (Jan. 22 and Feb. 5) an “Unpublished Letter from Shelley to Medwin and Alfred Tennyson” by his grandson Sir Charles Tennyson—a remarkable study of the singular personality of the poet’s father, which helped to account for Alfred’s sensitiveness.

Theatre Note-Book, vol. 3 (London), contained a number of valuable research articles, as well as a list of “works in progress” in the theatrical field. A similar list of a general kind was published by the Modern Humanities Research association. Notes and Queries completed its centenary on Nov. 3, 1949. The Dictionary of National Biography published its supplementary volume for 1931-40. (F. S. B.)

LITERATURE: see American Literature; Australian Literature; Book Collecting and Book Sales; Book Publishing; Canadian Literature; Children’s Books; Classical Studies; Czech Literature; Dutch Literature; English Literature; French Literature; German Literature; Italian Literature; Literary Prizes; Literary Research; Newspapers and Magazines; New Zealand Literature; Polish Literature; Russian Literature; Scandinavian Literature; South African Literature; Spanish-American Literature; Spanish Literature; Words and Meanings, New.

LITHUANIA. From Feb. 16, 1918, to Aug. 3, 1940, when it was annexed by the U.S.S.R., Lithuania was an independent republic. The British, U.S. and many other governments, however, had not granted de jure recognition to this annexation. For over two decades Lithuania was bounded by Latvia, Poland and Germany; in 1945 the U.S.S.R. became its eastern and western neighbour through the Russian enclave of Kongsberg (later Kaliningrad). Area: (before March 21, 1939, including Klaipeda [Memel]) 21,330 sq. mi.; (after Oct. 10, 1939, excluding Klaipeda but including Vilno [Vilnius]) 24,092 sq. mi.; (from 1945, including both Klaipeda and Vilnius) 25,173 sq. mi. Pop. : (Jan. 1939 est.) 2,575,000; (Jan. 1940 est.) 2,879,000; (Jan. 1946 est.) 2,533,000. If there had been no movement of population the last figures should have been 3,032,000. The reduction is explained by the evacuation of 34,000 Germans from Lithuania proper in 1939-40 and of 59,000 Germans from Klaipeda territory in 1945, by the first Soviet deportation in 1940-41 of 35,000 people, the murder of some 208,000 Jews by the Germans, the fact that about 80,000 Lithuanians fled to Germany when the Soviet armies returned, by a second wave of Soviet deportations in 1944-45 (about 85,000) and by the evacuation to Poland of about 178,000 Poles. Chief towns (Jan. 1940 est.): Vilnius (cap., pop., 209,400); Kaunas (154,100); Klaipeda (38,900). Chairman of the presidium of the Supreme Soviet of the Lithuanian S.S.R., Justas I. Paleckis; chairman of the Council of Ministers, Mci- slovas A. Gedvilas.
LIVESTOCK. During 1949 the changes in the livestock industry caused by World War II either in its different phases of development or of recovery from wartime disturbances became more clearly revealed, especially in countries with dense populations of farm livestock.

For example, the problems of marginal lands became more prominent, although such lands were usually defined by reference to heritage associations and cropping systems rather than as regions in which different forms of livestock production intermingled. In so far as the highest common factor in marginal lands, whatever their geographical context, was their production of store animals for subsequent use in other areas, their main economic difficulties were similar, and could only be overcome through resuscitated markets for their products instead of through temporarily alleviation by subsidy schemes.

Thus, in 1949, while subsidies were continued in many countries, there was a marked tendency to encourage expansion and intensification of livestock output in the more productive areas, thereby stimulating production of store and breeding stock in the fringing marginal areas. The continued increase in numbers of sheep in New Zealand and of their associated dairy cattle provided an instance of this trend, although an enlarged use of fertilizers and sown pastures has undoubtedly enhanced this development in the 1940s. Similarly in Great Britain there was some revival of the lowland sheep industry in the form of grassland flocks grazing leys, often run with dairy herds; this led to an increased demand for suitable grassland types which in turn helped the market for stock bred and reared in the upland regions and improved the prospects of farmers who practised extensive pastoral stock husbandry in the mountain and hill grazing areas. There was also a notable revival of the rearing of beef stores in these areas; this was encouraged by the calf subsidy but was also partly attributable to the extension of the scheme that provided for the free artificial insemination of inferior milch cows by semen from bulls of beef breeds which colour marked their offspring. Bullocks of the larger framed dairy breeds were being kept to a greater extent for finishing for slaughter to augment British home grown beef supplies; and in Northern Ireland and Eire official policy stressed the importance of dual purpose cattle stocks.

Artificial insemination became an established husbandry technique especially for the breeding of dairy cattle. Significant fractions of the milch cow populations of Denmark, the United States, England and Wales and New Zealand were artificially inseminated as a means towards improved potentials of production and for combating infertility; and in many other countries the method was used in measures of disease control.

The continued restriction in importations of feeding stuffs and concentrates further stimulated attempts to use home-grown fodder and grassland more efficiently and to reduce wastage. In this connection there was some increase in the pig and poultry populations generally, although such increases tended to occur through the integration of highly productive enterprises on each holding rather than through the renewed development of specialized farming units. On the whole, the postwar pattern of efficient livestock husbandry did not repeat the older mixed farming aggregations of what had been usually relatively inefficient stock units.

Probably the most important local contributions to the livestock industry were made in Australia in connection with the development of new stock-raising areas in South and Western Australia following upon the correction of soil deficiencies, of large scale cropping of sorghum and pig keeping in Queensland and of irrigation and improved transport facilities in the northern beef cattle areas of that continent.

(J. E. N.)
United States. Livestock on U.S. farms in 1949 began once more to increase in numbers, with the exception of horses, mules and possibly sheep. The number of stock sheep on farms on Jan. 1, 1949, was the lowest on record, apparently because of the competition with more profitable cattle production and the high cost and scarcity of labour. The number of beef cattle began to increase despite the fact that markets were bidding strongly for high-grade slaughter cattle. Dairy herds, because of the easy feed situation, were fed more heavily and less carefully culled. The large 1948 corn crop caused more brood sows to be kept. More chickens and turkeys were produced because the demand for eggs and poultry continued to be fairly favourable and the feeding situation improved. Horses and mules continued to decline owing to mechanical replacement.

Stimulated by the record corn crop of 1948 and the very large one of 1949, the pig crops of 1949 were larger, with the promise of a still larger one in early 1950. The spring crop of 1949 was 59,039,000 head, compared with 51,266,000 head a year earlier, and a preliminary estimate of 62,500,000 head for the spring of 1950. The autumn crop of 1949 was estimated at 37,262,000 head, compared with 33,921,000 head a year earlier. Thus the total for 1949 was 96,301,000 head, against 85,187,000 head in 1948.

Livestock on U.S. Farms, Jan. 1, 1949, 1948, and 10-Year Average, 1938-47 (thousands of head)

World. World horse numbers in 1949 were estimated at 76 million head, a slight increase compared with 1948, but 21% below prewar numbers. Increases were mostly in countries recovering from extensive war damage.

World cattle numbers at the beginning of 1949 were estimated at 761 million head, a record, and about 10 million more than a year earlier, and 4% above the prewar estimate. Significant increases occurred in all continents except North America and Africa. Practically all European countries increased; numbers in Argentina declined.

World sheep numbers, estimated at 720 million head early in 1949, increased for the second consecutive year, but were nevertheless 20 million head, or 3%, below the prewar average. Both improved grazing conditions and higher prices encouraged the expansion. The decreases in the U.S., Argentina, and China were more than offset by increases in Europe, Australia, and the U.S.S.R.

World pig production expanded in 1948, resulting in some 261 million head at the beginning of 1949, or 6% more than a year earlier. Further expansion was indicated for the 1949 crop. Significant increases occurred in all continents, with the devastated areas of Europe and the U.S.S.R. showing the major increases. (See also Poultry; Veterinary Medicine.)

LLOYD, HILDA NORA, British gynaecologist (b. Aug. 11, 1891), was educated at King Edward's high school for girls, Birmingham, and the University of Birmingham, where she obtained the degrees of bachelor of science, medicine and surgery. She became senior surgeon at the women's hospital and the maternity hospital, Birmingham, and professor of obstetrics and gynaecology at Queen Elizabeth hospital and the University of Birmingham. On Nov. 3, 1949, she made medical history, when, in the presence of the Queen, she was installed as the president of the Royal College of Obstetricians and Gynaecologists—the first woman to hold the office of president of any British medical college. She succeeded in office Sir William Gilliatt who, a few minutes before handing over to Professor Lloyd, admitted the Queen as an honorary fellow of the college.

LOCAL GOVERNMENT. Great Britain. An outstanding event of the year 1949 was the setting up in January, under the authority of the prime minister, of the Local Government Manpower committee composed of representatives of government departments and local authorities with terms of reference:

"To review and co-ordinate the existing arrangements for ensuring economy in the use of manpower by local authorities and by those government departments which are concerned with local government matters; and to examine in particular the distribution of functions between central and local government and the possibility of relaxing departmental supervision of local authority activities and delegating more responsibility to local authorities."

This committee originated from the request made by the government to local authorities in 1947 that the local authorities should economize in manpower. The local authorities had thereupon made representations to the government that economizing in manpower was not possible while government departments continued to concern themselves with the details of local government administration and that reduction in manpower could be carried out only if departmental controls over local authorities were diminished. The work of the committee was subdivided by the appointment of a number of sub-committees and panels, each concerned with particular local government services.

The first general local government elections to be held under the Representation of the People act, 1948, (which effected certain amendments in the law of elections) took place during April and May. The alteration in the law and procedure and, in some cases, in the areas of constituencies made it difficult both to foretell the results of the elections or to compare them with those of previous elections. Politically there was a swing towards the right; some former socialist councils lost their majorities and in many cases the socialist majority was substantially reduced. The election for the London County council produced the extraordinary result that Conservatives and Socialists obtained equal numbers of seats on the council (64 each) with one Liberal in addition. The fact that a number of the aldermen remaining in office were Socialists was sufficient to ensure the election of a socialist chairman. In the election of the new aldermen (for which only councillors may vote) the chairman of the council took the unusual step of voting. Five out of 11 of the aldermanic vacancies were secured for the Conservatives and the remaining 6 for the Socialists. In the result the council remained socialist by a majority of 78 to 70 (aldermen and councillors together but excluding the chairman).

The local government world received with surprise the announcement by the minister of health (Aneurin Bevan) in the House of Commons on June 27 that the Local Government Boundary commission was to be disbanded. The commission had, in their report for 1948, pointed out the difficulty of reviewing areas of local government without a corresponding review of the functions of local authorities. Bevan alluded to this difficulty and said that the government had come to the conclusion that it would be advisable to repeal the Local Government (Boundary Commission) act of 1945 from which the commission derived their powers; this would involve the winding up of the commission and would put the position back to what it had been before the act was passed until such time as the government had had an opportunity of reviewing the structure and functions of local government.
The Civil Defence act, passed in Dec. 1948, empowered ministers of state, designated by Order in Council, to impose civil defence duties on local authorities (other than parish councils) by means of regulations. The home secretary and the minister of health, having been designated under the act, held discussions with local authorities and their representative associations on the drafting of regulations to be made and on the future form of the civil defence service. On Aug. 10, 1949, the Civil Defence (General) regulation, 1949, came into effect and conferred on local authorities the administrative powers necessary to carry out the civil defence functions subsequently to be assigned to them under further regulations. On the same date the Civil Defence Corps regulations authorized the local authorities each to organize a local division of the Civil Defence corps.

Further regulations were issued during November dealing with the organization for civil defence purposes of fire brigades and rescue and ambulance services, with the evacuation of the civil population, with the accommodation and care of the homeless, with the safeguarding of sewerage services and with the instruction of the public in civil defence. Local authorities were busy during the year considering ways and means of carrying out their duties in these matters.

Economic difficulties continued to restrict the activities of local authorities throughout 1949, particularly in the field of public works. One notable exception was the project of the London County council for the construction of an embankment on the south side of the Thames, in the borough of Lambeth between Westminster and Waterloo bridges. This project, encouraged by the government, had the short-term object of providing a site for the Festival of Britain exhibition in 1951 and the long-term object of forming part of the permanent re-development of the south bank area. The erection of the new embankment was so designed as to recover some 4½ ac. of land from the river. As part of the scheme both for the exhibition and for permanent use, the erection of a new concert hall was commenced, the foundation stone of which was laid by the prime minister, C. R. Attlee, on Oct. 12, 1949. The London County council indicated that it was their intention to use the hall for programmes, whether of music, ballet or drama, of a high artistic order, promoted by the council itself and by commercial and other interests under lettings from the council. The council also decided to cooperate in the formation of a company for carrying out in Battersea park activities connected with the festival.

County councils and county borough councils were occupied during the year with the making of schemes for the setting up of valuation courts, constituted from valuation panels made up of unpaid members, to hear appeals from decisions of valuation officers of the commissioners of inland revenue who, under the Local Government act, 1948, were given the duty in place of the local assessment committees of making valuations for rating purposes. The minister of health asked that the panels should be constituted by Nov. 1949 so that the valuation courts could start functioning early in 1950.

(W. E. J.)

United States. Significant federal legislation in 1949 which affected cities included the provision of increased federal aid for airports, increased federal aid for hospital construction by municipalities and payments in lieu of taxes to cities on low-rent housing projects for the fiscal year 1950 with retrospective payments for the fiscal years 1949 and 1948. Also, the programme of federal aid for local public works planning programmes which terminated...
on June 30, 1947, was resumed in 1949 when congress authorized a two-year programme of $100 million interest-free loans to states, cities and other public agencies to finance plans for a $3,000 million group of public works projects, and appropriated $25 million for the fiscal year 1950. While arrears in necessary public works throughout the country were estimated at about $100,000 million, materials granted increased more available and there was a decline in construction costs.

After hearings in May at which federal, state and local officials, members of the Hoover commission and others appeared, a measure for the establishment of a permanent National Commission on Intergovernmental Relations composed of 14 members representing the federal, state, municipal and county governments and private citizens was introduced into the Senate. The commission would be responsible for the continuous study of the allocation of functions between governmental levels, and of intergovernmental fiscal relations. The American Municipal association at its annual conference in December adopted an extensive statement of national municipal policy on intergovernmental relations, endorsing federal legislation for the establishment of a National commission, and urged increased aid by the federal government for urban streets and highway construction.

The federal housing legislation of 1949 contained two sections of major interest to cities: one on urban redevelopment, providing federal aid in the acquisition, clearance and development of blighted or undeveloped areas; the other offsetting federal aid in the construction of low-rent public housing for low-income families.

Fiscal data on the nation's 397 largest cities for 1948 showed that expenditures by cities of over 25,000 population totalled $4,000 million and exceeded expenditures in 1947 by 16%. Revenues amounted to $3,700 million, or 14% more than in 1947. Revenues from property taxes increased 10%; from city sales and gross receipts taxes, 31%; and from state aid and service charges, 14% each. Expenditures for current operations, constituting three-fourths of municipal spending in 1948, exceeded the 1947 total by 13%; capital outlays increased almost 50%.

Budgets early in 1949 reflected a cautious approach by city officials, due to declines or a levelling off in prices and construction costs. There were few general increases in city salaries, few extensions of municipal services and no substantial increases in property tax rates. During 1947 and 1948, local sales and income taxes had become the largest sources of tax revenues next to the property tax.

The work of the Hoover commission in recommending economies in the national government set the wheels in motion for similar action in local government. Los Angeles, for instance, appointed a commission of 27 citizens to study all city departments, with a view to the improvement of city organization and operating methods.

A survey of pay rates in 100 cities showed that fewer city employees received increases in the first half of 1949 than in the corresponding period of 1948 and 1947: 40% compared with 61% and 47% for 1948 and 1947 respectively.

On Dec. 31, 1949, there were 891 council-manager cities in continental United States, and 15 council-manager counties. Of the cities, 71 adopted the plan in 1949, compared with 74 in 1948 and 75 in 1947. There were eight abandonments in the United States in 1949. Voters of Des Moines, Iowa, decided to abandon the commission form of government it had adopted in 1908, in favour of council-manager government, effective in March 1950.

Proportional representation was finally abolished in Massachusetts when the legislature, after several attempts, succeeded in removing it from the state's optional Plan E charter for cities. (A. M. Ds.; L. Gu.)

**LOCKE, ARTHUR D'ARCY** (Bobby), South African golfer (b. Germiston, Transvaal, South Africa, Nov. 20, 1917), was educated at Benoni high school. At the age of 17 he won the Prentice tournament and in 1935 won the South African open and amateur championships, being the youngest player ever to do so. He again won the South African open in 1937 and held it throughout World War II. During a European tour in 1938 he won the Irish open and the Dutch open, and also in the same year the New Zealand open. He joined the South African air force in World War II, becoming a pilot and serving in the middle east and in Italy. He played in England in the 1946 season and was awarded the Harry Vardon trophy for the lowest aggregate score for competition play in Britain during the year. He won the Canadian open in 1947. During the early part of the 1949 season he played in the United States and arrived in Britain for the open championship at Sandwich. With a final score of 283 for 72 holes—the same as that of H. Bradshaw, of Kilcroney, Ireland, he won the play-off by 12 strokes and thus won the open at his sixth attempt. In the Irish open, Bradshaw beat Locke by one stroke. During the year the American Professional Golfers' association banned him from competition because of alleged failure to keep his playing contracts. He returned to the United States and left for Johannesburg in September to undergo an operation for appendicitis.

**LOCKOUTS:** see STRIKES AND LOCKOUTS.

**LOCKSPÉISER, SIR BEN,** British scientist (b. March 9, 1891), was educated at the Grocers' school, at Sidney Sussex college, Cambridge, and the Royal School of Mines. In 1939 he was appointed assistant director of scientific research at the Air Ministry, and from 1941 he was at the Ministry of Aircraft Production where he took a leading part in the direction of aeronautical research. Leaving in 1946, when director general of scientific research, he was appointed to the newly created post of chief scientist to the Ministry of Supply and in May 1949 succeeded Sir Edward Appleton as secretary of the Department of Scientific and Industrial Research. In 1947, accompanied by Sir Henry Tizard, he visited Canada at the invitation of the Canadian government to inspect defence establishments in the dominion; and in the following year he visited India as a member of the quinquennial reviewing committee of the Indian Institute of Science. On May 20 he opened new Nickell research laboratories at Ruabon, near Chester. He led the British delegation to the African regional scientific conference which was opened by D. F. Malan, prime minister of South Africa at Johannesburg on Oct. 17. He was knighted in 1946.

**LONDON.** The largest city in the world, the largest port, the largest industrial town in England, the capital city of the United Kingdom and of the empire. London consists of the Borough of London, comprising the City of London and the City of Westminster, the ancient heart of London (area, 1.05 sq. mi.; pop. June 30, 1949, est. 8,390,850), and Greater London, the 19th century suburbs and to the north, west, east and south, the County of London (area, 16 sq. mi.; pop. June 30, 1949, est. 8,909,594), comprising the whole of Middlesex and large areas of Kent, Surrey, Hertford and Essex. Chairman of the London County council, J. W. Bowen; Lord lieutenant of the county, Field Marshal Earl Wavell; Lord mayor of London, Sir George Aylwin, and, from Nov. 9, 1949, Sir Frederick Rowland.

**History.** On April 8 the triennial municipal elections took place both for the London County council and the metropolitan boroughs. In April in the elections to the London County council by a remarkable turn over of votes from Labour
to the Conservative party the two parties drew even (64:64) and the solitary Liberal elected, Sir Percy Harris, held the casting vote. The Labour party however claimed the right to appoint the chairman and also to fill 6 of the 11 aldermanic vacancies. In the borough elections on May 12 there was a similar trend of votes resulting in a gain of six boroughs—Holborn, Paddington, St. Pancras, Lewisham, Stoke Newington and Wandsworth—all predominantly working-class districts, to the Conservative interest.

The year was for London the first after World War II of a return to something like normal life and routine, with fewer public events, less pageantry than in 1948 and with the tale of regular London fixtures and events revived after a lapse of ten years or more almost completed. Restoration and construction were proceeding steadily if not spectacularly: on many bombed sites the welcome sign "sold" replaced the hitherto too numerous "for sale" notices; and in important areas, notably in the city proper, mechanical grabs were at work clearing bombed foundations and steel frames were rising. Scaffolding on many of Wren's churches indicated repairs in progress: the restoration of St. Clement Danes began; and the restored Middle Temple hall and the reconstructed north aisle of All Hallows, Barking-by-the-Tower (Tooth guild church), were opened in July by the Queen. In October the prime minister laid the foundation stone of a new permanent concert hall, to form part of the 1951 Festival of Britain exhibition buildings, on the south bank of the river close to the railway between Waterloo bridge and County hall.

Continued cleaning of façades and increased use of flowers at windows, balconies and in churchyard gardens, and flower gardens laid out on bombed sites, did much to brighten the general aspect of the capital. The switching on of electric publicity signs on April 2 brought crowds to Piccadilly circus, Trafalgar square and the West End centres to see the return...
of London's former night-time gaiety; and in May, partly for the indulgence of foreign summer visitors a clause was added to the Licensing bill permitting properly licensed restaurants and night clubs in London to conduct business till 2 a.m.

Extensive rehousing activities in many parts of London included, among developments showing originality, a block of flats of unusual design in Finsbury, blocks of flats in Islington for old people built by the London Parochial Charities with garden courts and special amenities and equipment; and West Ham borough council partially completed a remodelling of a large, badly bombed district as a "neighbourhood unit" on garden city lines, intended to house 12,000 people, called the Keir Hardie estate.

Throughout the port of London there were steady repairs and reconstruction to wharves, transit sheds, quays, lock gates and docking machinery. New piers at Putney and Charing Cross were constructed to deal with the summer "water-bus" traffic. The tonnage handled in the port continued to rise and at 45,939,095 tons at the close of March 1949 was 44 million tons above the annual total at the same date in 1948 and 74% of the 1939 figure.

Noteworthy events in the artistic life of London were the visits during the summer of select masterpieces from the Alte Pinakothek, Munich, and the Kunsthistorisches Museum, Vienna, to the National and Tate galleries respectively. The Royal Academy in addition to the usual summer show (the attendance not quite up to the record of 1948) opened in January an exhibition of works acquired for the nation under the Chantrey bequest giving rise to animated public controversy as to standards of artistic taste; and in December an exhibition of French landscape painting, to run through the winter months.

At the British museum in September the Elgin marbles were restored to public view, after ten years' seclusion, in a much improved arrangement in the redecorated old Elgin rooms. The new galleries built for them (a gift of Sir Joseph Duveen) had received severe war damage. At St. Paul's cathedral a design was being considered for replacing the 19th century reredos by a baldachino of baroque style in keeping with Wren's known ideas. The apsidal chapel was to become a memorial chapel to members of the U.S. forces who lost their lives while based on Britain during World War II, the expenses to be borne by British contributions. A marble roll of honour was being prepared in the United States.

The normal tranquillity of the lord mayor's show (recapitulating the history of transport) on Nov. 9 was marred less by the torrential rains than by the bolting of the horses of the retiring lord mayor's coach to the discomfort and slight damage of some spectators. In November the officers and ratings of H.M.S. "Amethyst" were welcomed in London with a thanksgiving service at St. Martins-in-the-Fields and a banquet at Guildhall. In December there was a reception by the King, a triumphal march and luncheon at the Guildhall for representatives of the Royal Air Force and others who had taken part in the Berlin air lift.

Nearly all the statues removed from open air sites during the war returned to their positions. That of Sir Robert Peel formerly at the junction of Newgate street and Cheapside was still absent; the Royal Marines' memorial was re-erected in the Mall close to its former site now occupied by the Admiralty citadel; the Royal Naval division memorial was to go to Greenwich and the statue of General Gordon from Trafalgar square, after much discussion, was to stand in Whitehall place in front of the new government building in course of erection.

In addition to further discoveries relating to Roman and mediaeval London in the bombed Cripplegate area, the Mediaeval and Roman London Excavation council had to deal in circumstances of emergency with finds, principally Roman, brought to light by contractors' mechanical excavators clearing bombed sites for reconstruction in Old Jewry, Eastcheap, Wallbrook, Bankside and elsewhere in and around the city. The Wallbrook (now far below street level), which formed at Dowgate the Roman port of London, yielded remains of Roman quays, pavements, articles of use including a Roman sandal and a fragment of a presumably Roman stone bollard.

Budget. During 1948-49 the London County council were spending an estimated £64,569,217 on all amounts, towards which the state contributed grants estimated at £11.5 million. The net expenditure on these rates was estimated at £23.9 million.

**LONDON UNIVERSITY.** Bedfords College, the earliest university college in Great Britain for women, celebrated the centenary of its foundation in May 1949 and was honoured by a visit from Queen Mary. Much of the new building undertaken to replace what was destroyed in air raids had been completed. The dome of University college, also destroyed in air raids, emerged anew from the scaffolding on the main block, and good progress was made with the new laboratories on the site of the bomb crater at King's college. Good progress was also made with the reconstruction at St. Bartholomew's Hospital Medical college, at the London School of Hygiene, and with the new wing of the Royal Free Hospital School of Medicine. On the Bloomsbury site the shell of the new Birkbeck college was completed and further progress made with the reinstatement of war damage to Senate House and library.

The British Postgraduate Medical federation in 1949 had affiliated 13 institutes attached to specialist hospitals. The enlarged Institute of Education had admitted 30 institutions for the training of teachers as constituent colleges or departments of the institute, and inaugurated refresher and advanced courses for practising teachers.
The number of students in schools and institutions of the university was about 16,800 and there were a further 5,000 internal students in polytechnics, etc., in the London area. Hostels for women were opened at Wye college, Kent, and at Nutford house in London. The facilities for students at the temporary Union society buildings were improved by the introduction of a catering service which provided over 400 lunches daily at cheap rates.

The number of external students including those overseas exceeded 30,000 and was three times the prewar figure. An important development was the establishment of a special relationship with University college, Southampton, as a first step to similar arrangements with the other provincial universities whereby teachers at the college were directly associated with the university in the degree examinations for their students. The volume of the university’s extra-mural adult education work also increased, notable developments taking place in residential courses and in vacation courses for foreign students.

The vice-chancellor, Professor Lillian Benson, was one of the British delegates to the Conference of Commonwealth Universities at Halifax, Nova Scotia, and she took the opportunity of visiting several Canadian and U.S. universities. Other members of the university paid advisory visits to the new colonial university colleges in Africa and the West Indies and assisted in the recruitment of staffs. In addition, many of the teachers in the university co-operated with teachers in these colleges in the setting and marking of their examinations. The Senate considered this aspect of the university’s work to be of paramount importance.

(J. H. Ps)

LORDS, HOUSE OF: see PARLIAMENT, HOUSES OF.

LUCA, VASILE, Rumanian politician (b. Lemneni, Trei Saune, Transylvania, June 8, 1898), son of a Hungarian peasant, spent seven years in an orphanage and later became a mechanic-locksmith apprentice. He served in the Austro-Hungarian army in 1915-18 and took part as a Socialist in the Hungarian revolution in 1918-19. He remained in Rumania after the signature of the Trianon peace treaty and in 1922 joined the Communist party of Rumania, becoming in 1928 a member of its central committee. Sentenced to 10 years’ imprisonment for organizing a strike in Grivita railway workshops in 1933, he was freed by the Soviet army in 1940, at the time of the occupation of Bessarabia. He became a Soviet citizen and from 1940-44 was deputy to the U.S.S.R. Council of Nationalities. In Aug. 1944 he was sent back to Rumania, renounced Soviet nationality and assumed the duties of secretary general of the Rumanian National Democratic front (from 1946 the Democratic Parties’ bloc). On Nov. 19, 1946, and on March 28, 1948, he was elected deputy from Cluj to the National Assembly. In recognition of his voluntary service in the Soviet army during the war, he was appointed in Nov. 1947 brigadier general (reserve) of the Rumanian army and, on the 7th of the same month, minister of finance. On April 15, 1949, he became one of the three deputy prime ministers in the Petru Groza cabinet.

LUTHERANS. Lutheran Churches throughout the world were engaged during 1949 in three major tasks: the work of serving refugees, expanding their mission programme and fighting against persecution from totalitarian states.

Within the framework of the Lutheran World federation a department of service to refugees was giving spiritual ministrations and assisting in re-settlement of displaced persons and refugees. Large-scale immigration from Germany, Austria and Italy to the United States, Canada, Australia, South America, New Zealand and South Africa was changing the geography of Lutheran protestantism. It had become evident that millions of Lutherans from eastern Europe would have to find a permanent place in the life of Western Germany because of the limitations of mass emigration. Refugees previously settling in Italy, France, England and Sweden had created new developments. In Italy a Lutheran church body was formed in 1949, the first in the country’s history.

The absence of a peace treaty with Germany, currency restrictions and war devastation made necessary the support of orphaned missions and younger churches in the near east, Africa, China, India, New Guinea and Indonesia. The Lutheran World federation organized a commission on missions to co-ordinate the evangelistic efforts of the various member bodies. An immediate result was an international approach as in Africa, where American, Swedish, Norwegian and Finnish missionaries were working in one field. Lutherans launched a new advance in their mission programme in Japan where three groups began work in 1949.

The continued pressure from totalitarian states in eastern Europe created serious handicaps to minority Lutheran groups. After imprisonment and imprisonment in 1948 of Bishop Lajos Ordass, new Hungarian church officials amenable to the state sought to win the favour of communism. The Lutheran World federation’s representative in Czechoslovakia was ordered out of the country just a few days alter the new church law went into effect. This law required that pastors and church workers be employed by the state. Opposition to totalitarian measures was extremely strong and effective in eastern Germany under the leadership of Bishop Otto Dibelius of Berlin.

A programme of inter-church aid was still in progress five years after the end of World War II. American Lutherans had contributed more than $50 million to relief and reconstruction in Europe and Asia.

(C E L. Q.)

LUXEMBOURG. An independent grand duchy of western Europe bounded on the south by France, on the north by Belgium and on the northeast by Germany. Area: 1,010 sq. mi., including the 11 sq. mi. of the uninhabited Kammerwald forest and a small village annexed on April 15, 1949, as accepted under the six-power agreement on March 26, 1949. Pop.: (Aug. 20, 1945, census) 281,572, (Dec. 31, 1947, est.) 290,992. Language: Luxembourgian (idiomatic) and (officially) French and German. Religion: Roman Catholic 98%. Capital: Luxembourg (pop., Dec. 31, 1947, est., 61,996). Ruler, Grand Duchess Charlotte (q.v.); prime minister, Pierre Dupont; minister of foreign affairs, Joseph Bech (q.v.).

History. The year 1949 was undisturbed by any crisis or government change, this political stability resting on healthy social conditions and an economy which was little affected by European uncertainties. Unemployment was negligible and food production was maintained at a high level.

Linked with Belgium by an economic and customs union, the grand duchy had to align the Luxembourg franc with the Belgian when the latter was devalued on Sept. 21 (see BELGIUM).

Having relinquished neutrality from April 15, 1948, Luxembourg took part in the various important international meetings, shaping its foreign policy to conform with the general political and economic trends of the western powers. On April 4 Joseph Bech, minister of foreign affairs, signed the North Atlantic treaty and the instrument of ratification was deposited on June 27 with the State Department in Washington by Hugues Le Gallais, Luxembourg minister to the United States.

Within the framework of the Organization for the European Economic Co-operation the grand duchy upheld a policy of a
progressive return to free circulation of goods in Europe.

Bech, speaking in Paris on Nov 2, commented that, although all must make sacrifices, no country should be asked to subscribe to the ruin of its key industry: Luxembourg was particularly vulnerable, since its steel and iron industry was the whole basis of its economic life.

(G.-H.D.)

Education. (1948) Schools—elementary 966, secondary 7, technical 3

Agriculture. About one third of the Luxembourg area is arable land

Production (in metric tons, 1948). bread grains 35,958; other cereals 37,881.

Industry. Industrial establishments (1948) 12,664, persons employed 46,513. Production (in metric tons, 1948, 1949, six months, in brackets) pig iron 2,626,334 (1,381,034), steel ingots and castings 2,452,844 (1,318,262); synthetic fertilizers 545,214 (292,178)

MACAO: see Portuguese Colonial Empire.

MACARTHUR, DOUGLAS, U.S. army officer (b. Little Rock, Arkansas, Jan. 26, 1880), as commander of the southwest Pacific forces accepted the Japanese surrender in Tokyo bay on Sept. 2, 1945, and was made supreme commander of Allied powers in Japan. (For his early career see Encyclopedia Britannica.)

In Jan. 1949, MacArthur reported that the Japanese had accepted a democratic way of life and would not yield before Communism or any other concept of enslavement. Communist plotting continued to be one of his chief problems, however, and on June 13 he accused the U.S.S.R. of inciting disorders in Japan through the Communist party. In May he recommended that Allied control of Japanese affairs be relaxed, since continued occupation was not the fault of the Japanese, he said, but of conditions in China. On July 28 he ordered occupation controls at the local level to be disbanded by the end of the year, leaving such controls operative only nationally. On Dec. 21 he asserted that 370,000 Japanese prisoners were still in Soviet hands.

MACEDONIAN PROBLEM. Reduced to the simplest terms, the Macedonian problem centres on the attempt of the Macedonian people, divided between Yugoslavia, Bulgaria and Greece, to achieve unity and independence. Difficulties arise from the fact that the national consciousness of the Macedonians is of only comparatively recent origin, that they are small in number and that the strategic importance of the area concerned has made it a focus of conflicting interests among various powers. This problem, which had seemed near settlement after World War II by the transformation of Yugoslavia into a federal republic, and by reason of the friendly relations existing between Yugoslavia and Bulgaria, became acute again after the quarrel between the Moscow Politburo and Marshal Tito was made public.

History. In Nov. 1948 the Bulgarian government had allowed an organization of Macedonians in Bulgaria to publish a declaration to the effect that the only correct and democratic solution of the problem was a Macedonian state equal to Yugoslavia and Bulgaria. Five months later the so-called Greek Democratic government became involved in the controversy when it sponsored a similar plan. At a congress of 168 delegates held on March 27, 1949, in the rebel-controlled Vitsi massif, in northern Greece, a Communist organization in Aegean Macedonia (K.O.E.M.) was formed. The gathering was addressed by Nikolaos Zahariadis (q.v.), secretary general of the Communist Party of Greece, and Demetrios Partsalidis, the “prime minister.” Both pledged the support of the Greek Communist party for the new plan to form an independent Macedonian people's republic including not only Yugoslav and Bulgarian, but Greek (Aegean) Macedonia as well. The congress elected a central committee of which Mikhail Malov was secretary general and among its members were Paskal Mitrovski and Stavros Gochev, “ministers” in the Partisan “government.”

This change of tactics in 1949 was the third since the Kremlin decided to take an active part in the Macedonian problem. The first ploy had been formulated through the Comintern in 1924 when Dimitar Vlahov, a prominent Macedonian Communist, persuaded Todor Aleksandrov, the leader of the V.M.R.O. (Vontresha Makedonska Revolutsionna Organizatsia, or Internal Macedonian Revolutionary Organization), to form a new United (Obdenena) organization (O.V.M.R.O.) to fight for an autonomous Macedonia within a Communist Balkan federation. Shortly afterwards, the members of the old V.M.R.O.—fighting simply for a Great Bulgarian solution of the Macedonian problem—assassinated Aleksandrov and elected A. N. Protophorov as their leader. When he in turn was assassinated in 1928 he was succeeded by Ivan Mikhailov.

The second Moscow policy in the Macedonian problem was evolved during World War II. As Yugoslavia was partitioned and practically all Macedonian lands were in Bulgarian occupation, Moscow decided that the Macedonian problem should be dealt with through the Bulgarian Communist party. On July 12, 1943, at Petrich, Dushan Daskalov, on behalf of the Bulgarian Communist party, and Yannis Ioannou, on behalf of the Communist Party of Greece, signed an agreement fixing the southern frontier of Macedonia on the Olympus latitude and deciding that Macedonia should be one of the independent republics within the Balkan Communist federation.

By then, however, the importance of Josip Broz (Tito) was growing in Yugoslavia. In his opinion a Balkan Communist federation was desirable but could become a reality only under the leadership of the Communist Party of Yugoslavia. Already in 1943 Tito had sent Svetozar Vukmanović (General Tempo) to Skopje to organize the Macedonian section of the Yugoslav Liberation front, with such success that the Kremlin had to accept the fait accompli. In 1945 Dimitar Vlahov became vice-president of the Federal Republic of Yugoslavia and Lazar Kuliševski prime minister of
the republic of Macedonia, with Skopje as capital. At that
time Tito was looking south, towards Salonika. At Skopje
on Oct. 11, 1945, he said: "We shall never renounce the
right of the Macedonian people to unite. There are brothers
in Aegean Macedonia to whose destiny we are not indifferent."

At a meeting between Tito and the Bulgarian prime
minister, Gheorghi Dimitrov, at Bled, in Aug. 1947, it was
agreed that Bulgarian Macedonia should be incorporated
into Yugoslav Macedonia as a first step towards the unifica-
tion of the Macedonian people. The two leaders hoped that
Aegean Macedonia would be included after it had been
liberated by the Greek Communist rebels: they were also
planning a great South Slav federation including Yugos-
lovakia and Bulgaria. In Jan. 1948, however, Dimitrov was
rebuked in Pravda for supporting such an idea. The Kremlin
was already exchanging not-too-friendly letters with Tito
and on June 28, 1948, the breach became public.

By sponsoring the creation of K.O.E.M., the Soviet
government was reverting to its second policy in the Mace-
donian problem—that of using Bulgaria as its main pawn
in the Balkans. Tito replied by concentrating in Macedonia
ten divisions—one-third of the entire field strength of the
Yugoslav army—and by closing the Yugoslav-Greek frontier.
This last move, announced on July 10, 1949, was of great
assistance to the Greek army in their fight against the rebels.
On Aug. 2 Marshal Tito in a speech at Skopje attacked the
Bulgarian Communists for postponing the fusion of Bul-
garian and Yugoslav Macedonia. In particular he described
Vladimir Poptomov (whose appointment as minister of
foreign affairs of Bulgaria was announced a few days later)
as one who had "sold his national conscience for a chicken
drumstick." (Tito had in mind the Macedonian national
conscience of Poptomov who, in the mid-twenties, was a
active member of the O.V.M.R.O.); he also was one of the
56 members of the Anti-fascist Council of National Liber-
ation of Yugoslavia [A.V.N.O.J.] formed at Jajce, Bosnia, on
Nov. 29, 1943). Marshal Tito also attacked Zahariadis whom he
accused of having forgotten about the struggle for democracy
in Greece and of regarding support for the Cominform's
campaign against Yugoslavia as the more urgent task.
On the same occasion Kulievski re-voiced the claim that Yugo-
slav Macedonia had become the "Piedmont" of the whole
of Macedonia.

In Athens and elsewhere these Skopje speeches were
noted without alarm. There was no reason to suppose that Yugo-
slavia would adopt a friendly attitude towards anti-Com-
munist Greece. Nevertheless, as the year closed, a Yugoslav-
Greek dispute over the Macedonian problem seemed only
a most remote likelihood.

Statistical Data. Yugoslav or Vardar Macedonia, a member of
the Yugoslav federal republic from 1945, covers 10,338 sq. mi and—
according to the 1948 census—had a population of 1,52,500,
four-fifths of the Macedonian people who are a branch of the south Slav
people. According to an article by Dimitar Vlahov in the Belgrade
Blazon (Oct. 20, 1948), Bulgarian or Pro Macedon a covers 2,623
sq. mi, with a population of 240,000 Greek or Aegean Macedonia
has an area of 13,360 sq. mi with about 1,759,000 inhabitants. But if
the Yugoslav and Bulgarian parts have a Macedonian majority, in
Greek Macedonia—according to the 1940 census—there were only
65,221 Macedonian Slavs, 16,639 Bulgarians and 18,086 Pomaks or
Moslem Bulgars.

(K. Sm.)

MACHINERY AND MACHINE TOOLS.

During 1949 the output of the machine building industries
in Great Britain continued to be governed rather by ability
to produce than by demand; and, despite the limitations
imposed on the rate of re-equipment at home under the
government's capital investment programme, supplies failed
to satisfy the urgent needs of British manufacturers on the
one hand and of overseas customers on the other. Although
the makers of industrial machinery were themselves still
handicapped by lack of modern plant and by the scarcity of
the necessarily skilled labour, considerable progress was made.
The important textile and hosiery machine group, for example,
had an average monthly output valued at £5,589,000 during
the first half of the year as compared with an average of
£4,693,000 for the whole of 1948. Similarly, the machine tool
industry, upon which all other forms of manufacture ulti-
mately depend, averaged £2,800,000 between Jan.-June as
compared with £2,591,000 monthly average in 1948.

Exports of machinery continued to increase and for
the first nine months of 1949, while the figures were still un-
affected by the devaluation of sterling, reached a total of
£207,751,000, as against £170,307,065 in the same period
of 1948. Although less marked, the corresponding increase
in tonnage, namely, from 577,000 in 1948 to 657,000 in 1949,
was still substantial. Of the various main groups into which
machinery exports were divided, textile machinery was easily
the most important with a value for Jan.-Sept. of £30,795,000,
representing an increase of nearly £4,000,000 over the
equivalent figure for 1948. In the same period machine tool
exports amounted to £12,138,000 or about £500,000 more
than for the first nine months of 1948. Machinery thus made
a substantial contribution to the overseas trade of the United
Kingdom, accounting for more than 15% of all exports, and
was of great importance in connection with the short term
problem of securing a balance between exports and imports.
In relation to the long term problem of raising the general
level of productivity and, consequently, the average standard
of living, however, the scale of machinery exports was
greater than the country could afford.

At a time when the builders of machine tools and other
types of metal-working machinery were preoccupied with the
necessity for continually increasing output, it would have
been unreasonable to expect any widespread introduction of
new designs and, for the most part, the leading firms were
content to consolidate the advances they had made in prepara-
tion for the Machine Tool and Engineering exhibition held
at Olympia, London, in 1948. Some machines of noteworthy
size were, however, completed, among which may be men-
tioned a boring and turning mill weighing 475 tons with a
normal turning capacity of 35 ft. which could be extended to
50 ft., a 3-roll bending machine for stainless steel plate up
to 22 ft. wide by 1 in. thick believed to be the largest of its
type ever made in the United Kingdom and an unusual
gashing machine for preliminary operations on the forged
blanks for sections of large cranks. On the last mentioned
machine the work was rotated, and the 24-in. wide gashes
were formed by a 12 ft. 6 in diameter cutter of the circular-
saw type. Another outstanding machine was supplied to a
manufacturer of aircraft gas turbines. This was a lathe used
for grooving the casings of axial flow compressor units; the
tools could not be seen by the operator while cutting but
their positions were indicated on an optical screen so that the
necessary settings could be made rapidly to a high degree
of accuracy.

The fine-boring process was increasingly employed for
work which had to be held to close limits, and a new 4-way
machine was introduced for operations on diesel fuel pump
housings in which the part was held in an indexing fixture
and 40 bore diameters and 14 faces were finish machined in
34 mm.

There was considerable activity in connection with the
development of special-purpose machines designed to meet
the needs of various industries whereby substantial economies
might be achieved. Such machines included a hydraulic
blade grinding machine for the edge tool trade; a machine
for making 80 cycle spokes per min.; roller fluting, frame
drilling machines for the textile machinery trade; a
McCLOY

duplex spindle locomotive cylinder boring and facing machine and a double-ended centering machine for large aluminum alloy billets.
(Scientific American)

United States. The downward trend in machine tool industry continued during 1949, when shipments barely touched $250 million, compared with $286 million the previous year and a wartime level of $1,360 million. The year opened in lively fashion, with the new-orders index of the National Machine Tool Builders' association at 93 in March (with an average month of 1946-47-48 taken as 100). Then business dropped abruptly until the low level of 47 was reached in July. Recovery was slow, but in November a sharp rise occurred which brought the index figure up to 83. It stayed close to that level in December.

Unlike other postwar years, in 1949 new machine tool orders exceeded shipments. The Economic Co-operation administration supplied the finance for much of the demand. Overseas sales accounted for one-fourth or more of all machine tool orders; England, Italy, France and Western Germany were the best overseas markets.

U.S. machine tool builders realized during the year that in the future they would have stiffer competition from the machine tool industries of England and European countries, especially Germany, but also Italy, Belgium, Sweden, Switzerland and France.

Near the end of 1949 the American Machinist's mid-century inventory of metalworking equipment revealed many facts about machine tools and other production machinery. It showed that the nation's metalworking industries had 3,118,702 production units installed in their plants. Of that number, 1,143,815 were machine-tool units and 471,237 were metal-forming units. If the machine tools in college shops and in maintenance departments outside the metalworking field were included, U.S. machine tool resources were over 2-2 million units which was a record.

It was also revealed that about 42% of all metalworking equipment was ten or more years old, and 19% was over 20 years of age. On the average, the country's production equipment was considerably older in 1949 than it had been at the end of World War II.

Other facts revealed by the American Machinist's inventory were: (1) there were installed in U.S. metalworking industries 396,491 lathes, 362,776 grinders, 361,935 drilling machines and 182,154 milling machines—the four basic types of machine tools; (2) the south had doubled its metalworking operations (based on machines installed) since World War II, and New England had increased its machine tool holdings 53% in the same period; (3) there had been a sizable shrinkage of machine tool facilities in the aircraft industry in the postwar period, and also in the car industry; and (4) the car industry had the highest percentage of old machines of all metalworking industries.

In technical developments, machining speeds tended to increase during 1949. The desired "mile-a-minute" cutting speeds were reached in grinding, even with small-diameter wheels, by developing wheelhead speeds up to 200,000 r.p.m. Lathe speeds had gone up to 1,650 f.p.m. in tests and to 1,500 f.p.m. on production units. Planer speeds had risen more than 50% to 310 f.p.m.

The problem of operating machines at so-called "supercritical speeds" was more seriously tackled in 1949. Research was given an impetus by the disclosure that a German patent was issued in 1931 to C. Salomon, who tested machining of aluminum at speeds of 55,000 f.p.m., of copper at 9,350 f.p.m. and of bronze at 5,300 f.p.m. Manufacturers were looking into the possibility of determining from the metallurgical make-up and condition of the metal exactly what the best machining speed should be, and ordering machines and tooling to fit the specifications.

The scope of carbide tools was broadened. Carbides were mounted so that the cutting force was compression rather than shear and required only simple end dressing of a rotatable performed shape; new forms of holding were employed to reduce the likelihood of cracking from brazing strains; and new forms of carbides themselves were developed.

Several companies in 1949 offered combined coolantslubricants for use in screw machines, and additives for water to reduce its corrosiveness so that its maximum potentialities as a coolant could be realized. (See also ELECTRONICS.)

McCLOY, JOHN JAY, U.S. businessman and lawyer (b. Philadelphia, March 31, 1895), was educated at Amherst and Harvard. He served in World War I and in the occupation forces in Germany after that war. He later practised law in New York city, specializing in corporation law and foreign litigation. In Oct. 1940 he was appointed expert consultant to the secretary of war, and, in April 1941, assistant secretary of war. He became president of the International Bank for Reconstruction and Development in Feb. 1947. Early in 1949, in that capacity, he denied charges by the Warsaw Communist government that the International Bank had discriminated against loan applications from eastern Europe and instead had helped finance French and Dutch wars against rebels in Indo-China and Indonesia. On May 18 McCloy was appointed by President Harry S. Truman as first civilian U.S. high commissioner for Germany, succeeding General Lucius D. Clay. He became also chief E.C.A. representative for Germany, and U.S. representative on the three-power Allied council set up to exercise supreme Allied authority in the federal republic of Germany, which became operative in Sept. 1949.

John Jay McCloy who in 1949 became United States High Commissioner for Germany.
MADAGASCAR: see French Union.

MADRID. Capital city and geographical centre of Spain, chosen as such by Philip II in 1561; second in size to Barcelona. Pop. (est. 1949): 1,440,041. The Royalist mass for Alfonso XIII, organized on the anniversary of his death, on Feb. 28, by the Council of Grandees, which in 1948 was prohibited by the authorities, was attended by 3,000 Monarchists. A strong police force was present: there were no incidents. In March a Madrid court-martial sentenced three Communists to death for terrorism and nine others, including one woman, to imprisonment from 10 to 30 years. Manifestations in the capital in connection with the tenth anniversary of the end of the Civil War, on April 1, were on a larger scale than usual. The Real Academia de Ciencias celebrated the centenary of its foundation in May, under the presidency of General Franco; learned societies of 12 foreign countries were represented. The director of the Spanish Academy, Ramón Menéndez Pidal, emeritus professor of Madrid university and doyen of Spanish scholars, received notable tributes from home and abroad on his 80th birthday. Ramón Pérez de Ayala, novelist and former Republican ambassador to London, returned to Madrid from Argentina, where he had been living in exile.

An exhibition of British painting from 1730 to 1830 was opened in February by Philip Hendy, director of the National gallery in London. Editorial Aguilar, a leading Madrid publishing house, held an exhibition in London in April. Ten boys from the Instituto Ramiro de Maeztu, a famous Madrid secondary school, arrived in London in July to return a visit paid to it by Middlesex boys in June. (W. C. An.)

MAGNANI, ANNA, Italian actress (b. Rome, March 26, 1908). At the age of 17 she attended the Eleanor Duse academy of dramatic art in Rome and later made her debut in music halls. In 1932 she married a film-director, Goffredo Alessandrini, but their marriage was dissolved in 1940. In 1936 Magnani appeared for the first time in films in Cameraria; there followed La Principessa Tarakanova (1938); Una lampada finestra (1940); Finalmente soli (1941); La fugitiva (1941); Teresa Venerdì (1941); La fortuna viene dal cielo (1942); Campo dei fiori (1943); La vita e bella (1943); Un uomo ritorna (1945); Roma città aperta (Open City) (1945), which, directed by Roberto Rossellini (q.v.), earned Magnani the Silver ribbon (Italian) award for 1945-46 and the American critics' award for the best actress of 1946; Abbasso la ricchezza (1946); Il bandito (1946); Davanti a lui teneva tutta Roma (1946); L'Onorevole Angelina (Angelina, M.P.), (1947), where her performance won her the Grand International prize for the best actress of 1947 at the Venice Film festival; Assunta Spina (1948); Molti sogni per le strade (1948). Again in 1948 Magnani was awarded the Silver ribbon for her acting in Amore, in which for some 90 min. she was practically alone in front of the camera. In 1949 she acted in Vulcano, directed by W. Dieterle for the United Artists' film corporation. In March she visited London and attended the premiere of her film, Angelina, M.P. Anna Magnani has been recognized as the greatest actress of the Italian cinema and her art, which is strongly emotional, derives much of its truthfulness from an intuitive realism in approach. Speaking of Roma città aperta, Magnani said, "I don't act, I live."

MAKONNEN ENDALKACHAW, Bitwadded,* Ethiopian statesman (b. Addis Ababa, Feb. 16, 1891). His father, Balambaras Endalkachaw, a military commander under the Emperor Menelik, was killed in a campaign in Wallamo. Makonnen's first appointment was registrar of companies (1926); in the following year he became minister of commerce with the rank of negadras. In 1928 he was Ethiopian delegate to the League of Nations; after staying some time in France, he was appointed Ethiopian minister in London. Returning to Addis Ababa in 1932, he became kanitha (lord mayor) of the city; at the end of his term of office he was appointed minister of the interior, with the rank of dejazmach. In 1935 he was made governor of Illubabor; during the Italian invasion (1935-36) he saw service on the southern (Ogaden) front, being promoted brigadier general. After sharing the emperor's five years' exile he became, in 1941, president of the council of ministers, holding in addition the portfolio of the interior; two years later he was made prime minister, with the rank of bitwadded; he is a member of the Imperial Crown council. He signed the Anglo-Ethiopian agreement of 1944 as Ethiopian plenipotentiary, and in 1945 went to the San Francisco conference as chief Ethiopian delegate. He married, first, Waizero Zawditu, daughter of Ras Bitwadded Mangasha Atikam; by her he had a daughter and a son; after her death in 1936 he married Princess Yeshash-Warit, niece of the emperor. His published works are a play (The Voice of Blood) performed with success in Addis Ababa: This Capricious World, a novel romance, and The Stone of Cain, a philosophical dialogue.

MALAN, DANIEL FRANÇOIS, South African statesman (b. Riebeek West, Cape Province, May 22, 1874), became prime minister and minister of external affairs on June 3, 1948, in succession to Jan Christiaan Smuts (q.v.). (For his early career see Britannica Book of the Year (1949).

On Feb. 16, 1949, he was taken ill while introducing the second reading of the South West Africa Affairs bill in the House of Assembly, but was able to continue his speech on the following day. He left the Union for the first time after becoming prime minister when in April he flew to London for the Commonwealth prime ministers' conference. After the conference he went to the Netherlands where he was received by Queen Juliana, and to the Utrecht university where he had been a student nearly fifty years before. He also visited Berlin, Switzerland, where he went to the house once occupied by Paul Kruger in Montreux, and Rome where he was received by president Luigi Einaudi. He returned to South Africa on May 6. In a speech to the House of Assembly on May 11 on the Commonwealth conference he stated that he believed that South Africa's greatest chance of unity lay in a republic but that it would never leave the Commonwealth. In a speech to the Orange Free State Nationalist party congress on Oct. 26 he declared that he was preparing to make representations to the British government for the incorporation of the protectorates of Bechuanaland, Basutoland and Swaziland into the Union. On Dec. 16 he opened the Voortrekker memorial at Pretoria.

* All titles are printed in italics.
History. In the federation the disturbances, which had broken out in June 1948, continued to dominate the situation in 1949. The actual number of Gurkha and British troops engaged was not disclosed but was believed to be about a division; and they were assisted by the forces of the Malayan regiment, air force units, naval coastal patrols and at least 20,000 police. The daily cost of the operations was estimated at £25,000. But in spite of the strength of the forces involved and the fact that the Communist-led bands were never assumed to number more than 5,000, the hard core of the revolt was not broken. Up to November approximately 900 bands had been killed and 525 captured, as opposed to 21 officers and 99 other ranks killed; 15 officers and 162 other ranks wounded; 264 police and 568 civilians, including 34 Europeans, killed. September saw an intensification of the campaign, combined with an offer by the government to those who had been consorting with the bands—in many cases unwillingly—that they would not incur the death penalty for the carrying of arms if they surrendered voluntarily to the authorities. But the offer met with small response and the campaign dragged on.

One effect of the troubles was to bring the leaders of the various communities closer together. In January a Communities Liaison committee was formed; it truly reflected the variety of races that goes to make up Malaya, comprising 6 Malays, 6 Chinese, 1 Indian, 1 European and 1 Eurasian under the chairmanship of a Ceylonese. In March this committee put out a statement in which it stressed the need for close understanding and cordial co-operation between all those races; and in another statement, issued in September, it showed that a basis had been agreed for a policy of political, social and economic development of the country.

In May it was announced in the British parliament that in view of the increased burdens which Malaya had had to bear, the British government had decided to offer a free grant of £20 million towards the Malayan War Damage Compensation scheme in place of the £10 million offered in the previous year; and also that an interest-free loan of £160 million (approximately £184 million) was to be made available to the federation government to be repaid in annual instalments (to the extent that it was taken up) commencing in 1956. In the same month the federation government floated a £8,050,000 loan on the London market to finance rehabilitation and development projects including railway and road communications, drainage and irrigation schemes, and other public works.

Law and order was maintained in Singapore, which was the scene of a number of conferences, both local and international, including a conference of British governors and service chiefs in Southeast Asia under the chairmanship of the commissioner general in January; another in November for British diplomatic representatives, colonial governors and service chiefs in the far east; the inaugural session of the Indo-Pacific Fisheries council in March; and the fifth session, attended by 19 countries, of the United Nations Economic Commission for Asia and the Far East in October.

The legislatures of both territories accepted the recommendations of the Commission on University Education in Malaya and passed legislation creating a University of Malaya, of which Malcolm Macdonald was appointed first chancellor. The university was formally opened in October.

In spite of the troubles in the federation, production of rubber and tin never failed; and at Kuala Lumpur in February for the first time in the history of Malaya there took place a Trades Union conference attended by some 150 delegates representative of 80% of the unions of the country.

Principal exports. Rubber, tin, tin ore, palm oil, coconut oil and copra. The trade figures are exclusive of trade between Singapore and the federation; and noie should be taken that as an entrepot centre Singapore was the federation’s chief source of supply and chief customer—

to the extent of $370,915,301 and $498,967,682 respectively in 1948

(J. A. Hu.)

MALENKOV, GHEORGHY Maksimilianovich, Soviet politician (b. Orenburg [Chkalov], Jan. 8, 1901), joined the Communist party in April 1920. After the civil war, he studied at Moscow Higher technical college and was secretary of the Communist students’ organization. In 1925 he was appointed personal secretary to Joseph Stalin. In 1930 he was organizing secretary of the Moscow section of the party. In March 1934, before the purges of 1936-38 Stalin appointed him head of the Personnel department. The 18th congress of March 1939 elected him member of the central committee of the All-Union Communist party which, in turn, appointed him one of the four secretaries. On Feb. 21, 1941, he became a substitute member of the Politburo and on June 30, 1941, a member of the State Defence committee. For organizing aircraft production during World War II he was awarded in 1943 the title of Hero of Socialist Labour and the Order of Lenin. On March 19, 1946, he was appointed one of ten full members of the Politburo and one of eight (they were 13 by 1949) deputy chairmen of the Council of Ministers. Besides Stalin, only Malenkov was simultaneously a member of the government and of the three key party bodies: Politburo, Orgburo and secretariat. On Sept. 22-23, 1947, he and the late A. Zhdanov were Soviet delegates at the conference at Wilcza Góra, Poland, at which the Cominform was created. In a speech delivered in Moscow on Nov. 6, 1949, he said that the warmongers envisaged the creation by means of violence of an “American world empire” but there could be no doubt that if the imperialists unleashed another world war it would mean the grave of world capitalism.

History. A delegation from the government of Malta consisting of the prime minister, Dr. Paul Boffa, the deputy prime minister, Dom Mintoff, and the commissioner general in London, Edward Ellul, visited London during the summer of 1949 in order to obtain further assistance towards the colony’s finances and economy. The three main objectives of the delegation were an indefinite prolongation of U.K. contributions to the cost of food subsidies (which were due to end in 1949); the maintenance of the existing high levels of employment in Malta by the British armed services, notably in the dockyard where 12,500 were employed compared with 8,050 in 1939; and more direct benefits to Malta under the European Recovery programme.

The British government requested information on the economic and financial position in Malta; but instead of supplying this information in a suitable form the Maltese government presented an “ultimatum.” The British government thereupon stated that it was not willing to continue the talks and Dr. Boffa withdrew the “ultimatum” on Aug. 15. The talks continued but the British government was unable to concede the major claims of the Maltese government, although it was decided to reduce the rate of dismissals of persons employed in the dockyards and the War Office offered to give work in Cyrenaica to Maltese workers.

Dom Mintoff resigned from the government on Aug. 15, and Edward Ellul resigned his post the following day because
they did not agree to the withdrawal of the "ultimatum." Dr. Boffa continued the discussions in London until Sept. 5. In a debate in the Legislative Assembly from Sept. 9 to Sept. 19, Dr. Boffa defended his action against a bitter personal attack by Dom Mintoff and received a vote of confidence by 24 votes to 7 (Mintoff and six supporters abstaining). The Maltese Labour party, by 244 votes to 141, censured Dr. Boffa as leader of the party and prime minister. Dr. Boffa and other ministers subsequently resigned from the party and Dom Mintoff was elected party leader.

In the period April 1948 to March 1949, 3,140 Maltese residents left for other countries. Of these 1,265 went to Australia, 772 to Canada, 323 to the U.S. and 747 to Britain (see also IMMIGRATION AND EMIGRATION).

MAN, ISLE OF. An island in the Irish sea forming part of the United Kingdom of Great Britain and Northern Ireland, but administered separately by a lieutenant governor, an appointed Legislative Council, and the House of Keys of 24 elected members. Both branches of the legislature sitting together as one body, but voting separately, are known as the Tynwald court. Area: 220-7 sq. mi. Pop. (1939 est.): 50,829. Capital: Douglas (pop. 20,012). Lieutenant governor, Air Vice Marshal Sir Geoffrey Bromet.

History. In May the Tynwald unanimously passed a resolution declaring that it was right that the island should make a greater contribution towards the cost of imperial defence and other common services. Under the Isle of Man Harbours act, 1866, the island paid £10,000 annually to Great Britain. The home secretary suggested certain revision including a form of customs union and a deputation led by the lieutenant governor visited London for discussions. The Treasury suggested an increase in the annual payment to £300,000, but ultimately agreed on £100,000 a year.

The debate was resumed in the Tynwald in October. A resolution was moved on behalf of the deputation that the contribution be £5,000 with an additional 7 1/2% upon "common purse" receipts from customs duties above £1 million with provision for revision every ten years. An amendment was moved to fix the payment at £50,000 with provision for revision each year. This was carried in the Keys but defeated in the Legislative Council. The original motion was defeated in the Keys and carried in the Council; and so deadlock was reached. On Nov. 15 the Tynwald decided to increase the payment for five years to an amount equal to 5% of the customs receipts. In 1949 this would be £85,000.

At the annual Tynwald ceremony at St. John's on July 5, 32 laws were read which had been passed by the Tynwald during the previous year. In January the Tynwald passed a resolution asking the King to extend to the island the amended National Service act which extended the period of whole-time service to 18 months.

Education. Schools: primary 36, pupils 4,162; secondary 6, pupils 2,870; domestic science college 1, students 208; school of technology, art and crafts 1, students 225.

MANDATES: see TRUST TERRITORIES.

MANN, THOMAS, German novelist (b. Lübeck, June 6, 1875), received in 1929 the Nobel prize of literature. Exiled from Germany in 1933, he became a naturalized U.S. citizen during World War II. (For his early career see Encyclopædia Britannica.)

Before World War II Mann was a severe critic of all compromises which assisted Hitler to power. During the war he broadcast to Germany in the transmission Voice of America. In 1945 he published a "Message to the German People" in which he expressed the conviction that not only Hitler, the Nazi party and German generals had been responsible for starting World War II and committing crimes and atrocities, but also the people themselves. For such forthright opinions he was not popular in Germany. Nevertheless, on the occasion in 1949 of the 200th anniversary of Goethe's birth, Mann received the Goethe prize (Dm.10,000) from both the city of Frankfurt and the city of Weimar, which, in addition, conferred upon him honorary citizenship.

In an address at Frankfurt on July 25 he said that there was in Goethe, as in the soul of every German, a mixture of the demoniac and the good. Goethe had succeeded in harmonizing his demoniac forces in the service of the good. He prefaced the address by stating that he remained a German writer and felt his country's fate as deeply as any good German. After visiting Munich, he arrived at Weimar on Aug. 1 and in a speech there—in the Soviet zone—declared that he did not see how humanity could emerge from its existing political, economic and intellectual difficulties without conflict. In the U.S., after his first visit to Germany in 16 years, Mann told the press reporters that what impressed him most about Germany was her nationalism and impertinence about the Hitler regime.

MAO TSE TUNG, Chinese statesman (b. Shaoshan, Hunan, 1893), co-founder of the Chinese Communist party in 1921 and member of its first central committee; from 1936 chairman of the party and head of the Yunan Communist government. (For his early career see Britannica Book of the Year 1949.)

In Nov. 1948 Mao proclaimed that the Communists were in control of nearly one-third of China. During 1949 practically all continental China fell into their hands. On March 25 Mao arrived in Peking with Chou En-lai (q.v.) and General Chu Teh (q.v.) and soon afterwards it was announced that the ancient capital would again become the seat of a new central government. On June 15-19 Mao presided over a committee preparing a Chinese People's Political Consultative conference, a sort of constituent assembly which was convened in Peking on Sept. 21. On June 30, speaking on the 28th anniversary of the foundation of Chinese Communist party, Mao said that new China belonged to the anti-imperialist camp under Soviet leadership. On Oct. 1, he became chairman of the central government council of the Chinese people's republic—an office similar to that of the president of the republic. The formal proclamation of the republic was announced by a proclamation read by Mao before a crowd of some 200,000 in the square of the Gate of Heavenly Peace at Peking. On Dec. 16 he arrived in Moscow for the first time in his life and was received the same day by Joseph Stalin.

MARGARET ROSE, PRINCESS (b. Glamis castle, Angus, Aug. 21, 1930), the younger daughter of King George VI (q.v.) and Queen Elizabeth accompanied her parents and Princess Elizabeth (q.v.) on a state visit to the Union of South Africa in the early months of 1947. After the wedding of Princess Elizabeth on Nov. 20, 1947, Princess Margaret undertook many public engagements. In March 1949 she made a series of visits of an educational nature. These included Battersea power station, Scotland Yard, the East London juvenile court, the central criminal court, the House of Commons and the offices of a London newspaper. On April 27, 1949, she left England by air for a month's holiday in Italy and visited Naples, Capri, Pompeii and Rome, where she attended the International Horse show and on May 10 was received in private audience by the Pope. She also visited Florence, Stresa and Venice and spent a few days in Switzerland and in Paris before returning to England on June 1. Her interest in youth movements was reflected in many engagements with the St. John Ambulance cadets, of which she was colonel in chief, the Girl Guide movement, of which she was commodore of the sea ranger section, and the national and Scottish associations of girls' clubs. During her first visit to Bristol in March she opened an exhibition "Youth at Work and Leisure." In 1947 she was appointed to the Order of the Crown of India and on Jan. 13, 1949, was invested dame of justice of the Venerable Order of the Hospital of St. John of Jerusalem.

MARIANAS ISLANDS: see TRUST TERRITORIES.

MARINE BIOLOGY. Research in marine biology showed some expansion after the end of World War II. 

---

Princess Margaret (left) in Rome during her visit to Italy in 1949. She arrived in Rome on May 6 and on May 10 was received by Pope Pius.
MARKET GARDENING

On the seashore attention continued to be devoted to the general ecology of plants and animals, and to their relations one with another. Much new information was recorded on the growth and reproduction of some of the larger seaweeds, which were being used increasingly as the source of certain commercial products. Seasonal changes in the chemical composition of these weeds were also followed. A remarkable demonstration was given of the influence of the common limpet on the growth and distribution of seaweeds in the Isle of Man where all limpets were removed from a wide strip of the rocky foreshore between tulemarks.

Much research was done on the problem of the settlement of the larval stages of marine animals on or in the bottom substratum inhabited by the adults, and of their subsequent metamorphosis. The effect of sand particle size and shape was examined as a factor in the metamorphosis of certain polychaete worm larvae. Similarly, the role of copper present in sand and its influence on the metamorphosis of ascidian larvae was studied. Settling reactions were also studied in relation to the fouling growths on underwater structures and on boats. In addition, a problem of major interest to those concerned with the production of satisfactory anti-fouling compositions. Interesting new information became available on the settling of oyster spat which tended to settle in greatest abundance in the neighbourhood of the largest concentrations of the young and adult oysters. This, of course, had an important bearing on the practice of laying of oysters.

Considerable attention continued to centre round the general problem of the productivity of the sea. The search for limiting factors continued and manganese was shown to act as a trace element in the sea as it does on land. Attempts were made to translate information which had accumulated on seasonal changes in the presence of nutrient salts in solution in the sea and of the abundance of the phytoplankton and zooplankton organisms into equation form so as to express mathematically the changes that might be expected should there occur an alteration in any one of the conditioning or environmental factors. That the science of the ecology of sea-water should have reached this stage was regarded as definite advance and it was hoped that such analyses of the data available would point the way to new lines for research.

At the same time the assessment of the available producer crop in the plankton remained uncertain owing to lack of knowledge of the part played by the smaller nanoplanckton organisms, such as flagellates, whose collection and identification present considerable difficulties. Attention was devoted to the culture of these minute organisms, and their possible importance as food for lamellibranch mussels was stressed by research. Previously it was thought that the size of food organisms eaten by such mussels as mussels and oysters was determined by selection by the cilia of the gills. It was now suggested that, when feeding, the gills were covered by a mucous layer and that consequently much smaller particles could be retained.

A fresh interest developed in methods of collecting samples of plankton for quantitative purposes. Research aimed at perfecting methods whereby the quantity of water from which the plankton organism had been collected could be accurately known. For this purpose pumps and measuring nets were used and the catches statistically analysed to evaluate the errors involved. It was hoped that by this means it would be possible to set the limits of accuracy of the different methods employed. Doubt was thrown on the reliability of the standard silk closing net as a quantitative apparatus for collecting plankton.

Attention was centred on the so-called "scattering layer" now found to exist in most ocean water. This is a layer which produces a diffuse echo when ultrasonic fathometers are used and which usually occurs at a depth of 150 fathoms or deeper. It is remarkable for showing a diurnal rise and fall in the depth at which it occurs. This latter property suggested that its origin was biological, but the actual organisms that may cause it were still unknown. Planktonic euphausians, squid or fish were considered at present to be possible causes, and further information on the phenomenon was awaited with interest.

Further advances were made in the study of the quantity of life on and in the sea bottom. For this purpose new types of apparatus for sampling known areas of the sea floor were developed. At the same time, methods of underwater photography were improved. These means showed promise of producing a truer and more accurate picture of the distribution and quantity of animals in and on the various types of deposits. Some remarkable parasitic feeding habits of small bottom-living molluscs were described. (See also Fisheries; Zoology.)

MARKET GARDENING. Small scale growers of horticultural crops in Great Britain had cause to remember 1949 as a crucial year. The business pendulum began to swing backward. Two uncontrollable factors, the weather and the economic situation, operated against a continuance of the hitherto high returns. The mild winter brought along heavy supplies of spring vegetables and prices slumped. Most of the country had only one-third of normal rainfall between May and August, consequently summer crops made no bulk and, more important, winter greens made little growth until October. Early season offerings tended to meet more competition from imported supplies, and with general farmers beginning to encroach upon the mid-season market for the staple crops like peas, carrots and celery, the market gardener was left once again in a favoured position only in his own local and high quality market. The output of drupe fruit was much reduced and great harm was done to strawberry beds on light soils in the south of the country.

The soft fruit acreage increased during the year from 39,900 to 48,500. — the 1939 level — with raspberries showing the biggest proportional, and strawberries the biggest absolute, increase. By contrast the acreage of vegetable supplies was 52,789 smaller, at 529,996. There was a general withdrawal over all vegetable crops, denoting a marginal retraction of farm production and a return towards specialized production by market gardeners. Farm-produced vegetables became a feature of the trade during World War II and influenced many market gardeners to turn to out-of-season produce, which entailed increased outlay on portable glass structures. The use of glasshouses increased, and flower- and nursery stock-growing became a more popular activity. A limited amount of new glasshouse construction was allowed.

The technical advance in methods of disease control was maintained. Toxic smokes began to supplant dusts and sprays in glasshouse practice, and a new soil fumigant to counter root-knot eelworm was introduced. More generally, compounds containing the new phosphoric insecticides were given cautious trial in view of their suspected toxicity to humans. The culture of strawberries under cloches, with varieties adapted for the purpose, became more widespread. A research station to cover soft fruit growing was opened in Hampshire and plans were made known for three other horticultural research stations.

Part IV of the 1947 Agriculture act, which deals with the provision of smallholdings, came into operation on Oct. 1. The Smallholdings Advisory council, in a report published
in April, recommended that new holdings should provide full-time occupation and an annual net income of some £450 to the tenant. It was considered that five or six acres of good market gardening land, or a more intensive holding of two acres on which a heated glasshouse would be provided, would enable market garden undertakings to fulfill these requirements. (See also Agriculture, Fruit; Horticulture; Root Crops; Vegetables.)

MARRIAGE AND DIVORCE. Shortly after World War II, divorce rates had risen sharply in Great Britain, western Europe, including the occupied countries, and the United States. In 1949 there seemed little doubt that this temporary postwar peak was past; but in spite of further decreases in many nations, comparable to those of the previous year, divorce rates were expected to resume the upward trend of the previous decades.

Great Britain. The long-awaited report of the Royal Commission on Population included recommendations that the national health service be empowered to give contraceptive information to all married persons desiring it, that parenthood clinics be set up to deal with the increasing number of childless marriages, that sex education and homemaking should be widely developed, that family allowances should be increased and that incentives should be found to encourage the professional classes to have more children. On the basis of the 1947 census, the registrar general estimated that in England and Wales the total number of women exceeded that of men by 2,308,000. The Marriage Reform committee, claiming that 100,000 British couples were living out of wedlock because either the man or woman was unable to divorce the legal mate, demanded that a royal commission be established to study existing divorce laws and to consider their liberalization.

The Birmingham Marriage Guidance council reported that the three major causes of marital disharmony were ignorance of sex, lack of spiritual foundation and inadequate or unsuitable housing and that, of the marriages investigated, half of them involved civil rather than church weddings. The London Catholic Marriage Advisory council tabulated the problems of 1,543 clients and reported that 17½ per cent concerned annulments, 13½ per cent related to legal problems, 10½ per cent were medical, 8½ per cent dealt with church rules or moral questions, 6½ per cent were premarital and the rest were miscellaneous; of 447 clients with marital problems, 159 represented marriages between Catholics and non-Catholics.

Canada. The Dominion Bureau of Statistics found that the size of families was decreasing steadily among younger French-Canadian married couples. Another study indicated that in 1926 the divorce rate was one-seventeenth that of the United States, but within the intervening years it had increased to one-seventh. There was continuing demand from Quebec and Newfoundland for separate divorce laws since all actions from these provinces must be adjudicated by the Canadian parliament.

United States. The marriage rate (10·8 per 1,000 population) declined for the third successive year; the number of marriages was estimated at 1,625,000, a drop of nearly 10 per cent from the provisional total of 1,802,895 in 1948 and a decrease of over 18 per cent from the final total of 1,991,878 for 1947. The U.S. Public Health service estimated that 29,953 of the marriage licences issued in 1948 and 22,965 in 1947 were not used, and concluded that for any given year marriages tended to be from 1 to 3½ per cent below the number of marriage licences issued. Divorces, including annulments, were not expected to exceed 380,000, a decrease of 6 per cent from the 405,000 divorces of 1948 and of 21½ per cent from 483,000 in 1947.

Research found that one-fourth of the total labour force were women, of which approximately one-half were married and one-sixth divorced; about 36 million men were married (13½ per cent more than once), of whom nearly one-third were under 35 years (6 per cent previously married); and, for all ages of 15 years and above, the number of males per 1,000 females was 977, the first time in history that women had outnumbered men. The first divorce law passed in South Carolina took effect as from April 1949 and cited grounds of adultery, desertion, physical cruelty and habitual drunkenness. In the Catholic archdiocese of New York, Rochester, New York, and Hartford, Connecticut, a new rule permitted mixed marriages to be performed in church but they could not be celebrated at the altar or with a nuptial mass.

Other Countries. In Europe generally the divorce rate was falling, particularly in Belgium, Denmark, France, the Netherlands, Norway and Sweden, although the marriage rate showed no great decline. Offering a bonus of Fr.22,000 upward, Belgium was encouraging families to build new homes. Czechoslovakia and Poland made civil marriages mandatory but these could be followed by religious ceremonies: divorce restrictions were tightened with divorce by mutual agreement no longer permitted; illegitimate children were given legal rights equal to those of children born in wedlock. In France the Young Women's Family service was providing training in homemaking to girls in several centres. After the ban on marriages of U.S. soldiers in German civilian was lifted, Frankfurt army headquarters reported that about 2,000 such weddings had been authorized. From Israel came the report of a drop of 40 per cent from the divorce rate under British mandate.

Both marriage and divorce rates were increasing in Italy and the first marriage-counselling centre was opened at Milan under the direction of Dino Origlia; the general council of the International Union of Family Organizations was convened at Rome in September. In Japan, where concern was expressed at the alarming rise in abortions, parent-teacher associations were formed in a majority of the new elementary and secondary schools. To encourage parenthood, Luxembourg extended its allotment system to provide Fr. 5,000 for the first child and Fr. 3,000 for each additional birth. Through its church and school department, Norway was utilizing a national committee of physicians and clergymen to deal with problems of family-life education.

The supreme court of the Soviet Union urged the lower courts to strengthen marriage and family ties by not granting divorces for accidental or transitory causes (including "casual cohabitation"), by encouraging sex education through parental example; the ministry of justice prohibited its citizens from marrying foreigners. As from July 1, working-class couples in Spain were granted outright c. £60 to help find new homes and families. In Sweden, the Institute for Spiritual Guidance and Psychic Counselling began marriage counselling in its branches at Gothenburg, Hernosand, Norrköping and Uppsala.

At Buenos Aires, Argentina, the first International Congress of Mothers resolved to establish an institute of family education in every Latin American state. The second Pan-American Congress of Social Work met in Rio de Janeiro with the support of the family as its theme. An association for the study of fertility was formed in Uruguay. (See also Vital Statistics.)

MATHEMATICS. The year 1949, in contrast with 1948, was not distinguished mathematically by any striking discovery. No outstanding old problem appeared to have been solved or any promising new method to have been devised. Nevertheless, the output of highly technical mathematics accelerated and almost equaled in bulk that of the late 1930s. Much European work, especially German, that had been delayed in publication by World War II was printed, making further demands on the already overcrowded journals. At the close of the year it was too early to sift and appraise this mass of detailed contributions.

As the mid-20th century approached it seemed that the cultivation and production of mathematics was likely to be governed by economic and military considerations to an extent which would have seemed fantastic prior to World War II; such considerations appeared to have become a significant feature of mathematical progress during 1949 and affected mathematics in all countries; many mathematicians who before the war had not worked in applied mathematics were deflected from their previous interests, in which they had made their reputations, into governmental work of one kind or other.

On the economic level, the continued increase in the cost of printing drastically curtailed the publication of mathematical research. The most urgent problem facing the mathematicians of the United States, for example, was how to finance publication. Since about 1920 this problem had steadily become more acute. With few exceptions mathematical research was unpaid; it was done, mostly by university professors, in the researchers’ own free time; and, although mathematical discovery might contain the germ of a lucrative industry, the man who made the discovery received no financial reward, for his discovery could be neither patented nor copyrighted. His compensation was that some academy or mathematical society printed his work without cost to him. Now expense made this no longer possible. Several of the European academies suspended publication. With great reluctance the American Mathematical society (with the largest membership of any body of professional mathematicians in the world) reversed its policy of publication cost-free to authors, a policy of over half a century’s standing, and would henceforth ask either the author of a research paper or the institution with which he was connected to bear a substantial part of the cost of publication. An example of the financial crisis of 1949 was the plight of the abstract-journal, Mathematical Reviews, founded in 1940 to anticipate the suspension of similar European journals, which was sustained only by a subvention of $21,500 for one year from the office of air research. This, too, illustrated the way in which military departments had aided mathematical research since the close of World War II, even though some of the subsidized research was in fields which, at least to a layman, seemed to have no possible connection with military needs—for example, a special case of the decision problem in mathematical logic—and this type of work was not kept secret for reasons of military security and was given freely to the public, ultimately, of course, at public expense.

A more far reaching interest in mathematics on the part of military planners was expressed in the report (June 27, 1949) of the Policy Committee for Mathematics. This committee in Feb. 1949 “established a Committee on Liaison with the Department of the Army and Department of the Air Forces.” This and the following quotations were transcribed from the report of the Policy committee of the American Mathematical society, Aug. 1949. Their application, with obvious qualifications, was world-wide: “The technical uses of mathematics in the army, as well as of the other services, began to multiply rapidly in World War II, and have continued to do so. Adequate and effective utilization of mathematical skills in the National Military establishment is therefore to some degree still a matter for pioneering. The fact that the number of highly trained mathematicians is limited creates a personnel problem which would become critical in an emergency . . . It was decided, therefore, that the Committee of Liaison should hold itself ready to . . .

BIBLIOGRAPHY. A complete list of publications for 1949, with concise abstracts, is given in Mathematical Reviews, vol. 10.

MATTÁ, JOSÉ CAIroles, Portuguese educationalist, lawyer and statesman (b. Jan. 6, 1883, Vinhieiro, Portugal). After receiving his degree of doctor of law at the University of Coimbra, he was appointed there as professor in 1907 and for 13 years taught Roman law, history of Portugal, civil and commercial law, and law of society. In 1920 he was transferred to the University of Lisbon where he was professor of international law (public and private) and of statistics. From 1928 to 1947 he was rector of Lisbon university. From April 1933 to April 1935 he was minister of foreign affairs, from 1944 to 1947 minister of education, and from Feb. 7, 1947, minister of foreign affairs for the second time. He represented his country at the two Paris conferences (July 1947 and April 1948) at which the Organization for European Economic Co-operation was planned and created. On April 4, 1949, at Washington, he signed the North Atlantic treaty for Portugal and said that Europe was struggling against the greatest and most dangerous mental epidemic of all time, which threatened to destroy the flower of its culture, but that she was facing her position with courage and decision. Senhor da Mattá has written many books on law in Portuguese and French, and received honorary degrees of doctor of law from the universities of Madrid and Toulouse.

MAURITANIA: see French Union.

A campaign to stamp out malaria was inaugurated and made good progress. A commission of inquiry into the workings of the Supply Control department cleared the controller of charges of bribery but was in general critical of the department and found apparent evidence of fraud among minor employees. The visit to the island in May of the Indian cruiser “Delhi” was the social event of the year.

Finance and Trade. Currency: 1 rupee = 1s. 6d. Budget (1947-48): revenue Rs. 39,856,646; expenditure Rs. 49,147,495. Foreign trade (1948): imports Rs. 136,265,540; exports Rs. 144,343,359. Principal export, sugar. The 1949 sugar crop was expected to reach the record size of 410,000 metric tons.

MEAT. Livestock production increased during 1949 in many countries. As a consequence meat rationing relaxed; in certain European countries consumer rationing was abolished altogether, while in others only price control remained. Great Britain’s slaughtering of cattle and sheep in Jan.-Aug. 1949 were higher than the previous year so that beef supplies increased 24% and mutton and lamb 19%, while pork and bacon output more than doubled.

U. K. imports of meat of all descriptions in 1949 were 3% heavier than the previous year. Taking carcass meat only into account, the aggregate 15,114,000 cwt. was 530,000 cwt.
below 1948, a 3% reduction. The variation was due almost entirely to canned meat supplies, which were over 500,000 cwt. in excess of 1948. Beef imports, 9,189,322 cwt., were heavier by 107,000 cwt., or 1%, but those from the dominions showed a drop of more than 1 million cwt., nearly 30%. Australian supplies declined 603,000 cwt. (28%) and New Zealand 434,000 cwt. (31%). Arrivals from South America, on the other hand, were substantially increased—Argentina 665,000 cwt. (13%), Uruguay 505,000 cwt. (60%). Denmark sent 84,000 cwt., nearly twice as much as in 1948. The weight of veal imported dropped from 400,000 cwt. to 232,000 cwt. Mutton and lamb imports (7,527,886 cwt.) were down 471,000 cwt., a 6% reduction. All senders shared in the deficit with the exception of Australia, whose contribution increased by 408,000 cwt. (47%). The reduction in the case of New Zealand was 382,000 cwt. (7%) and of Argentina 322,000 cwt. (23%). The weight of pork received during the year, 600,000 cwt., was nearly treble that of 1948. Other pork products except bacon amounted to 591,000 cwt., a slight increase. Deliveries of bacon, 2,772,000 cwt., were 105,000 cwt. more than the previous year. Denmark, with 1,606,000 cwt. compared with 478,000 cwt. in 1948, had taken the place of Canada.

Commonwealth. The output of beef and veal in Australia for 1948-49—nearly 11.5 million cwt.—was the largest recorded since 1938, when nearly 12 million cwt. was produced. Home consumption, however, increased to a greater extent than the increase in output and exports declined 15%. At the beginning of the new season, production figures for beef showed a fall as compared with 1948. A 15-year agreement was signed in May under which Britain guaranteed a market for Australia's exportable meat surplus. Production of beef and veal in Canada in the first eight months of 1949 was lower than in the comparable period of 1948 and both exports and the balance available for consumption declined. The export of cattle and calves, 199,000 head, almost all to the United States, was 84% greater than the comparable period of 1948 and 81% above 1938. Pig meat production in Canada was 23% less than in 1948.

New Zealand output of beef for export in 1948-49 fell below the level reached in the two preceding seasons, the total being 20% less than in 1947-48. Production of mutton and lamb in 1948-49 was 3% greater than in the previous season, although below the record set up in 1946-47. Pork production was 20% less and the output of bacon fell slightly below the level of 1947-48.

Europe. The cattle population of Denmark—2,962,000—was 5% above 1948, although below the prewar and immediate postwar figures. The sheep population had declined to 67,000; the census of pig stocks in Oct. 1949, was 3,029,000—68% above the previous year. Exports for the first nine and a half months of 1949 were 83% over 1948, although only half the previous figure.

Cattle exports from the republic of Ireland in the first nine months of 1949 were 314,000, 30% above 1948. Exports of sheep and lambs, 71,000, although nearly double the previous period, were only about one-third of prewar. For the first time since 1942 bacon was to be sent from Ireland to the United Kingdom. The trade in pigs and bacon was in the region of 800,000 cwt.

The number of cattle in the Netherlands continued to increase, the total in Sept. 1949 being over 2.5 million higher than at any time in the previous four years. A recovery in the pig population evident in 1948 was fully maintained, and in September stood at 1,766,000. This was 55% higher than in Sept. 1948. Cattle and calves for slaughter were 22% heavier, pig meat supplies nearly double and sheep 18% heavier. In November rationing was abolished, but price control was maintained. In May a four-year bacon pact was concluded between Great Britain and the Netherlands for the supply of a minimum of 10,000 tons in 1949, 25,000 tons in 1950 and 35,000 tons in 1951.

United States. Production of all meats increased very moderately in 1949, the total being estimated at a minimum of 22,130 million lb., compared with 21,599 million lb. in 1948; the prewar average (1937-41), however, was only 17,675 million lb. Pork accounted for most of the increase. The total meat supply per head in 1949 was estimated at 147 to 150 lb., compared with 146.6 lb. in the previous year and 126 lb. average in 1935-39. The consumption of beef per head was estimated at 64.1 lb., slightly more than the 63.3 lb. of 1948. Veal consumption in 1949 was 8.5 lb., compared with 9.4 lb. in 1948. Pork consumption per head for 1949 was estimated at 70.2 lb., compared with 68.7 lb. in 1948.

Lamb and mutton meat production declined to 600 million lb. in 1949, or 4.0 lb. per head, compared with 753 million lb. in 1948, and an average prewar consumption of about 6.8 lb. per head. Stock sheep numbers on Jan. 1, 1949, were only 27,818,000 head.

U.S. exports of meats were small, estimated at 73 million lb. (carcass weight) during 1948-49, compared with 152 million lb. in the preceding year and 1,376 million lb. in 1945-46, lower even than the 123 million lb. prewar average.

Because of the larger number of pigs, the production of lard in 1949 was forecast at 2,850 million lb., as compared with 2,526 million lb. in 1948 and a prewar average of 2,091 million lb. Exports of lard were very large, amounting to 513.2 million lb. in the period Jan.-Sept. 1949, as compared with 235.1 million lb. during the same period of 1948. Storage stocks in December were 38,285,000 lb., less than half those for 1948. (See also Livestock.)

MEDICINE. 

Cortisone. The most interesting medical event of 1949 was the announcement by P. F. Hench and his colleagues at the Mayo clinic in Baltimore, that injections of E. C. Kendall's compound E or cortisone in rheumatoid arthritis produced remissions of the symptoms in a few hours. It was significant because this painful and crippling disease had long resisted all attempts at cure and also because never had so much interest been aroused by a report of such a therapeutic trial on so few cases. Only 14 patients were treated, all of whom benefited. The smallness of the trial was due to the great cost of the material which was produced by a 36-stage synthesis from desoxycholic acid, a scanty fraction of ox bile. The yield of the process was so small that 13,000 tons of cattle would be needed to provide enough cortisone to treat a patient for a year. The estimated cost of treating a patient was about £1,500 a week. Unfortunately too, the evidence so far was that cortisone was not a cure but acted in a way similar to that of antihistamine which must be taken for the rest of the patient's life. It was later announced that cortisone could be made by a shorter synthesis from a glucoside of sarmentogenin, found in the seeds of a tropical plant, *Strophanthus sarmentosus*. Although this source would yield cortisone at a cost it would still be too expensive for any wide use. The plant takes five years to mature so cultivation was not a simple answer to the production problem. Besides the many clinical questions raised by cortisone, it posed a multitude of chemical and production problems and stimulated the best brains in the field of steroid chemistry to seek their solution. Parallel to this discovery came the announcement, also from the Mayo clinic, that the adrenocorticotrophic hormone (A.C.T.H.) seemed to have much the same effect as cortisone itself. This too was a substance of great scarcity, being obtained only from the pituitary glands of animals. No chemical method yet had been found of making it. There were indications that cortisone and A.C.T.H. would be of benefit in other conditions besides rheumatoid arthritis. This was probably only the beginning of what might prove to be one of the most epoch-making discoveries of medicine. But it was important to realize that it would be a long time before either of these substances, or similar drugs derived from them, could be applied in ordinary practice. Although this was of small comfort to sufferers from rheumatoid arthritis, at least it did give a ray of hope which was not there before.

Tuberculosis Prophylactic. In 1908 two French bacteriologists, A. Calmette and C. Guérin, produced a vaccine "B.C.G." from the tubercle bacillus which, they claimed, was harmless to man but could induce immunity against the dread disease of tuberculosis. For a number of reasons this vaccine was never used on any scale in Great Britain, although it found favour elsewhere, especially in Scandinavia. During 1948-49 a large scale trial was started by the Ministry of Health in America. So as to keep strict critical control of the test and yet to meet the need of those most exposed to risk, the application of the vaccine was confined in the main to medical students and to the nursing staffs of hospitals. Small supplies for individual use were given to chest specialists to use on their own responsibility, for example, for contacts with tuberculosis cases. Some years would have to elapse before all the answers to this trial could be obtained.

Radiological Advance. The first synchrotron in the world to be built and used for medical research was installed in the Royal Cancer hospital, London, under the auspices of the Medical Research council. This 30 million volt instrument produced X-rays of great power and intensity. It differed from conventional X-ray machines which could not effectively be made for potentials above about a million volts. This remarkable apparatus was first used for varied biological researches. These, *inter alia*, gave data of importance in planning the later application of the machine to the treatment of patients with cancer in those organs where the particular properties of the rays had special advantage. The possibilities offered by this immensely powerful apparatus were very wide. It was the first of two such instruments.

Blood Transfusion. During World War II great advances were made in the technique of blood transfusion, and its uses were extended. The interest this aroused continued in 1948 as was shown by work on further refinements in blood typing and on the genetic Rh factors which may cause the death of new born infants. Another line of investigation resulted in the standardization of methods of preparing several fractions of human blood. In Great Britain this brought these fractions within the scope of the Therapeutic Substances act. Owing to certain difficulties in using blood for transfusion many possible substitutes were tried. In general they were unsatisfactory for one or more reasons. For some time the Swedish had been investigating Dextran (a long chain molecular substance prepared from sugar) as a blood plasma substitute; and in 1948 some work was published in America and elsewhere which, although critical in some respects, showed that Dextran was an appreciable step nearer the goal of a blood plasma substitute. In the autumn it was made commercially available in Great Britain. This should make possible the wide experience necessary before a final assessment of such a substance could be reached.

Anti-histaminics. In 1910 when Dale (now Sir Henry) advanced the theory that the effects of allergic disorders were produced by histamine he opened up a far reaching vista of research which led to many important discoveries. Not least among these was the introduction in 1948 of several powerful new drugs with many applications. The simplest explanation of the basic idea was that by an antigen-antibody reaction the substance histamine is released from tissue cells releasing histamine and this produced the broncho-spasm in asthma, the skin weals in urticaria and the many other signs and symptoms now classed together as allergic. In 1937 D. Bovet and A. M. Staub developed the first anti-histaminic drug, that is, a substance which blocks the responses of the tissues to histamine yet which in the same dosage range has little or no apparent effect on the normal body. This offered effective therapy in allergic conditions which had hitherto presented many difficulties in treatment. This disorders included hay fever, some asthmatics, angioneurotic oedema, chronic urticaria, pruritus, neurodermatitis, some neuralgias and some intestinal troubles. In addition to successful reports on these there were indications of benefit in the symptoms of serious treatment of Parkinson's disease and in the nausea and vomiting of pregnancy. A particularly valuable discovery in 1948 was the chance one that Dramamine and Anthisan were effective preventives of motion sickness; and they soon found wide-spread use for abolishing sea sickness. With these as with other anti-histaminics, large doses could produce side effects such as giddiness and somnolence; so they had to be used with care and it was inadvisable to take them without the guidance of a doctor. There were also hints that the sphere of usefulness of the anti-histaminics might be still wider; e.g., in migraine and some forms of rheumatism. Among other new anti-histaminic drugs put on the market (though all were not available in Great Britain) were Antitin, Pyribenzamine, Neohetramine, Neostergan, Histadyl, Chlorothem, Theophorin, Trimeton, Theophorin and Thenylene. Chlortrimeton...
A scene in the laboratory at the Imperial Chemical Industries works near Manchester where the new drug Antrycide, which would provide immunity against trypanosomiasis (sleeping sickness), was being manufactured.

combined with aspirin and caffeine in a compound called Coricidin was tested by the U.S. navy for treating the common cold and first reports were favourable. Owing to the proctean nature of this condition however, further research was needed. But over all, it was unquestionable that in the anti-histaminic drugs a most useful company had been added to the armamentarium of the physician.

Vitamin B₁₂. In 1948 it was noted that in America, E. L. Rickes had isolated vitamin B₁₂ from liver and that this substance was effective against pernicious anemia. At the same time E. Lester Smith in England had discovered two crystalline factors from liver, and one of these was identical with Rickes' B₁₂. Further work showed that injections of extremely small amounts of the vitamin not only make the blood picture of pernicious anemia normal again but improve the whole appearance and strength, mental alertness and appetite of a patient. There was even improvement in patients who had combined degeneration of the spinal cord. The factor was thought to be the same as, or closely associated with, the "animal protein factor," a vitamin not chemically identified, which promoted growth of chickens and rats. Research showed that there were more widely distributed sources of B₁₂ than liver. The most interesting discovery was that it could be isolated from a by-product of the culture of Streptomyces, such as was used in the manufacture of streptomycin. This would undoubtedly lower the cost so much that it should be possible to make the vitamin generally available. If liver was the sole source of B₁₂ this would not be practicable owing to the extremely small yield.

Antibiotics. Further work continued on penicillin, for example, by giving it as an inhalation in the form of a fine dust or an aerosol mist. Procaine penicillin suspended with aluminium stearate became firmly established as it made possible the painless injection of a large dose with a "depot" action, that is, delayed absorption enabling the necessary blood levels to be maintained with fewer injections. The uses of streptomycin were extended beyond tuberculosis and good results were obtained in B.coli infections of the urinary tract, hitherto most obdurate towards treatment. Increase of supplies in Great Britain made it possible to release this antibiotic from restrictions on its use which the government had to enforce. A. Hirsch and A. T. R. Matlick reported that nisin, an antibiotic developed entirely in Great Britain, was active against experimentally produced tuberculosis. This substance promised well if production problems could be solved. In America S. A. Waksman discovered another antibiotic, neomycin, which also appeared to be active against tuberculosis. A great chemical triumph from America was the synthesis of chloromycetin (Chloramphenicol), the antibiotic which was effective against enteric fevers and rickettsial infections, psittacosis and brucellosis. There had never before been any specific against these diseases. Aureomycin, another relatively newcomer to this field, had much the same range of activity as chloromycetin and like it could be given by mouth. The chief disadvantage of these promising drugs was their high cost.

As an aid to the general and psychological treatment of alcoholism a new drug was introduced which made subsequent doses of alcohol extremely unpleasant to the patient who was, indeed, made to feel extremely ill. This was tetraethylthiuramdisulphide, also known under the proprietary names of Antabus and Antalco. Although it was undoubtedly effective this was a drug which had to be treated with knowledge and respect and fatalities were reported from its use.
Some other medical fields in which the year saw great activity were geriatrics or the science of the diseases peculiar to old age; psychosomatic medicine which stressed the influence of the mind on the production of physical disease; the epidemiological researches in Great Britain by the Ministry of Health, the Public Health Laboratory service and the Medical Research council, particularly into food poisoning and the common cold; and the work of the Technical commissions of the World Health organization, for example, on the nomenclature of disease (a matter of great importance in pathology and medical statistics) and on the unification of pharmacopoeias. (W. P. K.)

United States. The most important announcement of an advance in medicine during 1949 was the control of rheumatoid arthritis by use of an extract from the adrenal gland called Cortisone or an active principle from the pituitary gland called ACTH or the adrenocorticotropic hormone (see above).

It was discovered in 1949 that anti-histaminic drugs such as benadryl, pyrbenzamine, chlor-trimeton and many others could, when used early, avert the common cold or cure it. The food and drug administration permitted the public sale of these drugs, including mixtures of anti-histamine drugs with the common ingredients of cold tablets such as aspirin and phenacetin and caffeine as well as mixtures with nose drops and creams. Allergists asserted, however, that at least one-third of the people taking anti-histaminic drugs suffered drowsiness and warned against the possible toxic effects of such drugs when used without medical controls or over long periods of time.

A third announcement in 1949 which attracted much attention was the elaboration in Denmark of a drug called Antabus, technicely known as tetraethyl thiuram disulphide, which created an unpleasant reaction in persons who had previously taken alcohol.

Dramamine, a combination of an anti-histaminic drug with amnophyllin, established its usefulness in controlling sea-sickness and air-sickness and it was also being tried with some success in controlling the nausea of pregnancy and the dizziness associated with Meniere's disease.

Continued work with streptomycin indicated its effective-

ness in several forms of tuberculosis. Extensive studies made by the Veterans' administration showed that streptomycin combined with a drug discovered in Sweden called para-

amino salicylic acid was more effective in a considerable number of cases than either drug used alone.

Attention continued to be focused on the antibiotic drugs and their usefulness in a variety of conditions. Pencillin continued to be the mainstay against most germ infections. Antibiotic drugs were being sought in a variety of sources, including fungi, germs such as the Bacillus subtilis (which yields bacitracin), also in ragweed, bananas and sweet potatoes.

Aureomycin was found especially effective in Rocky Mountain spotted fever, typhus, atypical pneumonia, undulant fever, syphilis, veneral granuloma, herpes, pemphigus and whooping cough.

Chloromycetin, renamed chloromphenicol, was also found useful in many of these conditions, and especially in the treatment of infection with the germ of typhoid fever.

Several new drugs were being tried in hypertensive disease, or high blood pressure, with particular interest centred on veratrum viride and dihydroergocornine, which seemed to have the ability to put the sympathetic nervous system out of action, thus achieving to a considerable extent the same result accomplished by surgical procedures on the sympa-

thetic nervous system that had attracted interest for some years.

Research with radioactive isotopes continued. Radio-

active iodine became the main factor in the control of dis-

turbances affecting the thyroid gland and was being used instead of operative procedures for excessive action of the thyroid, called hyperthyroidism. Radioactive isotopes were also used extensively in studying the physiology of the body and in tracing drugs, vaccines and other preparations injected into the body to determine their effectiveness.

Especially interesting in the field of research was the introduction, almost as a routine procedure, of injection directly into the veins of the local anaesthetic substance called procaine. Procaine was used especially for the control of pain in burns and after operation in a variety of inflam-

matory conditions. The drug was tested also for producing anaesthesia in childbirth, for frostbite and asthma and in painful cases of infantile paralysis. Procaine given intraven-

ously has the special power of inhibiting action of the sympa-

thetic nervous system. When the drug is given by injection into the vein, there is a sensation of warmth throughout the body five to seven minutes later, also dilation of the pupils of the eyes and some lightheadedness, followed by relaxation. Paraldehyde was prominent in the research field during 1949 and was used for the treatment of epilepsy; other drugs were mephan as a substitute for morphine, and Vitamin B12 or Cobine as an effective treatment in pernicious anaemia and in other anaemias. Caleferrol, a highly concen-

trated vitamin D preparation, was found useful in lupus vulgaris. Two new drugs, parpanit and Artane, were tried for spasmodic conditions and tremors in shaking palsy and similar diseases. In amebic dysentery a new drug called milbiv (bismuth glycolyl arsenilate) was recommended.

Among surgical procedures, greatest interest continued to attach to operations on the blood vessel system, including shunt operations such as those used for the control of blue babies, also an operation for correction of the aorta. New devices enabled partial clamping of this great blood vessel during which operative procedures could be carried out.

Other surgical procedures in the research field during 1949 included prefrontal lobotomy by a variety of techniques to change the functions of the brain as a mechanism for the control of depressive and other forms of mental disturbances. Antonio Moniz of Lisbon, Portugal, who devised this procedure, received the Nobel prize in medicine for 1949. The prize was shared with R. W. Hess for his discoveries of the factors in the nervous system concerned in sleep.

Among new devices which were the focus of attention were electronoc waves for inducing heat and various changes in the tissues of the body; and also the jet injectors for injecting drugs into the body without breaking the skin.

In surgical procedures for removal of portions of the lung, the operation was improved by the use of Lucite balls in a polythene sac to fill the area removed in a surgical operation called thoracoplasty, an operation performed in severe tuberculosis and also in abscesses of the lung. A gallstone detector was devised in the form of a probe which gives off an amplified sound when the probe is passed into the gall ducts and touches a stone.

Research on the causes of disease centred on the observa-

tion that poliomyelitis or infantile paralysis is not caused by one virus but by several viruses; the development of a vaccine against the disease would involve determination of the specific form of virus responsible for any individual epidemic.

At Notre Dame university, South Bend, Indiana, experi-

ments were conducted on cats and chickens with a view to raising animals in an atmosphere entirely free of infective germs. Noteworthy observations included the fact that chickens raised under such conditions developed a form of jitters not occurring under ordinary conditions. The theory
was that the absence of germs permitted the growth of viruses which were specifically dangerous to the nervous system. Animals kept under such conditions, however, showed complete absence of dental decay. (See also cross reference Medical Articles.)

MELBOURNE, capital of the state of Victoria, Australia. Pop. (June 30, 1947 census): 1,226,923. Lord Mayor, J. S. Disney.

The new governor for Victoria, Lieut. General Sir Dallas Brooks, took up residence in Melbourne in October. Following a series of articles in the Melbourne Herald, by a former Communist leader, Cecil Sharpley, which alleged Communist ballot-rigging in trade union elections, the Victorian government appointed a royal commission of inquiry into Communist activities. Hearing of evidence by the commissioner, Mr. Justice Lowe, sitting in Melbourne, started on June 20 and continued into 1950. A controlling interest in one of the three Melbourne morning newspapers, the Argus, was acquired by the London Daily Mirror.

As in Australia generally full employment and economic prosperity continued, coupled with an acute labour and housing shortage. 14,646 houses were completed in Victoria during 1948-49. Progress was made with the Kiewa power scheme. The coal strike reduced Melbourne's gas supply to a very low level. The Victorian government later decided to introduce a German process for the gasification of brown coal, of which Victoria has large reserves.

The Olympic Games for 1956 were allotted to Melbourne; the decision would involve the construction of many new hotels, sports facilities and other considerable expenditure.

The number of students at Melbourne university was 9,124; approximately 400 less than in 1948. An important experiment in decentralization came to an end with the decision to close the Mildura branch of Melbourne university, which had trained first-year students of a number of faculties since 1947. The decision was caused by the prohibitive cost and the problems of dispersal of staff and equipment.

There were many theatrical and musical events of importance, which included a return visit of an Italian opera company, a visit of the Shakespeare Memorial company from Stratford-on-Avon and concerts by a number of famous visiting conductors, pianists and singers.

MENTAL DISEASES. Developments carried on during 1949 from the well established leucotomy included topectomy or resection of cortical grey matter which was done in several American and at least one British hospital; undercutting of the cerebral cortex which was practised by W. B. Scoville in America, and, calling it thalamotomy, H. T. Wycus at Temple university, Philadelphia, reported an operation involving the use of a stereotaxic instrument whereby it was possible to produce partial electrical destruction of the dorsomedial nucleus of the thalamus. In several publications Professor A. Meyer of the Institute of Psychiatry in London described the neuropathological findings in cases which had come to autopsy, and paid particular interest to the use of posterior cuts in leucotomy and to the anatomical correlations of improvement in this operation. Posterior cuts appeared to have been responsible for certain undesirable symptoms; he found nothing to justify claims to the localization of function within the frontal lobe. Persistent personality changes were found to occur after bilateral lesions of the frontal lobes and there seemed to be a quantitative relationship between the personality change and the amount of cortex cut off. This change showed a positive correlation with the degree of improvement found.

MUCH interesting biochemical work was published, including W. R. Ashby's paper, which won the Burlingame prize, on the effects of electrical treatment on cortin and ketosteroids; these substances were found to be excreted in increased amount during the first few days of the treatment and this brisk outpouring was associated with a greater tendency to clinical recovery. Derek Richter published articles on the brain metabolism during emotional excitement and sleep with particular reference to the amount of lactic acid found in animals killed under these conditions. He showed in another paper that there was no evidence that cerebral stimulation caused a liberation of ammonia into the cerebro-spinal fluid and that the cerebro-spinal fluid ammonia level was not a reliable indicator of the degree of cerebral irritation.

In therapy, curare preparations and a similar substance C.10 were used to reduce the muscular violence of electrical treatment; inhalation of CO₂ was advocated for the investigation of certain cases and several new substances were tested for their therapeutic value including parparin which was used in Parkinsonism without very great improvement. Myasine proved useful in certain conditions but it had to be given by injection and its effects quickly wore off. Antabuse was used for the treatment of alcoholics; this method of getting the patient to take a daily tablet which, if combined with even the smallest amount of alcohol produced an intensely unpleasant reaction, was ingenious, but there still seemed to be some dangers associated with its use.

Much work was done with the electroencephalograph and the International Electroencephalograph conference in Paris in September produced several valuable contributions including those of Denis Hill of the Institute of Psychiatry. An account was published of the interesting Danish experiment in the treatment of criminal psychopaths by committing them to a psychopathic prison with an indeterminate sentence; the results had so far proved encouraging.

The organization of the mental health services consequent upon the division of the country into 14 regions under the National Health Service act continued and the regional psychiatrists justified their appointments.

Much material was being collected throughout the year for presentation before the International Congress of Psychiatry to be held in Paris in Oct. 1950. (See also Psychiatry; Psychosomatic Medicine.)

MENZIES, ROBERT GORDON, Australian statesman (b. Jepart, Victoria, Dec. 20, 1894), was educated in the state schools of Victoria, at Grenville college, Ballarat, and at Wesley college, Melbourne. In May 1918 he was called to the Victorian bar and high court of Australia, and 11 years later became a K.C. In 1928 he was elected to the Victoria Legislative Council and in the following year to the Victoria Legislative Assembly. He was minister without portfolio, 1928-29, and attorney general, minister for railways, and deputy prime minister of Victoria, 1932-34. In the latter year he was elected to the federal House of Representatives for Kooyong, and from 1935 to 1939 was attorney general and minister for industry. He resigned in March 1939 in protest against a decision to postpone a national insurance scheme but retained the portfolio of co-ordination of defence.

After the death of J. A. Lyons on April 7, 1939, Sir Earle Page was prime minister until April 26, when he was succeeded by Menzies who had been elected leader of the United Australia (later Liberal) party. He resigned on Aug. 29, 1941, after the Labour party had refused to join a coalition government, and was succeeded by Arthur Fadden, leader of the Country party. Menzies remained as minister for co-ordination of defence until the fall of the Fadden ministry on Oct. 7, 1941. From 1943 he was leader of the Federal
opposition in the House of Representatives. The general election of Dec. 10, 1949, resulted in a defeat for the Labour government led by J. B. Chifley (q.v.), and Menzies was sworn-in on Dec. 19 as the head of a coalition of the Liberal and Country parties.

**METALLURGY**

A few of the more important developments in the field of metallurgy during 1949 are summarized in the following paragraphs.

**Aluminium.** Steel sheets coated with aluminium were produced by hot-rolling two sheets of aluminium foil on to the surfaces of a steel strip, after passing the strip through a cleaner bath and an electrolytic cell which plated a thin layer of electrolytic iron on the surface of the steel.

**Cobalt.** A new plant was completed in the United States for the treatment of cobalt ores, and a new smelter was nearing completion in Canada, to handle cobalt-silver-arsenic ores from the cobalt district. The latter plant was expected to work new ores and to rework old tailings piles which still contained some ore.

**Gallium.** Gallium was being produced and sold in small quantities, after recovery as a by-product in the treatment of bauxite ores.

**Magnesium.** New uses for magnesium included its employment for lightweight components in textile looms.

**Titanium.** Marked advances were made in methods for the production of pure titanium metal, and extensive research was under way on its possible commercial applications.

**Substitutes.** The shortage of steel during 1949 resulted in a considerable need to substitute aluminium, especially in sheets. This substitution might have gone further, had aluminium supply been plentiful. In the making of containers for repeated use, such as milk cans, tin plated steel was being replaced by stainless steel, for greater strength, lighter weight, freedom from corrosion and upkeep and a useful life that was expected to last two to four times as long.

Probably the most frequent substitution was in the replacement of metals by plastics. This movement was advancing rapidly and extensively, not only in toys and gadgets, but also in industrial equipment such as gears and other machine parts.

The U.S. army was reported to be testing a plastic pipe, for possible use in combat oil lines. The high cost was offset by its light weight, its ease of handling and laying, besides the fact that it saved steel consumption.

**Welding and Soldering.** Difficulties in soldering on a metal surface plated with passivated zinc, such as a radio chassis, were overcome by devising a special technique for resistance welding. An indium-base solder was also developed which made possible the soldering of glass to glass or glass to metal. (G. A. Ro.)

**METEOROLOGY.** The outstanding events in meteorology and the principal results of research during 1949 can be grouped conveniently under the sub-headings Experimental Meteorology, Synoptic Meteorology, Applied Meteorology, Theoretical Meteorology and Research, International Co-operation and Weather of 1949.

**Experimental Meteorology.** Experimental methods that have given revolutionary results in other physical sciences have had only limited use in meteorology although there have been repeated efforts to find a laboratory approach to the secrets of the atmosphere. Renewed attacks in experimental meteorology were reported and the approach gained ground during 1949. As in other sciences there were certain problems in meteorology that could be isolated and analysed step by step in the laboratory and eventually broken down into their components.

Work in experimental meteorology approached laboratory techniques in two ways: one made use of radar, rocket, rawinsonde, artificial modification of clouds and other free air experiments, in an effort to make the atmosphere itself the meteorological laboratory, the other involved a more concerted effort to devise conventional laboratory techniques for simulating if not duplicating free air conditions.

Among the latter were the laboratory studies of the rates of fall and rates of evaporation of water droplets and a new experimental determination of the terminal velocities of falling raindrops. This research also gave new and more exact measurements of the electrical charges on falling raindrops. Other studies repeated measurements of the size and distribution of cloud droplets and their behaviour in an electrical field. Another interesting research project was a refinement of earlier attempts to simulate the circulation of a fluid on a rotating globe with opposing currents set up by applying heat at one place. The apparatus was designed to duplicate the general features of the circulation of the atmosphere about a polar hemisphere and to study the flow along the boundaries of opposing currents. These laboratory studies, although not yet conclusive, were aimed at determining quantities fundamental to full understanding of the general circulation of the atmosphere, the formation of fronts and cyclones and the condensation and coalescence of moisture into precipitation. The results of these and other experiments were published in the *Journal of Meteorology* and the *Bulletin of the American Meteorological Society*.

Research that used the atmosphere itself as the "laboratory" was greater in scope and diversification than meteorological research in the usual laboratory sense. Experiments in the modification of clouds, the conversion of super-cooled cloud droplets into ice crystals and the precipitation of rain and snow from shower type clouds were carried on more systematically and with more thorough scientific examination of the results during 1949 than in the preceding year. Methods were essentially the same although refinements in techniques were reported. The chemical agents most commonly used in treatment of shower clouds from aircraft flying above or through the cloud were dry ice and silver iodide. In experiments designed to diffuse condensation nuclei into the cloud from generators on the ground, silver iodide was generally used.

Unfortunately scientists disagreed about the results. Project Cirrus, financed by the United States Office of Naval Research and the Signal corps of the army, reported success in causing rain to fall from shower-type clouds in southwestern United States, but the Cloud Physics project of the air force and the Weather Bureau, in extensive tests in Alabama, California and Ohio, designed to investigate aspects of the subject not duplicated by Project Cirrus, found little evidence that artificial means had been successful in increasing rainfall sufficiently to be of commercial value, except possibly under very exceptional circumstances. In Canada, under the National Research council, field tests were reported in which "seeding" clouds with dry ice had caused rain in considerable quantities.

Although professional "rainmakers" of the past have claimed power to bring rain clouds even though skies were clear, no reputable rainmaker in 1949 claimed more than a means of inducing or increasing the fall of rain from clouds formed by natural causes. Artificial methods were not applied except when weather conditions were such that cumulus clouds were already present. Showers as distinct from steady, light rain come from cumulus clouds. Thus the rainmaker usually went to work when the weather was favourable for the development of showers without artificial
aid and it was difficult to determine whether the cloud treated with dry ice or silver iodide gave rain as a result of the treatment or whether it would have developed in exactly the same way from natural causes. It was well known that the moisture necessary for heavy rainfall comes from vast quantities of humid air brought into the shower cloud by the larger scale atmospheric flow. By a comparatively large scale inflow of air from other regions, sometimes from far away. Since rainmakers did not usually claim to set in motion by artificial means the large scale circulation necessary for heavy rainfall except as a possible consequence of the initial rain which they did claim to produce, meteorologists pointed out that artificial rainmaking had not yet shown conclusive evidence or made a scientific case for its claims. In their experiments rainmakers usually selected for their tests those clouds which appeared most promising as shower producers. Meteorologists also pointed out that few commercial rainmaking operations had been accomplished by comprehensive and impartial observations of results and by documentation of unsuccessful as well as successful attempts. The general opinion of scientists familiar with the subject appeared to be that the quantity of rain might be increased locally by artificial rain, but not that it was certain that artifical rainmaking was a solution for widespread drought when atmospheric conditions were unfavourable for rain. However, intensive research into this important but controversial subject was being continued.

Experimental meteorology during 1949 also announced new altitude records for high level sounding balloons. In Project Skyhook the Office of Naval Research reported soundings at altitudes slightly over 100,000 ft., while the Army Signal corps published the results of one sounding in which the balloon was computed to have reached 140,000 ft., the highest altitude ever by a sounding balloon. The naval balloons were fabricated from very thin polyethylene sheets only 0.01 in. in thickness. Unlike rubber sounding balloons they did not expand much as they ascended. Their maximum size inflated was approximately 100 ft., in vertical diameter and 70 ft. in horizontal. When they reached their equilibrium altitude they could remain at constant level for many hours and by suitable design in size, weight and other characteristics it was possible to manufacture balloons for any desired intermediate altitude within rather rough limits. This constant altitude balloon provided a new device for exploring the atmosphere especially with reference to wind flow for long distances at high altitudes.

The Signal corps high level balloons were made of neoprene latex. At maximum altitude their size was about 75 ft. in diameter. Their lifting capacity was not as great as that of the naval balloon. In addition to their measurements of atmospheric pressure and temperature and their evidence of wind discontinuities not previously suspected in the upper air, these balloons were used for other physical research in ozone distribution, ionization and cosmic radiation. Too costly for everyday soundings, these high level balloons were still in the experimental stage.

Among other developments during the year in experimental meteorology were practical studies in the use of radar for

</table>
the identification of thunderstorms and possibly tornadoes; also research on the possibilities of using radar to estimate the quantity of rainfall over an area of several hundred square miles. Although individual studies in the use of seismographs and "sferics" recorders to detect the development and movements of hurricanes far out at sea were continued, there were no outstanding achievements in these methods during 1949.

**Synoptic Meteorology.** During 1949 the principal weather forecasting centres in the United States received synoptic messages every six hours reporting the weather in about 700 places in the northern hemisphere, and in addition many of these centres received several hundred reports each hour, more than 10,000 each day, from airport weather stations conveying meteorological items of importance in air navigation. Yet these voluminous reports presented only a small part of the picture of local conditions and variations in weather of significance to agriculture, commerce and transport. There was a constant demand from business concerns and the general public for a more comprehensive coverage by the government meteorological service; and as aviation expanded there was an urgent need for more weather reports. Surface weather observations were augmented by upper air soundings with pilot balloons and radiosondes, by aircraft reconnaissance reports and, more recently, by hundreds of "in-flight" weather reports from commercial pilots who, on their regular air transport routes, encountered local storms, icing clouds and air turbulence that would otherwise not be reported for entry on the daily weather charts from which forecasts and storm warnings were prepared. The great number of incoming reports arriving in a continuous stream flooded the primitive facilities of the weather map analyst and forecaster, so that fewer and larger analysis centres became essential, with facilities for mechanical processing of data and the transmission of completely analysed maps by facsimile to remote district and local forecasting offices.

This evolutionary trend was well advanced by the end of 1949 and the practice of central analysis could not be completely adopted until communication facilities were available and other technical problems solved, but by the end of the year the use of upper air charts and prognoses prepared by the central analysis unit in Washington had become general throughout the United States.

The flood of weather reports led to other steps. It was impossible for the individual forecaster to assimilate and interpret mentally the innumerable items of meteorological data required to determine or define the state of the atmosphere over the country, the continent and the globe. Nevertheless this overall analysis was important for air navigation, for long range weather forecasting and estimates of agricultural production and other business analyses and activities. There was, therefore, some improvement during 1949 in the use of machine tabulation methods and electronic computer apparatus for rapid processing of synoptic weather data.

In an effort to reduce the number of immediate reports required to represent the state of the atmosphere, one investigator proposed a new concept of synoptic presentation, a system which would show the virtual parameters of the weather over an area rather than a point. This concept was too great a departure from customary synoptic practices and the elements it represented were too intangible for immediate acceptance by weather forecasters; but it constituted one solution to a pressing problem.

In the preceding years evidence of distinct wind streams in the upper air, occasionally with velocities of 200 m.p.h. or more, called jet streams, and the relation of these streams to the general circulation and their bearing on the operation of high altitude aircraft and missiles caused synoptic meteorologists, during 1949, to bring out new theories on the connection between fronts in the troposphere and jet streams in the stratosphere. Preliminary observations of the occurrence of these high velocity wind streams in the southern hemisphere were presented with theoretical reasons for believing the phenomenon to be less frequent and less intense than in the northern hemisphere. Direct observations so urgently needed to delineate the extent and nature of jet streams five or ten miles above the ground probably depended upon wider and more frequent soundings with the constant level high altitude balloons already described. It was formerly contended that winds in the stratosphere were relatively constant and formed a fairly simple general global circulation, but later it was calculated that the velocities in jet streams occasionally reach 300 m.p.h. However, most meteorologists, pointing to the rarified state of the atmosphere at high altitudes, believed the air and winds there had insufficient weight and driving force to exert much influence on weather in the lower troposphere far below near the ground.

Some meteorologists were giving more attention to pragmatism in weather forecasting. During 1949 there were many studies and some progress in developing more objective methods for forecasting the weather locally, that is, methods based on substantive factors and "engineering" techniques rather than upon subjective prognostics and expert opinion alone. Forecasts of river stages and floods and of seasonal water supply in western states, where snow accumulation in the mountains is an important source of water for irrigation in the summer growing season, had been improved in recent years and were especially valuable during 1949.

The daily synoptic reports and upper air soundings in the Arctic and over the oceans, which had been new achievements during the preceding years, became routine operations in 1949. Throughout the year weather reconnaissance flights to the north pole were made by U.S. air force planes operating...
from Alaska, and during the hurricane season similar flights were made over tropical waters. Weather reconnaissance flights and radar observations contributed much toward keeping the hurricane warning service of the Weather Bureau at a high level of accuracy. For reasons of economy the nations participating in the ocean weather vessel patrol in the North Atlantic agreed to reduce the number of station vessels to 11 and for similar reasons the United States reduced the number in the Pacific to three. Television, an excellent medium for meteorological services in which map display is important, came into wider use as a means of picturing the weather from day to day for the general public.

**Applied Meteorology.** After World War II meteorologists redoubled their efforts to encourage and develop the practical applications of weather science and its services in the everyday operations of business and industry and the thousands of enterprises where weather and climate are important factors. During 1949 the American Meteorological Society gave special attention to opportunities in applied meteorology.

Research work at the Laboratory of Applied Climatology of John Hopkins university, Baltimore, Maryland, in the meteorological factors relating to crop development and harvesting led to improved quality of product, better scheduling of harvest and reduced labor costs. Although in previous years agricultural experimental stations of state and federal governments and agricultural colleges had worked extensively on relationship between weather, climate and crops, the work of the Laboratory of Applied Climatology was outstanding as an instance in which an industrial concern made broad use of a scientific consultant service in meteorology.

In the building industry a preview of the application of modern meteorology and climatology to design, construction and location of industrial and residential structures was shown with the co-operation of the American Institute of Architects and one of the popular periodicals on home design. The publication aroused widespread interest and heralded closer co-operation in research for better utilization of natural "resources" in weather and climate for planning and selecting the best site for the particular industrial or residential purpose, and for other uses such as revision of building codes and formulation of better maintenance practices to meet the diverse effects of different kinds of weather and climate.

The problem of control of air pollution focused attention on micro-meteorology, especially in localities like Donera, Pennsylvania, where in Oct. 1948 local weather conditions led to concentration of factory effluents and to many casualties among people overcome by the vapour. In Nov. 1949 the Public Health Service published a comprehensive report of studies completed in co-operation with the Weather Bureau and other investigating groups. The results were of interest to all cities and industrial communities that suffered from air pollution. Although the Donera study had to do primarily with local meteorology rather than micro-meteorology in the strict sense, it was illustrative of the attention being given to investigations into the small scale or local details of weather and climate.

The year saw other new activities in applied meteorology. An example was specialization in local forecasting of sea wells and hurricane winds dangerous to persons engaged in oil drilling operations off the coasts of Louisiana and Texas. In applied climatology and micro-climatology as well as in applied meteorology scientists spoke optimistically of the possibilities and need for specialization in the work of these meteorological fields.

**Theoretical Meteorology and Research.** Most technical papers contributing to knowledge in theoretical meteorology during 1949 were published in the *Journal of the American Meteorological Society* (A.M.S.), the *Quarterly Journal of the Royal Meteorological Society* and *Tellus*, a new quarterly which first appeared in March 1949 as a publication of the Swedish Geophysical society and the University of Stockholm. Other important research results on subjects of a less theoretical nature were published in the *Bulletin of the A.M.S.* , the *Meteorological Magazine*, London, and the *Transactions of the American Geophysical Union*. A number of the longer research treatises appeared as monographs of the A.M.S., or as separate publications and reports issued by the meteorological departments of universities, government offices or their contracting agencies.

The predominance of papers dealing with the general circulation of the atmosphere showed the basic importance of this subject in the minds of meteorologists. Of special interest was the research in development of mathematical techniques for predicting the weather through use of the electronics computer to perform the very large number of computations involved.

**International Co-operation.** The new convention for the World Meteorological organization proposed by the International Meteorological organization (I.M.O.), its Washington conference of directors of national meteorological services in 1947 had been ratified by 27 nations as 1949 came to a close. During the year the United States continued its programme of assistance to the Philippine meteorological service and to the services in certain other countries where assistance was required as part of international co-operation in support of air commerce. Of international interest in the Americas was the thirtieth anniversary of the American Meteorological society in December.

**The Weather in 1949.** In parts of western Kansas and Nebraska as well as portions of adjoining states the heavy snows and cold weather which began the first week of Jan. 1949 practically paralysed normal winter activities for the
ensuing six weeks, and one blizzard after another threatened to cut off entirely the supply of food and other essential commodities from many localities. Emergency supplies were flown in by the air force and some of the main roads were re-opened with great difficulty by the corps of engineers. Traffic on main railroads was interrupted for days in parts of the middle west and near northwest. Snowfall was the heaviest ever recorded in many localities. At Deadwood, South Dakota, the fall in January was 77 in. Places in Arizona, New Mexico, Texas and southern California had snow for the first time in a century. Temperatures in Texas reached the lowest ever recorded there. Waco experienced 5°F. below zero.

In May, Fort Worth, Texas had the worst flood in the history of the city with a rainfall which exceeded 10 in. in 24 hours. In the northeastern states late spring and summer months were unusually hot and dry. New England had the second hottest July in the long meteorological records for that region. As a result of the exceptionally dry summer, crop damage in New Jersey, eastern New York and New England was heavy and the water supply reservoirs of many cities and towns were seriously depleted. Toward the end of the year the long rainless period led to a serious water shortage in the entire metropolitan area of New York City. (See also Seismology.)

F. W. RR.: X.)

METHODOIST CHURCH. In 1949 the Methodist Church in Great Britain showed its first increase (2,602) in membership for 17 years; the number of Sunday school scholars rose by 23,000, making a total gain of 50,000 since 1947; and the president of the conference, the Rev. H. B. Rattenbury, reported that there were now 30 million Methodist adherents in the world.

The annual conference sent to every church a call to action, urging each society to examine its spiritual condition and to adapt its machinery to modern needs. The Ministerial Manpower commission suggested an amalgamation of certain circuits in order to economize ministerial manpower. A survey of churches in mining areas revealed that in many districts progress was being made though some apathy existed when Christianity was strong. The Home Mission department was empowered to train workers for the mining areas and to undertake full-scale evangelism in selected districts. A travelling cinema van was equipped to serve as a mobile Sunday school in rural and new areas; several caravans for deaconess-evangelists were also dedicated for this specialized work. The Women's fellowship (chairman, Mrs. Leslie Church) showed marked advance in its social service and as a spiritual force in the life of the Church.

The Overseas Mission department appealed for an additional annual income of $100,000 and for 100,000 new supporters. A new constitution for the Ceylon synod was approved, to become operative in 1950. Hospitality for overseas students and visitors was organized and close cooperation with colonial welfare officers maintained.

The Methodist Church in Australia in 1949 launched a three-year drive, stressing Christian teaching as related to human needs and aiming at recapturing the spirit of the 18th century revival of religion. In the first year many members were added to the Church. The programme for the second year would be devoted to extensive work in youth organizations, and for the third year to a press and radio campaign directed to people outside all Christian churches; in some cities an open forum would also offer Christianity to the unattatched masses. During 1935-49 Methodist membership in Australia increased by 187,403 (27.4%) as compared with 14-3% increase in population. Arrangements were made to receive emigrants, especially from the National Children's Home and Orphanage. Two units of outback motor patrol nursing services started working in the Darling river area, based on Menindie.

In South Africa the membership of the Methodist Church showed an increase of 11,000. The racial problems were faced and no barriers of colour or caste were acknowledged. A joint training scheme for ministerial students was established and a divinity faculty set up at Rhodes university college.

United States. The Methodist Church, the largest Protestant body in the U.S., on May 10, 1949, closed its first decade since the reunion of three bodies brought it into existence. During the ten years notable advances were recorded. Membership since the merger showed a gain of 1,432,382, the number on Jan. 1, 1950, being 8,792,569. This figure included 24,255 ministers, but not 671,820 preparatory members or 875 full members in 50 mission lands.

Progress in the 1948-48 programme, the "Advance for Christ and His Church," was registered in observance of a week of dedication in March.

The four-year study programme first centred on the documents of the Amsterdam Assembly of the World Council of Churches; it was followed in October by a nationwide series of 78 all-day mass meetings to launch a formal study of, and deeper commitment to, Christian faith. Eight months of 1949 and 1950 were dedicated to concentration upon a specific doctrine, aided by booklets, sermons and group study. (See also Church Membership.)

MEXICO. A federal republic of North America lying between the United States and Central America. Area: 767,168 sq. mi. Pop.: (1940 census) 19,653,552; (mid-1949 est.) 24,448,000; about 55% of the population was mestizo 29% Indian and 15% white. Chief towns (pop., 1948 est.): Mexico City (federal district, 2,043,574); Guadalajara (282,280); Monterrey (252,639); Puebla (159,701); Mérida (114,967); Tampico (106,874). Language: Spanish, but an estimated 14% speak only Indian tongues. Religion: predominantly Roman Catholic. President, Miguel Alemán Valdes (g.v.).

History. The most important events of 1949 were connected with attempts to solve the nation's economic problems. Among these were a continuing unfavourable balance of trade and the instability of the Mexican peso. After a series of downward fluctuations from the pegged value of 4.85 to the U.S. dollar, which began in July 1948, the peso was finally stabilized at 8.65 to the U.S. dollar on June 17, 1949. Stabilization was achieved with the help of a loan of $25 million from the U.S. Treasury through a renewed stabilization agreement between the two governments and $22-5 million from the International Monetary fund. These loans together with the Bank of Mexico's reserves, announced at $84 million, gave the 8.65 pesos to the dollar rate a total support of $131.5 million. Certain groups, such as the exporters of Mexican goods and those engaged in the tourist trade, stood to benefit. On the other hand, importers of goods from the U.S. feared that the new rate would accelerate an already serious inflation.

To halt inflationary tendencies, Ramón Beteta, secretary of the Treasury, announced an eight-point programme which included balancing the federal budget, prevention of inflationary credits by private banks, control of monetary circulation, maintenance of wages and salaries at their maximum purchasing power, downward revision of import tariffs to lessen the blow of devaluation to importers; retention of the 15% ad valorem surtax on all exports, prohibition of certain imports (on June 21, 1949, 207 classifications of the Mexican import tariff were added to a previous list of prohibited imports) and suspension of the export permit system.
MINERAL AND METAL PRODUCTION AND PRICES

On the political scene, the government, on Jan. 28, 1949, cancelled the registration of the P.F.P. (Partido Fuerza Popular), the political organ of the Unión Nacional Sinarquista. The petition of the P.R.I. (Partido Revolucionario Institucional), the government party, on which the government based its decree, accused the P.F.P. of being anti-democratic and of aiming at restoring the Roman Catholic Church to the position of influence it had enjoyed before the Law of Religious Reform of 1929.

The federal elections, held throughout Mexico on July 3, 1949, resulted in a sweeping victory for the government party, the P.R.I., which won 143 of the 147 contested seats in the Chamber of Deputies. The remaining 4 seats were won by the more conservative P.A.N. (Partido de Acción Nacional). The P.R.I. announced that its candidates had also won in the six state elections for governor. Under Mexico's new compulsory registration and voting law (1948), about 3.5 million citizens registered although only about 60% of this number voted. The election was conducted with a minimum of violence and, although the P.A.N. made bitter charges of fraud, the decision was accepted peacefully.

An event which produced a tremendous outburst of popular enthusiasm in the United States in Sept. 1949, of the discovery of the remains of Cuauhtémoc, the last of the Aztec chieftains and one of Mexico's greatest national heroes. The discovery was made through the directions in a document, allegedly preserved since the conquest. The authenticity of the find was strongly challenged by one group of scholars, while another group maintained just as strongly that the remains were genuine. Regardless of the outcome of the contest, the event was a graphic illustration of contemporary Mexico's repudiation of the Spanish conquest and its glorification of its Indian past. (L. N. McA.)

Education. Schools (1949) kindergarten 837, pupils 98,155, teachers 2,887, primary 24,625, pupils 2,997,198, teachers 67,880, secondary 4,466, pupils 80,598, teachers 7,805, technical 199, pupils 41,928, teachers 1,676; agricultural 16, pupils 5,949, teachers 701, teachers' colleges 77, students 26,998, teachers 2,854, universities and institutions of higher education 12, students 40,031. Illiteracy (1948 ext.) 65%.

Agriculture and Fisheries. Main crops ('000 metric tons, 1948; 1949 ext. in brackets) maize 2,832 (3,139), wheat 477 (451), barley 120 (126); oats 35; rice 163 (176), potatoes 140, beans 234 (283); vegetables, fruits, nuts 1,443; cotton, ginned, long-staple (1949) 55 Livestock ('000 head, Jan. 1949) cattle 12,240; sheep 4,742, pigs 5,314, horses 2,641, asses 2,471, mules 1,001, poultry (Jan. 1949) 37,393.

Foreign Trade. (Million pesos) Imports (1948) 2,950, (1949, six months) 1,797; exports (1948) 2,594, (1949, six months) 1,653.

Main imports wheat, vehicles, tractors, machinery, rayon, generators, petrol, tubing and pipeline Main exports lead, silver, zinc, copper, petroleum and products, cotton and fish. In 1948, the United States took 75% of Mexican exports and supplied 87% of imports.

MIDDLE CONGO: see French Union.

MIDWAY ISLANDS: see United States Territories and Possessions.

MILK: see Dairy Farming.

MINC, HILARY, Polish politician (b. Kazimierz, Poland, Aug. 31, 1905), studied law and economics. During a stay in France (1927-28), he was active in organizing Communist cells among the Polish miners; but in Poland, as a civil servant (1930-39), he succeeded in concealing his political ties. He worked in the editorial section of the General Statistical office, was a member of an advisory committee at the ministry of finance and was for some time attached to Gdynia. After the partition of Poland between Germany and the U.S.S.R. he became professor of economics at the University of Samarkand (1939-43). In 1943 he was one of the organizers of the Union of Polish Patriots, the cradle of the Communist-controlled government of Poland. In June 1943 he became minister of industry and trade in the first government of "national unity." In the cabinet appointed on Feb. 7, 1947, and presided over by Józef Cyrankiewicz, he was minister of industry. Though ready in June 1947 to accept Marshall plan, he kept in line with Moscow when informed of the Soviet attitude. As a member of the Politburo of the Polish Workers' (Communist) party he was one of the delegates at the conference of Wilczek Góra, Poland, in Sept. 1947, at which the Cominform was created. On April 22, 1949, he was appointed acting prime minister with far reaching powers to co-ordinate the economic activities of all branches of the state administration.

MINERAL AND METAL PRODUCTION AND PRICES. Table I shows the output of the more important minerals and metals in the major producing countries. Table VII gives the prices for the leading minerals and metals, as quoted on New York and London markets at the beginning and end of 1949. Many of these prices, especially those of the major non-ferrous metals, took sharp drops during the year, marking the end of the postwar period that had exhausted the backlog of industrial demand that had accumulated during World War II. Following the abandonment of price control in 1946 there was practically continuous advance in prices. The E. & M. J. Metal and Mineral Markets weighted index of non-ferrous metal prices, which averaged 90-86 in 1945, rose to 142-19 in Dec. 1946, to 152-48 in Dec. 1947 and to 185-52 in Dec. 1948. A peak of 185-75 in Feb. 1949 was followed by a gradual decline to 131-20 in June and a reaction to 142-24 in September, with further minor fluctuations in subsequent months, closing at approximately the level prevailing late in 1946.

Aluminium. Although world production of aluminium in 1948 increased one-sixth over 1947, to more than double the 1939 total, it was still only 65% of that of 1943, the World War II peak year. The bulk of the increase was in Canada and the United States, which supplied respectively 26% and 45% of the total and together accounted for 62% of the increased output of 1948.

The demand for U.S. aluminium increased steadily and until the latter half of 1949 supplies were not plentiful. While the production rate advanced appreciably during the first half of 1949, strikes in several of the plants cut output in the second half. The total output up to the end of Oct. 1949 was 526,436 tons, and the total for the year was expected to be about the same as that of 1948.

Copper. World production of copper was gradually recovering from the postwar slump. The 1948 total was 14% more than the 1939 level, but was still short of the World War II peak by a similar percentage. Incomplete
smelter reports for 1949 indicated appreciable gains in output in Canada, Germany, Japan and Northern Rhodesia, but these were largely offset by declines in Chile and the United States, and little improvement could be expected in the yearly total.

Demand exceeded supply until well into 1949, when a reversal of the trend was marked by a sharp drop in prices.

In the U.S., the 1948 output fell somewhat short of that of 1947 because of strikes in the industry, although the decreased ore tonnage was partly offset by a small increase in copper content of the ore. The decline in domestic output was more than offset by increased imports, giving a small increase in the total supply above that of 1947.

In 1949 mine output suffered declines, partly from labour stoppages and partly from a cut in working time from 48 to 40 hr. a week. Mine production during the first three-quarters of 1949 totalled 557,581 tons, a reduction of 11% from the average monthly rate in 1948.

In Canada, primary copper production advanced from 225,861 tons in 1947 to 240,732 tons in 1948, and continued to improve at about the same rate in 1949 with a total of 172,925 tons up to the end of August. Small tonnages of ore and concentrates were exported, but the bulk of the output was converted into refined copper. Refinery output increased from 202,427 tons in 1947 to 221,275 tons in 1948 and 151,985 tons in the first eight months of 1949.

**Lead.** The lead output of the major producing countries and estimated world totals are shown in Table II. Early in 1949 a sharp break in prices took place, due to increased production which brought supply ahead of demand.

While the U.S. mine output of lead showed little improvement in 1948, and refinery output declined 8%, this trend was reversed in 1949. The mine total was stepped up to 311,281 tons in the first three quarters of 1949, while the primary refinery output advanced to 399,139 tons.

The output of primary lead in Canada increased from 161,668 tons in 1947 to 167,251 tons in 1948, but operations were slowed down in 1949, for the total for the first eight months being 98,452 tons.

**Manganese.** The output of the more important manganese producing countries, as listed in Table III, are usually about 90% of the world total, although there are about 35 manganese producers.

The domestic output of manganese in the U.S. continued to decline. Shipments from the mines showed only a minor

Nickel. The bulk of the world's supply of nickel came from Canada, but outputs of other significant producers and the estimated world totals during several recent years are shown in Table IV.

There was a sharp increase in Canada in 1948 as both production and exports of nickel, and extensive development work was under way in the mines to expand the ore reserves.

Oradea, Crude magnetite. 1KgO equivalent of salts produced. {Mainly crude sulphur, but includes some ore and some sulphur recovered from roaster gases.}
United States in 1948, which more than doubled over 1947.

During 1949 smelter operations were maintained at approximately the 1948 level, the output up to the end of November totalling 37,253 short tons, as against 37,546 tons in the same period of 1948.

Uranium. The major sources of supply of uranium in the past were the Belgian Congo and Canada, with small amounts from the United States, Czechoslovakia and Portugal. With the development of the atomic bomb a new incentive arose for a world-wide search for uranium ores. In such a widespread programme favourable results could be expected in only a relatively few locations, but no definite information was available during 1949 on the findings. A number of new locations were reported, but for security reasons little detailed information was made public.

Before the discovery of the rich ores of the Belgian Congo, small amounts of radium ores were mined in the United States, and from these uranium was recovered as a by-product. The Colorado plateau area of Colorado, Utah and Arizona had supplied moderate tonnage of low grade vanadium-uranium-radium ores since the early 1930s. Prospecting and new development were active in this area, and late in 1949 it was reported that there were about 300 mines in operation, employing 1,000-1,200 miners and supplying ore to six treatment plants. Other areas of Arizona also made marked progress, and in mid-1949 ore production was estimated at 200 tons per day.

To stimulate the prospecting programme in the United States, a price of $3.50 per pound of uranium oxide was guaranteed, supplemented by a bonus of $10,000 to any operator who delivered as much as 20 tons of concentrates of at least 20% of uranium oxide from any single claim not previously operated.

Zinc. World production of zinc in 1948 advanced by 6% to a level above that of 1939. The outputs of the important producing countries and the estimated world totals during the past several years are shown in Table VI.

Smelters in most European countries were up to or past their prewar outputs, and the deficiencies in Germany and Poland were more than offset by increases elsewhere.

**Mineralogy.** The occurrence in nature of the well-known nickel compound, NiSO₄·6H₂O, was reported by Clifford Frondel and Charles Palache and the name regisitered assigned to it as a mineral (American Mineralogist, vol. 34, 188-194). W. C. Smith, F. A. Bannister and M. H. Hey described cymrite, a new barium mineral, BaAl₅O₉OH, from the Benallt manganese mine, Rhiw, Carnarvonshire, Wales (Mineralogical Magazine, vol. xxviii).

The increased demand for single crystals, the success achieved in growing them in the laboratory, their properties and many uses were described in an illustrated article "Crystals" by Hans Jaffe (Physics Today, Sept. 1949).

The progress made from 1939-49 in producing synthetic gem materials in the United States was discussed in "American Synthetic Crystals—Sapphire to Titania" by A. K. Seemann (Gems and Geology, vol. vi, pp. 151-159) and by C. H. Moore, Jr., in "Formation and Properties of Single Crystals of Synthetic Rutile" (Mining Engineering, Mining Transactions, June 1949).

During the year the following books became available. Story of Jade by Herbert P. Whitlock and Martin Ehrmann.

This was an important contribution to our knowledge of jade, with 179 black and white illustrations and four full colour plates of notable jade objects. The third edition of E. S. Dana’s *Minerals and How to Study Them* (New York), well adapted to the needs of beginners and amateurs, was revised by C. S. Hurlbut, Jr. The first edition appeared in 1895. The revised and enlarged 10th edition of G. F. Herbert Smith’s *Gems and Minerals* (London) was widely used. *Crystals and X-Rays* by Kathleen Lonsdale (New York) was intended for all interested in crystallographic science. *Probleme der Naturwissenschaften* by Paul Niggli (Basel) was an attempt to explain the concept, and its development, of the nature of crystals and minerals. *Gesteine und Lagerstatten* by Paul and Ernest Niggli (Basel) presented a modern treatment of rocks and mineral deposits. *Die Kristallwelt* by H. Tertsch (Vienna) described in detail the history and development of crystallography and mineralogy.

Notable progress was made in Germany in re-establishing journals which were discontinued during World War II and in launching new ones. During 1949 the leading German journal devoted to gemology and jewellery, *Die Deutsche Goldschmied-Zeitung*, which ceased publication in 1943, began to re-appear. Moreover, two new journals were launched: *Edelsteine und Schmuck* at Idar-Oberstein, recognized as a leading gem centre for more than four centuries, and *Achat*, devoted to mineralogy, gemology and jewellery was issued at Hamburg.

The greatly increased application since 1939 of X-ray analysis and electron diffraction to the study of crystal structure and the solid state led to the formation of the Crystallographic Society of America and the American Society for X-ray and Electron Diffraction. As the functions and memberships of these societies overlapped, it was voted to merge them, as from Jan. 1, 1950. The new organization would be known as the American Crystallographic association.

The Washington A. Roebling medal was awarded to Herbert E. Merwin of Washington, D.C., by the Mineralogical Society of America at its annual meeting at El Paso, Texas, Nov. 11, 1949. For 40 years Merwin had been on the staff of the geophysical laboratory of the Carnegie institution. He had contributed extensively to the advancement of mineralogy and petrography. (See also MINERAL AND METAL PRODUCTION AND PRICES.)

(E. H. KR.)

**MISSIONS, FOREIGN RELIGIOUS.** All over the world the enterprise of foreign missions continued to take the strain imposed by financial tension and, in many countries, by political developments or tendencies. Recruits were short except in the Roman Catholic missions.

**India and Pakistan.** New troubles were experienced in the state of Hyderabad and in Kashmir, but European missionaries remained at their posts and carried on their work. In the south the recently united Church of South India (Anglicans, Wesleyans, Presbyterians and Congregationalists) proved to be a steady influence. In the north the aftermath of the separation of India and Pakistan continued to be felt,
especially in the Punjab and in the Northwest Frontier province. Around Delhi there was some return to Hinduism but the Indian clergy remained loyal. The future of the mission schools and colleges still remained uncertain. Unless adequate standards were maintained they would be taken over by the state. In India English was displaced by Hindi and Christian teaching was to be given outside school hours in the middle and primary schools. In Kashmir the government favoured the mission schools; but in Assam the government took over responsibility for them. Much the same was true of the mission hospitals and other institutions. On the other hand, church buildings, formerly the property of the British government of India, were being handed over to the missions by the new government, with a temporary grant for their maintenance.

In order to mitigate the effects of these changes, the Society for the Propagation of the Gospel set up a reserve fund for India and Pakistan, upon which the metropolitan bishop of Calcutta, in consultation with the provincial bishops, could draw for the next ten years, chiefly for stipends in those parts of the mission field where the local churches were contributing. Moreover, annual grants were to be gradually reduced, and a new policy of capital grants introduced, where local effort responded, in order to help to endow the church in India and Pakistan. The transfer of lands and buildings would go on.

Relief work among the Moslems in the North-West Frontier province impressed the Pakistan government. Progress was made in the Church Missionary society's area in the western Punjab where the offerings of village Christians were twice as high as in the previous year. The Baptists reported little or no interruption to their work, though they expected restrictions in the schools. At Serampore college they recorded a high enrolment of students, and also at Bishnapur where they co-operated with the Congregationalists. A scheme of union for the Baptists in north India was inaugurated.

Ceylon. The Methodists and Baptists reported improved relationships between the government and the missions after the declaration of Ceylon's independence on Feb. 4, 1948. There was no disturbance or communal strife. Christian teaching in the schools was forbidden in school hours; nevertheless, the classes held outside school hours were well attended. The Buddhists were adopting Christian methods in order to counter Christian propaganda. Negotiations to unite the Anglican, Methodist, Baptist and other Churches in Ceylon continued.

Burma. With China and Korea Burma was one of the most disturbed mission fields. Communists and insurgent Karens rendered the work difficult, although the latter opposed the separation from the British and continued to be the strongest Christian section of the population. It was difficult to obtain leave for missionaries to enter the country, except for those who were there before World War II. Yet Anglicans reported that buildings were being repaired in Rangoon and the Methodists reported the same at Mandalay, and that their work was progressing on the Assam border.

Far East. China. In spite of the spread of war to the southern provinces the spirit of the Chinese churches and missions was buoyant, especially where work was being done among students and young people. There were great opportunities in other branches of the work, but shortage of staff and rising costs prevented them being used. Inflation reached prodigious figures. Hospital work was being maintained, even in areas occupied by Communist forces. In the north some missionaries were working entirely cut off from communication with the home churches. The Baptists and Methodists reported that the National Christian council had organized a Forward movement. Nearly 1,000 students from 13 universities were baptized during the year, and the Methodists reported over 3,000 baptisms in the middle schools. The government permitted the teaching of the Bible in secondary schools in central China, where also the primary pupils crowded into the church services. Where they had to evacuate, the Baptist missionaries were co-operating with the Church of Christ, the London Missionary Society, the English Presbyterians, the American Baptists and Canadian missions. But the sweep of the Communists to the south would place new obstacles before all this work.

Korea. This was probably the most difficult field for missions in the world. Political barriers separated north and south. In the south the Americans restored freedom of Church life. The need was stressed for more missionaries who would stay for life, to replace those who were growing old. Higher education was in demand especially at the American Presbyterian and Wesleyan hostel at Seoul university.

Japan. The Church Missionary society (C.M.S.) reported the recommencement of church life at Hiroshima. The Japanese bishops and clergy asked for more missionaries to meet opportunities open on all sides. There was an evangelistic mission throughout Japan in the spring in response to a widespread desire to hear Christian teaching. By 1949 no field appeared to be more open to Christian missions.

Singapore. Mission work was difficult on the outskirts owing to the interference of bandits, but the schools were full and more could be opened.

Borneo. Schools were desired, people crowded to Christian preaching and the rebuilding of churches was going on.

Middle East. The Christian Church in Palestine was scattered by the flight of the Arabs to Lebanon and Jordan; a despairing remnant remained in Palestine under the care of a few Arab pastors. The C.M.S. headquarters were in 1949 at Amman, Jordan, where relief work among refugees was being carried out by the missionaries. In Egypt the teaching of Christianity to children in the state schools was sanctioned and would be financed by the government. In the mission schools Moslem children should be taught the Koran. Closer relations with the Coptic Church were established in Cairo and in the towns around. In Persia Christian schools were restricted by the government and there was a shortage of doctors in the hospital, this hindered contact with the people. The Presbyterians of north Persia and the Anglicans of the south united to form a Christian Literature committee.

Africa. Christianity, Islam and political materialism were bidding for the soul of Africa. The African was taking up the function of leadership amid the industrial changes that were going on. The importance of schools and colleges in which these leaders could be trained was emphasised by the missions. On the Gold Coast, Anglicans and Methodists, in spite of nationalist ambitions, reported that educational work was progressing, there was no shortage of funds but recruits for the ministry were not forthcoming. In the Neger and Yoruba field the C.M.S. was fostering the development of Christian home life and also the provision of maternity homes. Shortage of staff hindered the work. In the Far East, the Missionaries were co-operating with the C.M.S. and the Church of Scotland in a theological college. On the Congo, the Baptists reported that the schools were full. The Grenfell Training institute (Yalemba) for educational and pastoral work had a successful first year. On the middle Congo the work progressed in all its branches, but on the lower Congo it was hindered by shortage of staff while the Belgian government expected a higher standard in the schools in return for its subsidies. The Methodists reported that they could not meet all the opportunities in education. In Portuguese Angola, in spite of growing industrialism the
Baptist mission was advancing. In French Dahomey there was a revival of fetish worship among the converts.

In the diocese of Zanzibar the Anglicans reported that new government salary scales increased the financial burden of educational and medical work. Moreover, since the African clergy were paid one-fourth the rate of a grade-one teacher, it was difficult to secure recruits for the ministry. In Nyasaland Anglican schools and hospitals were suffering from a reduction of staffs and medical units were being placed in charge of nursing sisters; but in most parts there was increased financial support. In the Presbyterian and Dutch Reformed missions the salaries of the African ministers were entirely paid by Africans. In Northern Rhodesia, while commerce and industry expanded, pastoral and evangelistic work made little progress, through a shortage of European missionaries. Here, as elsewhere, the visit of the bishop to the Lambeth conference in 1948 produced very few recruits.

In Masasi diocese there was a sense of frustration owing to the slow progress of the groundnut scheme. Few European settlers supported the missions, though they were friendly. There were three more schools than in 1948, but the standard in the schools needed to be improved to retain government grants. In Southern Rhodesia there was a great demand for baptism among the Africans who flocked into the towns for work, but the missionaries were too few to cope properly with the work. The Anglicans were preparing an evangelistic campaign for 1950. Several new parishes were founded; and the colleges at Gwelo and Penhalonga, founded largely by support from the Society for Promoting Christian Knowledge, were turning out well trained teachers.

In the Union of South Africa racial tension became more acute owing to the diminution of Native rights by the government. The missions, through the Christian Council of South Africa, upheld the claims of the Africans. Great opportunities for evangelism were being lost by understaffing and overwork among the clergy. However, new Anglican mission stations continued to be opened. The Roman Catholic and Methodist stations were at work on the new gold fields near Bloemfontein. In Basutoland the Roman Catholics and the Paris Evangelical mission were doing well, but the Anglicans were handicapped by lack of support. However, at Pretoria a gift of £12,000 was received and would help Anglican schools and other institutions.

**MOHAMMAD, Riza Shah Pahlavi,** Shahanshah (king of kings) of Persia (b Tehran, Oct. 26, 1919), succeeded to the throne on Sept. 16, 1941. (For his early life see Britannica Book of the Year 1949).

On Feb. 4, 1949, a newspaper photographer named Fakhri Rai, a member of the Tudeh (Masses) party, attempted to murder the Shah, firing live shots at 10 ft. range. On Feb. 24, asking for an amendment of the constitution, giving him the right to dissolve the Majlis and call fresh elections, the Shah said that the Majlis had done nothing to improve the economic position of the country, having not even passed a budget for the previous five years. In June he received the visits of Liaquat Ali Khan (q.v.), prime minister of Pakistan, and of Abdulhullah (q.v.), the regent of Iraq. On July 28 King Abdullah (q.v.) of Jordan paid a state visit to Persia. During the year, in statements to foreign correspondents, the Shah appealed repeatedly to the west for financial aid to the country. On Nov. 16 he arrived in Washington on a six-week visit to the United States. He returned to Tehran on Jan. 2, 1950.

**MOHAMMED BEN YUSSEF,** Sultan of Morocco (b. Micknes, 1911), the third son of Mulay Yussef, of the Alauite dynasty which had ruled the country from 1639. He was elected sultan on Sept. 18, 1927, by the college of ulemas of Fez. By virtue of being descended from the Prophet, he had the religious title of sherif. Consequently he exercised both temporal and spiritual power. Taking seriously his role of sovereign, Sidi (or Sir, as he was styled) Mohammed held out against the forms of direct administration of the protectorate by refusing or delaying his signature of the dahus (decrees having the force of law) which was essential to their validity. Without taking any official stand, he made no secret of his goodwill towards the Istiqlal party working for Moroccan independence. He declared that he favoured democracy if considered as an application of the moral principles of Islam which respected the integrity of theocratic prerogatives. His elder son, Prince Mulay Hassan, constituted himself spokesman for Moroccan youth, and the eldest of his three daughters, Princess Lalla Ayesha, who threw off the veil and other traditional restraints, called upon Moroccan women to emancipate themselves. In a number of speeches after World War II the Sultan claimed the right of Morocco to achieve liberty, but without explicitly demanding independence. His opposition to French rule was in general both subtle and controlled. On April 10, 1947, however, at Tanger, he made a friendly reference to the Arab league and claimed independence for Morocco. The civil resident general, Frik Labonne, was therefore recalled and General Alphonse Juin, exponent of authoritarian tradition, appointed in his place. From that date the Sultan unremittingly continued his passive resistance. So, in 1949, he protested against the speech of a French minister in which Morocco was regarded as an associated state within the French Union.

(C. A. J.)

**MOHAMMED Zahir Shah, Al-Mutawakkil-Ala-Allah,** King of Afghanistan (b. Kabul, Oct. 15, 1914), son of Mohammed Nadir Shah. On his father's banishment by King Amunullah in 1924, Zahir studied at the lycées Janson de Sailly and Pasteur in Paris and later at Montpellier. Following the assassination on Nov. 8, 1933, of his father, who by defeating and executing the intervening ruler Habibullah had eventually become king after the abdication and exile of Amunullah in 1929, Zahir succeeded to power without difficulty, chiefly by reason of the support given by his uncles, one of whom, Sirdar Mohammed Hashim Khan, was prime minister and another, Sirdar Shah Mahmud Khan Ghazi, war minister and c. in c. On Nov. 7, 1931, he married his cousin, Ummarrah Begum, daughter of Sirdar Ahmad Shah Khan, and they had five children, including the crown prince Mohammed Akbar Khan (b. Kabul, Aug. 10, 1933). On July 3, 1949, opening the National Assembly, the king said that Afghanistan did not recognize any agreements or pacts concerning the Indo-Afghan frontier concluded with Great Britain, as the British had left India (see Afghanistan and Pakistan). On Oct. 13, 1949, he arrived in Paris for eye treatment and was received by President Vincent Auriol.

Prince Louis II Goyon de Matignon-Grimaldi, who died on May 9, 1949, was succeeded by his grandson Rainer (b. May 31, 1923), son of the hereditary Princess Charlotte-Louise-Juliette and of Count Pierre de Polignac. He was enthroned on Nov. 19.

Social changes of the postwar period were felt in Monaco. The casino of Monte Carlo, the financial mainstay of Monaco, saw its salles privées shut and the roulette players risking only modest sums. To attract tourists the casino broke its tradition
by introducing in the summer of 1949 the American dice game of craps. A discussion was initiated with the French government with a view to "liberalizing" the French-Monacan financial agreement of April 14, 1945, by which the principality was submitted to strict fiscal and exchange control by the French authorities.

**Finance.** Budget (1930 est., million francs): ordinary, revenue 924-4, expenditure 884-8; extraordinary, revenue 120-2, expenditure 50-3.

### MONGOLIAN PEOPLE'S REPUBLIC

(formerly OUTER MONGOLIA. A vast tableland bounded on the north by Siberia, on the east by the Mongol-populated fringes of the Manchurian provinces of China, on the west by the Chinese province of Sinkiang (part of the frontier being in dispute), on the south by the Mongol-populated fringes of the Chinese provinces of Ninghsia, Suiyuan, Chahar and Jehol. Area: 580,158 sq. mi. Pop. (according to Soviet figures published in 1948, but cited from data of 1941): 850,000. Religion: Lama-Buddhism, followed by the majority of the population, though the properties of the great temples and monasteries, formerly untaxed, have been appropriated by the state, and the "reincarnation" of "living Buddhas" has been forbidden. Capital: Ulan Bator, formerly Urga (pop., 1941 est., 70,000). Chairman of the presidium of the Little Hural, Bumatsende; prime minister and commander in chief, Marshal Choibalsan.

**History.** The first, chronologically, of Soviet-dominated people's republics celebrated during 1949 the 28th anniversary of its national revolution and the 25th anniversary of the foundation of the present regime.

The foundation of the Mongol People's Revolutionary (Communist) party in 1921 was the occasion of a solemn meeting, at Ulan Bator on July 11. The main speakers were Y. Tsedenbal, secretary general, and Choizhamb, secretary of the central committee of the M.P.R.P.

More important still was the celebration of the anniversary of the adoption by the first Great Hural or people's assembly of the Mongolian constitution (Nov. 26, 1924). On this occasion Joseph Stalin sent a message to Marshal Choibalsan congratulating the Mongolian people for having liquidated through stubborn labour the heritage of the past, the age-old backwardness of the Mongolian people. Choibalsan replied by proclaiming that the Mongolian people owed their freedom and independence and all their achievements in state, economic and cultural construction of their country to "the many-sided and disinterested assistance of the great Soviet people."

At a big meeting held at Ulan Bator on Nov. 25, Surunzhab, deputy prime minister, reported on progress achieved in 25 years. Land cultivation was 173 times larger than in 1927; the arats (peasants) of Mongolia had organized 121 collective stock farms; livestock (horses, cattle and sheep) numbered in 1949 twice as many head as in 1924; extraction of coal (which began in 1915) had increased 127 times and the total number of industrial establishments was 252 times greater than a quarter of a century ago; by the end of 1949 there were in the country about 1,000 km. motor roads and on Nov. 7 the first railway line linking Ulan Bator to the Trans-Siberian was inaugurated. There were also big achievements in the cultural field: 25 years ago illiteracy had been almost universal; by 1949 it was reduced to 55-4%.

In April 1949 Dango Surun Neydachin, secretary general of the Revolutionary Union of Youth of Mongolia, took part in the 9th congress of the Young Communist league in Moscow. Tsedenbalm, secretary general of the M.P.R.P., was present in Moscow on Dec. 21 at the celebration of Stalin's 70th birthday. Together with other people's republics Mongolia recognized the Chinese People's republic (Oct. 9).

The application of Mongolia for United Nations membership, already rejected in 1946 and 1947, was again opposed by the Security council on Sept. 15. U.S.S.R. and Ukrainian S.S.R. voted for; Canada and China against; Argentina, Cuba, Egypt, France, Norway, United Kingdom and United States abstained.

**MONIZ, ANTONIO CAETANO DE ABREU FREIRE EGAS,** Portuguese medical scientist and diplomat (b. Avanca, Portugal, Nov. 29, 1874), was educated at the universities of Coimbra and Bordeaux. Until 1911 he was a professor at Coimbra and from 1911 was professor of neurology at Lisbon university. He served in the Portuguese parliament, in 1918 was minister in Madrid and from 1918 to 1919 was minister of foreign affairs. He was a pioneer in the surgical treatment of mental disorders. In 1927 he invented "cerebral angiography," a method of visualizing the blood-vessels of the brain and making it possible to diagnose and locate cerebral tumours. On Oct. 27, 1949, it was announced that he had been awarded, jointly with Dr. W. R. Hess (q.v.), the 1949 Nobel prize for physiology and medicine for his discovery of the therapeutic value of the prefrontal leucotomy in the treatment of certain mental disorders.

### MONTREAL. A city in the province of Quebec, Canada, first called Ville Marie. The population of the city proper was estimated in 1949 at 1,420,057 and of greater Montreal at 1,650,011.

The port of Montreal is the largest in Canada. Deep-sea vessel arrivals in 1949 (commercial) numbered 1,112, with a net tonnage of 4,113,320. The number of coastal or inland vessel arrivals (commercial) in 1949 was 3,198, with a net tonnage of 3,502,218. During 1948 a total of 2,568,010 tons of cargo passed through the port, including 2,209,884 tons inward and 358,126 tons outward.
The assessed value of real estate, as of April 30, 1949, was $1,442,136.8 million of which $1,081,710.9 million was taxable. In 1949 building permits were issued for 4,717 new buildings, having a value of $78,218 million and for 2,878 repairs, having a value of $10,921 million. Bank clearings for 1949 were $13,911 million.

MONTSERRAT: see LEEWARD ISLANDS.

MONUMENTS AND MEMORIALS. 1949 saw the erection and dedication of many memorials to the fallen of World War II. On Remembrance Sunday, Nov. 6, many monuments were unveiled and many more were consecrated during the year. On Nov. 8 two memorial books containing the names of 20,000 men of the R.A.F. Bomber command who fell were placed in the Royal Air Force Chapel of St. Michael in Lincoln cathedral.

The Imperial War Graves commission continued to record and maintain graves of the fallen of two world wars and in November it was announced that 90,000 headstones for World War II had been made and engraved. Ancient monuments under the ownership or guardianship of the Ministry of Works continued to increase in number. The report of the Ministry of Works gave details of 28 monuments and historic buildings for which the ministry took over responsibility during 1948. They included Hadleigh castle, Essex; Hailes abbey, Gloucestershire; Eynsford castle, Kent; Longthorpe tower, Northamptonshire; Caer Gybi Roman wall, Holyhead; Auchindoun castle, Banffshire; Drumlin castle, Banffshire; Craignethan castle, Lanarkshire; Cairnpapple burial site, West Lothian; and Edron Old Norman archway, Berwickshire. A new edition of regional guides to ancient monuments in England and Wales was in preparation. Volumes had been published for North Wales, South Wales and Northern England.

A bronze equestrian statue of Lady Godiva (1040-1080) in Broadgate, Coventry, was unveiled by Mrs. Lewis Douglas, wife of the American ambassador, on Oct. 23. The statue, 9 ft. 6 in. above its large plinth of Portland stone, was the work of Sir William Reid Dick and was the first permanent memorial in Coventry to Lady Godiva. It had cost £20,000 and was presented by W. H. Bassett-Green.

A stone plaque in memory of Sir Arthur Conan Doyle (1859-1930), was unveiled at 11, Picardy place, Edinburgh, in April. A plaque in memory of David Livingstone (1813-1873) was unveiled in September in Newstead abbey where he wrote *The Zambezi and its Tributaries*. The entrance arch of the Navy aisle in Portsmouth cathedral was dedicated on July 24 to Admiral of the Fleet Sir Osmond de Beauvoir Brock (1869-1947), chief of staff, grand fleet, 1916-19.

A public subscription of £25,000 was raised for an open air auditorium in the state of Victoria, similar to the Hollywood bowl, California, in memory of the Australian singer, Dame Nellie Melba (1861-1931). A memorial statue of General Sir John Monash (1865-1931), commander of the Australian Army corps in France, 1918, was being prepared in England for erection in the Melbourne domain in the shadow of the Shrine of Remembrance. The Australian-American society in October approved plans for the erection of a memorial in Canberra as a tribute to the contribution of the United States to the defence of Australia in World War II.

In Canada, the partnership of Australia, Canada, Great Britain and New Zealand in the British Commonwealth Air Training plan was commemorated at the Royal Canadian Air Force station, Trenton, Ontario, on Sept. 30. The memorial took the form of double main gates and posterns of ornamental handwrought iron made in Great Britain and bearing the coats of arms of the four nations. On July 27 a granite monument commemorating the landing of the first trans-Atlantic cables, 1858-66, was unveiled at Bay Bull's Arm, Trinity bay, Newfoundland.

In the United States, congress passed a bill, signed by President Harry S. Truman on Sept. 28, providing for a memorial to Mahatma Gandhi (1869-1948) in the form of a building containing books by and about him and of Indian culture.

In Israel the government decided to plant a forest in the Judaean hills in memory of Count Folke Bernadotte (1895-1948). In October was opened the Rathbone Memorial institute, in memory of Eleanor Rathbone (1872-1946), described as "champion of justice and a lover of children."

A statue by Gustaf Nordahl of the pioneer of Swedish gymnastics, Per Henrik Ling (1776-1839), was erected in Stockholm. On May 2, Oskar Helmer, Austrian minister of the interior, opened the former Nazi concentration camp at Mauthausen for public inspection, as a national memorial to the memory of those who lost their lives there. (X.)

MORAVIA, ALBERTO, pseudonym of Alberto Pincherle, Italian novelist and essayist (b. Rome, Nov. 28, 1907), was compelled by an illness to leave school and live as an invalid for five years. In 1929 Moravia published his first novel, *Gli Indifferenti* which brought him immediate fame and was largely responsible for a new naturalistic and existentialist literary outlook in Italy. This and later novels were characterized by a realism and psychological interest reminiscent of some Russian writers, in particular Dostoyevsky. In general there was a pre-occupation with crime and self-destruction and, to present his subject truthfully, he often dispensed with conventional reticence. From 1929-42, while publishing novels and short stories, he travelled in England, France, Germany, the U.S.A., Mexico, Greece and China. *La mascherata*, a satire on the dictatorship, was written during this period, as also were *La bella vita* (1935), a collection of short stories, and *Le ambizioni sbagliate* (1935), translated into English in 1937 under the title *The Wheel of Fortune*. Later novels included *Agostino* (1945), for which
Moravia was awarded a literary prize, and *La Romana* (1947), both translated into English, the latter in 1949 as *The Woman of Rome*; *La disubbidienza* (1948); and *L'amore coniugale* (1949). Moravia also wrote *La speranza*, a collection of essays, and several books of short stories: *L'imbraglio* (1937); *I signi del picco* (1940), *L'amante infelice* (1943) and *L'epidemia* (1945) were also written by him. Many of his books have been translated into several languages. Moravia contributed regularly to the daily newspaper, Il Corriere della Sera, and to a weekly magazine, *Il Mondo.*

**MOROCCO:** see **FRENCH UNION: SPANISH COLONIAL EMPIRE:** Tangier.

MOSCOW, capital of the Union of Soviet Socialist Republics and of the Russian Soviet Federated Socialist Republics and the fourth largest city of the world. Area: (1917) 68 1 sq mi, (1939) 110 1 sq mi. Pop.: (1917) 1,701,300, (1939 census) 4,137,018.

Moscow, which houses the headquarters of the vast administration of the state and the headquarters of the Communist party, exercised a magnetic attraction for the ambitious citizen who strove to get to Moscow, where the best jobs were to be had and where living was better than in the provinces. From about two million in 1926 the population reached over four million in Jan. 1939 and, though official figures were not available, it was generally accepted that the figure for 1949 was in the region of six million. The building programme had by no means kept up with this growth and, in spite of police efforts to relieve the town of any citizens who had no permit to live there and of legally laid down norms of accommodation, housing conditions were difficult, with two rooms as the average allowance for a family.

The main streets, which radiate like spokes of a wheel from the crenellated walls of the Kremlin with two ring-roads which link them, showed signs in surfacing, tree-planting and laying-out of flowerbeds of the civic pride of the City Soviet, though the side-streets failed to live up to their standards. The crowds thronging the main shopping streets showed in the general shabbiness of their dress that in 1949 the Soviet Union still had a long way to go before the needs of all could be met. However, supplies of food and consumer goods in the shops maintained signs of improvement, queues decreased and, most important of all, prices of some classes of goods were lowered. The citizens of Moscow still had to struggle with congested public transport, in spite of the continued efforts to improve it. But, whatever the rigours of life and travel, Muscovites enjoyed the consolation of good theatres, excellent concerts and the best ballet in the world.

(R. Pst.)

**MOTION PICTURES:** see **Cinema.**

**MOTOR-BOAT RACING.** The 46-year-old Harmsworth trophy (British international trophy for power boats), held by American boats since 1920, returned to competition in 1949 for the first time since 1933, with a Canadian challenge by E. A. Wilson's "Miss Canada IV," driven by the owner's son, Harold Wilson. The races for it on the Detroit river, July 29-Aug. 1, were won by R. Stanley Dollar, Jr., of California, driving his "Skip-A-Long." He averaged 94 285 m.p.h. to lower the previous (1931) Harmsworth record of 89-913 m.p.h.

Though it failed to take the Harmsworth trophy, "Miss Canada IV," early in October at Picton, Ontario, set up a new North American straightaway speed record of 139-5 m.p.h., a close call for the world's motor-boat speed record of 141-74 m.p.h. made by Sir Malcolm Campbell in 1939 with "Blue Bird II." An unsuccessful attempt to beat this record was made in England by Sir Malcolm's son, Donald Campbell, on Lake Coniston.

The North American record, made by Gar Wood in "Miss America X," had stood for 17 years until Aug. 20, 1949, when it was broken by Dan Arena, driving Jack Shafer's "Such Crust," on Gull lake, Michigan, at 126-588 m.p.h., a record which lasted only 6 weeks before Wilson broke it with "Miss Canada IV".

Outstanding among unlimited speedboats in American racing during 1949 was Horace Dodge's Hacker-built, Allison-powered "My Sweetie," driven by Bill Cantrell. With the single exception of the Harmworths, "My Sweetie" won every race it entered during the year, including the Gold cup and Silver cup events at Detroit, Michigan, free-for-alls at Red Bank, New Jersey, and Buffalo, New York, and the President's cup race at Washington, D.C. (W. H. Tr.)

**MOTOR CYCLE AND CYCLE INDUSTRY.** Increased production in 1949 in both branches of the industry in Great Britain was still not capable of supplying the demand in the home market and in the export fields, where British cycles were still attracting the greatest interest. The industry produced mainly for the export market and in the first nine months exported 50,969 motor cycles and 1,705,836 cycles. The total value of the trade's exports for the period Jan.-Sept., 1949, including parts and accessories worth £5,322,956, was £22,436,208.

The largest export market for motor cycles was Australia which was importing from Britain at the rate of about 2,000 machines a month. India, Pakistan, South Africa, British West Africa, Malay and Indonesia were the chief markets for British pedal cycles.

Until the summer of 1949, India was by far the best customer for cycles, but the introduction of a tariff on British bicycle products of 60% ad valorem seriously restricted trade. In June the value of the exports of cycles to India was £346,607 but in September it was only £7,482. Raleigh Industries, Ltd., announced in November the formation of Sen-Raleigh Industries of India, Ltd.; land was acquired at Asansol, 150 mi. from Calcutta, where it was hoped to start production in 1951 with an initial output of 50,000 bicycles a year. Hercules announced in October that it was entering the Indian market with a factory in Madras. Its products would be sold under the name of "Hercules India." The B.S.A. company was also planning to manufacture cycles in India.

The silver jubilee Cycle and Motor Cycle show was held at Earls Court, London, in October. Export orders were at least double those received at the 1948 show. The export figures achieved by the industry during the year gave encouragement but there was fear of possible competition from Germany and Japan. Before World War II the total cycle...
exports from Germany were worth approximately £3 million, while in 1948 the bizeone exported cycles and components worth only £800,000. In 1940 Japan produced 1,245,000 cycles and in 1948 only 337,000. The Japanese industry improved its position in 1949; the production for the first five months was at an annual rate of 474,000. In both these countries, cycle production, although far behind the prewar average, was slowly increasing and British manufacturers saw in this a possible reduction in future exports.

For the first time springing and other devices developed from British racing motor cycles were available in two-stroke models for the general public.

MOTOR CYCLING. The premier award in the international six days' trial held in Wales was won by Great Britain. The British team of B. H. M. Viney (A.J.S.), F. M. Rist (B.S.A.), P. H. Alves (Triumph), C. M. Ray (Ariel) and C. N. Rogers (Royal Enfield) rode without loss of marks. The Czechoslovakian team was second with a loss of 29 marks. Czechoslovakia won the subsidiary silver vaze competition with Great Britain second; neither team lost marks, the tie being decided on a special test. Great Britain won the only manufacturers' team prizes awarded.

Of the world's five road-racing championships three were won by British riders and machines: 500 c.c., R. L. Graham (A.J.S.); 350 c.c., F. L. Frith (Velocette); sidecar, E. Oliver (Norton). The Italians N. Pagani (Mondial) and B. Ruffo (Guzzi) won the 125 and 250 c.c. championships.

The winners of the Isle of Man Tourist Trophy races were: senior, H. L. Daniell (Norton); junior, F. L. Frith (Velocette); lightweight, M. Barrington (Guzzi). The senior Manx Grand Prix was won by G. E. Duke (Norton); the junior race by W. McCandless (Norton).

The other international races were won by: 350 c.c., F. L. Frith—Swiss, Dutch and Ulster Grand Prix; 500 c.c., R. L. Graham—Swiss and Ulster, W. Doran (A.J.S.)—Belgian, N. Pagani (Guzzi)—Dutch and Italian; 250 c.c., B. Ruffo—Swiss, M. Cann (Guzzi)—Ulster, D. Ambrosini (Benelli)—Italian.

America's premier event at Daytona saw British Norton machines finish first, second and third in the professional race; first and second in the amateur race. (G. WA.)

MOTOR INDUSTRY. By Nov. 1949 the British motor industry was producing at an annual rate of 390,000 cars, 210,000 commercial vehicles and over 100,000 agriculturaltractors, and throughout the year it kept the position it had gained in 1948 as the largest exporter of motor vehicles in the world. The great, banked-up domestic demand for cars, estimated at between half and three-quarters of a million, remained on the order books of British distributors, while 70% of the cars and 50% of the commercial vehicles made in the country were sent overseas. The home market had an unexpected windfall of about 50,000 extra cars in the summer as a result of the dock strike, the temporary closure of the South African market and the low sales in the United States in the months before devaluation. In spite of this the target earnings of foreign currency, set by the government, were surpassed in the case of motor cars and all but attained by the makers of commercial vehicles and agriculturaltractors.

Prices and Raw Materials. During 1949 manufacturers took steps towards the simplification and standardization of their models and the "Big Six" formed a standardization committee whose purpose was to reduce the varieties of components used in the mass-produced makes of car. The consultation and exchange of information between the Austin and Nuffield companies which had been projected in 1949 did not materialize but Nuffield proceeded with the rationalization scheme which included the geographical concentration of units of production. In fact, however, the main element of cost lay outside the maker's control for it consisted of raw materials, which had increased 24% since prewar days, and bought-out parts. Taken together these items form 65% of the cost of a mass-produced car. Another—and in the long run a more important—cause of high prices was the fact that the industry was only producing at 75% of its capacity of 800,000 units a year. Here the limiting factor was lack of sheet steel. This deficiency could not be met from domestic production because of limited plant capacity and, being unwilling to deny steel to other users, the minister of supply was left with the alternative of increasing imports of steel sheet from the U.S. During the first three quarters of 1949 these had amounted to 15,098 tons—enough to make 30,000 cars. At the end of October the ministry, encouraged no doubt by the greater volume of sales in the U.S. following devaluation, announced that there would be an increase in the steel allocation and that this steel, most of which would have to be paid for in dollars, would go to those manufacturers who were most successful in their exports to the U.S. This meant in practice the "Big Six" who were the only manufacturers capable of maintaining a rate of export of over 75% of production during 1949.

Exports. Whatever its value to the country the U.S. dollar harvest was the most difficult of all to reap. Even in 1948 manufacturers had been selling their cars at prices that represented a net loss or at any rate a substantially lower rate of profit than was to be gained in soft-currency markets. The only incentives in fact to export to what L. P. Lord called the "hardest and toughest country in the world in which to sell anything" were the obvious national necessity, the threat by the Ministry of Supply to withhold steel supplies from unsuccessful exporters and the hope that costs would be gradually reduced as the sales of British cars in the United States grew in bulk. The American recession, signaled by a reduction in U.S. car prices, made the situation in early 1949 more difficult still and in February shipments fell to

The German "Volkswagen" on view at an open-air motor show in Berlin, Sept. 1949.
697 compared with a monthly average of nearly 2,000 in 1948. The months which followed, when the world, and particularly the U.S., was waiting for Great Britain to devalue the pound, saw a further decline in shipments until in August only 158 cars were sent to the U.S.

The impetus given by devaluation was immediate and dramatic and the American distributors cleared their stocks within a few days and placed large new orders. Retail prices were reduced by between 16 and 20% on the mass-produced models and there was a large demand even for some of the more expensive makes. At first it was asked whether this was not after all mere panic buying, to be followed in the months ahead by a gradual decline in sales. But the demand held till the new year and manufacturers were fully committed in the U.S. market for some time to come.

In spite of the fact that British makers had not cut prices by the full margin of devaluation the American market was still not a profitable one. Charges for freight, handling, duty and the American distributors' margin still had to be paid in dollars and from the exporters' point of view these were at a less favourable rate. At the same time raw materials had increased in price and it was likely that wages too would soon rise as a direct result of devaluation. Nevertheless manufacturers were determined to stay in the U.S. market and they had every confidence in their ability to do so now that the heavy initial cost of breaking into it had been paid.

Although devaluation as a policy had chiefly aimed at increasing sales in the United States it had the paradoxical effect of stimulating demand from other markets as well, for it made American cars relatively more expensive. The world-wide shortage of dollars also led to increased sales of British cars, notably in Canada, where, in the third quarter of the year (when American purchases had dwindled to a mere trickle), 9,522 cars were exported compared with an average quarterly figure of 526 in 1947 and 3,654 in 1948. Throughout 1949 Australia remained the largest buyer of British cars taking no less than 22,276 in the third quarter. The South African import restrictions, first on built-up cars and then on C.K.D. also, caused a drop from 6,700 in the second quarter to 2,383 in the third. But with devaluation and the new price of South African gold it was expected that the government of the Union would reconsider its restrictions.

Trends in Design. In the first six months of 1948 25% of British cars exported had an engine capacity of more than 1,600 c.c.; in the same period of 1949 this percentage had risen to 35. These figures indicated the importance which manufacturers had attached to the demand in overseas markets when designing their 1948 models. They had also, no doubt, calculated that the British motorist would demand a larger car as a result of the introduction of the new flat rate of motor taxation in 1948. There was evidence, however, that designers were not prepared to commit themselves wholly to the production of larger cars. Already in 1948 Lord Nuffield had produced a new version of the Morris "Minor" and in Oct. 1949 the chairman of the Austin company announced that if Austin produced a new model it would be a "Seven."
Further evidence of the makers' unwillingness to abandon the small-car field was provided by the appearance at the Earls Court motor show of the Triumph "Mayflower"—the only entirely new British car on view—with an engine of 1,250 c.c. Except for this car and the six-cylinder Rover "75," the coachwork of which had been completely modernized as well as the gear-change and other features, the British cars on view were modified versions of those which had first appeared in 1948. The capacity of the Hillman "Minx" engine had been increased to 1,265 c.c.; the Jowett Javelin appeared as an open tourer as well as a saloon; there was also a saloon version of the Austin A "90"; and Rolls-Royce showed their first model with coachwork by the parent company. Two new commercial vehicles appeared in 1949: an A.E.C. truck with a direct-injection diesel engine of 11·3 litres capacity and a Guy "Otter" with a load capacity of five to six tons and three alternative lengths of wheel box. Both models illustrated the efforts of British commercial vehicle manufacturers to cater for the diverse needs of overseas users. It was also encouraging to note that by 1949 British factories were producing every type of agricultural tractor, including the heaviest "crawler" types; domestic production of these essential agricultural tools would save both Britain and the sterling area many dollars.

Europe and the Dominions. The French industry made notable progress in 1949: production increased by 50% to 300,000—the figure laid down in the Monnet plan—and by the time of the Paris Salon in October it was clear that the industry had passed out of the prototype stage and that series production, particularly of the miniature cars which had, after the close of World War II, become the backbone of the industry, had swung into its full stride. About 40% of the total production was exported. The search for economy continued and to the Renault 4 h.p. (which by October was being produced at the rate of 315 per day), the Dyna-Panhard and other small French cars was added the new Citroen 2 h.p. This car had an engine capacity of only 375 c.c. but was capable of carrying four passengers and 100 lb. of luggage. The price was to be Fr.229,000—50,000 less than the baby Renault and the petrol consumption was claimed to be 71 mi. to the gallon. Citroen had not been scheduled under the postwar plan to produce a small car but the makers pointed out that their enterprise was in accordance with the need of the country for economical transport.

In Italy production of motor vehicles had risen to an annual rate of 70,000 during the first six months of the year. This was 25% more than the total in 1948 and 16% more than the 1938 figure. Within this total, however, production of cars had risen since 1946 by three times while the production of trucks had fallen to a third of the 1946 rate. It was learnt during the year that the Fiat company was to receive dollar loans totalling $25,700,000 from Economic Co-operation administration and the Export-Import bank for the expansion and re-equipping of their plant. Most of the sum was earmarked for the motor-car division of the company. In August west German production reached a new postwar record of 15,628 units.

In Australia a factory was set up for the assembly of Standard and Triumph cars and Ferguson agricultural tractors; and an Australian company began to produce a low-powered three-wheeler which would cost only £250 and would do 60 mi. to the gallon. During 1949 India produced its first agricultural tractor and the Rootes group's new assembly plant went into production. In New Zealand there was an expansion of assembly plant and in May it was announced that no more import licences would be granted for built-up vehicles.

United States. In 1949 output of vehicles was 6,255,401. This exceeded the long-standing record of 1929 by more
than one-sixth. Passenger car production reached a total of 5,119,911—an increase of 11.6% over 1929, 35.5% over 1941, and 31% over 1948. The output of motor lorries was 1,135,490, 47.3% over 1941. Compared with 1948, however, there was a decrease of 18.5%.

The 1949 wholesale value of passenger cars was estimated at $6,900 million, an increase of 42% over 1929, 169% over 1941 and 42% over 1948. Motor truck wholesale value was estimated at $1,560 million, an increase of 175% over 1929, 46% over 1941, but reflected a decrease of 16% below 1948.

The activities of the motor industry as a whole remained remarkably steady throughout the year, in terms of number of units produced, despite the strike in one large company during part of the month of May, and the major strikes in the steel and coal industries during the latter part of the year. This relative stability in production activity was made possible by the foresight of motor vehicle manufacturers in purchasing reserve supplies of steel, coal and other materials in anticipation of a possible major strike in those industries.

As in the preceding year, foreign markets continued to reflect the shortage of American dollars, resulting in a decrease of 35.6% in factory sales of passenger cars to foreign markets, and a decline of 37.3% in the number of lorries for export, or a combined decrease of 36.5%. The decrease was progressively steeper throughout the year, reaching its lowest point in December.

The demand for lorries continued to be for a higher proportion of the lighter type of vehicles. During the first 11 months of 1949, 45.3% of motor lorry factory sales was in the 5,000 lb. class and under (gross vehicle weight), as compared with 36% in 1948 and 30.6% in 1947. Preliminary registration totals released by the U.S. Bureau of Public Roads for the end of 1949 were 35,491,000 passenger cars and 7,807,000 lorries and buses, or a combined total of 43,298,000. This was an increase of 6.7% over 1948 for passenger cars and 6.1% increase for lorries. (O. P. P.)

**MOTOR RACING.** The most outstanding Grand Prix successes in 1949 were recorded by the Italian 1.1 litre 12 cylinder Ferrari, with the older Maserati cars offering the most serious opposition. Notable absentees from the leading events were the Alfa Romeo cars.

A new ace appeared in Juan Manuel Fangio, who, after a succession of brilliant Grand Prix successes at Pau, Pergipmag, Marseilles and Albi, France, and Monza, Italy, early in the year, returned to his home in the Argentine. The 300 mi. British Grand Prix held on the Silverstone aerodrome circuit was won by Baron Emmanuel de Graffenried (Maserati) at 77-31 m.p.h., with F. R. Gerard in his 1937 E.R.A. second.
Biondetti (Ferrari) won the Targa Florio race round Sicily, while L. Chinetti, also in a Ferrari, won the two 24 hr. classic events at Le Mans (France) and Spa (Belgium). At Le Mans, with Lord Peter Selsdon as his co-driver, he covered 1,970 mi. at an average speed of 82-27 m.p.h.; at Spa, with J. Lucas, 1,899 mi. were covered at 78-7 m.p.h.

One of the most outstanding events of the year was a one-hour race for production cars held at Silverstone. Winner in the general classification was L. G. Johnson who in a new 3½ litre standard Jaguar two-seater sports car averaged 82-8 m.p.h. British hill climb champion was Sidney Allard (3,700 c.c. Allard). (CH. FL.)

Bill Holland of Reading, Pennsylvania, after being second to Mauri Rose of South Bend, Indiana, in the two preceding years, captured the 500-mi. Memorial day classic at Indianapolis speedway at a record average speed of 121-327 m.p.h. Duke Nalon cheated death in the 24th lap when a tire tore loose and his car burst into flames as it struck a wall. Nalon had set a first-lap record of 126-564 m.p.h. The former record of 123-02 m.p.h. had been established in 1948 by Rex Mays of Glendale, California, who met his death in a motor racing accident on Nov. 6, 1949, at Del Mar, California.

Alex Yxidas of Burbank, California, set a world record of 153 m.p.h. at the first annual meeting for American stock power motor cars at Bonneville Salt Flats, Utah. Yxidas had held the previous record of 138-74 m.p.h. (T. V. H.)

MOTOR TRANSPORT. The British Transport commission's accounts published in its Report and Accounts for 1948 (H.M.S.O., Sept. 1949) showed a deficit of £4-7 million for the calendar year 1948; by the beginning of November it was clear that the deficit would approach £20 million and authority was asked of the minister of transport to raise freight rates on the railways by 16-5%. This was a stopgap measure designed merely to cut down future losses and ran counter to the expectations of the public and the intentions of the commission that nationalization of transport should bring with it a co-ordination of charges and a general integration of all forms of transport.

The Transport commission had been required under the act to produce a charges scheme and submit it to the Transport tribunal by Aug. 6, 1949, but it was found impossible in so short a time to produce such a scheme in view of differences between the systems in use in the several branches of the transport industry and a further two years was granted by the minister. The commission was well aware, however, that an overall scheme of charges was the foundation-stone of a properly integrated transport structure. The responsibility for this work was given to the Charges committee.

The work of co-ordination, apart from charges, went on and the most important task of examining branch-line traffic with a view to the substitution of road services resulted in the closing down of several branch lines during the year. Radical changes could not however be expected at this stage; and when Sir Cyril Hurcomb, the chairman of the commission, announced the setting-up of the new transport research organization he said that the most economic distribution between road and rail services could not be judged until arrears of maintenance had been made up and obsolete stock replaced on the railways. It was reasonable to suppose that until the railway system had been modernized and pruned of dead wood the road services would take the financial load; nevertheless it was hoped that the "bold application" of this sharing principle would not lead to heavily increased road charges.

Road Passenger Transport. At the end of 1948 the commission had acquired the 15 or so bus companies which made up the Tilting group. On Jan. 25, 1949, it also acquired control of the Scottish Motor Traction group for £234 million. Thus by the beginning of the year the commission controlled nearly 20,000 buses and coaches including those belonging to London Transport. It also held large interests in British Electric Traction and its subsidiary companies. It was never the intention, however, that the commission should directly control even a majority of the bus services in the country: the function of the Road Transport executive and of the Road Passenger executive which succeeded it in 1949 was to co-ordinate, in conjunction with the local authorities, the bus services in different areas.

The first scheme under section 63 of the act was for the northern area comprising Northumberland and Durham and a large part of the North Riding of Yorkshire. The scheme affected 6 local authorities, 1 joint board and 130 undertakings. The proposals included the setting-up of an area board with a chairman and from 7 to 11 part-time members. Under the area board would be three districts, each under a manager. The area board was to have as much autonomy as it was possible for the commission to grant under the act and there would be consultations between the board and the railway executive to co-ordinate services.

During 1949 some 1,600 new or reconditioned buses were put into service by the London Transport executive. Though this was twice as many as in the previous year the figure did not cover the number of old buses withdrawn from service and the greater operating efficiency in terms of miles run was largely gained at the expense of passengers' comfort. However, Lord Latham, chairman of the London Transport executive, expressed optimism about the situation in 1950 when there would be a net increase in numbers of buses and trolley buses and a consequent expansion of services. He also announced that preliminary steps were being taken for the conversion of the south London tramways into bus routes and that 16 new garages or converted depots were to be built at a cost of £4,600,000. For the more distant future the executive was preparing the re-organization of its services to meet the decentralization of population under the government's plan for London.

Statistics taken from the Report showed an interesting comparison between the costs and takings per car/mi. for the different services of London Transport during 1948.

While in 1948 fares on the railways had increased by 55% over the 1938 level, those of London Transport were only 30% up and fares on the provincial and Scottish services were the same as before World War II.

Road Haulage. Under part III of the act the commission was to have the sole right to carry on long-distance haulage.
for "hire or reward" (except in the case of goods like petrol, milk and timber for which specialized vehicles were needed) after an appointed day to be fixed by the minister. In November the minister announced that the day had been fixed as Feb. 1, 1950. After this date only firms which had been operating on Nov. 28, 1946, and had original permits or those which had since been granted permits to operate could continue in their business, and then only until the Road Haulage executive was ready to take them over.

In 1948 a nucleus of important road haulage concerns had been taken over by the commission. Some of these were part of the assets of the railways and others had been taken over by agreement or by compulsory acquisition. By the end of 1949 30,000 vehicles—three-quarters of the total in the A and B licence class—had been acquired and an organization comprising eight regional divisions and districts set up to control them.

In its Report the commission called attention to the post-war growth in the numbers of C licence holders. In 1947 there had been 487,151 vehicles under C licence and by the beginning of 1949 the figure was 590,516. These traders, who, so long as they carried their own goods, would be able to operate within any distance of their base, formed a hard core of competition to the services provided by the commission; and the Report stated, rather ambiguously, that although most of the vehicles were under 30 cwt. and were therefore presumably engaged in retail distribution, the increased use of C licensed vehicles affected the commission in planning, in fixing charges and in the eventual integration of its services. There were criticisms of the commission who foresaw curtailment of the "privilege" of C licences when the commission really found itself up against competition from that quarter; others pointed to the attitude of the chairman who was inclined to face the challenge and await results. A clear indication of the future of C licence holders could not be expected until at least the appointed day, when practically all other forms of transport would be controlled by the commission, and probably not until 1951 when the overall charges scheme would have been worked out.

It was interesting to compare the method adopted in France for co-ordinating charges for road and rail services. A decree published on Nov. 15 laid down that the railways would no longer run road passenger services and that rates for road services would be fixed by the minister of transport. Transporters would then be required to fix their charges at between 10% over and 20% under the basic rate. Basic rates would also be set for the transport of goods, and road transporters would only be able to compete with the main-line railways by authorization of the latter. The railways were to have far greater freedom in fixing detailed freight charges and would thus be able to co-ordinate their charges with those of the road transporters and compete with them for traffic.

United States. The production of new buses in the United States during 1949 was less than half of that in 1948 when 11,143 buses were put into service on city and intercity bus routes. Available information indicated that 4,650 motor buses and 650 trolley buses were produced in 1949 for bus companies that were operating over regular routes.

The motor industry's production in the United States in 1949 totalled 6,255,401 vehicles. Included in this were 5,119,911 passenger cars and 1,135,490 lorries and buses. The industry's previous record was in 1929 when 5,358,420 cars and lorries were produced. At the end of 1949 it was estimated that nearly 3,000,000 more passenger cars and lorries had been registered in the United States than in 1948.

The transport industry as a whole in 1949 was estimated to have carried 19,000 million passengers, 46% more than the 1936-40 average. Although this figure was 11% lower than that for 1948, it represented a weekday average of about 63 million rides on the nation's street cars, trolley buses, buses and underground systems. Fare increases kept the industry's operating revenue at $1,490 million, or slightly above that of 1948. Operating expenses, including depreciation but not taxes, decreased in 1949 by approximately 1.5% to $1,324 million. When compared with the previous year, according to these preliminary figures, net revenue was approximately $166 million, or 14.52% more than in 1948. Despite poor net earnings, transport companies had purchased 3,000 surface and subway coaches, 3,500 trolley buses and 37,000 motor buses, or nearly 44,000 new vehicles in the years 1944-49. Estimates placed the number of surface trolley coaches in use during 1949 at 16,100, a decrease of about 41% since 1944; and buses at 59,000, an increase of 22% during the same period. The total number of passenger carrying vehicles owned by the transport industry was estimated at slightly more than 90,000, approximately the same number as in 1948. However, the vehicles purchased in later years generally had greater seating capacity and the actual number of seats available for passengers had increased.

Approximately 97,600 buses were used daily during the school year of 1949 to transport 5,720,000 children to and from 45,256 public schools, largely in the rural areas. The routes served totalled 2,079,000 mi., and the actual distance covered by the buses was about 736 million bus mi., at an estimated cost of about $177.5 million.

In bus and lorry traffic the trend continued toward the use of diesels. The number of diesel lorries in service increased from about 7,600 in 1944 to about 12,000 in 1948. The conversion of buses to diesel engines was more rapid, over 70% of the new buses delivered to companies during two months of 1949 being diesel powered. It was estimated that 50% of the total bus production for transport in city and intercity services was diesel powered. A 50-passenger city type bus was developed for ultimate use on the municipally-owned routes in New York city; it had staggered seats, wide and easy-moving windows, fluorescent lighting, double width exit and entrance doors and improved springing.

(C. W. S.)

MOZAMBIQUE: see Portuguese Colonial Empire.

MUNICIPAL GOVERNMENT: see Local Government.

MUNITIONS OF WAR, U.S. Army. Some of the developments in munitions and related fields during 1949 are briefly described below.

Armour. Specially fabricated plastic armour was successfully tested and stopped a .45-calibre bullet.

Battery. The army signal corps perfected a 24-v. electric battery that would start an engine at 65°F. A dry-cell battery using magnesium instead of zinc was also made. It had twice the capacity of the conventional type and required no special machinery for its manufacture.

Boat. A new assault craft for the use of infantry in crossing rivers was made of Fiberglas spun to one-thirtieth of the thickness of a human hair. This was woven into cloth and impregnated with tough plastic. A boat so constructed weighed less than 300 lb., was powered by a 33-h.p. engine and could carry 15 men.

De-activator. The Ordnance department worked out a process for safely removing fuses and boosters from high explosive bombs and projectiles. A television camera transmitted an image of the work being done to an operator who manipulated control tools from a bombproof shelter.

Engines. Continental Motors corporation developed an
OF the like operation the development force's developing advances power deflected aircraft military this Patton Navy. The result of this work was the XAAM-A-1, an airborne guided missile designed to be aimed at targets in the first few seconds. It could be launched from a U.S. Navy patrol aircraft and would intercept the target at high speed. It could be fired with a high degree of accuracy, allowing it to be used in both land and air operations. Its development was a significant step forward in the development of guided missiles, and it paved the way for future developments in the field.
the added power of its own “booster” rocket and finally its flight rockets. A direct hit was not necessary because an improved type of proximity fuse detonated its heavy explosive charge when the missile came within lethal range of the enemy.

A further development of an air defence missile was announced which did away with the mother plane. This was a ground-to-air pilotless aircraft which was in advanced development in the U.S. It could climb much faster than a piloted aircraft and when it reached the point where it could see the enemy with its own radar eye it cut itself off from ground control and started its electronic brain working. This solved a complicated mathematical equation taking into account the relative speeds of the enemy bomber and missile and then enabling the missile to blow itself and bomber at the point of interception.

After two-and-a-half years of constructional work, the first long-range ground-to-ground rocket missiles were fired from the testing ground of the British Commonwealth at Woomera, New South Wales, in the summer of 1949. Between 2,000 and 3,000 personnel were employed at this station during the year. Supersonic missiles were fired on four ranges, the main range covering a course of 1,200 mi. to the western Australian coast and Indian ocean, with an extra 1,500 mi. to Christmas Island.

Apart from the guided missiles field, a revolutionary tactical air development was the helicopter assault operation, successfully tested by the U.S. Marine corps, superseding the need for landing craft to creep ashore under heavy fire. (See also AIR FORCES OF THE WORLD; ARMIES OF THE WORLD; METALLURGY; NAVIES OF THE WORLD.) (N. F. S.)

MUNNINGS, SIR ALFRED JAMES, British artist (b. Oct. 8, 1878), was educated at Framlingham college, at Norwich school of art and at Paris. He first exhibited at the Royal Academy in 1898, was elected an associate in 1919, an academician in 1925 and on March 15, 1944, was elected president of the academy in succession to Sir Edwin Lutyens. His fresh, smoothly glittering paintings of thoroughbred horses in settings of open, downland landscape won him renown; and his works were purchased by the cities of Aberdeen and Birmingham and by the Chantrey bequest. During World War I he was attached to the Canadian cavalry brigade in France and painted 45 war pictures for the Canadian government. He has also modelled equestrian statues. Early in 1949, he announced his intention of retiring from the presidency of the academy, and on Dec. 8 Sir Gerald Kelly was elected to succeed him. In a speech at the Royal Academy banquet at the opening of the 1949 summer exhibition he severely criticized modern art and described some modern painters as “young jugglers.” On May 28 he opened a memorial exhibition of painting by Stanhope Forbes at Newlyn, Cornwall, and again criticized works by Henri Matisse and others. Describing Forbes’ “The Health of the Bride” as his favourite picture he complained that although purchased for the Tate gallery under the Chantrey bequest it was not on public view. (See also ART EXHIBITIONS.)

MUSEUMS. The year 1949 showed a steady improvement in the museums and art galleries of most countries of the Commonwealth and British colonies and in those of Europe.

In Great Britain the government, in addition to giving general approval to the Report of the Standing Commission on National Museums and Galleries issued in Oct. 1948, also continued assisting provincial museums; and discussions took place between the Ministry of Education, the Museums association and representatives of the local authorities. But towards the end of 1949 the economy drive tended to slow down the approach.

In London galleries were re-opened at the British museum and the Victoria and Albert museum. At the Elgin marbles were on view again for the first time after 1940. Preparations were continued for accommodating the London museum in its new quarters in Kensington palace. At the Science museum work was about to begin on the construction of a large central block on the roof of which a Planetarium would be erected; it was hoped to finish this in 1954. The complete restoration of the Tate gallery was marked by its re-opening in Feb. 1949. New galleries were opened at the Imperial War museum and at the Public Record office.

At the Natural History museum, Birmingham, the gallery containing the Chase collection of British birds was re-opened. Near Bristol, the Blaise Castle House Folk museum, a branch of the Bristol City museum, was opened in May; and in the same month a new art gallery was opened in Berwick.
on-Tweed. In July there were formal openings of the Cecil Higgins museum at Bedford and the Jane Austen museum at Chawton, Hampshire. There were also considerable developments at Leicester and Southampton. The first museum in Great Britain and one of the very few in Europe to be devoted entirely to eastern art was opened at Oxford as a branch of the Ashmolean museum under the charge of Dr. William Cohn.

In Scotland a few museums enjoyed the first financial year free of the ancient threepenny rate limitation, Paisley being a notable example. In Edinburgh the Scottish National Portrait gallery and the Scottish United Services museum were re-opened, the Royal Scottish museum was rehabilitated after the disorganization caused by World War II and the Beasts of Prey hall was re-opened in March. Edinburgh also recorded considerable progress on the educational side of museum activities. At Glasgow an open air museum of sculpture was formed at the new Burrell museum.

In the dominions there was steady progress though without any particularly spectacular developments. In the Union of South Africa the proposed commission to consider the further development of the research function of museums did not eventuate. In the British colonies one of the most interesting developments was the decision of the government of Nigeria to appoint a museum technical instructor to train Africans as museum technical assistants.

In France three important museums in the Palais de Chaillot, the Musée de l’Homme, Musée de la Marine and the Musée des Monuments Français were re-opened to the public after having been closed in April 1948 because of the occupation of that building by the United Nations general assembly. The Musée de Cluny, Paris, and the Musée Céramique de Sèvres were also re-opened. In the provinces there were re-openings at Marseilles, Autun, Le Mans and Dieppe; new museums were opened at Toulouse, Beaucaire and elsewhere and considerable improvements were made at Besançon, Compiègne, Dijon, Nancy, Poitiers and Rheims. All the state museums in Belgium and the museums of Brussels were open once again to the public; the Musée des Beaux Arts de Liège, badly damaged in 1944, was being completely modernized. There was a move on foot to extend state control to provincial museums. In Holland the Rijksmuseum was being systematically re-organized and the picture galleries were now open to the public. At the Stedelijk museum 70 exhibitions of modern art had already been held since the liberation in 1945. In Poland, 1948 saw the publication of Muzealnictwo edited by Stefan Komarnicki and Tadeusz Dobrowolski, which was a combined manual for curators, a history of the Polish museum movement and a handbook of Polish museums. The Museum of Archaeology, Warsaw, which was looted by the Germans in 1939 and in consequence closed throughout World War II, had now recovered about half of its collections and most of its furnishings; it was installed in the beautiful Lubomirski palace towards the end of 1949. There was little news of improvements in museums in Germany; but the Deutsches Museum resumed publication of its technical handbooks and the Goethe Haus at Frankfurt was restored and re-opened.

In Austria, Greece, Italy and Norway there was a steady but not spectacular improvement in the museum situation but, as in Germany, there could be little hope yet of permanent reconstruction or building in most of these countries. Sweden had a series of outstanding museums and, considering its limited population and resources, was probably the best country in Europe for museum buildings and display techniques. Its methods were being studied and copied throughout the world.

The International Council of Museums (I.C.O.M.) decided to set up a committee to consider encouraging the various countries who were members of U.N.E.S.C.O. to publish Directories of Museums; only seven countries had so far produced such Directories after World War II. I.C.O.M. also published André Levélie’s Les Musées scientifiques, techniques, de la santé, planétaria et la popularisation de la science (Paris, 1948). Late in 1949 U.N.E.S.C.O. published an 18-page pamphlet entitled Art Museums in Need which reviewed the war damage to museums in Europe and Asia and appealed for funds to assist in their reconstruction. A book which had a mixed reception was A. S. Wittlin’s The Museum: its History and its Tasks in Education (London, 1949). Icon News carried special articles on the museum situation in Tunisia and Morocco which showed that considerable progress had been made in these areas.

The Museums division of U.N.E.S.C.O. continued its activities, its new director being J. K. van der Haagen. Its well produced publication Museum enjoyed a world-wide reputation.

(S. F. M.)

of the Prodigal Son," given by the Avalon foundation through the generosity of Mrs. Ailsa Mellon Bruce.

The Detroit Institute of Arts acquired " St. Jerome in the Wilderness " by the great Spanish baroque painter Ribera (1568-1652); the portrait of Hendrick Swalmius by Frans Hals (1580-1666); and Baron Gros's (1771-1835) sketch for " Murat Winning the Battle of Aboukir." A small but select collection of near eastern and oriental art was being assembled at the Cincinnati Art museum by the gift of approximately $150,000 from the heirs of Charles F. Williams. The gift of contemporary American 18th century portraits were purchased by the City Art museum of St. Louis. These were Ralph Earl's (1751-1801) " Major Moses Seymour " (1789) and " Mrs. Moses Seymour and Son." The Portland (Oregon) Art museum purchased with the aid of several donors, the outstanding collection of northwest coast American Indian Art assembled by Axel Rasmussen, a former schoolteacher and superintendent of schools in Skagway, Alaska. This collection consists of some 5,000 objects and includes masks, potlatch boats, house posts, totem poles, etc.

The William Rockhill Nelson Gallery of Art in Kansas City held a gala celebration of its 15th anniversary and put on view a group of new acquisitions. Outstanding among these was a statue of St. Barbara (c. 1570) by the French sculptor German Pilon; four Roman portrait busts, including the emperors Lucius Verus and Caracalla; and a stone guardian lion, Chinese, of the T'ang dynasty.

Perhaps the greatest collection to go to a museum during the year was received by the Baltimore museum as a bequest of Etta Cone. This collection, valued at $400,000, contained 350 paintings and 50 pieces of sculpture and included 10 Picassos, 39 paintings and 10 bronzes by Matisse (most important single group in any collection), top quality paintings by Gauguin, Van Gogh, Cézanne, Renoir and Corot. Miss Cone and her sister, Claribel Cone, were pioneer collectors of modern art. (See also Art Exhibitions; Art Sales.)

MUSIC. From the point of musical activity, 1949 was the most productive of the postwar years. In the realm of opera it was England which, for the second successive year, took the European lead in first performances and important revivals. Arthur Benjamin's Prima Donna was presented for the first time in February, although the work was written in 1933; Inglis Gundy's Aton followed in April; in June, at the Aldeburgh festival, Benjamin Britten's opera for children Let's make an opera had its first performance; and in September, the new Arthur Bliss—J. B. Priestley opera The Olympians was presented at Covent Garden. Of these, only the third and fourth seemed likely to survive. Britten's work was of a specialized nature, written for a specific educational purpose within the bounds of which it was highly successful; The Olympians, though hardly the unqualified masterpiece that advance publicity had suggested, was a worthy addition to the short history of British opera and seemed likely to retain a place in the repertory of the Royal Opera house.

The revivals included a concert performance of Alban Berg's Wozzeck given by a distinguished group of soloists with the B.B.C. Symphony orchestra conducted by Sir Adrian Boult; the performance was of exceptional quality, and renewed acquaintance with the work confirmed its important position in the history of contemporary music. At Covent Garden, two complete cycles of Richard Wagner's Der Ring des Nibelungen were presented for the first time after the end of World War II; Kirsten Flagstad, Set Svanholm and Hans Hotter were the principal singers in an international cast, and both cycles were conducted by Karl Rankl. Another interesting revival took place at the People's palace, where the London Philharmonic orchestra sponsored a series of performances of Rutland Boughton's The Immortal Hour, conducted by the composer; although largely devoid of originality, the work was seen to possess a certain elusive charm that ensured a popular reception. The opera from which it was in certain respects derived—Claude Debussy's Pelléas et Mélisande—was presented by the Paris Opéra-Comique at Covent Garden in July.

In September, the death of Richard Strauss deprived the musical world of one of its most respected composers; it also severed the last link with the creative musical world of the late 19th century. As a composer Strauss remained active to the last, although he was likely to be best remembered by the works of his early manhood. Memorial concerts were held throughout Europe; in London, Sir Thomas Beecham conducted a programme which concluded with a superb performance of Don Quixote. English musical scholarship lost two notable figures during the year; the death was announced of Dr. Ernest Walker, essayist, composer and teacher, and of Sir Stanley Marchant, the respected principal of the Royal Academy of Music. In October, the musical world mourned the death of the young French violinist Ginette Neveu, killed in an air disaster (see obituaries); her artistry and musicianship would long be remembered.

Notable first performances during the year included Edmund Rubbra's Fifth Symphony, a work of considerable interest though lacking in some degree the power and originality of its predecessors. At the Edinburgh festival, Ernest Bloch conducted the first performance of his new Concerto Symphonique for piano and orchestra; the work had a mixed reception from the critics, most of whom felt that it was below the standard set by the composer in his Second Quartet and Piano Quintet. Later in the season, Bloch conducted a concert of his own music in London, including the beautiful Sacred Service in which Mark Rothmuller sang the solo part. At the festival of British music held in Cheltenham, the first public performance of Richard Arnell's Fourth Symphony was given; the composer, although British by nationality, had spent much of his creative life in America and consequently his music had not yet become established in Europe. First performances at the autumn Promenade concerts included Aton Rawsthorne's Concerto for String Orchestra, William Alwyn's Oboe Concerto, and a Duet Concertino for clarinet, bassoon, strings and harp by Richard Strauss—the latter work revealing an altogether charming facility within unpretentious bounds.

Most of the European festivals during 1949 were successful, though few new works of importance were introduced. The International Society for Contemporary Music held its meeting at Palermo, Sicily; most of the critics seemed to prefer the surroundings to the music, although Matyas Seiber's Fantasia for violin and strings was generally praised, as also were string quartets by Armin Schibler of Switzerland and Willem Pijper of Holland. In London, a festival of Edward Elgar's music was held in May and June, incorporating performances of all his major works; Jascha Heifetz gave an admirably lucid interpretation of the Violin Concerto. The
festival at Salzburg followed tradition and restricted itself mainly to high class performances of established classical works; similarly at Edinburgh the focus was mainly on the works of the past, although L’Orchestre de la Suisse Romande under Ernest Ansermet gave a performance of Frank Martin’s interesting Symphonic Concertante for piano, cembalo, harp and string orchestra. The Swiss players were highly praised, and the orchestra was in some respects superior to the Berlin Philharmonic which appeared under the direction of Sir John Barbirolli (q.v.) and Eugene Goosens; the latter conducted a fine performance of Gustav Mahler’s First Symphony. In addition to those already mentioned, festivals were also held at Aldeburgh (English Opera group), Amsterdam, Bath and Hereford (The Three Choirs).

The Philadelphia orchestra, under its chief conductor Eugene Ormandy, paid a short visit to England and impressed audiences with a remarkable display of orchestral virtuosity; the Vienna Philharmonic also gave a number of excellent concerts in London. On the occasion of Sir Thomas Beecham’s 70th birthday a special concert was given in London by the Royal Philharmonic orchestra, which also appeared with Sir Thomas at the Edinburgh festival. The interchange of artists on an international basis continued to play an important part in European musical life: in Paris, the German pianist Wilhelm Kempff rapidly re-established himself among the great interpreters of Bach, Mozart and Beethoven; in England, Eduard van Beinum (conductor of the Amsterdam Concertgebeouw orchestra) took over the London Philharmonic for a period of six months, during which time a considerable improvement in orchestral technique was noticed. Later in the year he was succeeded by Nicolai Malko.

Reports of increasing musical activity in the dominions and commonwealth were received during 1949. In addition to a wealth of native talent, Australian musical life enjoyed the presence of several well known European artists, including Rafael Kubelik and Aleksander Helmann.

In Germany, the return to a stable currency brought about a strenuous revival in musical activity, though there remained little indication of new creative thought. Opera productions in the main towns and cities reached a high standard (particularly in Munich, under the musical direction of Georg Solti) and the programmes for the autumn season were ambitious without showing much deviation from the paths of convention; among the few contemporary composers active in Germany, Boris Blacher emerged as a figure of potential importance.

Early in the year it was reported from Vienna that the death mask of Wolfgang Mozart had been discovered by Professor Willy Kauser. Preliminary evidence seemed to suggest that this was the death mask taken by Count Deym on Dec. 5, 1791; the Austrian Ministry of Education appointed a commission to investigate the discovery and to arrange for the publication of details if or when authenticity could be determined.

In the philosophy of music, the dominating problem remained that of the relation of the composer to his audience, typified on the one side by the “free” composers in the western European states and on the other by those composers working under state patronage in the eastern and certain mid-European countries. In the technical sphere, the dispute continued between composers writing within the twelve-tone system and those seeking to write originally within the established tonal system. To a certain degree these problems appeared to be inter-related, and might have been partly responsible for the somewhat precarious creative state evident in European music during the year. (J. Cw.)

United States. During 1949 several orchestras extended their seasons, for example, the Cleveland orchestra, the Minneapolis Symphony, the Nashville Symphony and the Tulsa Philharmonic. Serge Koussovitzky retired from the conductorship of the Boston Symphony, and was succeeded by Charles Munch. The Chicago Symphony orchestra also acquired a new conductor—the Czechoslovakian, Rafael Kubelik. Antal Dorati and Walter Hendel began successful seasons with the Minneapolis Symphony and the Dallas Symphony orchestra respectively. Conductor Karl Kreuger resigned from Detroit Symphony orchestra. Hans Kindler resigned from the National Symphony orchestra and was succeeded by Howard Mitchell. Although the pavilion at Ravinia park, near Chicago, was destroyed by fire, the summer programme was successfully carried on in a huge tent which was once a B-29 hangar. A concluding series of chamber music concerts at Ravinia brought Jascha Heifetz, Artur Rubinstein and Gregor Piatigorski together for the first time in trio work.

A summary of the new works performed in and about New York city indicated that 1949 was an encouraging year for music. There were over 500 performances, including 200 premières. (F. B. C.)

Popular Music. The importance of the American operetta style, and the superiority of stage songs to the routine output of conventional writers, were established in 1949. Two musical shows, far in advance of all their predecessors in this field, provided proof of this triumph of good popular music. They were South Pacific, adapted by Richard Rodgers, Oscar Hammerstein II and Joshua Logan from the prize-winning Tales of James A. Michener, and Kiss Me, Kate, for which Cole Porter wrote both words and music to a book by the Spegawks based on Shakespeare’s Taming of the Shrew. Later came the Berlin-Sherwood-Hart Miss Liberty, which suffered only by comparison with its rivals.

“Some Enchanted Evening,” sung by Ezio Pinza in South Pacific, was the most popular song of the year, according to the Lucky Strike Hit Parade, which presented it for more than 20 successive weeks, heading the programme 13 times. Actually there were better songs than this in the Rodgers-Hammerstein score; three of them, “A Wonderful Guy,” “Bali Ha’i” and “Younger Than Springtime,” received adequate recognition from radio’s high tribunal.

Unquestionably Kiss Me, Kate contained the best songs and music ever written by Cole Porter. “So in Love” appeared a dozen times on the Hit Parade and was definitely the most popular number in the show, although such songs as “The Life I Late Have Led,” “Always True to You in My Fashion” and “Too Darn Hot” were also popular.

Miss Liberty, which pleased the public more than the critics, had two songs in the Hit Parade, “Just One Way to Say I Love You” and “Let’s Take an Old-fashioned Walk”; but there were other numbers fully up to the Irving Berlin standard, including the plaintive “Homework.”

The top song of 1948, “Buttons and Bows” held its own well into 1949, as did the two Loesser hits, “My Darling, My Darling,” and “On a Slow Boat to China.”

Most of the popular songs were definitely reminiscent of earlier music, particularly “Far Away Places” and “Cruising Down the River,” “Powder Your Face with Sunshine” had some individuality, but there was nothing particularly distinctive about “A Little Bird Told Me,” “Again,” “A Room Full of Roses,” “You’re Breaking My Heart,” “That Lucky Old Sun,” “Don’t Cry Joe” and “I Can Dream, Can’t I?,” all of which reached the top of the Lucky Strike list more than once. The humorous “Baby, It’s Cold Outside” was handicapped by radio censorship. Late in the year a line by Stephen Foster suggested the currently successful “Dear Hearts and Gentle People,” and Christmas brought the year’s real novelty in “Rudolph, the Red-Nosed Reindeer.” (S. Sr.)
NARCOTICS. The Commission on Narcotic Drugs of the United Nations, at its fourth session in May 1949, made a number of decisions and recommendations with a view to suppressing illicit traffic and tightening controls over the production of opium and the distribution of all dangerous narcotic drugs. Progress was made toward the drafting of a new single convention to replace and simplify existing conventions and agreements. The commission considered the creation of only two control bodies—a policy-making body and an administrative body—with a single secretariat for these two bodies. Also proposed were an international purchasing and selling agency for distributing opium and an international clearing house for reviewing import permits covering narcotic drugs before the issuing of export permits.

A sub-committee composed of representatives of the principal opium-producing countries—India, Persia, Turkey, the U.S.S.R. and Yugoslavia—was appointed to consider the desirability of convening a conference to conclude an interim agreement for limiting the production of raw opium to medical and scientific needs. The sub-committee agreed that an ad hoc committee of the Commission on Narcotic Drugs composed of the representatives of these principal opium-producing countries should meet in Turkey.

The Commission on Narcotic Drugs has drawn the attention of the Economic and Social council to the large volume of illicit traffic in narcotic drugs throughout the world, the council adopted a resolution designed to suppress such traffic. It recommended that all states should increase their efforts to suppress the illicit production of all raw materials from which narcotic drugs were prepared and the illicit manufacture of these drugs, as well as of those produced synthetically. It further recommended that stringent measures of control should be applied to the distribution and transportation of narcotic drugs and that special attention should be paid to the smuggling of drugs in aircraft. Finally, steps should be taken to strengthen measures for apprehending traffickers and to subject them to severe penalties.

The Commission of Inquiry on the Coca Leaf started work in Peru in September. It was appointed to study the economic and social effects of the chewing of the coca leaf and to recommend measures for limiting the production of the coca leaf to medical and other legitimate requirements.

An important accomplishment of 1948 in the international control of narcotic drugs had been the approval by the general assembly of the U.N. of a protocol which brought under international control manufactured drugs outside the scope of the convention of 1931. This new protocol, unanimously approved by the general assembly on Oct. 8, 1948, and thereafter opened for signature, brought all synthetic narcotic drugs under international control. If the World Health organization found that a drug was capable of producing addiction or of conversion into a product capable of producing addiction, it would notify the secretary general of the U.N., who would immediately inform all members of U.N., non-member states who were parties to the protocol, the Commission on Narcotic Drugs and the Permanent Central Opium board. On receipt of this information the parties to the protocol would apply to the drug the appropriate control laid down by the 1931 convention.

Trends in the illicit drug traffic in the United States indicated that some of the old sources of supply, such as Turkey, France and Italy, were active as in prewar years. In addition, it appeared that India and Hong Kong were bases for the smuggling of narcotic drugs. Raw opium seizures increased in the Atlantic coast area. Turkey and other near eastern countries served as sources of supply of raw opium and hashish. Indian raw opium seizures were heavy in the Atlantic coast area, being second in quantity to those of Turkish opium. Raw opium seizures identified definitely as originating from Persia were fewer than Turkish and Indian opium seizures, but it was believed that a number of unidentified seizures were of Persian origin.

There was a disturbing increase in the quantity of cocaine seized. Reliable information indicated that cocaine for smuggling into the United States was available in large quantities in Peru, Chile and Bolivia. Seizures of marijuana also increased. Accidental deaths and suicides directly attributable to the effect of barbituric acid drugs continued to increase in the United States. The lack of adequate control prompted the introduction in congress of two bills to bring these drugs under federal narcotic laws. The administration opposed these measures on the grounds that there was no smuggling and no interstate illicit traffic and therefore the problem should be controlled by the states.

(H. J. A.)

Measures controlling the consumption in Great Britain of a number of dangerous drugs were strengthened by regulations which came into force on Jan. 1, 1949. Two of the new requirements were that persons authorized to be in possession of dangerous drugs were compelled to take proper care of them, and accredited vendors had to keep them under lock and key. The regulations restricted the authority to dispense dangerous drugs and imposed on pharmacists the responsibility for satisfying themselves of the genuineness of all prescriptions for which they dispensed a dangerous drug. Drug addiction did not present a serious problem in Great Britain, and statistics showed that addicts numbered only 383. The principal drugs used were morphine and heroin. Few used cocaine and the number was decreasing.

The domestic manufacture of drugs was controlled by a system of licensing and Home Office inspection, and, according to a government report to the U.N., addicts or would-be traffickers had little chance of obtaining drugs from these sources.

It was announced on March 3 that, by arrangement with the Pharmaceutical society, the B.B.C. would discontinue broadcasting messages concerning lost drugs, except when real danger to life existed or where drugs and poison were known to have been purchased in mistake for harmless medicines.

Abnormal traffic in drugs in the British and U.S. zones of Germany was the subject of a report submitted by the occupation authorities on May 19 to the U.N. Commission on Narcotic Drugs. The traffic was aggravated by groups of people who bartered drugs for coffee and cigarettes provided as amenities in camps for displaced persons. The British representative reported that most narcotics seized in the black market came from former Wehrmacht medical depots and supply trains looted at the end of World War II. The report stated that there was no proof of the illicit import of such drugs.

NATIONAL HEALTH SERVICE. 1949 was the first full year during which the National Health Service act, 1946, operated. Ninety-five per cent of the population had registered with general medical practitioners under the scheme. Although a large proportion of doctors in general practice accepted service under the scheme, patients were sometimes delayed in obtaining treatment owing to the shortage of doctors; and there were complaints of overwork in the profession. There was evidence that some people were going to their doctors too readily and that the provision of free medicine was being abused by a minority of the patients. It was decided, therefore, that a charge of one shilling should be made for each prescription. There was some criticism of...
the service being available to foreigners. It was therefore decided that the provision of artificial limbs, dentures and other appliances or expensive treatment should not be available to persons coming specially to Great Britain for the purpose. Dental treatment was even more difficult to obtain than medical treatment for some years because there had been a great shortage of dentists in Great Britain. Under the new scheme the earnings of some dentists were considered to be excessive and revision of their fees was under consideration. In the school medical service dentists continued to be paid by salary and there was a tendency for this service to suffer since private practice became more attractive. The epiliphalic service was also carried on under some difficulty, particularly in the supply of spectacles of which five million were provided in the first year.

When the new scheme was introduced the British Medical association, acting for the profession, feared the possibility of the establishment of a state medical service. The National Health Service (Amendment) act, 1949, was accordingly passed to give a statutory guarantee that a whole-time salaried service for general medical practitioners would not be introduced without special legislation. This act also met objections which had been raised to the operation of the main act in regard to partnership agreements.

The development of the health services received consideration in the dominions and particularly in Canada where, during the year, progress was made with the National Health programme under which some $30 million were to be made available by the dominion government to the provinces for the improvement of health services.

In India consideration was given to the indigenous systems of medicine, known as Ayurveda, Unani, etc., and to a scheme in connection with the Employees Insurance act.

The Nurses act, 1949, aimed at raising the standard of the profession in order to redress the shortage of nurses which had restricted hospital service during postwar years. The General Nursing council gave a more intimate contact with the training hospitals through the establishment of nurse-training committees. Further it was hoped that the provision in the act for the election of nurses to the General Nursing council would encourage amongst nurses themselves a steadily growing interest in their own profession and in the health service as a whole. (See Nursing.)

Owing to financial stringency it was only possible to make a small increase in hospital provision. There was considerable difficulty in obtaining hospital accommodation for the elderly sick. On the other hand, in some hospitals the accommodation for the sick was being used by ambulatory patients. Voluntary organizations (particularly the National Corporation for the Care of Old People and the National Old People's Welfare committee) in association with the medical profession were exploring the possibility of establishing rest homes to which such persons could be transferred. Similar problems were receiving attention in the United States and Canada. Economy of expenditure and restrictions on new building limited progress in the provision of health centres by local health authorities.

The estimated cost of the service for the financial year was £232 million or about 2½ 1d. a head a week of the whole population. This was considerably greater than had been anticipated when the scheme was introduced but was no doubt due largely to the fact that health needs which were clearly neglected or inadequately provided for were being met more efficiently. There was some criticism of the cost of the administration of the scheme, but the minister of health pointed out that it was not more than between 2½ and 3% of the total expenditure on the national health service. The expenditure was reviewed by a House of Commons select committee which considered that there was need for public recognition that any abuse of the service constituted a grave threat to its maintenance and further expansion. The committee had evidence that there was some difficulty in maintaining professional standards which could be overcome only by the utmost endeavour on the part of all concerned to use the service wisely. In this connection mention should be made of the adoption by the World Medical association of an international code of medical ethics.

NATIONAL INCOME. The computation of national income statistics made further considerable headway during 1949. The United Nations Statistical bulletin was able to extend its comparative table, which could now be regarded as fairly representative for both western Europe and the Commonwealth. In Great Britain the White Paper on National Income and Expenditure of the United Kingdom contained more detailed estimates for 1948 than for previous years. Other governments, too, inspired by the efforts of U.N.S. to make information available about the national incomes of its member countries, improved their statistical services in that direction.

Nevertheless, the computation of national income statistics left much to be desired. No uniform method had so far been adopted by the countries which contributed their figures to U.N., so that the various series of figures were not, strictly speaking, comparable. There was also a danger that the lay reader might attribute to these figures a higher degree of accuracy than they could justifiably claim to possess. In this respect the warning contained in the introductory notes of the British White Paper referred to above was well worth bearing in mind.

"It cannot be too strongly emphasized that the estimates in this paper are not based on exact information collected by census enumerators or obtained by scientifically designed sample enquiries. They are, in almost every case, estimates based on incomplete information collected by government departments in a form designed to suit needs other than those of the national income investigator. In some cases the information available is exiguous in the extreme. Little is known about the distribution trades, little about wages and salaries in some other service industries, little about changes in the value of manufacturers' and distributors' inventories and work in progress. In other cases the available information is so scanty that it has been possible to make no direct estimate at all. Thus the estimates of personal saving in this paper are all residues obtained by subtracting estimates of expenditure from estimates of income. Even in cases where information is more complete it is available only after considerable delay. . . . The figures shown are the best estimates that could be made, but as there had been no body of accumulated experience to draw on in making them it would be surprising if they stood the test of time as well as other estimates in more familiar fields."

This candid admission applies to the national income figures published by other governments probably even more than to the British figures, for the statistical services of most countries were less highly developed than those of Great Britain. It is with this reservation in mind that the table of national incomes between 1937 and 1948 should be studied.

The figures of various countries in the table were not comparable, because each government had its own idea on how to treat various items. Moreover, in some cases the figures were based on the gross value of national products at market prices, in others on the gross value of national

</table>

Although wages had more than doubled, during the ten years ended 1948, salaries increased by only some 70%, a fact which showed the stronger bargaining position of physical labourers compared with black-coated workers. Professional earnings also rose to a smaller extent than wages. The increase of trading profits was striking, but in that respect the effect of higher taxation on net profits had to be borne in mind. Incomes from farming increased by over 200% by 1947 and by 300% by 1948, though the latter was an abnormally good year. This sharp increase was largely due, however, to the abnormally low level of farming profits before World War II. Continued rent control was reflected in the very moderate increase of incomes from rent of land and buildings. The decline of Great Britain's net income from abroad to less than a quarter of its prewar figure was a change of considerable importance. The higher total of pay and allowances of the British armed forces was largely due to the maintenance of a larger number of men under arms than before World War II.

The levelling effect of taxation on various items of the national income was illustrated by the fact that, whereas before World War II untaxed wages were roughly equal to the total of untaxed profits and interest, and rent and taxed wages were 39% of the total of personal incomes against 34% for profits, interest and rents, in 1948 untaxed wages represented 44% and taxed wages 48% and profits, interest and rent declined to 32% before taxation and to 28% after taxation. Salaries too represented a lower proportion of the total, both before and after taxation, than before World War II. According to the estimate of the Oxford University Institute of Statistics, the net national income of Great Britain during the third quarter of 1949 was at the annual
rate of £10,470 million; real income had been rising throughout the year at the same rate as in 1948, viz., £90 million a quarter; and the increase of wages seemed to have slowed down, the proportion of wages to the national income being somewhat lower than in 1948.

It could be assumed that the national income of many other European and Commonwealth countries besides Great Britain continued to rise during 1949. There was no setback of trade and prices comparable to that experienced in the United States during the first half of the year and again after the devaluation of sterling. Nor was there any substantial unemployment, except in Belgium and Italy. In spite of much talk about disinflation and the profits of a large number of firms showing declines, the wages bills continued to increase everywhere. In none of the countries did the experience of the early '20s or the early '30s, when deflation went far enough to cause a substantial decline in the national income, repeat itself during the period after World War II. Since almost all western European and Commonwealth countries devalued in Sept. 1949, this further removed the possibility of any such setback. Although the devaluations could not produce any appreciable effect on national incomes in Europe within the brief space of the three months, they certainly influenced the underlying trends in the direction of an increase in national income. This was most marked in the raw material producing Commonwealth countries, since the prices of their staple products in terms of sterling rose sharply; their increased exporting capacity, also a result of devaluation, set into motion factors tending to cause an expansion of production. In European countries the effect, though not so distinct, was substantially the same, for it had the effect of increasing production, wages and profits. Thus it could be assumed that in the last quarter of 1949 there was an increase in the national income both in Commonwealth countries and, to a lesser extent, in European countries.

(P. E.)

The United States. According to preliminary estimates, the U.S. National income in 1949 amounted to $222,000 million and the gross national product to $259,000 million. Both of these comprehensive measures of the nation's economic activity were less than 2% below the record established in 1948.

Another indication of economic well-being in 1949 was the virtual maintenance of personal income at the 1948 level. Preliminary data indicated that personal incomes aggregated $210,000 million in 1949, only slightly below the record total of $212,000 million in the previous year.

The pace of economic activity was not uniform throughout 1949. National income and product continued their upward postwar movement throughout 1948 but turned downward in the first half of 1949. With the recovery of industrial production and construction, there was a general stabilization in business activity following this downward adjustment. National income, as measured by the U.S. Department of Commerce, is the sum of the net earnings of labour and property arising from the current production of goods and services by the nation's economy.

Personal income is the current income received by persons from all sources, including transfers from government and business but excluding transfers among persons. Not only individuals (including owners of unincorporated enterprises), but non-profit institutions and private trust and welfare funds are classified as persons.

Gross national product or expenditure is the market value of goods and services produced by the nation's economy, before deduction of depreciation charges and other allowances for business and institutional consumption of durable capital goods. Other business products used up by business in the accounting period are excluded.

A substantial reduction in the income of farm proprietors was the principal change in the distributive shares of national income from 1948 to 1949. There were comparatively minor changes in the proportions of national income formed by the other broad types of earnings.

Wages and salaries remained stable at the 1948 level of $135,000 million, as higher average earnings offset a small reduction in the total number of workers employed. Government pay rolls, including civilian and military, advanced from $19,700 million to $20,700 million over the two years, whereas private-industry pay rolls declined from $116,100 million to $114,300 million. This small decline was centred in manufacturing, which was the sector in the nation's non-agricultural economy most directly affected by the business downturn in the first half of 1949.

Nearly all of the 1948-49 decrease of business earnings in the non-corporate sector occurred in agriculture. The aggregate net income of farm proprietors dropped from $18,400 million to $15,000 million, chiefly because of lower farm prices.

The corporate profits component of national income—"corporate profits and inventory valuation adjustment"—was an estimated $31,500 million in 1949, as compared with $32,600 million in the previous year. The size of this measure of corporate earnings was very much less than that shown by "corporate profits before tax." The sizable drop in the latter measure, from $34,800 million to $28,800 million, reflected very largely the predominant corporate practice of charging inventories to cost of sales in terms of prior-period prices, rather than current replacement prices.

The 1948-49 decline in the gross national product was accounted for by a substantial drop in inventory investment demand. In 1948, when inventories were still rising to meet postwar requirements, there was an inventory accumulation of $6,500 million. In 1949, however, there was a small liquidation of inventories.

Net foreign investment, which measures the net export of goods and services commercially financed, expanded sharply in the early postwar period because of the heavy demand for
NATIONAL INSURANCE

The national insurance schemes, including that replacing the former Workmen's Compensation scheme, came into operation on July 5, 1948, and there was no further legislation on the subject in 1949. Like many modern statutes the implementation of the two acts required the making of a large number of regulations by the minister of national insurance. During the year there were some amendments to these regulations.

In the first 12 months of the operation of the new scheme 10 million claims, involving 40 million separate payments, were dealt with at the 987 local offices of the Ministry of National Insurance. The death grant payable under the act, which was a cash payment varying in amount up to a maximum of £20 to help to meet the expenses connected with the death of an insured person, did not take effect until July 5, 1949. Seven million new claims to sickness benefit were made in the year, about half of which included claims for dependants. Under the former national insurance schemes no payments were made for dependants. There were 800,000 maternity benefit claims. At the end of the period July 5, 1948-July 5, 1949, 4,150,000 men over 65 and women over 60 were receiving national insurance retirement or old age pensions. About two-thirds of all insured men reaching 65, and about one-half of all insured women reaching 60, after July 5, 1948, continued in regular employment and accordingly qualified for the increments for postponed retirement that would be added to their retirement pension when they eventually did retire and claim the pension. These increments were in effect 1s. (2s. for married couples) for every six months of postponed retirement and could increase the joint pension of a man with a wife over 60 by 20s. to 62s. a week.

Four hundred and sixty thousand widows under 60 were receiving widows' benefits. A new arrangement was brought into force during 1949 whereby anyone notifying the death of a married man received from the registrar of deaths a simple leaflet giving details of the national insurance death grant and widows' benefits. In addition to the widows' benefits, guardians' allowances or orphans' pensions were being paid to 10,000 children. Industrial injuries insurance formed another big section of the scheme. About 750,000 claims were made to industrial injuries benefits during the first year.

In Sept. 1949 changes were made in the application of the main insurance scheme to persons who were being maintained free of charge in hospital under the national health service scheme or by the Ministry of Pensions. No reduction of benefit was to be made normally during the first eight weeks in hospital, but after that period the benefit was reduced by 5s. a week if the patient could be treated as having a dependant, or otherwise by 10s. a week. After a year in hospital no more than 5y. was normally payable direct to a person in hospital, unless he was under treatment for respiratory tuberculosis, in which case 10s. was payable. The exception related to certain circumstances where the person had a dependant. Towards the end of the year, draft regulations were made by the minister modifying the classification for national insurance purposes of persons in certain specified part-time employment. The administration of the scheme, like the previous scheme, involved insurance cards being stamped which, in the case of a large organization, caused considerable work. Arrangements were therefore made by the ministry with certain large employers under which payments could be made in bulk.

The foreign ministers of Belgium, France, Luxembourg, the Netherlands and the United Kingdom signed two important conventions representing a new stage in their collaboration in social matters. The first convention, which was closely linked with the network of bilateral agreements on social security already negotiated or in course of negotiations, enabled nationals of these countries to take advantage of any

(C. F. Sz.)
NATIONALIZATION

of these bilateral agreements, no matter in which of the five countries they were residing or had resided. The benefits covered by these agreements included benefits provided in case of sickness, invalidity, old age, death, maternity, industrial injuries and prescribed occupational diseases. The second convention was based on the principle that, if a national of any of the five countries, when resident in the territory of any of the other four, required social or medical assistance but was without sufficient resources, he would receive such assistance from the latter country on the same basis as its own nationals. (See also National Health Service: Social Security, U.S.)

NATIONALIZATION. In 1949 the pace at which nationalization had been carried out since 1945 was sensibly slowed down. In Great Britain the Labour government's programme was completed. In Europe generally such nationalization as was intended had been carried out before the beginning of the year. And in the Commonwealth and other countries there was actually some retreat. In some countries the need for foreign capital dictated a more cautious policy. In Great Britain compensation was paid during the year for the Cable and Wireless company and for many of the gas undertakings; in their trade treaties the countries of eastern Europe made arrangements to compensate the expropriated foreign holders.

Great Britain. In Great Britain the only tangible development in the Labour government's programme of nationalization was the vesting of the gas industry (May 1). All other industries intended for nationalization had been vested in state ownership before the beginning of 1949 with the exception of iron and steel. The Iron and Steel bill was given its third reading by both houses of parliament in the summer; and a compromise at the last minute over the vesting date enabled the bill to receive the royal assent on Nov. 24—without the operation of the new Parliament act. According to the act the industry was to be vested in public ownership on Jan. 1, 1951, or within a year from that date, no members of the corporation being appointed before Oct. 1950. Whether or not it should be nationalized was thus made to depend on a general election. (See Iron and Steel.)

However, 1949 also saw the publication of the Labour party's proposals for fresh nationalization, and the Conservative party's counter-proposals for dealing with the industries already nationalized. The Labour party's policy statement included the nationalization of all departments of all industrial insurance companies, which later in the year was modified to "mutualization"; of cement; of sugar manufacturing and refining; of meat wholesaling; of water; and of all "suitable" mineral rights. The document also proposed an examination of the chemical industry with a view to nationalization and a development council for the shipbuilding industry. It foreshadowed besides a new departure in the party's attitude to state ownership; for, where nationalization was thought to be unsuitable, it suggested that state-owned undertakings should enter into competition with private industry. The general principle of the Conservative counter-proposals was that nationalization should be undone as far as possible: the nationalization of iron and steel would of course be reversed; but, in addition, road haulage and road passenger transport would be sold back to private ownership; and the Liverpool cotton exchange would be re-opened. Other industries in the Conservative view could not be de-nationalized. For these, in a radical decentralization, it was proposed that there should be independent price tribunals and that the operations of the nationalized industries should be brought within the scope of the Monopolies commission. (See Political Parties, British.)

During 1949 the reports of several of the major nationalized industries for 1948 were published. In 1948 the National Coal board made an operating profit of £162 million and a net profit of £1.7 million; but it still carried over into 1949 a deficit of £218 million—the result of the loss in 1947. The year's profit was almost entirely due to the premium of £1 a ton which was obtained for export coal and the board felt it necessary to say that this premium could not be counted on for very much longer. However, devaluation later in the year gave the board a further margin in many markets; and in the first and second quarters of 1949 the board reported net profits of £3.8 million and £2.5 million respectively. Later in the year the outlook for the industry was less promising. The cost curve which had seemed to be flattening out took another upward turn; and in Britain, as in France, a fall in the labour force set in, spreading even to the face-workers. Nevertheless, the production target set was reached. (See Coal.)

The Transport commission reported a much smaller loss for 1948 than had generally been expected. There was a revenue deficit of £17 million and a net deficit of £4.7 million. This unexpectedly favourable result was due, in part, to the economies that had been put in hand before nationalization; in part also it reflected a perhaps inadequate provision for depreciation; nothing was placed to general reserve. Nor was it more than superficial; for by the end of the year the prospect of a £20 million deficit forced the commission to apply for increased freight charges on the railways. The commission was unable to report much progress in its principal task of unification since its main pre-occupation was and would be for some time, the standardization of its separate parts. But during 1949 the British railways announced further schemes for the standardization of equipment and two area schemes for road passenger transport were published. Towards the end of the year the appointed day for the takeover of long-distance road haulage was announced. (See Motor Transport, Railways.)

Cable and Wireless, in spite of rising costs and unchanged traffic, made a profit for 1948 almost exactly the same as that for 1947—£1.7 million; and the falling trend of traffic seemed to have been checked. (See Telegraphy.)

The Raw Cotton commission made a profit of £10 million on a turnover of £611 million.

The nationalized air transport once again exceeded its vote. B.O.A.C. reduced its deficit by £1.2 million and B.E.A. by £800,000. But B.S.A.A.'s deficit increased and the combined loss was only slightly lower at £97 million. These losses were again largely owing to the use of unsuitable types of aircraft, but both the major corporations reported an increase both in capacity-ton miles and in productivity. A bill was introduced merging B.O.A.C. and B.S.A.A. But the fruits of this merger were not expected to be gathered until well on into 1950 and it was likely that the target of a deficit of £5.5 million for 1949 would not be fulfilled. (See Aviation, Civil.)

The British Electricity Authority whose first report was published at the end of the year made a profit of £4,391,684 in its first financial year which ended on March 31, 1949.

These financial results were on the whole better than those for 1947. But in 1949 it was still too early to judge the results of nationalization solely by profit and loss. In general, though the nationalized industries had the statutory duty of balancing their accounts "taking one year with another," the proponents of nationalization tended to argue that the industries should be judged primarily by the service that they rendered, secondly as instruments for maintaining full employment and only thirdly as ordinary commercial undertakings. Here the experience of 1949 suggested that the development of the nationalized industries was following two directions. On the one hand, those industries, which like
cable and wireless, or even gas and electricity, offered the community largely technical services, employing relatively small labour forces, showed every sign of carrying on under state ownership in almost exactly the same ways as under private ownership. The integration of capital investment was expected to yield economies, but only in the long run. On the other hand, the industries which were large employers of labour and whose labour costs formed the principal item of their expenses, particularly coal and transport, seemed to be running into trouble precisely where nationalization had been expected to bring the greatest benefits. In 1947 the principal benefit of nationalization had been psychological; production rose and the labour force expanded. But in 1949 it seemed that this initial enthusiasm was dying away. And both the coal mines and the nationalized transport suffered from unofficial strikes. Those who had always opposed nationalization considered they had found confirmation for their belief that the association of the trade union leaders in management would not in the long run be wise. And even the supporters of nationalization seemed sometimes to doubt whether the ownership of these industries by independent public corporations offered the most satisfactory way of conferring them.

Europe. In Europe the difficulties of the nationalized industries were hard to distinguish from the economic difficulties of the countries. Particularly in eastern Europe, where nationalization had been one of the means of implementing very heavy programmes of capital investment, the failure to produce sufficient was a general complaint. In France only the Regie Renault and the nationalized electricity undertaking made profits: the profit of Fr. 25,000 million shown in 1948 for electricity, however, took no account of capital expenditure which was financed by the counterpart fund of Marshall aid. Gas, transport and the mines all showed losses and there seemed little hope that the losses would be less in 1949. The nationalized railways, though they succeeded early in 1949 in returning to prewar standards of service, were severely criticized for the number of pensioners, for the financial organization, for methods of control and for the unco-ordinated way in which they had planned. Railway lines known to be uneconomic before 1939 had been restored, though competition from the roads and from the waterways would soon close them.

The coal mines suffered heavily in the strikes of 1948; the contribution of Fr. 8,000 million made by the government was estimated to be too little. And they had the formidable task of overtaking arrears of maintenance. It was estimated that Fr. 53,000 million of investment was needed merely to maintain production, a further Fr. 57,000 million for long-term development and Fr. 34,000 million for overtaking arrears of maintenance. The prewar production rate was recovered, but in spite of an improvement in productivity during 1949 the Monnet plan objective of 65 million tons in 1950 and 70 million tons in 1952 had to be modified to 60 million tons in 1952.

In eastern Europe the nationalization of industries was virtually complete at the beginning of the year. Where parts of the economy were still in private hands, as for example some of the retail shops in Czechoslovakia, the distribution of supplies was used as a method of squeezing out private ownership. One of the few countries still nationalizing was Rumania, where, during the year, the pharmacy industry and insurance were transferred to public ownership—with the exception of those establishments which had already been transferred to the U.S.S.R. as reparations. Almost everywhere during 1949 there was, it seemed, a fall in output in the nationalized industries below the targets set. And special measures were taken. In Hungary "norms" of work were laid down each month and the workers shared in profits if they exceeded the norm. In Czechoslovakia a system of accounting was adopted under which each workshop was treated as a self-supporting unit: rendering weekly and fortnightly accounts. Only in Western Germany, where the election results were interpreted as a vote against nationalization, was there a specific reaction against the policy.

Commonwealth. In the Commonwealth countries there was a distinction in attitude between those countries which were industrially advanced and those which were in need of foreign capital. In New Zealand (though at the end of the year the vote against the Labour government was in part a vote against nationalization) a further step was taken when in April the privately owned coal mines were nationalized; plans were also made during the year for the construction of a state-owned pulp and paper mill. In Canada plans were made to nationalize the whole external communications system, including Canadian interests in the British state-owned Cable and Wireless company. In Australia the desire of the government was once again overruled by a legal decision. During 1948 the act nationalizing the trading banks was declared unconstitutional by the High Court, and in 1949 this decision was confirmed after a record hearing of 36 days by the judicial committee of the Privy Council. On the other hand in the countries where the need for capital was great, the policy of nationalization was considerably modified. In India the government was publicly committed not to entertain any further projects for nationalization for a period of 10 years. And in Burma, private capital was invited to share in all the major industries, some of which had been nationalized in 1948, under terms which guaranteed the investor against nationalization for a specific period. (J. R. Ay.)

NATIONAL PARKS. In March 1949 the National Parks and Access to the Countryside bill was published. The main objects of the bill were to provide for the designation of national parks in England and Wales and for the establishment of a National Parks commission; to confer on the Nature Conservancy and on local authorities' powers for the recording, creation, maintenance and improvement of public paths and for the establishment of long-distance routes; to enable the public to have access to open country; to confer further powers for preserving and enhancing the natural beauty of the countryside; and to provide for exchequer assistance towards these purposes. The bill broadly followed the recommendations of the Hobhouse committee which reported in July 1947, but differed from it in giving administrative powers to local county councils and borough councils. The National Parks commission, appointed by the minister of town and country planning, would select any extensive and beautiful area which it considered suitable and would encourage the provision and improvement of facilities for visitors to the national parks. The bill received the Royal Assent on Dec. 16 and Sir Patrick Duff was appointed the first chairman of the National Parks commission.

The six National Forest parks, administered by the Forest commission, became increasingly popular. More camping sites were provided and facilities for visitors improved. Additional guides to the forest parks were published including booklets on Hardknott and Glenmore.

Canada. The Fundy national park was officially opened during the summer of 1949. The 80 sq. mi. scenic and recreational area in New Brunswick was proclaimed a national park in April 1948 and in 1949 parliament approved the name "Fundy." An essay contest was held throughout provincial schools to select a title for the park. In June the deputy minister of mines and resources, Dr. H. L. Keenleyside, announced that the Dominion Wildlife service would carry out special intensive studies of wildlife in the national parks. Developments in the national parks included additional
work on park highways in Waterton Lakes park, Prince Albert national park, Riding Mountain national park, Cape Breton Highlands national park and on the highways leading to the mountain national parks. Facilities for the protection of the forest parks were also improved. During the first four months of the fiscal year 46-5% more visitors entered the parks compared with the same period in 1948. In August 1949 visitors to the parks numbered 485,133.

Kenya. The government took over the ancient ruined city of Gedi, 10 mi. south of Malindi, as a national park. Investigation and conservation work was to be carried out by J. S. Kirkman, warden of Kenya's historic sites. The ruins of the city, which include five mosques, a ruler's palace and many large houses were first discovered 25 years ago.

New Zealand. Extending south from a track between Te Anau and Milford sound to Lake Manapouri an area of 400,000 ac. of Fiordland national park in South Island was proclaimed a bird sanctuary.

Northern Rhodesia. In September the Legislative Council passed a motion providing for the proclamation of an area of 8,650 sq. mi. in the southern, central and western provinces as a national park. The area was situated entirely in Native trust lands and was almost entirely infested with tsetse fly and had extremely poor soil. It was almost uninhabited except in a small area along the Kafue river. It was estimated than an expenditure of £40,000 over a period of three years would be required to bring it up to the standard of the Wanke game reserve and that the recurrent expenditure would be approximately £8,000 a year.

Southern Rhodesia. A National Parks act was passed during the year. It provided for the establishment of national parks and for the preservation of wild animal and fish life and vegetation and objects of geological, ethnological, historical or other scientific interest; and for the control and management of such parks by a National Parks Advisory board appointed by the minister of internal affairs. The act scheduled the following areas as national parks: Wanke game reserve (3,256,998 ac.); Robins game sanctuary (25,398 ac.); Kazuma Pan game reserve (48,640 ac.) and Chinamani national park (20,213 ac.). The first three were situated in the Wanke native district and the last in the Melsetter district.

Uganda. An official committee was set up during the year to examine the possibility of establishing national parks in the protectorate. (X.)

United States. Visitors to U.S. national parks and other areas totalled 31,864,180 in 1949, an increase of more than 2,250,000 over 1948.

Three areas of historic significance were established. The massive fortifications in San Juan, Puerto Rico, were designated as San Juan National Historic site; bluffs along the Mississippi river containing unusual prehistoric earth mounds were established as Effigy Mounds National monument; and the De Soto National memorial, to commemorate the landing of Ferdinand de Soto's expedition in Tampa bay, was established in the vicinity of Bradenton, Florida. Deeds to approximately 33,500 ac. of land in the Jackson Hole region of Wyoming were donated to the federal government by John D. Rockefeller, Jr., for administration as part of Jackson Hole National monument. At the year's close, areas administered by the National Park service totalled 181, with a combined area of 21,754,134 ac. (N. B. D.)

NAURU: see British Empire; Trust Territories.

NAVIES OF THE WORLD. At the end of 1949 only two navies could be considered as being first class, those of the United States and of Great Britain, the former being fully three times larger than the latter. The fleets of the U.S.S.R., France and Italy could be reckoned as second class, and those of Argentina, Australia, Brazil, Canada, Chile, Netherlands, Spain, Sweden and Turkey as third class. Several of the smaller navies renewed their strength by acquiring surplus warships from the United States and Great Britain. The relative strengths of the navies of the world can be seen at a glance from the table. It became apparent during the year that the importance of the battleship and the cruiser had more than ever waned, and that the various admiralties and navy departments were concentrating on the development of aircraft carriers, destroyers, submarines and frigates to counter the ever increasing
menace of atomic weapons, more deadly aircraft and faster submarines.

Many battleships and cruisers of the two principal navies were broken up or discarded, together with prewar or war-built destroyers, submarines and smaller craft no longer required, but there were signs that this was the final reduction of the large wartime fleets to a postwar establishment commensurate with foreseeable needs and straitened economies.

The major part of the warships of the principal nations were put in a state of preservation or refitted for placing in reserve, but many experiments were carried out with aircraft carriers, destroyers and submarines. While designs of the warships of the future were being prepared according to the lessons of World War II to counter the latest aircraft and submarines, most navies perforce made the best of existing warships by bringing them up to date or modifying them for new duties.

There were signs, however, that revolutionary types of warships were being prepared for the operation of atomic bombs, guided missiles, rockets and new anti-submarine and anti-aircraft weapons developed since the war, these ships being designed with novel types of propelling machinery such as atomic energy, hydrogen peroxide and gas turbines.

In most of the big navies there was a shortage of personnel to man operational ships, of which fewer than ever were in full commission. This was partly due to a falling off in recruitment and the demobilization of wartime entries, but chiefly to the long training in the handling of the complicated weapons and advanced scientific apparatus which an officer or rating must now undergo on shore before he is competent to control and maintain the equipment of modern warships.

Among the naval events of the year which shocked and stirred the world were the surprising halt in the construction of the giant U.S. aircraft carrier "United States," the largest warship ever designed, only five days after she had been laid down on April 18; the trapping of the British frigate "Ame-thyst" by the Communists in the river Yangtse on April 20, her attempted rescue by the cruiser "London," destroyer "Consort" and frigate "Black Swan," and her subsequent remarkable feat of navigation in escaping down the river to join the fleet on the night of July 30-31; the Western Union naval "Exercise Verity" carried out by the combined fleets of Great Britain, France, the Netherlands and Belgium in July; the loss of the U.S. submarine "Cochino," which after two explosions in her battery room caught fire and sank off the north coast of Norway on Aug. 26 while on an Arctic training cruise; the loss of the Argentine minelayer "Fournier" which sank in the Straits of Magellan on Sept. 21; the gamma ray tests on the obsolete British cruiser "Arethusa" during the summer; and the scrapping at the end of the year of the oldest warship afloat in the world, the 148-year-old British man-o'-war "Impalacable," formerly the French "Duguay-Trouin," which was laid down in 1797, fought against the British at the battle of Trafalgar, was captured a fortnight later and served in, or latterly in close association with, the Royal Navy ever since.

**United States Naval Strength.** Late in 1949 only one of the 15 U.S. battleships remained in full commission, the "Missouri," which led a task force of ten warships on a separate midshipmen's training cruise to Great Britain and France during the summer. The battleships "Kentucky" and the battle cruiser "Hawaii," laid down during World War II, were still only 73 and 84% complete, respectively. The 27,100 ton aircraft carrier "Oriskany," modified from the original "Essex" class design while under deferred construction, was completed in December. Twelve other ships of the class were to be modified on similar lines to enable them to operate heavier aircraft. The fleet comprised 15 battleships, two battle cruisers, 37 fleet aircraft carriers, 66 escort carriers, 25 heavy cruisers, 44 light cruisers, 363 destroyers, 244 escort destroyers, 172 submarines, 195 mine craft, 122 patrol vessels, 844 amphibious craft and 537 miscellaneous vessels. The total strength of personnel was 394,500 in the navy and 77,000 in the marine corps.

**British Naval Strength.** One battleship and eight cruisers were removed from the effective list. Of the five remaining battleships none was in operational commission at the end of the year, the "Vanguard" being in the training squadron and the four of the "King George V" class relegated to reserve. There were 12 fleet aircraft carriers and one escort carrier. The large aircraft carrier "Eagle" was not completed, and her sister ship "Ark Royal" was not launched. Little progress was made with the intermediate fleet carriers "Aegir," "Bulwark" and "Chival" and the remaining ship of the class, the "Hermes," was not launched. The light fleet carriers "Hercules," "Leviathan" and "Powerful" were still suspended. As a result of scrapping, cruisers were reduced to 25. No building progress was made with the cruisers "Blake," "Defence" and "Tiger" begun in 1942-43 and stopped in 1946. Destroyers numbered 111. Two of the eight large destroyers of the "Daring" class ordered during World War II were launched. There were 167 frigates, including 50 former escort destroyers of the "Hunt" group, 24 former sloops, and 26 former corvettes, which were all re-classified as frigates. Submarines numbered 68, including four "midgets." Other vessels included two monitors, three fast minelayers, three aircraft maintenance carriers, 66 fleet minelayers, and many coastal craft, miscellaneous vessels and auxiliaries. Naval personnel numbered 146,000.
On Nov. 8, 1949, King George (1) went on board U.S.S. "Columbus" at Portsmouth. Combined manoeuvres of the navies of the Western Union powers were held in July and (2) Sea Hornets are seen on the flight deck of H.M.S. "Implacable." An earlier "Implacable," which fought at Trafalgar (4), was sunk on Dec. 2. H.M.S. "Vengeance" (3) is seen during Arctic exercises early in 1949.
U.S.S.R. The Soviet navy returned one battleship, seven destroyers and three submarines to Great Britain and one cruiser and 27 frigates to the United States which had been on loan since 1944; but the U.S.S.R. was compensated by the acquisition of one battleship, one cruiser, six destroyers, two submarines and other warships from Italy under the peace treaty, six destroyers and other warships from surrendered Japanese tonnage and a considerable number of ex-German ships, including the incomplete aircraft carrier "Graf Zeppelin." Total available strength in 1949 was three battleships, 14 cruisers, two coast defence ships, 60 destroyers, 24 escort vessels, 360 submarines and numerous minelayers, minesweepers, patrol vessels, torpedo boats and auxiliaries.

France. Owing to straitened finances the battleship "Jean Bart" was still not completed, the aircraft carrier "Clemenceau" was not proceeded with and the cruiser "De Grasse" was not resumed. The fleet comprised two battleships, one light fleet carrier, one escort carrier, 11 cruisers, one coast defence battleship, 20 fleet destroyers, 16 escort vessels and frigates, 12 submarines and numerous patrol vessels and other warships. Personnel numbered 50,000.

Italy. The fleet was reduced to the two battleships, four cruisers, four fleet destroyers, 16 escort destroyers, 20 corvettes and a number of minesweepers and auxiliaries that were allowed under the peace treaty.

Other European Countries. Turkey acquired four destroyers from the United States, and now had one old battle cruiser, 12 fleet destroyers, ten submarines, and smaller warships.

Personnel: 4,800.

The Netherlands had a well balanced fleet of one light fleet aircraft carrier, two cruisers, seven destroyers, three escort vessels, eight submarines and a number of other warships and auxiliaries, among them a sloop converted into a radar training ship and an ex-German whaler adapted as a submarine detection ship. Personnel: 27,700.

Sweden had four cruisers, five coast defence ships, 13 fleet destroyers, eight escort vessels, including two older destroyers being converted into anti-submarine vessels, 24 submarines, two minelayers and numerous other warships including a radar training ship. Personnel: 13,500.

Spain possessed six cruisers, 13 fleet destroyers, 15 escort vessels, six submarines, six minelayers and seven fleet minesweepers, also many minor warships and auxiliaries. Personnel: 22,300.

Greece had one cruiser, two destroyers, eight escort destroyers, six submarines, eight corvettes and numerous smaller craft. Personnel: 10,000.

Norway had six destroyers, seven escort destroyers, five submarines, three corvettes, two fleet minesweepers and sundry minor warships.

Portugal acquired three submarines and two frigates from Great Britain, and completed the reconstruction and modernization of her five fleet destroyers. At the end of 1949 there were five destroyers, eight sloops and frigates, six submarines and various ancillary vessels.

Poland had two destroyers, four submarines, and smaller craft.

Denmark possessed ten torpedo boats or small escort destroyers, two frigates, three submarines, a corvette and minor vessels.

Rumania had two destroyers, one submarine, two minelayers and minor craft.

Yugoslavia had three escort destroyers and seven submarines.

Belgium possessed two sloops and a frigate, with minor craft.

Finland had only minor craft, but her navy was to be built up to the 10,000 tons aggregate allowed under peace treaty.

Bulgaria had a few coastal craft.

South and Central America. Argentina had two old battleships, three cruisers, a coast defence ship, 11 destroyers, four escort destroyers, four frigates, three submarines, a corvette, two patrol vessels and a considerable number of other craft.

Brazil had one battleship, seven fleet destroyers, eight escort destroyers and four submarines, also six trawler-type corvettes and smaller craft.

Chile possessed one battleship, two coast defence ships, six destroyers, three frigates, three corvettes and various other vessels.

Peru had two obsolete cruisers, one old destroyer, three frigates and four submarines.

The Dominican Republic had greatly strengthened her navy by the acquisition of two destroyers from Great Britain and three frigates from the United States. She also had an ex-frigate presidential yacht, five corvettes and a number of patrol vessels and coastal craft.

Colombia had two destroyers, a frigate and several smaller craft.

In the Mexican navy were four sloops, four frigates, five submarine-chaser type patrol vessels, and minor craft. Venezuela possessed six corvettes, two gunboats and a few small craft.

Cuba had two sloops, three frigates, two patrol vessels and a number of minor war vessels.

Asia. China's navy was very divided. The cruiser "Chung-king," formerly H.M.S. "Aurora," and the sloop "Chang Shih" (ex-Japanese "Uji") were lost in the civil war in March and September, respectively, and the escort destroyer "Lin Fu," formerly H.M.S. "Mendip," was returned to the Royal Navy in May. The fleet comprised four destroyers, ten vessels of the escort destroyer and sloop type and numerous corvettes, minesweepers, gunboats, patrol vessels and coastal craft.

Siam possessed four small coast defence ships, two sloops, two corvettes, an old destroyer, a fleet minesweeper, ten torpedo boats, 12 M.T.B.s. and a number of other small warships.

Persia acquired a frigate and a fleet minesweeper from Great Britain.

Modern Types of Warships. The principal types of warships in the world's navies were as follows:

Battleships. U.S. "Iowa," 45,000 tons; nine 16 in., twenty 5 in. guns; 33 knots; 200,000 S.H.P. U.S. "South Dakota," 35,000 tons; nine 16 in., twenty 5 in. guns; 30 knots; 130,000 S.H.P. British "Vanguard," 42,500 tons; eight 15 in., sixteen 5-25 in. guns; 28 knots; 130,000 S.H.P. British "King George V," 35,000 tons, ten 14 in., sixteen 5-25 in. guns; 27 knots; 110,000 S.H.P. French "Richelieu," 38,500 tons; eight 15 in., nine 6 in. guns; 30 knots; 150,000 S.H.P. British "Battleship Cruisers." U.S. "Alaska," 27,500 tons; nine 12 in., twelve 5 in. guns; 33 knots; 150,000 S.H.P.

Aircraft Carriers. U.S. "Midway," 45,000 tons; eighteen 5 in. guns; 137 aircraft; 33 knots; 200,000 S.H.P. U.S. "Essex," 27,100 tons; twelve 5 in. guns; 82 aircraft; 33 knots; 150,000 S.H.P. U.S. "Saipan," 45,000 tons; light guns; 48 aircraft; 33 knots; 120,000 S.H.P. U.S. "Independence," 11,000 tons; light guns, 45 aircraft; 33 knots; 100,000 S.H.P. British "Implacable," 23,000 tons; sixteen 4.5 in. guns; over 60 aircraft; 32 knots; 148,000 S.H.P. British "Glory," 13,190 tons; light guns; 40 aircraft; 25 knots; 40,000 S.H.P.

Cruisers. U.S. "Des Moines," 17,000 tons; nine 8 in., twelve 5 in. guns; 32 knots; 130,000 S.H.P. U.S. "Oregon City," 13,700 tons; nine 8 in., twelve 5 in. guns; 33 knots; 120,000 S.H.P. U.S. "Worcester," 14,700 tons; twelve 6 in., twelve 3 in. guns; 32 knots; 120,000 S.H.P. U.S. "Fargo," 10,000 tons; twelve 6 in., twelve 5 in. guns; 33 knots; 100,000 S.H.P. U.S. "San Diego," 6,000 tons; twelve 5 in. guns;
NEHRU—NERVOUS SYSTEM

33 knots; 75,000 S.H.P. British "Superb," 8,000 tons; nine 6 in., ten 4 in. guns; 31-5 knots; 72,500 S.H.P. British "Dido," 5,450 tons; eight 5-25 in. guns; 32 knots; 62,000 S.H.P. Swedish "Tre Kronor," 7,400 tons; seven 6 in. guns; 33 knots; 100,000 S.H.P.

Destroyers. U.S. "Gearing," 2,400 tons; six 5 in. guns; 35 knots; 60,000 S.H.P. U.S. "Sumner," 2,200 tons; six 5 in. guns; 36 knots; 60,000 S.H.P. British "Battleaxe," 1,980 tons; four 4 in. guns; 31 knots; 40,000 S.H.P. British "Jutland," 2,400 tons; five 4-5 in. guns; 31 knots; 50,000 S.H.P. French "Hoche" (ex-German), 2,660 tons; four 6 in. guns; 36-5 knots; 70,000 S.H.P. Swedish "Öland," 1,880 tons; four 4-7 in. guns; 35 knots; 44,000 S.H.P.

Submarines. U.S. "Balao," 1,526 tons; two 5 in. guns; ten 21 in. torpedo tubes; surface speed 21 knots; 6,500 B.H.P. British "Amphion," 1,120 tons; one 4 in. gun; ten 21 in. torpedo tubes; 18 knots; 4,300 B.H.P. Russian (ex-German type), 1,600 tons; light guns; six torpedo tubes; 15 knots; 4,800 B.H.P. (R. V. B. B.)

NEHRU, PANDIT JAWAHARLAL, Indian statesman (b. Allahabad, Nov. 14, 1889), was one of the leaders of the Indian independence movement and on Aug. 15, 1947, became the first prime minister of the dominion of India. (For his career see Encyclopædia Britannica and Britannica Book of the Year 1949.)

In April 1949 he attended the Commonwealth conference at which a solution was found whereby India could become a republic and at the same time remain within the Commonwealth. Pandit Nehru described the decisions of the conference as "good for India, the Commonwealth and the world." On April 28 he visited Dublin, where he was received on the floor of the Dail, and then went to Switzerland where at Berne on May 5 he ratified the Indo-Swiss treaty of friendship which had been signed in New Delhi in Aug. 1948. Addressing the Delhi provincial political conference on June 19 he announced that it had tentatively been decided that India should be declared a republic on Jan. 26, 1950. He broadcast on June 29 on India's food situation and urged the nation to co-operate in a "mighty drive for food production." After outbreaks of violence in Calcutta, he paid a three-day visit to West Bengal in July. The dispute with Pakistan over Kashmir reached a climax in September; and Pandit Nehru expressed surprise at letters from Clement Attlee and President Harry S. Truman and again claimed that Kashmir was part of India (q.v.). In October he went to the United States and Canada at the invitation of the two governments and also visited London. He returned to Bombay on Nov. 14. On May 23 at Dak Pathar he laid the foundation stone of the first river valley project in United Provinces, known as the Yamuna hydro-electric scheme.

NEPAL. An independent kingdom in the Himalayas, lying between India and Tibet. Area: c. 54,000 sq. mi. Pop. (1948 est.): c. 6,910,000. The aboriginal stock is Mongolian with an important admixture of Hindu blood. Languages: the Gorkhali, or Gurkhas, speak Parbatia which is of Sanskrit origin; the Bothias use Tibetan; the Newars, who came from southern India, speak Gubhajius, which resembles Tibetan but is interspersed with many Sanskrit words. Religion: Buddhism mixed with Hinduism. Capital: Kathmandu (pop., c. 110,000). The ruling family are Hindu Rajputs. All power is in the hands of the prime minister, to whom it was permanently delegated by the king in 1867. Ruler: Maharajadhiraja Tribhuvana Bir Bikram Jung Bahadur; prime minister and supreme commander in chief, Sir Mohan Shumshere Jung Bahadur Rana.

History. Constitutional reforms of a minor character had been introduced but in 1949 power was still wielded by a

NERVOUS SYSTEM. Research in nervous and mental diseases in 1949 had good results with regard to Parkinsonian syndromes and convulsive diseases. Two synthetic drugs, artane and tridione, were intensively used on patients. Artane (tri-hexyphenidyl), and antispasmodic, was used primarily in the treatment of all forms of Parkinsonian-like diseases—conditions caused by an infection of the brain (encephalitis) or disturbances of the blood vessels of the brain (vascular). The drug was found to stop or reduce the tremor found in nearly all cases of Parkinsonian syndromes. Other symptoms, rigidity and weakness were often relieved occasionally. Fortunately toxic effects were not produced by this new drug. Tridione (tri-methyl-oxazolidine-dione) was used in 1949 in the treatment of petit mal epilepsy (a momentary lapse of consciousness). Treatment of this condition had previously been disappointing, but tridione was found to arrest or stop the petit mal attacks. Its use, however, was found to cause harmful or toxic effects on the white corpuscles of the patient's blood. The white

Snaker Shumshere Jung Banasur Rana, the Nepalese ambassador to France, after presenting his credentials to President Vincent Auriol, Nov. 1949.
blood cells were reduced in number at first and then altered so that an increase in the lymphocytes and a decrease in the polymorpho-nuclear leucocytes resulted. Tridione was found to produce glare phenomenon, decreased day vision, macropsia, drowsiness, epigastric distress, headache, skin rashes and swellings of the eyelids, lips and many other regions. When such symptoms developed, the drug was eliminated and in all cases the symptoms vanished. If the drug was not stopped early agranulocytosis (diminished white blood cells) might develop and cause death; three deaths were reported. Although the toxic reactions were found in a small number of cases tridione was highly recommended.

Cortisone (compound E) was another new substance that was found to have a definite value in the care of nervous and mental diseases. The drug could improve the mental capacity of the patient as well as give him a sense of well-being. Such help was often needed by patients who were afflicted with a debilitating disease. The drug was also found to be exceedingly helpful in myasthenia gravis when given with neostigmine. (See also PSYCHOSOMATIC MEDICINE.)

NETHERLANDS. A kingdom of northwest Europe, bounded on the north and west by the North sea, on the east by Germany and on the south by Belgium. Area: 12,868 sq. mi. (not including the waterways and sheets of water larger than 185 ac. and minor acquisitions along the German frontier). Pop. (July 1, 1949, est.): 9,955,394. Language: Dutch. Religion (May 1947): Roman Catholic 38·50%, Dutch Reformed 31·03%, Reformed Churches 7·93%, non-church members 17·04%. Chief towns (pop. July 1, 1949, est.): Amsterdam (cap., 832,583); Rotterdam (671,901); The Hague (555,339); Utrecht (191,811); Haarlem (161,380); Eindhoven (139,320). Ruler, Queen Juliana; prime minister, Willem Drees; minister of foreign affairs, Dr. Dirk Uipko Stikker (q.v.).

History. At the beginning of the year the country was the object of world attention and criticism on account of the government's decision to resume military operations in Indonesia on Dec. 18, 1948, and the Indonesian question (see NETHERLANDS OVERSEAS TERRITORIES) remained in the forefront throughout the year. It led, following the resolution of the United Nations Security council of Jan. 28, to the resignation on Feb. 14 of Dr. E. M. J. A. Sassen, minister of overseas territories, and later, after the government's acceptance of the van Royen-Roem statements of May 7, which provided, inter alia, for the return of the republican government to its seat at Djokjakarta, to the resignation of the first high commissioner of the crown in Indonesia, Dr. L. J. M. Beel, and his replacement, on June 2, by A. H. J. Lovink. From Aug. 23 to Nov. 2, The Hague was the scene of the round table conference between Dutch and Indonesian representatives, with observers of the U.N. Commission for Indonesia in attendance. At this conference agreement was reached on the charter transferring sovereignty to the new republic of the United States of Indonesia, on the statute of union between the kingdom of the Netherlands and the new republic and on a number of technical regulations arising out of the transfer. The ceremonial transfer of sovereignty took place in the royal palace at Amsterdam on Dec. 27. In view of the close ties uniting the Netherlands to its far eastern territories in past centuries, changes so fundamental were likely to have marked repercussions in the home country.

The year saw further important developments in the country's postwar participation in European and world affairs. It was a signatory of the North Atlantic treaty (q.v.), concluded at Washington on April 4 and approved by the Lower and Upper Chambers on July 19 and Aug. 4, respectively; while in September the minister of foreign affairs, Dr. D. U. Stikker, attended the first meeting of the North Atlantic council. On May 5 the country was likewise a signatory of the statute of the Council of Europe (q.v.) and took part in the first meeting of the new council's assembly at Strasbourg during August and September and in the meeting of the committee of ministers in Paris in November. As a member of the Brussels treaty, it sent delegates and experts to the various Western Union conferences held during the year, while, in the summer, units of the armed forces participated in the five powers' combined fleet and air manoeuvres. That these commitments, however, imposed

Wouter van Leer, prime minister of the Netherlands, addressing the round table conference at The Hague, which evolved a new status for Indonesia. The conference opened on Aug. 23, 1949, and continued until Nov. 2.
heavy burdens on a country still struggling to recover from World War II was shown ... the Netherlands to withdraw its

The story begins with the Netherlands Overseas Territories, an area that includes Indonesia, Surinam, and the Netherlands Antilles. The text discusses the economic and political challenges faced by the region, particularly the heavy burdens imposed by World War II recovery efforts. The government's efforts to prevent economic collapse are highlighted, including the successful conclusion of the round table conference on July 11, 1950. Despite the serious difficulties involved, the immediate Benelux goal of full economic union between the Netherlands, Belgium, and Luxembourg was nearing completion.

The text also notes the integration of national economies, mentioning the significant efforts made to improve the economic situation. For instance, the 1949 competition law, which was put into effect in 1946, was seen as a significant step in industrialization. The Dutch economy had grown substantially since the war, and the government was committed to maintaining its momentum.

The text further discusses the agricultural sector, with significant exports of flax and cotton, as well as the rise in sugar beet production. The Netherlands Antilles also benefited from this growth, with the export of sugar increasing significantly.

The text concludes with a discussion of the political situation in the region, noting the influence of the United Nations Security Council in the determination of the Netherlands to withdraw its presence. The Netherlands, along with other countries, had taken action to support the principle of self-determination, a key concern in the post-war world.
troops from former republican areas in Java and Sumatra, to release the captured leaders and to restore the government of the republic at Djokjakarta.

Faced with this grave development on the one hand and its inalienable responsibilities as the recognized sovereign power in Indonesia on the other, the Netherlands government chose to make it clear that it had to reject this intervention. The consequence of this attitude soon assumed alarming aspects, as in reply to the Netherlands refusal to yield to the Security council’s injunctions, sanctions and suspension of aid under the European Recovery programme were adumbrated. To break the deadlock, Canada’s representative in the Security council tabled some constructive suggestions in March, which proved to be acceptable to the Dutch and which were finally embodied in the council’s “ruling” of March 24. The ruling combined the operative part of the Security council’s Jan. 28 resolution with the recommendations that the republic, if it were to be restored, should in future undertake to cooperate towards an effective cessation of hostilities in Indonesia and should, furthermore, be prepared to take part, together with the Netherlands and the Federalists, in a round table conference at The Hague, which was to provide for a peaceful and lasting settlement of the Indonesian problem. The Dutch forthwith concurred with the Canadian ruling, and from then on developments moved with noticeable rapidity. On May 7 the leaders of the Dutch and Republican delegations, negotiating on the newly recommended basis of compromise, announced that agreement in principle had been reached. On June 22 a meeting of the heads of the delegations was brought about regarding a method to effectuate the cessation of hostilities (it took effect on Aug. 10 in Java and on Aug. 14 in Sumatra). Thereupon the evacuation of Djokjakarta and surrounding districts by the Netherlands troops took place on June 24, and on July 6 the reconstructed Republican government was allowed to return to its former capital.

Meanwhile the governments of the Indonesian federal states, who welcomed the new policy of compromise and who had contributed their influence to bring it about, took steps to safeguard their own positions. An inter-Indonesian conference was held, bringing together Federalists and Republicans for the purpose of exploring the possibilities of a common policy to guide their respective delegations at the forthcoming round table conference. The inter-Indonesian conference ended in Batavia on Aug. 2 on a note of complete harmony, which covered amongst other things recognition of the federal structure of Indonesia as a basic conception of the new constitutional system.

The round table conference thus opened in The Hague on Aug. 23 in a favourable atmosphere which prevailed to the end, notwithstanding occasional clashes. Some part of this success might be attributed to the U.N. Commission for Indonesia, which attended throughout the conference and towards the end arbitrated in several delicate cases. On Nov. 2 the round table conference ended with a solemn plenary session in the mediaeval Hall of the Knights at The Hague, where the completion of its business was announced and the documents were signed by the three delegations, Netherlands, Republican and Federalist, certifying agreement on the following main subjects:

1. The charter of transfer by the kingdom of the Netherlands of sovereignty over Indonesia to the republic of the United States of Indonesia, to be effected not later than Dec. 30, 1949. (It was also agreed that the Netherlands kingdom should retain sovereignty over the Dutch part of New Guinea [area 152,089 sq mi] for the time being, on which a further decision would have to be negotiated within one year.)

2. The statute of the union to be concluded between the Netherlands and Indonesia. The union, under the Queen of the Netherlands, would have to assure the co-operation of the partners in the field of their common interests through ministerial conferences twice yearly. Attached to this statute was a joint declaration on fundamental human rights and liberties followed by a series of agreements, some of them in detail, on the principal subjects of future co-operation—foreign relations, defense, financial and economic matters (rights, concessions and enterprises, financial and monetary conditions, commercial policy, public indebtedness of the former Netherlands Indies) and cultural interests.
An agreement on the transition period covering a great many problems arising out of the change from the old to the new constitutional status, citizenship, position and rights of civil servants, military questions, such as the withdrawal of Netherlands naval, land and air forces and the setting up of a Netherlands military mission to assist the new government of Indonesia to build up sea, land and air forces of its own.

All the above mentioned agreements and various protocols accompanying them required ratification by the Netherlands parliament and by the representative bodies of the federal states and the republic of Indonesia respectively.

The Netherlands government was the first to initiate proceedings of ratification. The first reaction of parliament was not directly favourable, the lack of precision and the absence of guarantees for the fulfilment of the agreements being amongst their main objections. Simultaneously with the end of the round table conference security conditions in several parts of Java showed a marked deterioration; and the question as to how law and order were to be maintained after the withdrawal of the Dutch troops did not fail to give rise to anxiety. It was to be foreseen, however, that both the Netherlands parliament and the Indonesian representative bodies on the other hand would realize that a rejection of the results of the round table conference would create an impossible and untenable situation and that under the circumstances trust in the good faith of all parties concerned in carrying out the agreements according to the spirit rather than to the letter, might be justified by future events.

While the round table conference was still in progress, the Republican and Federalist delegations in The Hague reached complete agreement on a preliminary constitution for the republic of the United States of Indonesia, based on the principles of federalism and parliamentary democracy, which would remain in effect until a constituent assembly, scheduled to convene within one year's time, should pass a final text. On the basis of this constitution, the Indonesians made preparations for the transfer of sovereignty. Ahmed Sukarno (g.v.) was elected on Dec. 15, at Djokjakarta, by representatives of the Indonesian states to be the president of the republic and the first all-Indonesian cabinet was formed with Mohammed Hatta as prime minister.

The round table conference agreements were ratified by both houses of parliament in Holland and by the representative assemblies of the Indonesian states in the course of the first few weeks of December. On Dec. 27 the solemn transfer of sovereignty by the Queen of the Netherlands to an Indonesian delegation headed by premier Hatta took place at Amsterdam, the capital of the Netherlands, while simultaneously in Batavia (renamed Jakarta) the high commissioner of the Crown, last representative of Netherlands constitutional authority in Indonesia, handed over the reins of government to President Sukarno. The rule of the Netherlands kingdom in Indonesia had come to an end, and under a darkening political sky spreading over southeast Asia the new republic faced the uncertainties of the future. (*See also Indonesia, Republic of the United States of.*)

### Education

**Schools.** (1940, public and private together), village schools 17,718, teachers 35,163, pupils 1,896,000; primary Indonesian 354, teachers 2,331, pupils 82,935, primary European 292, teachers 1,611, pupils 47,282, primary Chinese 110, teachers 707, pupils 25,696, higher elementary Indonesian 2,783, teachers 8,394, pupils 296,885; secondary 41, teachers 542, pupils 8,866; University of Batavia, teaching staff 1,246, pupils 58,714. The only postwar figures, excluding the republic of Indonesia, were as follows (1948), elementary schools 12,000, pupils 3,000,000; secondary schools 47, pupils 6,500.

Chief destinations of exports were (1948, million guilders) the Netherlands 775, Singapore and Malaya 197-8; the U.S. 183, Japan 25, the U.K. 21. Chief source of imports were the U.S., the Netherlands, the U.K. and the Federation of Malaya.

#### Agriculture

Main crops (1947, '000 metric tons, Java and Madoera only): rice (paddy) 6,600, maize 1,300, cassava 5,600, sweet potatoes 1,200, ground nuts 130, soy beans 101, treestock (1947, '000 head): cattle 1,590, sheep 1,640, goats 5,112, pugs 1,162, buffaloes 3,040, horses 620, fisheries (total catch, 1947) 28,900 metric tons.

#### Transport and Communications

Rallies (1947) 1,900 km. Roads (1947) 53,200 km, included metalled 12,600 km. Licensed motor vehicles (1947), cars 12,000, lorries 12,100. Shipping regularly serving Indonesia (1947) merchant vessels 154, gross tonnage 757,000. Finance. Budget (million guilders, 1947 est. in brackets 1940) revenue 1,154 (743), expenditure 1,229 (1,101) National debt was estimated in Dec. 1947 at £1,970,000. Currency circulation (Dec. 1947): £1,445,000. Until Dec. 1949 the monetary unit was Dutch guilder or florin with an exchange rate of £1 = Fl 10 64 and $1 = 13.80 (12.65 until Sept. 18, 1949).

### Netherlands Antilles

The Netherlands Antilles consist of six islands in the West Indies, with a total area of 403 sq. mi. and a total population (1949 est.) of 160,000, of which about one quarter are aliens. Three islands lie near western Venezuela, Curacao (210 sq. mi.), Bonaire (95 sq. mi.) and Aruba (69 sq. mi.). The population (1947) 1,300,000, sparsely populated, lie 500 mi. to the northeast—the southern portion of St. Martin (17 sq. mi.), St. Eustace (7 sq. mi.) and Saba (5 sq. mi.). The largest city and capital is Willemstad, on the island of Curacao (pop., 1949 est., 45,000). The official language is Dutch, but a local patois of diverse origin is equally widespread. Religion: mainly Roman Catholic (90%). Governor, L. A. H. Peters.

The first election in the colony too place on March 17, 1949. The National People's party gained 4 of the 8 seats of the island of Curacao in the Legislature (Staten), and all the 3 seats of Bonaire and the northeastern islands; these 7, with the 5 representatives of the Aruban People's party, set up a coalition. On April 19, the Legislature was officially installed, and the head of the National People's party, M. F. da Costa Gomez, became prime minister. Ill feeling between the Aruba and Curacaoan wings of the coalition soon forced the re-organization of the cabinet. After eight weeks of wrangling, at the end of July, there was set up a compromise cabinet, consisting in part of technicians not identified with any party, and presided over by L. C. Kwartsz.

An unusually severe and protracted drought affected Curacao through the first half of 1949. An ambitious programme of expanding the facilities for increasing the water supply was authorized to be undertaken immediately, in the hope of its completion in two or three years. (C. McG.)

### Economy and Finance

Petroleum refining is the most important industry. There were 3 refineries—Curaçao Petroleum Industries Maatschappij, at Emmastad on Curaçao, and Lago Oil and Transport Co (Standard Oil Co. N.Y.) and the Eagle Oil Co on Aruba. Production of refined petroleum products in 1948 by the first two amounted to 234 million bbl (95% of the total).

Exports in 1948 totalled Fl 766 million. imports, Fl 867 million. Abnormally high, of the exports of petroleum products, and 77% of the imports consisted of crude petroleum, almost all of which is brought from Venezuela by shallow-draft tenders. Total imports of crude petroleum in 1948 amounted to 245 million bbl.
NEWFOUNDLAND

Surinam (Dutch Guiana). A Netherlands colony in north-eastern South America, bounded on the north, east, south and west by the Atlantic ocean, French Guiana, Brazil and British Guiana, respectively. Area: 54,291 sq. mi. Pop. (1949 est.) 321,897. In addition over 80,000 native-born Surinamese and American Indians, principal population groups included 56,000 Asiatic Indians, 35,000 Javanese, 19,000 Negroes and 2,400 Chinese. The capital and chief port is Paramaribo (pop., 1946 est., 71,000). The official language of the colony is Dutch, although English, Javanese, Hindi and Urdu are also spoken. Governor, Willem Huender; from Dec. 2, J. Klaaszes.

Projects designed to secure autonomy for Surinam within the Netherlands empire moved forward during 1949 with less friction than in the previous year. However, some agitation followed the adjournment at Havana, Cuba, on July 21 of a meeting of representatives of the Latin-American republics sponsored by the American Committee on Dependent Territories, which had been established in 1948 by the 9th International Conference of American States. The Havana meeting adopted a resolution requesting the inter-American conference to call upon the remaining European powers with American possessions to co-operate in (1) granting eventual independence to these holdings and (2) establishing United Nations trusteeship arrangements for colonies found to be incapable of self-government. Meanwhile, the Netherlands government intensified its co-operation with the U.S., the United Kingdom and France through the Caribbean commission (g.v.), representing a four-power approach to the problems of Surinam and other dependent territories in the western hemisphere. (G. I. B.)

Economy and Finance. Exports in 1948 totalled FI.27,171,980, imports FI.36,172,323. Chief exports bauxite (79%), timber (5%), citrus fruit (5%) and gold (4%). Principal customers were the U.S. (85%) and the Netherlands (10%), the chief suppliers, were the U.S. (49%) and the Netherlands (30%). The major economic activity is the extraction of bauxite, most of which is exported to the U.S. Production in 1948 was 2,186,000 short tons.

Agriculture income in 1948 was FI.22,147,000 (est 1949: FI.26,683,000), actual expenditure was FI.22,120,000 (est 1949: FI.26,090,000). Notes in circulation (Oct. 1, 1949): FI.10,683,000; gold reserve, FI.6,586,649. Monetary unit: Surinam guilder or florin valued at U.S. $0.53.

NEW CALEDONIA: see French Union

History. In a referendum in July 1948 Newfoundland decided by 78,323 votes to 71,334 in favour of confederation with Canada as against a return to responsible government. By December the terms were completed. They were ratified by the Dominion parliament on Feb. 18, 1949, and approved by the British parliament on March 16. As from midnight March 31, Newfoundland, including Labrador, became the tenth province, thereby bringing to fruition the plan envisaged in 1864 of consolidating British North America as a political entity within the Empire.

Commission government terminating after a 15 years' tenure, Sir Albert J. Walsh was appointed provisionally lieutenant governor and Joseph R. Smallwood, moving spirit in the confederation campaign, was sworn in as acting premier. In the provincial election on June 27 the Liberals, led by Smallwood, won 21 seats against 5 Progressive-Conservatives and 1 Independent. In the federal contest for seven seats, 5 Liberals and 2 Progressive-Conservatives were elected. The Assembly met on July 12. Relinquishing his office, Sir Albert Walsh was succeeded by Sir Leonard Outerbridge.

Under the confederation agreement Canada assumed Newfoundland's public debt, pursuant to the Loan act of 1933, and took over the sinking fund established under that act. Subject to certain provisions, Newfoundland retained surplus revenue standing to the credit of the exchequer at the date of union. The province was to receive an annual subsidy of $180,000, together with an annual subsidy equal to 80 cents a head of the population in the first ten years, subject to adjustment thereafter, and a further subsidy of $1-1 million in recognition of geographical and other problems peculiar to the province. It was also provided that negotiations should be undertaken for a tax agreement for the rental to the government of Canada of income, corporation income and corporation tax fields and the succession duty tax field. Provision was also made for payment of provisional grants by Canada for 12 years, starting at $6-5 million, and gradually reduced to $350,000. To determine the financial consequences of union, it was arranged that a Royal commission would review the position within eight years. Canada assumed responsibility for the operation of the Newfoundland railway (showing an annual deficit of $2-5 million), including steamship and other marine services; the Newfoundland hotel; postal and telecommunication services; fisheries administration; surveys; shipping aids; marine hospitals, etc.; the broadcasting system; civil aviation, including the Gander airport; defence; veterans' affairs; customs and excise. Jurisdiction over natural resources, public health, education and public works remained with the province.

Social securities such as family allowances, old age pensions and unemployment insurance as obtained in Canada were extended to the province. Among other arrangements it was agreed that freight rates on traffic within, into or out of the maritimes should be applicable to the island of Newfoundland.

Newfoundland entered the new era still enjoying the economic prosperity resulting from wartime activities. Fishing, newswprint and mining industries operated at full capacity and exports commanded high prices. Surveys in Labrador revealed iron ore beds exceeding 300 million tons which promised future sources of revenue and employment, and development was being undertaken by Hollingers Consolidated and Hana company.

Spring operations opened with a highly successful seal fishery, valued at $500,000. A delayed ice blockade in the north hampered the fisheries which, in some sections, were a failure. The currency situation also had an adverse effect on trade and industry. Forest operations were curtailed owing to the loss of the British market for newsprint and sulphite pulp. Thus, with the fishery setback, left about 10,000 without employment by November. Instead of distribution, relief work was organized on a plan whereby the men were paid 55 cents hourly for three days of the week and on the other three gave free labour.

Finance. In the first six months of confederation, revenue totalled $16,696,710 (including federal grant of $4,405,000), expenditure $13,146,362. Family allowances in that period totalled $6,000,000.
Trade. Total trade in 1948 was: exports, $77,839,000; imports, $105,055,000. Fishery products were valued at $29,022,000; pulp and paper, $25,729,000; minerals, $15,760,000. Chief supplying countries: Canada ($54,983,000); U.S.A. ($40,313,000); United Kingdom ($6,228,000). Chief customers: U.S.A. ($26,063,440). United Kingdom ($13,484,942); Canada ($9,732,227).

Communications. Motor cars licensed in 1949 numbered 8,341 (in 1948, 7,343); other vehicles 4,531 (1948, 4,210). With a view to freight adjustments a Transportation commission heard briefs in October. Surveys for a trans-insular highway began. (C. E. A. J.)

NEW HEBRIDES: see British Empire.

NEWSPAPERS AND MAGAZINES. There was considerable improvement in the supply of newsprint in 1949, with the result that the British press, having been thwarted for so long, was at last given wider scope for its enterprise. Unrestricted sales of newspapers were resumed on Jan. 3, when a more generous allocation of newsprint permitted the penny newspapers to increase their size to a daily average of five pages. Nearly four months later further supplies of paper advanced the number of pages to six and so caused the disappearance of the four-page newspaper, which had been established by government regulation in 1941. With the removal of restrictions on circulations, the non-competitive period ended and newspapers were quick to take advantage of the new conditions. More news was covered and there was keen competition in new features; but although circulations rose there were not the large increases that had been expected.

The sales of daily newspapers rose from 19 million a day before World War II to 29 million, but the consumption of newsprint was much less than in 1938. The equalized price of newsprint at the beginning of 1949 stood at the high price of £42 2s. 6d. per ton and this was reduced by stages to £33 5s. in October. Approximately 70% of newsprint during the year was home-produced.

The Royal Commission on the Press, which had been appointed in 1947 under the chairmanship of Sir David Ross and cost over £20,000, published its report in June. The report—running to about 100,000 words—vindicated the press on the more exaggerated charges brought against it but criticized certain newspapers for excessive partisanship and distortion of news. The commission's chief recommendation was for the establishment of a voluntary General Council of the Press. This council was to consist of at least 25 members representing proprietors, editors and other journalists and to have a lay membership of up to one-fifth, the total including a paid chairman. The objects of the council as defined by the commission would be "to safeguard the freedom of the press; to encourage the growth of the sense of public responsibility and public service among all engaged in the profession of journalism—that is, in the editorial production of newspapers—whether as directors, editors or other journalists; and to further the proficiency of the profession and the well-being of those who practise it."

Other recommendations were that chain newspapers should be required by law to carry on the front page a formula clearly indicating their common ownership, and that if local monopolies in a considerable area should be found not to be within the purview of the Monopolies commission, the Monopolies and Restrictive Practices act should be amended to bring newspaper monopolies in areas of this size within its scope. The commission found that the case against chain organizations had been overstated; it did not favour state ownership of newspapers; and in stating that the press was free from corruption said that it was generally agreed that the British press was inferior to none in the world.

In a subsequent debate in the House of Commons Herbert Morrison, lord president of the council, said that the government accepted the report in general. They favoured the recommendation for a council and hinted that if the press failed to establish a voluntary body a statutory one would be set up. The press itself was not enthusiastic about the council, and although the conference of the Institute of Journalists accepted the idea in principle they wanted adequate safeguards against political and other outside interference. The executive of the National Union of Journalists accepted the proposed constitution of the council "as a working basis." Committees of the Newspaper Proprietors' association and the Newspaper society were examining the recommendations of the commission. The Daily Express and Sunday Express anticipated any change in the law by adding to their imprint "controlling shareholder Lord Beaverbrook."

The Institute of Journalists voted against supporting proposals for re-opening negotiations with the National Union of Journalists with regard to the fusion of the two bodies.

In March, the editor of the Daily Mirror was committed to prison for three months and the company fined £10,000 for contempt of court. The newspaper had published objectionable matter concerning a person who was under a criminal charge. On July 30, the same newspaper, with a circulation of over 4½ million, prominently displayed a statement signed by the editor that it would continue to feature sensational news. "The Daily Mirror is a sensational newspaper . . . We shall go on being sensational to the best of our ability." It expressed its opposition to a press council as proposed by the Royal commission.

Expenditure by government departments on advertising in the British press in 1948-49 (estimated) was £1,558,856, and
BRITISH NEWS PICTURES of the YEAR

The pictures on these facing pages received awards in the second annual "British News Pictures of the Year" competition sponsored by the "Britannica Book of the Year." The photographs of Ferdinand du Moulin and "Blue Baby Operation" have been selected from the winning portfolio and sequence entries. The competition was judged by Mr. Harold Lewis, editor of "Photography" and of "Photography Year Book," Mr. Percy Harris, F.R.P.S., Mr. Bertram Sinkinson, F.R.P.S., F.I.B.P., Mr. Stanley Devon, and Mr. John Armitage, London editor of "Encyclopædia Britannica."

SEQUENCE. After the operation: one of the 21 photographs in the winning sequence entitled "Blue Baby Operation" by E. G. Mandoline of "Illustrated" (London).
PORTFOLIO. Ferdinand du Moulin at Dover after swimming the English Channel: one of the ten photographs in the winning portfolio by Robert Rider-Rider of Associated Press (London). The winner in this category is accorded the title "British News Photographer of 1949."

FEATURE. The chorus dressing room of the show "Follies Bergeres" at the London Hippodrome theatre: by P. Waugh of "Illustrated" (London).

SPORT. Freddie Mills being counted out at the end of his championship fight with Bruce Woodcock in June 1949: by Roy Illingworth of P.A.-Reuter Photos (London).

More than 1,800 pictures were entered by 202 British press photographers. Entries were accepted from 32 centres in the British Isles, and for the first time one of the awards went to a provincial cameraman—the third prize in the news category to B. Hess of the "Birmingham Gazette." In addition to the five categories illustrated on these pages there was a sixth for colour entries. First prize in this section was awarded to R. Westwood of "Illustrated" (London) for his photograph of Margaret Leighton.
Among the appointments announced during the year were those of W. Vaughan Reynolds as editor of the Birmingham Post in succession to T. W. Hutton; B. C. Canter as editor of The Friend, the Quaker weekly; A. Woodward as editor of the Yorkshire Evening Post; J. R. Campbell as editor of the Daily Worker; F. Mathew as manager of The Times in succession to C. S. Kent; A. C. Duncan as chairman of Odhams Press; and W. Surrey Dane as chairman of Daily Herald, Ltd.

The long list of journalists and newspapermen who died during the year included, among other notable names, those of Sir Malcolm Fraser, a former editor of the Evening Standard; Sir Charles Iglesden, editor of the Kentish Express for some 68 years; Sir John Hammerton, who had edited several provincial newspapers and many popular works of reference; Sir William Bailey, president of the Newspaper society, 1939-46; Sir Fabian Ware, editor of the Morning Post, 1905-11; J. R. Scott, chairman and governing director of the Manchester Guardian and Manchester Evening News; Sir Errol Knox, an outstanding figure in Australian journalism; Robert Lynd, for many years literary editor of the News Chronicle; A. G. Cousins, chairman of the Daily Herald and of Odhams Press; J. L. Hammond, the well-known historian, who had a distinguished career as a journalist on liberal newspapers; H. Russell, night editor of The Times; E. Oldmeadow, editor of the Tablet, 1932-36; Dr. Albert Pcel, founder and for 23 years editor of the Congregational Quarterly; and William Rust, editor of the Daily Worker.

Commonwealth. The price of all South African daily newspapers was increased from 2d. to 3d. on Dec. 1. At the beginning of the year newspapers in Australia were freed from restrictions on newsprint and from price control of advertisement rates for the first time in 10 years. Daily Mirror Newspapers, Ltd., and Sunday Pictorial Newspapers (1920), Ltd., bought a controlling interest in the Melbourne Argus and the Australasian Post. The Sydney Morning Herald began publication of a Sunday edition, which within six months had attained a circulation of 270,000.

P. D. Ross, who had controlled the Ottawa Journal for over 60 years, sold his shares to E. Norman Smith, vice-president of the company, and M. Grattan O'Leary, associate editor. These two transferred blocks of shares to other members of the staff who thus obtained a proprietary interest in and control of the Journal. The London (Ontario) Free Press celebrated its centenary, with a special edition of 232 pages which was claimed as the largest newspaper ever printed in Canada.

In Cyprus the editor of the Communist newspaper Demokratis was sentenced to three months' imprisonment for publishing a seditious article. The paper was suspended for three months and fines were imposed on the company and the printer. The editor of a rightist paper in Cyprus was also sentenced to imprisonment for three months for libel. In the Gold Coast an owner and editor was fined for contempt of court; and two other editors received hard labour sentences for publishing seditious libels. The Bulletin, an English-language newspaper in Malta, edited by J. J. Scorey, was suspended for four days. The editor was convicted on charges arising out of a report which was alleged to have brought the governor "into hatred and contempt." In reply to complaints that colonial governors possessed excessive powers which endangered the freedom principle, the Empire Press union undertook a general survey of the laws affecting newspapers in the colonies.

An agreement was concluded which made the newspapers of India joint owners, with Great Britain, Australia and New Zealand, of Reuters, Ltd. Two new newspapers made their appearance in Bombay, the Evening Star and Bharat; the
city then had nine English-language dailies. An American syndicate was formed to purchase newspapers in India and other Asiatic countries. Its first acquisition was the Civil and Military Gazette (published in Lahore and Karachi), on which Rudyard Kipling once served as a sub-editor. The Pakistan government announced its intention to introduce legislation to regulate the ownership and editorship of Pakistani newspapers by foreigners.

Europe. The year saw some important developments in Western Germany. In 1946, when certain newspapers were licensed by the occupying powers, none of the ex-nazi dailies were allowed to appear but several of their owners were permitted to continue as printers. When, in Sept. 1949, the Allies gave up their licensing control over the German press it was feared that many of the pro-nazi newspapers would re-emerge. Some local sheets with nazi associations did in fact appear in anticipation of the ending of licensing but these were suppressed by the British authorities. In the American zone it was said that of the 106 newspapers due to start on Sept. 1 80% would be "chauvinistic, rabblerousing, anti-democratic, anti-Semitic and anti-American." An organization was set up in all three western zones to finance new papers in opposition to the established licensed press. A new press association, with hopes of 600 member-papers, was formed in opposition to the one set up under Allied supervision. The democratic press very soon felt the strain of competition and there was a general decline in circulations—Die Welt, Hamburg, the official British German-language newspaper, dropped from nearly one million to 500,000. A law was passed by the Allied high commission, which replaced the military government, giving the high commissioners power to act in cases of printed statements derogatory to the occupation powers or which might display the nazi spirit. The high commissioners made it clear, however, that it was the duty in the first place of the West German federal government to see that the democratic principles were not violated and that the freedom of the press was preserved.

Pressure in the "iron curtain" countries continued as before. Godfrey Lias, Prague correspondent of The Times, and John Fisher, an Australian journalist, left Czechoslovakia at the request of the Czechoslovak government. In Finland a printers' strike in March stopped all except the Communist and Social Democrat newspapers for nearly three weeks. Roman Catholic printing offices in Poland were placed under state control so that nearly all Catholic newspapers in Poland were printed on state-owned presses For a Lasting Peace, for a People's Democracy!, the journal of the Cominform published in Bucharest, was changed from a fortnightly to a weekly in September. A. Johnstone, the editor of the British Foreign Office newspaper in Moscow, British Ally (Britskiy Soyuznik), resigned from his post "for reasons of conscience." He denounced British nationality and decided to remain in the Soviet Union; W. R. Jones, assistant news editor of the Daily Telegraph, was appointed to succeed him. The English-language newspaper Moscow Daily News closed down in February, and Izvestia, the government newspaper, was awarded the Order of the Red Banner for "successful work in educating the workers." Meanwhile, the Court of Appeal in Britain ruled that the Tass agency (the official Soviet news agency) was protected against actions for libel by diplomatic immunity. (D. Hn.)

United States. The highest costs in history faced U.S. newspaper proprietors in 1949. The average hourly wage of mechanics passed the $2 mark for the first time, and further wage increases were demanded. Newsprint remained at the $100-a-ton price reached during the war. Consumption of newsprint broke all records, approaching 4 million tons during the first ten months. Many large special editions, including a 380-page New York Times, were partially responsible for the increase. Circulation in Jan. 1949 reached the new record of 52,285,297 copies sold daily and 46,308,081 Sunday sales, and appeared to be rising slightly, with afternoon newspapers leading. But copy prices had risen to five cents, with no one-cent and few two-cent daily newspapers on sale, and publishers estimated profits at 5% to 30% below those of 1948. For the sixth year, the number of daily newspapers increased.

The most important labour news was the settlement on Sept. 18 of the strike of the printers of five Chicago newspapers which had started on Nov 24, 1947. After printing with photo-engraved typewritten copy since the strike began, Chicago daily papers started using type again on Sept. 21, giving their 1,500 printers $10 a week increase and a new contract which met the demand of the International Typographical union for something like "closed shop" conditions without violating the Taft-Hartley labour law. After months of argument, the National Labour Relations board on Oct 29 found the I.T.U. guilty of violation of the Taft-Hartley law in its "closed shop" and "unilateral bargaining," but as late as Dec. 17 the union had taken no steps to comply with the board's order.

United Press set up the first teletype system in Japan and on April 26 transmitted a radio teletype message from London to three continents. Six Kansas daily papers joined in a tele-typesetter circuit for wire news. The New York Times printed a Paris edition for which matricules were flown daily from New York.

The most notable ownership change was the purchase on July 20 of the Washington Times-Herald by Colonel R. R. McCormick, publisher of the Chicago Tribune and part owner of New York Daily News. The New York Star, successor in 1948 to PM, suspended publication on Jan. 28, thus ending the venture of a newspaper carrying no advertisements started by Ralph Ingersoll in 1940.

A request of the U.S. post office in February for a 25% increase in second class mailing rates for publications led to much discussion at newspaper meetings, but congress adjourned without passing the bill to increase rates.

The magazine industry reported tighter business trends in 1949. Although circulations fluctuated, there was a 9-4% increase in total bookstall sales. Total advertising dropped by about 2% during the first nine months. Life cut its advertising rates by 3% on April 4. Paper prices dropped slightly during the early months of the year but rose again in August. Wages and selling costs rose and profit margins narrowed. The greatest sales gains were reported by "romance" magazines, cinema reviews, "teen-age," popular science, home architecture and fashion publications, while sales of standard women's magazines declined. More magazines were launched for ages 7-14. Morris Fishbein retired as editor of the American Medical Journal; David A. Smart returned as publisher of Esquire, and John Denson became managing editor of Colliers. An annual directory listed 7,800 magazines of all types in 1949. (G. M. Hv.)

NEW YORK CITY. Largest city in the United States and second largest in the world. The population of New York city was estimated in 1949 at 8,161,000. The city polled the largest majority vote in its history in the 1949 election and returned Mayor William O'Dwyer and the principal officers of his first administration to office.

On the fourth anniversary of the founding of the United Nations, the cornerstone of its permanent home was laid in an historic meeting of the general assembly on the site. In 1949 the city of New York contributed $23 million in property and services to the establishment of the permanent U.N. headquarters on the East river.
Construction, public and private, rose to the highest level since World War II. The city construction co-ordinator reported that $505 million of the city's improvement programme was under construction and that $555 million of construction by other public or quasi-public agencies was under way. School construction reached a peak, with projects completed at the rate of more than one a month. Public housing projects to accommodate more than 32,500 families were under construction or completed during the year. Plans were advanced for construction of 80,000 additional public housing apartments with state and federal financing. However, the shortage of housing continued acute and the city took steps to reinforce rent controls.

The last months of 1949 found New York city grappling with the most critical water shortage in memory. During the summer, the New York watersheds were parched by drought. Construction of the Delaware Water Supply system, initiated in 1937 but suspended during World War II, was several years from completion. With consumption averaging 1,150 million gal. per day, 175 million gal. more than in 1937, water in the reservoirs fell to one-third of capacity. A crisis was averted through a campaign for voluntary conservation which, at the end of the year, had curtailed consumption by 310 million gal. per day, thus giving the authorities time to consider further measures for husbanding supply.

NEW ZEALAND, DOMINION OF. A self-governing member of the Commonwealth of Nations. It consists of two large and several small islands in the south Pacific. Area: dominion proper 103,416 sq. mi.; other islands 519 sq. mi. Pop., dominion proper: (Sept. 25, 1945 census, excluding Maoris) 1,603,554; (est. June 1949) 1,888,000 including 114,000 Maoris; Cook and other Pacific islands 19,167; Tokelau islands (1945 census) 1,388. Western Samoa, a trusteeship, has an area of 1,133 sq. mi. and a pop. (est. March 1947) of 71,460. Chief cities (est. April 1949): Wellington (q.v.) (cap., 186,000); Auckland (q.v.) (289,000); Christchurch (164,000); Dunedin (88,800); Palmerston North (30,100). Language: English. Religion: mainly Christian (Anglican 37·5%, Presbyterian 23·4%, Roman Catholic 13·5%). Ruler, King George VI; governor general, Lieutenant General Sir Bernard Cyril Freyberg; prime ministers in 1949, Peter Fraser (q.v.) and (from Dec. 13) Sidney George Holland (q.v.).

History. The event of the year was the defeat of the Labour party by the National party in the general election held on Nov. 30. The Labour party led by Peter Fraser, who had held the office of prime minister for nine years, had completed 14 years of service. S. G. Holland, the new prime minister, was first returned to parliament in 1935. His party returned to office on a programme of relaxation of controls, discontinuance of further schemes of nationalization and a re-affirmation of the merits of private enterprise. The National party promised not to reduce the existing system of social security. Thus the swing of the political pendulum repeated political history which in general records decades of Liberal government interspersed with periods of Conservative administration (see Elections).

The year saw the wave of economic prosperity in New Zealand still high, and reflected throughout the whole community. Prices for cereals and meat broke all records at 66 1/2d. and 85d. per lb.; average prices were 26d. and 46 1/4d. per lb. respectively. High production in other primary industries made New Zealand Britain's chief supplier of meat, butter and cheese. Record production was achieved in timber milling and food processing works.

The buoyancy of the prosperity wave was reflected in the conversion of a £29 million debt loan floated within the country. Later in the year two further conversions on the London market were equally successful. The first, £7,322,579, 3 1/4% maturing 1954, of which £7 million was converted into 3% 1973-77; the second, £7·5 million, 5% maturing 1949, of which £6 million was converted into 3 1/4% 1963-66. The balance in each case was repaid.

In the field of international affairs New Zealand sent an observer to the conference on Indonesia and the government recorded support for the Antarctic agreement reached between Argentina and Great Britain. Representation on the Far Eastern commission was continued, while Lieut. Colonel
F. W. Voelcker and C. G. R. McKay represented the country on the South Pacific commission. A new legation in Paris was opened with Miss Jean McKenzie as chargé d'affaires, and a new consul general's office was established in San Francisco. James Thornd, high commissioner for New Zealand in Canada, gained distinction by being elected president of the U.N. Economic and Social council. New responsibilities in the administration of Western Samoa and Nauru island under the United Nations trusteeship agreement were assumed; and Sir Carl Berendsen led the New Zealand delegation to the United Nations meetings at Lake Success. Recognition was given to the new state of Israel and to Korea.

Legislation giving the state the sole right to transact workers' compensation insurance became effective. A national referendum on the question of gaming and hotel licensing hours was held, the majority favouring off-course betting through the existing totalizator facilities. The referendum also decided to continue the present licensing laws whereby hotel bars close at 6 P.M.

Emigrants from Britain in the postwar period to March 31, 1949, totalled 32,766. Of this total, 5,195 of single status and specially selected, received government assistance; and the Overseas league of Britain sponsored a child migration scheme during the year under which 128 children found homes in the country.

A defence scheme involving compulsory military service was submitted to a national referendum and approved by 535,016 to 152,575. The expansion of navy and air force units was also outlined.

Foundations were laid for the development of a salt industry at Lake Grasmere, and of a state factory to manufacture newsprint and other wood-pulp products at Murupara. New tests for smelting iron sands from Taranaki beaches by electrical processes were successful and were likely to increase New Zealand's industrial potential. Large schemes of hydroelectric development were carried forward on the Waikato river, where ultimately ten power stations were planned, and at Lake Tekapo and Rokoroke in the South Island. A seven-year plan for spending £5.4 million on such work was outlined by the minister of works, R. Semple. In September the devaluation of the currency and the maintenance of parity with sterling were announced.

Shipping lines improved their services to the dominion as new vessels and others, re-fitted after war service and carrying the latest devices for refrigerated cargo, took up the dominion run. The increased passenger accommodation assisted in reducing the long waiting list for intending travellers to and from the dominion.

The British Commonwealth Pacific Airways company began to fly the Pacific using the latest-long-distance Douglas aircraft. The route between Auckland, San Francisco and Vancouver via Fiji, Canton island and Honolulu, cut 104 hours off the previous timetable of 56 hours. The new service operated weekly instead of fortnightly.

The Pacific Science congress met for the first time in New Zealand in February with more than 300 delegates from many countries attending. The sessions held in Auckland and Christchurch discussed methods of co-operation and organized research, while stress was placed on the role of the Pacific area in the world's activities. Professor R. A. Falla, director of the Dominion museum, was chairman.

Education. (Dec. 1947) Primary schools 2,270, pupils 259,182, teachers 8,215; secondary schools 229, pupils 37,229, teachers 1,897; secondary schools for Maoris 16, pupils 804; technical schools 28, pupils 12,328 (part-time 18,697), teachers 706; University of New Zealand, students 12,764; training colleges 4, students 1,564.

Industry. (1948) Industrial establishments 35,579; persons employed 438,480. Fuel and power (1948; 1949, six months, in brackets): coal (in '000 metric tons) 969 (403); lignite (in '000 metric tons) 1,851 (942); manufactured gas (in million cu.m.) 155 (76); electricity (in million kwh.) 2,590 (1,189). Raw materials (in metric tons): pumice (1947) 3,443; white arsenic (1947) 8; superphosphates (1948) 558,400. Gold ore (in fine troy ounces, 1948) 93,903; silver ore (in fine troy ounces, 1948) 212,563.

NEW ZEALAND LITERATURE. Nearly all new novels published during 1949 were set in New Zealand in the thirties. Within a framework of family life, three novels developed themes which allowed their characters to be affected by the special issues of that time, from unemployment to war. Dan Davin's Roads from Home (London), the most powerfully written of them, outlined the problems of two sons of an Irish-Catholic railwayman in Southland, one with an unfaithful wife and the other expected by his pious mother to become a priest. Frank Sargeson's I Saw in my Dream (London) contained and completed his earlier, episodic When the Wind Blows (1945) by developing his lawyer-clerk hero into a back-country farm-worker who...
becomes involved in several very human, but unresolved, situations. A pacifist who later joins the army and finds himself forced to shoot a fugitive from justice was the main theme of Erik de Mauny's *The Huntsman in his Career* (London). These three novels and David Ballantyne's *The Cunninghams* (New York, 1948), were recognized as showing a considerable advance in technique and literary skill over earlier New Zealand fiction. Curiously all seemed to owe some of their qualities to John Mulgan's important *Man Alone* (1939), which, after being unprocurable for a decade, was re-published (Hamilton) during the year with the aid of a grant from the State Literary fund. The only other works of fiction were Greville Tizard's *These Dark Glasses* (Christchurch) and Nelle Scanlan's *The Rusty Road* (Wellington).

The most discussed poem was Ruth France's *Royal Ode*, which won a competition for the best ode celebrating the (postponed) royal visit to New Zealand. James Baxter, with a delicate awareness of landscape and a stronger turning towards the human scene, wrote some fine lyric poems. Save for Denis Glover's *The Coaster*, a film commentary in verse, the older poets published no major work; but the younger poets, particularly William Oliver and Pat Wilson, were effusive, sensitive, and highly romantic. In three acts of prose and verse, Howard Wadman's *Life Sentence* (Wellington) attempted to be a society satire and a drama of sin and expiation.

More Otago centennial publications appeared, the most important being A. H. McIntock's *History of Otago*, which brought to New Zealand for the first time the Ernest Scott prize, given for research in Australasian history. The Golden Jubilee of Victoria University college was marked by a witty, provocative college history by Dr. J. C. Beaglehole and a new anthology of college verse.

*Landfall*, a quarterly edited by Charles Brasch, completed its third year of publication; and a new Wellington literary quarterly, *Hilltop*, appeared in April. (R. W. B.)

**NICARAGUA.** A republic in Central America, situated between Honduras on the north and Costa Rica on the south, with a coastline of over 300 mi. on the Atlantic and over 200 mi. on the Pacific. Area: 57,143 sq. mi. (of which 3,475 sq. mi. is water). Pop. (Dec. 31, 1948 est.): 1,172,862. Nicaragua is the thinnest populated of the Central American republics; the population of the eastern half of the country is mainly Indian or Negro; the population of the western part is of mixed Spanish and Indian extraction, with some of pure Spanish descent. Chief towns (pop., 1948 est.): Managua (cap., 146,819); León (33,277); Matagalpa (53,118); Jinotepe (41,065). Language: Spanish. Religion: predominantly Roman Catholic. President of the republic, Victor Manuel Roman y Reyes.

**History.** The major political issue during 1949 was the national conciliation programme designed to bring about a coalition of all parties and to present a single presidential candidate in the next election. The pact which was subscribed to by the Nationalist Liberal (administration) party and the "civista" Conservatives in Feb. 1948, was discussed again during the year, but administrative attempts to bring the "genuine" Conservatives and the Independent Liberals into the coalition were fruitless. As a conciliatory gesture to the "genuine" Conservatives, the government invited their exiled chief, General Emilio Chamorro, to return to the country. Chamorro returned on June 18; but although talks between him and both President Roman y Reyes and General Anastasio Somoza continued until late November, no agreement was reached. The Conservative party's opposition to national conciliation was expressed in September when it ousted Carlos Cuadra Pasos from its leadership for his part in the Feb. 1948 agreement between the "civista" Conservatives and the administration party. The temporary arrest of Arturo Velázquez Alemán, secretary general of the Independent Liberal party, on March 21, intensified the antagonism of his group towards the official party.

A major point of contention was the influence in the government and the possible presidential candidacy of General Somoza, both of which were ardently opposed by the Independent Liberals. A tour of the Atlantic coast districts by Somoza and a public demonstration on his behalf when he returned to Managua in May were interpreted in some quarters as a bid by Somoza for the presidency in the next election.

On the economic front, Nicaragua continued to suffer an unfavourable balance of trade and shortage of dollar reserves, but was able to repurchase 2.5 million córdobas from the International Monetary fund and thus restore $500,000 purchased from the fund in 1948. Higher coffee prices in the latter part of the year gave promise of an improved economic position.

**Education.** Schools (1948-49) primary 1,302, teachers 2,918, pupils, 89,991; secondary 78, teachers 556, pupils 10,891; universities 2, students 620. For the year the national budget provided 7,764,390 córdobas for public education.

**Foreign Trade.** Exports during 1948 were valued at U.S. $26.6 million ($20.9 million in 1947); imports $24.1 million ($20.8 million in 1947). The U.S. supplied 85-5% of the imports and took 43-5% of the exports. In 1948 the leading shipments were gold (182,964-16 troy oz.); coffee (242,017 bags of 65 lb each), bananas (678,598 stems) and sesame seed (26,565,633 lb). Coffee exports from the 1948-49 crop (the lowest since 1912) totalled 109,609 bags.

**Communications.** In 1949, railways measured 236 mi., surfaced highways 1,017 mi., all-weather dirt roads 79 mi. At the close of 1948 there were 1,441 motor cars, 672 lorries and 151 buses registered in the country.

**Finance.** The monetary unit is the córdoba, officially maintained at 20 U.S. cents. The 1949-50 budget provided for expenditures of C. 74.3 million, a 14% reduction from the previous year. On Dec. 31, 1948, the public debt was C. 28.9 million internal and C. 17.8 million external. Notes in circulation (Sept. 1949): C 50.7 million (M. L. M.)

**NIGER: see French Union**

**NIGERIA: see British West Africa.**

**Nobel Prizes.** These are awarded from the Nobel foundation, a fund established under the will of A. B. Nobel, a Swedish chemist and engineer, who died on Dec. 10, 1896. The prizes were first awarded in 1901. The values of the prizes vary: the prizes in 1949 were 156,289 Swedish crowns (about £1,000).

The 1949 peace prize was awarded to Lord Boyd-Orr (q.v.). Lord Boyd-Orr was director-general, United Nations Food and Agricultural organization, 1946-47, and in 1949 was president of the World health organization, a world federal government. The prize for medicine and physiology was shared between Professor Antonio Caetano de Abreu Freire Egas Moniz (q.v.), a neurologist and former diplomat, of Lisbon, Portugal, and Professor Walter Rudolf Hess (q.v.), an eye and brain specialist, of Zurich, Switzerland. Dr. Hideki Yukawa (q.v.) of Tokyo, who in Sept. 1949 was appointed visiting professor of theoretical physics at Columbia University, New York, received the physics prize. This was the first time the prize for physics had been awarded to a Japanese. The prize for chemistry went to Professor William Francis Giauque (q.v.), professor of chemistry at the University of California.

The Swedish Academy of Letters decided not to award the Nobel prize for literature in 1949. The value of the prize would be carried forward to 1950.
The Crown Prince of Sweden (right) presenting the Nobel prize for medicine to Professor Rudolf Hess, of Zürich, in Stockholm, Dec. 10, 1949.

NOBS, ERNST, Swiss statesman (b. Seedorf, Canton Berne, July 14, 1886). A teacher by profession, he was editor of the Social Democratic daily newspaper Volksrech (Zürich) 1915-35. He was a member of the National Council, 1919-43, and a member of the state council of the canton of Zürich, 1935-42. In 1942-43 he was lord mayor of Zürich, and on Dec. 15, 1943, he was elected to the Federal Council as minister of finance and customs. On Dec. 16, 1948, he was elected president of the confederation for 1949, being the first Social Democrat in Swiss history to be appointed to this post. On July 28, 1949, President Nobs, a widower since 1948, married Rosa Hulda Froehlich.

NORDENSKJÖLD, BENGT GUSTAFSSON, Swedish air force officer (b. Sundsvall, Sept. 6, 1891), naval cadet 1907-08, served with the Royal Svea Life guards and graduated from the Military academy in 1924. After two periods on the general staff and further service with his regiment, he became (1931) an observer in the air force, where his interests henceforth centred, although he taught at the Military academy from 1933 and was a major on the general staff in 1935. He underwent training as a pilot until 1936, when he took over command of the air force staff. Study of the British, Canadian, Finnish, German, Italian and U.S. air forces and aircraft industries further equipped the creator of the Swedish air force, of which he had been c.-in-c. since 1942. During World War II he took a close personal interest in the care of Allied airmen who made forced landings in Sweden after attacks on Germany, and was created a K.B.E. In an address to Uppsala university students in 1942 he stressed the strict requirements of defence in a "war of brains" and the need for internal unity, to make Sweden the solid rock on which a free and happy North could build. When in Feb. 1949 he visited Canada to study winter flying conditions, the climatic similarity to Sweden enabled him to make valuable observations on a tour which extended to Whitehorse in the Yukon. (E. J. L.)

NORFOLK ISLAND: see BRITISH EMPIRE.

NORTH ATLANTIC TREATY. This treaty, which was concluded in 1949, links the United States and Canada with ten western European nations for 20 years in a defensive alliance, embodying the principles of joint strategic planning and of mutual aid in military supply policy. It was the first alliance ever entered by the United States in peacetime, and it formed the chief basis of security in western Europe. The conclusion of the treaty was one of the two most important world political events of 1949 (the other being the Communist victory in the Chinese civil war); it changed the world balance of power by checking Soviet expansion in Europe; it also noticeably reduced the danger of war, which had made itself felt in the preceding year.

When, on March 17, 1948, Great Britain, France and Benelux signed the Treaty of Brussels, President Harry S. Truman declared that "the determination of the free countries of Europe to protect themselves will be matched by an equal determination on our part to help them to do so." A Senate resolution, passed at the initiative of Senator Arthur H. Vandenberg on June 11, 1948, gave support to that declaration. The need for linking the defence of North America with that of western Europe was also expressed by the then minister of external affairs of Canada, Louis Stephen Laurent, on April 29, 1948.

The Soviet blockade of Berlin, which began on June 24, 1948, gave added urgency to the question of security in western Europe. Accordingly, exploratory discussions about a defensive alliance began in Washington on July 6, 1948, between the U.S. State Department and the ambassadors of the Brussels treaty powers and Canada. From July 21, a U.S. observer, Major General Lyman L. Lemnitzer, took part in the meetings of the military committee of the Brussels treaty powers in London.

By the beginning of 1949, the Washington negotiations had produced agreement in principle. The major difficulties — especially the obstacles placed in the way of advance commitments by the U.S. constitution, which reserves the right to declare war to congress — were overcome, and successive statements by the U.S. State Department began to prepare American public opinion for this major new departure in foreign policy.

At the same time, the State Department let it be known that it favoured the inclusion of Denmark, Norway, Iceland, Portugal and Ireland in the proposed regional defence group owing to their strategic importance to the defence system of the U.S. and the north Atlantic. Of these countries, Ireland refused participation on the grounds of its grievance over the status of Northern Ireland. On the other hand, Italy took an initiative of her own to be included in the proposed treaty. A journey of its prime minister, Alcide De Gasperi, to Paris and Brussels and a memorandum sent by its foreign minister, Count Carlo Sforza, to the Western Union council secured Western Union support for its membership, and the other founding members agreed.

A protracted crisis arose in Scandinavia over the proposed membership of Norway (q.v.) and Denmark (q.v.). At a meeting of the three Scandinavian prime ministers in Karlstad, Sweden, on Jan. 5, 1949, Sweden (q.v.) submitted an alternative proposal for a regional defence group of the three Scandinavian countries, which would be pledged to joint neutrality. This proposal was debated at further meetings at Copenhagen (Jan. 22-24) and Oslo (Jan. 29-30). In two notes of Feb. 1 and 6, the Soviet Union pressed Norway not to join the proposed North Atlantic treaty and offered a non-aggression treaty instead. On Feb. 6, the Norwegian foreign minister, Halvard Lange, flew to Washington to discuss the alternatives before Norway with the U.S. secretary of state, Dean G. Acheson, and in particular to ascertain whether a neutral northern defence group could expect American assistance in armament supply. The results of his journey were debated in secret session by the Norwegian Storting on March 3, when it was decided by a vote of 118
set up such subsidiary bodies as may be necessary; in particular, it shall establish immediately a defence committee, which shall recommend measures for the implementation of articles 3 and 5."

The preamble pays homage to "the principles of democracy, individual liberty and the rule of law." The other articles of the treaty contain references to the United Nations charter, general undertakings for consultation and economic co-operation, a definition of the area covered by the treaty ("north of the tropic of Cancer") and technical provisions for ratification, procedure for further accessions, possibilities of revision after 10 years and termination after 20 years.

After stormy debates in the French and Italian parliaments and searching debates in the U.S. congress, the treaty was ratified by all signatories during the summer and was proclaimed by President Truman to have entered into force on Aug. 24, 1949.

The Soviet Union reacted to the treaty with violent words and cautious actions. Moscow radio declared that "the pact means war against the Soviet Union" and the Soviet press spoke of its "aggressive aims" and called it "a weapon of the Anglo-American imperialists intent upon world domination." The Soviet Union also protested against the inclusion of Italy in the treaty, alleging that this violated the Italian peace treaty. At the same time, however, the Soviet Union proclaimed "a policy of peace" and rejoiced over the lifting of the blockade of Berlin. Tension in Europe relaxed somewhat, and the threat of a situation in which article 5 of the treaty might have to be invoked receded for the time being.

The rest of the year was mainly filled with activity to implement articles 3 and 9. On May 14, the U.S. State Department issued a "Peace Paper," stating that the existing defences of western Europe were so inadequate as to "invite military aggression" and asking for a Military Aid programme, consisting of dollar aid to increase military production in western Europe, direct supply of arms and equipment and provision of U.S. technical assistance. The cost of the programme for the year July 1, 1949, to June 30, 1950, was estimated at $1,450 million, of which $1,130 million was earmarked for the North Atlantic treaty nations.

The Mutual Defence Assistance bill, which embodied these proposals, had a difficult passage through congress but was in the end substantially passed under the impact of President Truman's announcement on Sept. 22 of an atomic explosion in the Soviet Union. The value of aid to the North Atlantic treaty nations was, however, limited to $1,000 million and made conditional on the acceptance of a generally agreed defence plan.

In November, the United States entered into negotiation with the prospective recipients of military aid for the conclusion of bilateral treaties about the conditions under which aid was to be supplied and the use to be made of it. These negotiations were aimed at the acquisition of a sufficient conclusion by the end of the year after initial differences, especially between the United States and Great Britain, had been narrowed down. No American arms were, however, actually delivered to the North Atlantic treaty countries during 1949.

In preparation of the planned military assistance to Europe, the U.S. government established, during the closing months of 1949, a new Military Assistance administration, largely modelled on the Economic Co-operation administration concerned with the European Recovery programme. Under the president, who was advised by the Defence Steering committee composed of the secretaries of state and defence and the E.C.A. administrator, military aid was to be operated by a Military Assistance Correlation committee, headed by a director of military aid. James Bruce was appointed to this post. A co-ordinating committee in London,
headed by the U.S. ambassador in London, was to direct operations at the receiving end, while U.S. military aid missions, consisting of military technicians, were to be attached to the U.S. embassies in the recipient countries.

Parallel with this American machinery for the purpose of assisting western European military re-equipment, formidable international machinery came into being during the closing months of 1949 for the purpose of joint strategic planning among the North Atlantic treaty powers. The North Atlantic council, established in article 9 of the treaty, held its first meeting in Washington on Sept. 17 under the chairmanship of the U.S. secretary of state. It set up a defence committee (consisting of the defence ministers), a military committee (consisting of the chiefs of staff or their deputies), a standing group (consisting of three high-ranking U.S., British and French officers and meeting in continuous session in Washington) and five regional planning groups, with the following membership: (1) Northern Europe—Great Britain, Norway, Denmark; (2) Western Europe—Great Britain, France, Benelux; (3) Southern Europe-Mediterranean—Great Britain, France, Italy; (4) North America—U.S., Canada; (5) North Atlantic—all members except Italy and Luxembourg.

It was decided that the U.S. should take part in the work of regional planning groups 1, 2 and 3 and that in addition Canada, Denmark and Italy should take part in that of regional planning group 2.

All these committees and groups started work during October and November in Washington (defence committee, military committee, standing group, planning groups 4 and 5), London (planning groups 1 and 2) and Paris (planning group 3). In addition, a military production and supply board (concerned with such questions as international standardization of arms designs) was established in London on Nov. 1, and a financial and economic committee (dealing with the economics of common defence and keeping liaison with E.C.A. and O.E.E.C.) in Paris on Dec. 19.

The defence and military committees met in Paris from Nov. 29 to Dec. 1 and agreed on a strategic over-all plan for the defence of the North Atlantic treaty area, a programme of production and supply and the co-ordination of planning between regional groups.

Altogether, the closing months of 1949 saw the North Atlantic treaty organization coming vigorously to life, though physical rearmament of western Europe through
American aid was only to start in 1950. One unsettled problem remained the relation of the largely duplicating international defence machineries built up under the North Atlantic treaty and under the treaty of Brussels. (S. Hr.)

NORTHERN IRELAND comprises the six counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone; it forms part of the United Kingdom of Great Britain and Northern Ireland, but (from 1920) has had its own parliament and executive (with limited powers for local purposes) although it is represented in the imperial parliament by 13 members. Area: 5,451 sq. mi. Pop. (Dec. 31, 1948, est.): 1,365,000. Language: English. Religions (1937 census): Roman Catholic 33·5%; Presbyterian 30·5%; Episcopalian 27%; Methodist 4·3%; etc. Chief towns (pop. est. 1948): Belfast (cap., 450,000); Londonderry (49,000); Bangor (19,000). Governor, the Earl Granville; prime minister, Sir Basil Brooke (q.v.).

History. The year began at election fever heat. Sir Basil Brooke, the prime minister, had announced that there would be a general election on Feb. 10 in order that the voters could respond to the British government's assurance that the status of Northern Ireland would not be changed unless it was people so wished. Sir Basil had visited Clement Attlee in London to get this assurance when Eire declared her intention of becoming an independent republic. The Nationalist opposition maintained that Sir Basil was rushing the election before the new electoral register came into force on April 1 so as to disfranchise a large number of possibly hostile voters. The campaign in Belfast, which is not noted for quiet elections, was even bitterer than usual. Jack Beattie, an Independent Socialist and a member at Westminster, protested in the British House of Commons that he was in bodily danger and was being denied the right of free speech. When the wrangling was finally over the Unionists were seen to have triumphed utterly. They were returned with 37 seats instead of 35; the Nationalists secured 9 (previously 8); Independent Unionists 2, Independent Labour 1, Socialist Republican 1 and Independents 2 were all unseated; the North of Ireland Labour party which had 3 seats was wiped out.

Though the Labour landslide was largely due to their own vacillation on the subject of Irish partition, Sir Basil Brooke could hardly be blamed when he said that Ulster had re-affirmed its allegiance to the King and its faith in the British Commonwealth. The raising of funds in the south of Ireland to help Nationalist candidates in the north certainly helped to harden and close the ranks of the Unionists who were bitter about what they termed "foreign interference." But once the verdict of the electorate was given and the British guarantee received by the passing of the Ireland act, the government at Stormont could afford once more to ignore the south and get on with its business.

It was pretty substantial business. Northern Ireland's efforts in 1948 totalled £159,158,000. It was announced in March 1949 that since World War II 211 factories had either been started or extended, to give employment to 35,000 people. Up to the end of 1948 10,000 houses, 2,000 of them prefabricated, had been erected, a number which would have been considerably greater but for shortages of labour and materials. To prove their constant assertion that they were the most industrious and thrifty persons in the British Isles, Northern Irishmen could point to the fact that their small savings in 1948 averaged £3 10s. a head, as compared with an average of 12s. a head for the rest of the United Kingdom. Nineteen-fourty-nine saw the upward movement of unemployment halted, though the figures remained higher than in 1948. It was proposed to build two satellite towns near Belfast, to be named Loughside and North Laganside, which would be reserved entirely for light industries. Meanwhile a new 24 mi. tunnel was to be driven through the Slieve Binnian mountain in Co. Down, to carry an aqueduct that would assure a permanently adequate water supply for Belfast. In June there were 21 merchant vessels, grossing 210,498 tons, under construction in Belfast yards and, though this figure was slightly smaller than in 1948, it still represented about one-twentieth of the total world tonnage being built. About 25% of the slips were idle, chiefly because of the difficulty of securing steel. Fees expressed early in the year that the rising price of steel would strike savagely at Belfast's main heavy industry were allayed by the announcement of devaluation which it was hoped would offset increasing costs. The linen industry, exporting 75% of its output, found trade difficulties hampering its efforts to hit a target of £10 million.

Though four-fifths of the agricultural holdings in Northern Ireland were of less than 50 ac., output again increased. In the year ending March 31, 1949, Northern Ireland's 90,000 farms exported to Britain over £27 million of food. There was an especially large increase in the export of milk, and during the autumn 70,000 gal. a day were sent to Britain by sea. The target of 80 million dozen eggs a year, originally set for 1952-53, seemed likely to be hit early in 1950.

In the government there were changes after the death of William Craig, minister of health and local government, and again when Edmund Warlock was made minister of defence in November. His place as minister of home affairs was taken by W. B. Magness, and there were other minor replacements in the cabinet. As though to refute the often made assertion from the south that the Unionists were "fascists," the government in autumn revoked a number of the regulations made under the Special Powers act. The year ended with a political flare-up which caused the resignation of the minister of education, Lieut. Colonel S. H. Hall-Thompson, after Unionist back bench pressure had tried to alter the terms of government grants to voluntary schools. According to the extremer Unionists these grants favoured the Roman Catholics. It looked as though the confidence gathered from their February triumph might after all be tempting the Unionists along a reactionary path. (R. K.)

Agriculture. Main crops: '000 metric tons, 1948: oats 398, potatoes 1,693, wheat 4 8, barley 6 6, drudge corn 7 4; hay 792. Livestock: '000 head, June 1949: cattle 980; sheep 645, pigs 458; horses 55, goats and kids 9 6, asves 5 5; poultry 24 237. Food production (1948-49): sales of milk 80 million gal.; eggs 74 million dozens; pigs 577,500 cwt.; mutton and lamb 94,500 cwt. Shipment of Great Britain (1947-48): 1948-49 in brackets: milk 14·8 (18·6) million gal. eggs 26·0 (32·0) million dozen; meat 742,000 (752,000) cwt.; bacon and ham 89,000 (131,000) cwt.; poultry 116,000 (140,000) cwt.

Arthur Creech Jones, secretary of state for the colonies, addressing the girls' school at Mindolo, Northern Rhodesia, during a visit to Africa in April, 1949.

History. In February unofficial European members of both the Northern Rhodesian and Nyasaland Legislative Councils took part in a conference, attended also by the prime minister and other members of the Southern Rhodesian government, at which a unanimous resolution was passed in favour of federation of the three territories and the creation of a federal parliament, the federal government to have wide powers.

Unofficial members of the Legislative Council having raised the question of taxing the mineral royalties of the British South Africa company, a meeting was called in London between the secretary of state for the colonies, the governor, and representatives of the elected members of the Legislative Council and the company; it was there agreed, inter alia, that, subject to certain guarantees in the meantime, the company should transfer its mineral rights to the government of Northern Rhodesia after 37 years.

A speech, made by the secretary of state for the colonies at Salisbury, Southern Rhodesia, during a tour of central Africa in the spring, was strongly criticized by the European element in Northern Rhodesia. In the course of the speech the secretary of state stressed the British government's responsibilities to the Africans in Northern Rhodesia and defined the scope of white settlement and European development. Later he found it necessary to enlarge on his statement and define his meaning more explicitly.

Under the auspices of the Beit trustees one of London's wartime bridges was transported and re-erected over the Kafue river, thus linking more effectively two sections of the Great North road in southern Africa (see BRIDGES).

(J. A. Hu.)

NORWAY. A constitutional monarchy of northern Europe, bounded on the N. by the Arctic ocean, on the E. by Finland, the U.S.S.R. and Sweden and on the S. and the W. by the North sea. Area: 125,147 sq. mi.¹ Pop.: (Dec. 3, 1946 census) 3,123,338; (mid-1948 est.) 3,181,000. Chief towns (pop., 1948 est.): Oslo (cap., 418,000, after extension of city limits); Bergen (108,933); Trondheim (56,444); Stavanger (42,218). Languages: Norwegian and Lappish (19,000). Religion: Lutheran. Ruler: King Haakon VII (q.v.); prime minister: Einar Gerhardsen (q.v.).

History. In a New Year's message Halvard Lange (q.v.), Norway's resolute minister of foreign affairs, said that co-operation must be expanded 'with peoples with whom we feel a kindred relationship—people outside the boundaries of Scandinavia,' and expressed the hope that Denmark and Sweden would come to the same conclusion. However, at three sessions held successively in Sweden, Denmark and Norway during January by the prime ministers and foreign and defence ministers of these countries, the possibilities of a Scandinavian military alliance were explored in vain. To reach common ground, Norway had been willing to forgo formal attachment to a more comprehensive regional system, but could not accept the Swedish stipulation that 'security and political realities' were not to be discussed with the western powers. Moreover it had been learned that arms would not be available from the U.S. for nations not committed to general western defence; and Sweden could not, alone, arm Norway and Denmark to the extent required.

Lange flew, therefore, to Washington (Feb. 6) for information about the proposed North Atlantic grouping, which was indeed the embodiment of a concept outlined in Nov. 1940 by Arnold Raestad, governor of the Bank of Norway, in London. Meanwhile a Soviet note (Jan. 29) denouncing the proposed treaty had evoked the reply that the government would not join any agreement with other states opening bases for foreign 'military forces on Norwegian territory, as long as Norway is not attacked or exposed to threats of attack.' Lange, who saw Ernest Bevin in London on his way home, received overwhelming support for his initiative from the Norwegian Labour party congress (Feb. 20) and, when a formal invitation from the seven negotiating powers was placed before parliament, in secret session (March 3), the 129 members in favour were opposed solely by 11 Communists (5 Labour opponents staying away). Einar Gerhardsen, the prime minister, said that 'those who want to wait until an Atlantic treaty is a reality must know that Norway does not want to shirk its share of responsibility. We wish to co-operate from the start, because we do not want the treaty to be only an affair of the great powers.' Simultaneously a second Soviet note (Feb. 5), suggesting a non-aggression pact, was answered by reference to the pledges of non-aggression made by all members of the U.N. and by the assurances that in determining what constituted a 'threat of attack' the government would depend on facts and not on rumours. As soon as the North Atlantic treaty (q.v.) was signed Norway requested military assistance; and when the Mutual Defence Assistance act had been approved by congress American officials visited Oslo to discuss the military aid programme, consultations continuing in London.

¹ Excluding Svalbard archipelago (Spitsbergen and Bear Island). Area: 24,294 sq. mi. The population, largely miners, shifts seasonally; in 1939 it was estimated at 2,210 (including 1,500 Russians). The extraction of coal, interrupted during World War II, reached in the Norwegian mines 436,800 metric tons in 1948, and about 435,000 in 1949.
many besides the Conservatives had doubts about the future; above all, Norway shared Europe's dollar problem. In a conciliatory post-election speech Gerhardsen promised not to intensify socialization and stated solemnly, "Only increased production can help us. If we could only increase production by $4\times 5\%$, we would not have any problem at all.

In May A. F. Staley, retiring chief of the F C A. mission, described Norway's four-year recovery plan as "unique among Marshall lands," and elsewhere the production index for 1948, that is, 138 (1937
100), had been cited as the best in the same group. Without Marshall aid, however, 1948-49 imports would have been cut by 50%, affecting food and investment. The outlook was also complicated by widespread demands for higher wages, which employers protested they could not pay because of increased working costs. After a visit by seven Labour leaders to the U.S., Haakon Lie, secretary general of the Norwegian Labour party, proposed that 200 workers should be employed annually for a period in U.S. plants, to study means of achieving a high output.

An old disagreement with Great Britain about the extent of Norwegian territorial waters came to the fore through the Storting's decision (Sept 1, 1948) to enforce a royal decree permitting Norway's fishing rights over areas not previously claimed. When negotiations failed in 1949, Storting referred the dispute to the International Court of Justice.

Education. Schools (1946) elementary 5,626, pupils 289,449, teachers 10,766, secondary 288, pupils 44,356, teachers 3,090. Technical schools (1947) day 9, pupils 1,821, teachers 233, apprentice 84, male students 1,127, female 1,778. Universities (1948) 1,700 students and 7 institutions of higher education (1948) students 7,743, professors and lecturers 730.

Agriculture and Fisheries. Main crops ('000 metric tons, 1948, 1949, except brackets): potatoes 243,433, barley 28,942, oats 15,877, hay 1,550, sugar beet 76 (611), barley 89, oats 17 (34). Livestock 1,454. Livestock ('000 head, June 20, 1948) cattle 1,175, sheep 1,629, pigs 248, horses 206, poultry 4,663, pigs ('000) 470, total catch 1.3 million metric tons, worth Kr 325 million. Landings of herring (metric tons, 1948, 1949 in brackets) 280,292 (567,454), landings of cod 133,712 (112,995).

NU, THAKIN, Burmese statesman (b. Wakema, Burma, 1906), became prime minister of Burma on Jan. 4, 1948. (For his career see Britannica Book of the Year 1949).
In April he visited India and Pakistan for talks with Pandit Nehru and Liaquat Ali Khan. The cabinet was reshuffled in March 1949, Thakin Nu remaining prime minister and taking charge also of the defence and home portfolios; on a further re-organization in April, he resigned the Defence and Home ministries but took charge of the Ministry of National Planning.

NURI PASHA AS-SA’ID, Iraqi statesman (b. Baghdad, 1888). A Sunni Moslem, he graduated from the military college, Istanbul, in 1906, and from staff college, Istanbul, in 1911. In 1913 he helped to found the Arab secret society Al-Ahd and joined the Sharif Hussein of Hejaz as soon as he proclaimed the Arab revolt in 1916. He became chief of staff to the Hejaz army and later commander of the Northern Arab army. In 1919 he accompanied Prince Faysal to Paris to present the Arab case to the powers. He returned in 1921 to Iraq, where he was one of those who invited Faysal to become king, and was appointed chief of staff and, for a while, acting commander in chief. He was minister of defence in six cabinets, six times minister of foreign affairs and in 1930 became prime minister—a post which he afterwards held on numerous occasions. He negotiated and signed the 1930 treaty with Great Britain and was a member of the delegation which signed the abortive treaty of Portsmouth in 1948. He was much attacked as an Anglophile. He had to flee the country after the Bekr Sidgi coup d’état in Oct. 1936 and again after that of Rashid Ali in April 1941. In 1943 he circulated a confidential memorandum, in which he proposed the reunion of Syria, Lebanon, Palestine and Transjordan in one territory under the name of Greater Syria and their union with Iraq in a league. His subsequent discussions with the Egyptian prime minister Nahas Pasha led to the formation in 1945 of the Arab League (q.v.). After becoming prime minister again in Jan. 1949, he was reported to be sponsoring with Syria (and possibly also with Lebanon) under King Faysal II a union of Iraq which became known as the “fertile crescent” scheme. He resigned on Nov. 7. (C. Ho.)

NURSING. In Great Britain a comprehensive Nurses’ bill was introduced into the House of Lords in April 1949 on behalf of the Ministry of Health. The bill refrained from attempting to lay down centrally the lines upon which the training of nurses should be modified and provided instead (i) freedom to experiment in nurse training; (ii) the separation of the finances of nurse training from that of the hospitals; and (iii) a more flexible constitution for the General Nursing Council. This bill was the most important step taken since the Nurses Registration act of 1919, when the training of nurses in Great Britain had first been placed under the control of the General Nursing council and state registration introduced. It was now widely held that the old arrangements were too rigid and that they failed to give the necessary financial support to nurse training schools to enable them to afford the young nurse a satisfactory student status. The bill was intended to remedy these defects without disturbing the system of apprenticeship, which distinguished nurse training in Great Britain from that in the United States and the various schools on the American model.

Although there was still a shortage of nurses (estimated at 48,000, as against an existing staff of about 121,000 full-time and 20,000 part-time nurses), the position improved and there were 29,000 more nurses and midwives in Great Britain in 1948 than in 1938. The ratio of 10·67 staffed hospital beds per 1,000 of the population was quoted by the Division of Nursing of King Edward’s Hospital fund as almost certainly the highest in the world; and it was added that probably the ratio of staff to beds in Great Britain was much higher than the average in other countries.

NUTS. From the 1920s there had been a growing appreciation of the value of nuts as human food, and as a result of World War II this appreciation greatly increased on account of the universal shortage of edible oils or fats and of meat or protein. Nuts are richer in fat and protein than any other vegetable food and, properly utilized, constitute a highly nutritious food, but being a concentrated food with generally little water and crude fibre or roughage in their make-up, are liable to cause digestive disturbance if taken in quantity. They are therefore to be eaten along with other foods in the same way that cheese is usually eaten with bread.

The nut or nut kernel requirements of vegetarians in the British Isles were taken into consideration during the 1940s and certain classes of nut kernels specially imported for holders of vegetarian rations books. The range of varieties and the selectivity had been somewhat restricted, but was now widening though currency considerations still imposed limitations. Importation was sanctioned for supplies of certain types of nut in the shell from France, Spain, Italy, Sicily, Turkey, Syria and Brazil for the general public, and these nuts were again freely on sale in the shops. Restricted varieties included chiefly hazel kernels from the Levent, almond kernels from Italy and Sicily and cashew kernels

Five 15-year old girls at Fulham hospital where a cadet nursing scheme for girls between 15 and 18 was started in 1949.

In 1949 an Interim conference was held in Stockholm to mark the 50th anniversary of the International Council of Nurses. Thirty-two countries were represented and the subjects for discussion were: the Medicine of Tomorrow and the Position of the Nurse; Nursing Education—Methods of Clinical Instruction; and Nursing Service—How to meet the Demand. Sweden, Denmark, Norway, Iceland and Finland provided the speakers on the first; the United States of America, Canada and Norway on the second; and Great Britain, Holland, New Zealand and South Africa on the third. These papers and discussions revealed a strong resemblance between problems and attempted solutions in different countries and a resolution was passed urging experiments along all possible lines. (See also Hospitals; National Health Service.)

(A. G. L. I.)
from India. American pecan nuts and the high quality walnuts from Californian nut groves which were so popular in Britain before World War II were not available on British and most European markets, and were unlikely to appear following the devaluation of the pound and other currencies that took place in the autumn of 1949.

Interest in the possibility of increasing supplies of English grown walnuts for the home market or for home consumption was maintained. This could only be done by selecting and propagating by grafting varieties of walnut that were well suited to English climatic conditions. Most of the trees throughout the country had been raised as seedlings, not grafted, and yielded poor quality nuts or were erratic in cropping. Experimental work showed that an important consideration was to choose varieties that were late in leafing out in spring and therefore more likely to escape injury from late spring frosts, an unfortunate feature of the English climate.

The most promising of the imported (French) varieties were Franquette, Mayette, Melunaise, Treve and Chaberte, and the most promising varieties of English origin, Excelsior of Taynton, Northdown Claret, Secret and Patching. The two last mentioned bore sound shelled, good nuts even in the extreme south west of the country while varieties of walnuts in the comparatively cool climate of Britain had always been a difficult matter; but by growing seedlings in pots and utilizing glass and bottom heat to stimulate callus formation a fair degree of success was obtained.

The fine hot summer of 1949 favoured nut production in many parts of the British Isles where established trees existed. Some very good samples of home-grown walnuts were produced. The chestnut crops in many European countries were also heavy.

(F. N. H.)

Membership of the Legislative Council was increased from 13 to 19 by the addition of three officials and three (two African and one Indian) unofficial members, thus for the first time providing non-European representation on the council. Severe drought necessitated the introduction of large scale precautions against famine; emergency food imports were arranged and an African Foodstuffs commission was established to control supplies.

OBITUARIES: The following is a selected list of prominent men and women who died during 1949—

Adams, James Truslow, U.S. historian (b. Brooklyn, New York, Oct. 18, 1878—d. Southport, Connecticut, May 18), received his bachelor's degree at Brooklyn Polytechnic Institute in 1898 and an M.A. at Yale in 1907. From 1905 to 1918 he was a partner in a New York stock exchange firm. He retired from this career in 1912 to become a historian and in 1916 published a history of his home town of Bridgehampton, Long Island. During World War I he served with the intelligence division of the U.S. general staff and was commissioned by Colonel E. M. House to prepare data for the Paris peace conference. He afterwards resumed his writing on colonial American history and in 1922 won the Pulitzer prize for his Founding of New England, which was followed by other volumes on New England. In 1929 he organized Business Conditions Unlimited and was followed by The Adams Family (1930), The Epic of America (1931), perhaps Adams' best known work, and many other books. His last work, The Rise of the American People (1944) and Big Business in Democracy (1946) 'Adams' literary activity was constant; and he was editor in chief of The Album of American History, The Atlas of American History and The Dictionary of American History, and was a contributor to The Dictionary of American Biography and the Encyclopedia Britannica.

Adams, William Thomas, British politician (b. Sept. 10, 1884—d. London, Jan. 9), elected M.P. for South Hammersmith, July 1945, held many posts in trade union and co-operative movements.

Allen, Hervey, American author (b. Pittsburgh, Pennsylvania, Dec. 8, 1830—d. Miami, Florida, Apr. 28, 1920), was the author of Anthony Adverse (1923), a massive novel ranging over a wide field of history in several parts of the world. In addition to his novels he wrote eight books on American history and was Israel 262 (1926), the study of the life and times of Edgar Allan Poe.

Amigo, Peter Emmanuel, Roman Catholic bishop (b. Gibraltar, Mar. 16, 1864—d. Saronico, Italy, May 24, 1888 and for four years taught at St. Edmund's college, Ware, where previously he had been educated. In 1904 he was consecrated bishop of Southwark; in 1925 he was nominated for the Pontifical throne in recognition of his intense personal devotion to the Holy Sec. In 1938, on the occasion of the golden jubilee of his consecration, he was appointed to the deanery of the archbishop of the Royal Household in Scotland, Admiral of the West Coast and metropolitan chief of clerics.

Bailey, Sir William Thomas, British newspaper director (b. Bedale, Yorkshire, Feb. 1, 1873—d. London, June 15), served in managerial capacities on Northern Daily Mail (1894-1900), Independent and Westminster Gazette. He was a director of the Westminster Press Provincial Newspapers, Ltd., and from 1939 to 1945 was chairman of the Press Council of Great Britain.

Barr, James, Scottish United Free Church minister and former M.P. (b. Bearscaft, July 26, 1862—d. Glasgow, Feb. 24), was minister at Johnstown and West Dunbarton from 1889 to 1922, and director of the Free Church, 1922-25, and moderator, 1929 and 1943. He was a Baptist (Lib. Brit. 1924-35).

Bates, Sir (Richard) Dawson, Northern Ireland politician (b. Nov. 23, 1876—d. Glastonbury, Somerset, June 9), was admitted a solicitor, 1900, and sat in the House of Commons, 1911-43, and was home secretary for the same period.

Beasley, John Albert, Australian politician and diplomat (b. Werribee, Victoria, Nov. 9, 1879—d. London, April 24), was colonial minister and worked for the Sydney city council electricity supply department for some years. He was an active trade unionist and for seven years from 1919 was president of the New South Wales Federation of Trades. From 1928 until 1946 he sat in the federal House of Representatives as member for West Sydney, and from 1929 to 1931 he was assistant minister for industrial and social affairs in the government of J. H. Scullin. In 1940, while leader of the non-Communist Labour party, he was appointed to the advisory war council, and in the following year he was a member of the national affairs committee, under the dictat of Curtin. When Curtin became prime minister in Oct. 1941, Beasley was made minister of supply and shipping. Because of ill health he resigned from the latter post July 1943, and on April 24, 1946, became leader of the Liberal party in the federal chamber, Feb.-July 1945, and from July until December was minister of post-war reconstruction. He was appointed a K.C.M.G., December 1, 1946, and in Aug. 1946 became high commissioner in New Zealand.

Beaumont, Sir Henry Hamilton Dawson, British diplomat (b. Feb. 4, 1867—d. Fawley, Southampton, Dec. 15), entered the diplomatic service in 1892 and served in Montenegro, Athens, Constantinople and Rome. From 1916 to 1923 he was minister to Venezuela.

Beer, G. M., Chicago, Ill., U.S., april 26, 1944, joined the staff of the Esquire (1946—d. Hollywood, California, April 15), left school to become an elephant trainer at a circus, then joined his brother in the chorus of a Broadway show. In 1921 he went into the movies and became Hitchcock as the star of The Yankee Tourist. In 1913 he joined the Essanay motion picture studios in Chicago, and from that year until his retirement in 1932, he was connected with the company in the early years in Hollywood, but by 1917 he had begun to be featured in villain roles. In his later career he generally played roughneck, but kindly character parts. He received an Academy Award in 1931 for his performance in The Champ.

Benelli, Sem, Italian poet and playwright (b. Prato, near Florence, 1872—d. Zoa, Italy, Dec. 18), joined the staff of the Italian Internazionale and later became its editor in chief. He was elected to the Italian parliament and took part in World War I and in the Ethiopian campaign. He was awarded his success at the Teatro La Maschera di Bruto. La Cena delle Befre was produced in London in 1921 under the title The Love Thief. His later plays included L'amore dei tre re, Rosmunda, Le Notte dei Centauri, Caterina Sforza and L'Orchidea. His impressions of the Ethiopian campaign were recorded in Jo in Africa.

Berard, Christian, French painter, illustrator and stage designer (b. 1903—d. Paris, Feb. 12), was well-known for his stage, screen and ballet décor. A close friend of Loury Jouvet and Jean Cocteau, he was a much designed for, them, including the sets for Cocteau's film, La Belle et La Bete.

Bergius, Friedrich Karl Rudolph, German chemist (b. near Breslau [Wroclaw], Oct. 26, 1864—d. Tennozu, Japan, Apr. 11), was honored during World War I in producing synthetic oil from coal. He also discovered the process for transforming wood into sugar. In 1931 he received the Nobel prize for chemistry with Carl Bosch, "for their services regarding the invention and development of chemical high pressure methods.

Berrymann, Clifford Kennedy, U.S. cartoonist (b. Versailles, Kentucky, April 2, 1869—d. Washington, Dec. 11), drew his first cartoon for The Evening Star (Washington) in Feb. 1907 and remained with the
Social Democrats reorganized themselves as the Bulgarian Workers' (Communist) party with Dimitrov and Vasil Kolarov as its leaders. By the end of 1920 Dimitrov reached Russia to take part in the third congress of the Comintern (1921), which elected him a member of its executive committee. Escaping into Yugoslavia after an abortive attempt to overthrow the Bulgarian government in Sept. 1923, Dimitrov was tried in his absence and sentenced to death. Under an assumed name he lived in Vienna as head of the Balkan section of the Comintern until 1929 when he was transferred to Berlin as leader of the Central European section. On March 9, 1931, he was arrested in the German capital and charged with complicity in the burning of the Reichstag. Though acquitted on Dec. 23, 1933, he was released from prison only on Feb. 27, 1934, when he left for Moscow. In 1935 he was appointed secretary general of the Comintern and held office until its official dissolution in 1943. In 1937 he was elected deputy of the Supreme Soviet. He returned to Bulgaria on Nov. 6, 1945, to transform the country into a communist republic. He was allowed to renounce his Soviet citizenship, adopted before the war, and reverted to Bulgarian nationality. On Nov. 22, 1946, he was appointed prime minister. In April 1949 it was announced that he had gone to Brussels with the rank of S.S.R. for medical treatment. He died three months later in the Barvikha sanatorium, near Moscow. His body was sent to Sofia and on July 10 was laid in a temporary mausoleum.

Dix, Richard (Ernest Carlton Brimner), United States actor (b. St. Paul, Minnesota, July 18, 1895—d. Hollywood, California, Sept. 20), began his film career as a featured player in Not Guilty. He appeared in about 200 productions in 25 years, winning greatest praise for his roles in pictures portraying episodes in the settling of the west.

Dodd, Francis, British painter (b. Holyhead, Anglesey, Nov. 29, 1874—d. Blackheath, London, March 7), was trained at the Glasgow School of Art and later studied in Paris and Italy. He settled in Manchester and in 1904 moved to London. He was elected to the New English Art Club as an A.R.A. in 1927 and an R.A. in 1935.

Drummond, Mrs. Flora, British suffragette leader (b. Manchester—d. Carradale, Argyllshire, Jan. 17), was active in the suffragette movement in 1912 and organized many of the meetings of the movement she served many prison sentences. On one occasion she invaded the cabinet room at No. 10 Downing Street during a sit-down demonstration. She founded the Workers' Suffrage League in 1920, was for many years its controller-in-chief and continued as chairman until her death.

Dullin, Sir Herbert (1892), theatrical producer (b. Yenise, Savoy, 1885—d. Paris, Dec. 11), made his first appearance at the Théâtre des Arts, Paris, in 1910 in Le Carnaval des Enfants after performing in showbooths at fairs, in the street and in cafés. He remained at the Théâtre des Arts for a few years and then joined Jacques Copeau's company at the Vieux Colombier before founding his own company of actors. In 1922 he gave his first Parisian season at the small workshop theatre, L'Atelier, and remained there for nearly twenty years.

Dunne, John William, British aviation pioneer and philosopher (b. 1875—d. Banbury, Oxfordshire, Aug. 24), developed the stable tailless type of aerofoil in 1904, and in 1907-8 his military aeroplane was tested by the War Office. Successful tests in 1912 on another machine failed to impress the War Office, and he flew the monoplane across the channel to France in 1911 where he sold the rights of the design to a French syndicate. His book An Experiment with Time, which appeared in 1917, attracted considerable attention. In it he recorded experiences which had led him to believe that future events are regularly foreseen in dreams, and with mathematical argument he elaborated his philosophy of "serialism." Later books on the same theme were The Serial Universe (1934), The New Immortality (1938) and Nothing Dies (1940).

Dunstan, Sir Wyndham Rowland, British agricultural chemist (b. Chester, 1861—d. April 20), was director of the Imperial institute, London, 1903-24, having previously been a lecturer at Oxford and later professor of chemistry at St. Thomas's hospital, London.

Du Parcq, Herbert du Parcq, Baron (life peer), of Grouville, Jersey, British lord of appeal (b. St. Helier, Jersey, Aug. 5, 1880—d. London, April 27), was educated at Victoria college, Jersey, and Exeter college, Oxford. He was called to the bar in 1906, and in the same year was admitted to the Jersey bar. In 1926 he was appointed a King's counsel. He was recorder of Portsmouth, 1928-29, and of Bristol, 1929-32. In the latter year he was made a judge of the high court and in 1938 a lord justice of appeal. In 1946 he was appointed a lord of appeal in ordinary and granted a life peerage. In Jan. 1932 he was called upon by the home secretary to report on disturbances which had occurred in the Prismor prison. He was chairman of the Committee on Persistent Offenders in 1931, and in 1946 was appointed chairman of the Royal Commission on Justices of the Peace.

Eason, Sir Herbert Lightfoot, British surgeon (b. July 15, 1874—d. London, Nov. 20), was senior ophthalmic surgeon, Guy's hospital, and dean of the medical school. He was vice-chancellor of the University of London, 1935-37, and president of the General Medical council from 1939. He was knighted in 1943.

Eddy, Sir Montague John, British railway administrator (b. 1881—d. Ryde, Isle of Wight, Dec. 22), was chairman or director of a number of railway companies in Argentina. He was knighted in 1944.

Ellis, Sir (Samuel) Howard, New Zealand born lawyer (b. June 2, 1889—d. Cambridge, New Zealand, Nov. 19), was called to the New Zealand bar in 1912 and to the Fiji bar the same year. He practised in Fiji and in 1942-45 was director of manpower and national service in Fiji.

Emnor, James, Belgian painter (b. Ostend, April 13, 1860—d. Ostend, Nov. 19), the son of an English father and a Flemish mother, he later took over their shop in Ostend for the sale of sea shells and souvenirs. With the exception of three years at the Brussels academy he lived in Ostend throughout his life. He was essentially a painter of the fantastic and macabre in the persistent Flemish tradition of Jerom Bosch and Pieter Bruegel. His most ambitious work was "Entry of Christ into Brussels" (1888), a huge canvas packed with grotesque figures which he refused to sell. He painted also excellent seascapes, interiors and still-life subjects. He led an uneventful life and during World War II rumour of his death enabled him to hear obituaries broadcast in his honour. An exhibition of his work was held at the National gallery, London, in 1946.

Ehretton, Sir George Hammond, British county clerk (b. 1878—d. Bristol, Jan. 22), was town clerk of Portsmouth, 1908-20, town clerk of Liverpool, 1920-22, and clerk of the Lancashire County council, 1922-44. He was knighted in 1927.

Everson, Sir (William) Valentine, private flying (b. 1891—d. Torquay, March 11), was M.P. for Melton, 1924-45.

Fisher, Sir Stanley, British lawyer (b. Feb. 12, 1867—d. Budleigh Salterton, Devon, Nov. 27), became a barrister in 1890. Fisher 1902 was appointed president of a district court in Cyprus. He subsequently served in Cairo, Trinidad and Ceylon, where he was succeeded in 1927.

Forrestal, James Vincent, U.S. politician (b. Beacon, New York, Feb. 15, 1892—d. Bethesda, Maryland, May 22), studied at Dartmouth college and Princeton university, served in naval aviation in World War I and then was on the New York stock exchange until June 1940, when he became one of President Franklin D. Roosevelt's administrative assistants. In Aug. 1940 he was appointed under secretary of the navy and followed Frank Knox as secretary in May 1944. He was appointed first secretary of defence in 1947 but resigned in March 1949. He was suffering from depression, and on May 22 threw himself from a window in the naval hospital, Bethesda.

Fortune, Sir Victor Morven, British military general (b. Aug. 12, 1883—d. Dumfries, Jan. 2), served in World War I when he was awarded the D.S.O. In World War II he commanded the 51st (Highland) division in 1940 and was taken prisoner at St. Valery-en-Caux.

Fraser, Sir (John) Malcolm, British journalist (b. Hampstead, Dec. 24, 1878—d. Poole harbour, Dorset, May 4), was editor of the Evening Standard, day editor Daily Express and editor in chief of the Birmingham Gazette. He was created a baronet in 1921 and was vice-chairman of the Conservative party, 1937-38.

Giraud, Henri Honoré, French general (b. Paris, Jan. 18, 1879—d. Dijon, France, March 11), was educated at the St. Cyr military academy and served as a captain of zouaves in World War I. Wounded and taken prisoner, he subsequently escaped from a German prison camp—a feat he repeated in World War II. He served as second in command to Marshal Louis Lyautey in the Rif campaign in north Africa in 1923-26, and was commander of the unit that received the surrender of the Moroccan leader, Abd-el-Krim. At
World War I he organized concert parties for the troops in France. In March 1922 he appeared in one of his most characteristic and successful parts The Man in Dress Clothes (an adaptation from the French). He wrote several books of autobiography and memoirs and in Vintage Years 1943 he looked back with regret to the Edwardian era. He was knighted in 1935. In 1939 he became controller of ENSA (Entertainments National Service association) and in 1940 was made a warman of the Advisory Production Council.

Horsnell, Horace, British playwright, novelist and dramatic critic (b. St. Leonards, Sussex, June 12, 1882—d. London, Feb. 10, 1942), was dramatic critic to Outlook (1927-28), Punch (1930-31), Observer (from 1920) and Tatler (from 1942). He wrote five novels and several plays including Advertising April (with Herbert Farjeon).

House, George, British politician (b. March 7, 1892—d. London, Feb. 8, 1945), started work as a printer and later became a trade union organizer. He was elected a co-founder of the London County council and was elected M.P. for St. Pancras, North, in July 1945.

Hubback, Eva Marian, British college principal (b. 1886—d. London, June 15, 1954), was a daughter of the head of the University of St. Felix school, Southwild, and Newnham college, Cambridge, where she graduated in 1908. She was appointed principal of Morley college for working men and women, London, in 1927. She worked for many years with Lord Simon of Wythenshawe and published in collaboration with him Education in Britain and The Population of Britain. She was editor-in-chief of the Royal Commission on Education (1937) and was the author of many legal books and also of plays and ballets for children.

Hughes, Arthur Walter, Roman Catholic archbishop (b. London, Aug. 25, 1902—d. Ewell, Surrey, July 12, 1954), was ordained in 1927, and in 1932 became a White Father. Missioned to Uganda in 1937, he became regent of the apostolic delegation in Egypt, being consecrated titular bishop of Hieropolis in May 1945, and two years later was appointed archbishop of April and nominated apostolic internuncio at Cairo.

Hyde, Douglas, (known in Ireland as An Cruthchín Abhainn—the dean of Irish statesmen) was the youngest of five children of a Hibernian bar, of Dublin, July 12, was the son of the Rev. Arthur Hyde, canon of Dublin, and his wife, a daughter of the Rev. John Barry, canon of St. Patrick's Cathedral, Dublin. From his earliest days he acquired a love for the Irish language, which at that time was neglected by scholars, and in 1788 he was one of the Society of the Propagation of the Faith in Ireland. In 1807 he left the society and started the Gaelic union which published the first periodical in the Irish language. In the nineties he travelled throughout Ireland campaigning to make the people realize the importance of Irish. He founded the Gaelic league in 1893 and held the position of president until 1913. In Nov. 1905 he left on a tour of the United States where he created great interest in the Gaelic league; he returned in June 1906 having collected £1,000. He was a lecturer on Irish at the University of Oxford from 1906 to 1909, and in 1909 he was second assistant editor of the Nationalist, Canada, and from 1909 to 1932 was professor of modern Irish in the National University of Ireland. His first publication appeared in 1889 and his last in 1939. Amongst his works in English were Story of Early Gaelic Literature (1895), A Literary History of Ireland (1899) and Medieval Tales from the Irish (1899). He also wrote many books, poems and plays in Irish and in Mise agus an Comhradh (1938) he told of his association with the Gaelic league. (See also Dublin, July 12, 1810—d. July 12, 1984).

Iggleston, Sir Charles, British author and journalist (b. Ashford, Kent, 1861—d. Ashford, June 26, 1931), became editor of the Kentish Express in 1881 and continued to edit the paper for 68 years.

Intris, Augustus Daniel, British entomologist (b. Aug. 24, 1880—d. Sidmouth, Devon, April 3), held posts in India, 1907-13, and at Manchester university. He was chief entomologist at Rothamsted Experimental station, 1918-31, and reader in entomology at Cam-
Brunner, Axel Martin Fredrik, Swedish physician and author (b. Östersund, Sweden, Oct 31, 1857—d. Stockholm, Feb 21, 1907), was educated at the University of Uppsala and later at the University of Moscow. He was a close friend of Jean Charcot at the Salpêtrière in Paris. After quarrelling with Charcot and leaving the Salpêtrière he conducted fashionable medical lectures in London and Paris. He wrote a book which was translated in some style in Keats's house. It built his villa of San Michele on the highest point of the island of Capri and created a bird sanctuary there. In 1898 he published "Blue Bebt." The work was written in English and published in 1929. It had an outstanding success and was later translated into almost every literary tongue. He died in 1939 as a guest of the king of Sweden in the Royal Palace in Stockholm.

Murphy, Frank, U.S. lawyer (b. Harbur beach, Michigan, April 13, 1898—d. Detroit, Michigan, Dec 15, 1929) studied at the University of Michigan in 1914. He served as judge of the Detroit record court 1921-29. mayor of Detroit 1919-23, governor general 1923-29. In 1929 he was elected governor of Michigan. In 1939, President Franklin D. Roosevelt nominated him U.S. attorney general and in 1940 appointed him to the U.S. supreme court. (See also Encyclopedia Britannica.)

Myers, Tom, British politician (b. Feb 15, 1872—d. Devon, Yorkshire, Dec 21, 1890), defeated Sir John Simon in a by-election for the Savan Place, and served as a member of Parliament for Commons until 1912. He was mayor of Devon, 1940-41.

Naidu, Mrs. Sarojini, Indian nationalist leader, poetess, and orator (b. Madras, May 3, 1899—d. London, 1947) was the eldest child of Dr. Agarbhath Chuttapayya, who became principal of the Nizam's college, Hyderabad. She matriculated at Madras women's college in 1912 and studied at Somerville college, London, and Girton college, Cambridge. Her first volume of poems "The Golden Threshold" was published in 1905 and shortly afterward published her second volume "The Red Bird," 1914, for which she received the introduction by Edmund Gwir in 1914. She was elected a fellow of the Royal Society of Literature about 1915. She met Mahatma Gandhi in London, in 1917 and became the first woman to the Indian National Struggle for Independence. In 1925 she became the first Indian woman to preside over the Indian National Congress. She accompanied the fighting of the Indian National Congress in London in 1931, but her return to India was impounded for her part in the civil disobedience movement. She was again imprisoned in 1940 by the Asan valley and released only after her birthday, and in the same year the advent of independence she became governor of the U.S. post held by her in India. (See also Encyclopedia Britannica.)

Neveu, Ginette, French violinist (b. Paris, Aug 11, 1919—d. [in an air crash] Algiers, Aro, Aug 28), made her first public appearance with the Column on the Pari, in the thirties, at the age of seven. She studied at the Paris Conservatoire and at 15 won the Wiemerski international violin competition in Warsaw. Her first appearance in London was in March 1945. After that she often played in Britain, appearing at the Edinburgh festival in Aug 1949 and three weeks before her death with the London symphony orchestra at the college of music in London and America to give a series of concerts when the plane in which she was travelling crashed in the Azores.

Nott, Percy Edward, a reknowned Egypologist (b. April 23, 1869—d. Hascombe, near Goulding, Surrey, Aug 7), was educated at King's college, London, and began the study of Egypt in 1884. In 1890 he entered the British officer in the Egyptian army, and was one of the leaders of the Egypt Exploration Fund. From 1895 to 1901 he undertook the supervision of the excavations of the Temple of Luxor, in the Catalogue of the Services of the Antiquaries of the Cairo museum. He was Director of the Egyptology in the University of Liverpool, 1909-19 and from 1929 to 1933 professor of ancient Egyptian art and archeology in the University of Cairo, Egypt. Cato was a member of the group under Howard Carter which in 1922 discovered the tomb of Inharnis, and from years later explored the Gebele Isba region of the Red sea province of the Sudan.

Newton, Sir (Hubbert) Alan Stephen, Australian surgeon (b. Victoria, Aug 27, 1887—d. Melbourne, Aug 14), retired from the University of Melbourne in 1909. At the age of 26 he joined the surgical staff of the Royal Melbourne hospital, and at the time of his death was its chief governing surgeon. He was surgeon-in-chief and later president of the Royal Australasian College of Surgeons.

Nicholson, Sir Charles Archibald, 2nd baronet, British architect (b. Elgin, Scotland, May 17, 1867—d. London, April 30, 1936) was a consulting architect for Wells, Lichfield, Llandaf, Luffield, Portsmouth, Sheffield and Belfast cathedrals. Besides planning works of recon- struction, he also designed the extension, 1901-02, of Eton College, consulting architect for Wells, Lichfield, Llandaf, Luffield, Portsmouth.

Nicholson, Sir William Newman Prior, British painter (b. Newark-on-Trent, 1872—d. Bledlow, Berkshire, May 16) Educated at the Manchester School, he studied at the Slade School of Art and was later the chief art critic of the Daily Chronicle. He admired considerable attention when, together with his brother-in-law James Pryde, he produced a series of posters under the supervision of the British railway administration. He turned to woodcuts and stained glass, he is probably known for his portrait in oils, which include those of W. E. Henley and J. C. Smuts. He was knighted in 1932. An exhibition of his work was held in the National gallery, London, in 1942. Examples of his work are to be found in the Tate library, London, of which he was a trustee 1934-39, and also in the Fitzwilliam museum, Cambridge, the Luxembourg palace, Paris, and several British municipal galleries. Gothic, Sir Frederick Wolff, British scholar and public servant (b. 

Morgan, Frank (Francis Philip Wuppener), United States author (b. New York, June 1, 1890—d. Beverly Hills, California, Sept 18, 1934), the began acting in 1914. As the Duke of Florence in The Firebrand, in 1924, he became firmly established, and the title role of Topaze (1930), brought him to the attention of Hollywood. He appeared in scores of films...
Douglas Hyde
Viscount Leverhulme
Marquess of Londonderry
Lord Russell

Feb. 7, 1893—d. London, June 10, was educated at Clifton college and Balliol college, Oxford. He served in the Bedfordshire regiment in World War I when he was seriously injured, losing his left arm. He returned to Ireland in 1919 and in 1920 became director of the economics at Trinity college; in 1926 he was appointed professor of political economy at the University of Edinburgh. He was president of the British broadcasting corporation. He took over at a difficult time and was responsible for re-shaping the BBC into a valuable part of Britain’s war effort. He resigned in 1942 and for a time served on the staff of the British Council. From 1944 until his death he was principal of Jesus college, Oxford.

Ollard, Sidney Leslie, British ecclesiastical historian (b. 1875—d. London, July 29, 1939), was a leading part in the installation of the grid system throughout Great Britain.

Pares, Sir Bernard, student of Russian history and the Russian language (b. March 1, 1867—d. New York, April 17, 1945), was educated at Harrow and Trinity college, Cambridge. He had a knowledge, unrivaled in his own country, of pre-revolutionary Russia which he visited for the first time in 1898. On his second visit, in 1906, Pares met many of the important figures of the secret societies, which was another meeting in St. Petersburg and his book Russia and Reform (1907) was the fruit of his experiences. In 1906 he had been appointed reader in Russian History and from 1908 to 1917 he was professor of Russian History, language, and literature in the University of Liverpool.

During World War I he was attached to the Russian army as official observer and in 1913 he joined the staff of the British ambassador in Petrograd. In 1919 he was appointed to a chair of Russian Law at London university and three years later he became, in addition, the Russian director of the School of Slavonic and East European studies. In 1926 his distinguished verse translation of Krylov’s fables was published. In World War I he was decorated in the U.S.A. for the British Ministry of Information and his book Russia in the Penguin series enjoyed wide sales in both Great Britain and the United States. Several visits to Soviet Russia had made him critical of the regime, which he saw in his My Russian Memoirs from the standpoint of the pre-revolutionary Liberals, but in 1936 he visited Russia once more and recorded in Moscow Admits a Critic opinions which were not unfavourable to it.

Peel, Albert, Congregational minister and writer (b. Gomersal, near Leeds, March 20, 1887—d. Glasgow, Nov. 3), was lecti... Central Union of England and Wales.

Pender, John Cuthbert Denison Pender, 1st Baron, of Porthcurnow, Cornwall, British politician (b. May 11, 1882—d. London Dec. 4), was M.P. for Newmarket, 1913-18, and for Salisbury and Fordington, 1918-32. He was joint managing director of the British Cotton Industry Research association, 1927-43. He was vice-chancellor of London university, 1937-39.

Pope-Hennessy, Dame Mary, British political economist (b. July 12, 1874—d. London, Aug. 16), who in later years wrote many literary and historical biographies. Her first book was Early Chinese Jades (1914) and six years later she published Three English Women in America. Her biographies included works on Sir Walter Scott (1932), Edgar Allan Poe (1934), Agnes Strickland (1940), Charles Dickens (1945) and Charles Kingsley (1948). During World War I she was a member of the central prisoners of war committee of the British Red Cross, and in 1920 was created a Dame of the British Empire.

Portal, Sir Edward Raymond Portal, 1st Viscount of Lavenheath, British businessman and politician (b. April 9, 1885—d. Whitchurch, Hampshire, May 6), was educated at Eton college and Christ Church, Oxford. He entered the firm of C.J. Raza and joined the legal department. He was reserve in 1911, but returned to serve in World War I and in 1918 was awarded the D.S.O. Appointed a justice of the peace in 1912 and a deputy lieutenant of the county of Southampton in 1924, he became lord lieutenant in 1948 in succession to Lord Mottistone. In 1919 he was one of the commissioners appointed by the government to report on the distressed areas (later renamed "development areas") and his part of the work was mainly concerned with sound railway schemes. At the outbreak of World War II he was appointed regional commissioner for Wales. In Dec. 1939 he resigned and early in 1940 became chairman of the Coal Production council and additional master of the Reformed society and president of the British Mining institute. When minister of works and planning, he introduced the "Portal" prefabricated house. He then returned to his business interests and became chairman of Raza and Great Western railway until it was taken over by the British Transport commission on Jan. 1, 1948. He was a keen sportsman, being president of the British Olympic association and chairman of the Olympic games of 1936 held under his presidency.

Purves-Stewart, Sir James, British neurologist (b. Nov. 20, 1869—d. London, June 14), studied at Edinburgh university and was later consulting physician to the Westminster hospital, to the West End Hospital for Nervous Diseases, and physician to the Royal National Orthopedic hospital. Author of many textbooks including Diagnoses of Nervous Diseases (10th ed. 1948), Nerve Injuries and their Treatment (ed. 1919), and an autobiography Sands of Time (1929).

Queenborough, Almeric Hugh Paget, 1st Baron, of Queenborough. Kent, British politician (b. March 14, 1861—d. Camfield place, near Stratford, June 18, 1930), was a Unionist M.P. 1910-17.

Radbruch, Gustav Lambert, German politician and lawyer (b. Lübbecke, Nov. 21, 1878—d. Heidelberg, Dec. 29), was minister of justice, 1912-17 and 1920-23, and professor of criminal law at Heidelberg, 1926-33 and 1945-48.

Ráfa (Reich), László, Hungarian politician (b. Székyé-Judvarhely [Olokor], Transylvania, 1899—d. Budapest, Oct. 15). As a student at Budapest university he joined the illegal Communist party in 1930 and was arrested the following year. In 1934 he founded the Hungarian civil war and early in 1939 was interned in France. In 1941 the Germans allowed him to return to Hungary, where he was arrested and sentenced to a short term of imprisonment. In Oct. 1944 he was again arrested but, freed after World War II, became influential in the re-organized Hungarian Workers’ (Communist) party. He was minister of the interior from Feb. 1946 until he became minister of foreign affairs in Dec. 1948. On Feb. 1, 1949, he was appointed secretary general of the re-organized People’s Independence front. He was arrested (b. on Mar. 17, 1927), on many occasions, and in April 1953 an indictment was published in which he was accused of plotting to murder Mátéy Rakosi and four other Communist leaders, and of spying for Marshal Tito and the U.S. military intelligence. It was also alleged that from 1931 he had been a Hungarian police agent. At his trial, which opened on Sept. 16, Rajk confessed to all the charges on which he was convicted, and Mátéy Rakosi was sentenced to death. He was executed on Oct. 15.

Rankenbour, James Fitzalan Hope, 1st Baron, of Buxted, Sussex, British politician and parliamentarian (b. Dec. 11, 1857—d. London, Feb. 14, 1919), was elected M.P. in 1900 for Brightside division, Sheffield, and from 1908 to 1929 sat for the central division. He was chairman of committees and later of the home affairs committee. He was also chairman of the select committee on agriculture, 1919-21. He was appointed chairman of the committee on the coal industry in 1923, 1925-33. He was made a Knight of the Order of the British Empire in 1912, 1918-19, 1920, and 1932, and created a baronet in the Order of the Bath, 1922.

Raza, All, Sir Syed, Indian statesman (b. Kundarki, Moradabad, April 29, 1882—d. Karachi, Pakistan, Aug. 15), was a member of the Uitlanderry seeyury council, 1912-20, and a member of the Council of State, 1921-26. He was agent general for the government of India in South Africa, 1935-38.

Read, Sir Albert James, British administrator (b. March 17, 1863—d. Oct. 17), entered the Colonial Office in 1889 and for more than 40 years worked in the interest of the colonies. He was one of the first to see the bearing of the study of tropical medicine on colonial administration. He was governor of Mauritius, 1924-30.

Reynolds, John Henry, British astronomer (b. Edgbaston, Birmingham,
June 27, 1874—d. Birmingham, Nov. 22), was elected a fellow of the Royal Society. He was president of the society, 1935-36, and treasurer, 1929-35 and 1937-38. 

Rintelen, Franz von, German naval officer and spy (b. Germany, 1884 — d. London, Aug. 29, 1943). He was interned in 1915 because of his German citizenship, but in 1917 he eluded the British authorities and fled to Spain. After the Armistice, he returned to Britain and was interned in 1920. He was later released and returned to Germany, where he was murdered.

Rippledale, Kimmcl, Sir George, successor to the first (1872-1936). He was a successful businessman and a prominent figure in British society. He died in 1936.

Robinson, William Albert, British politician (b. 1877—d. Liverpool, Dec. 31), was Labour M.P. for St. Helens, Lancashire, 1933-40. 

Rothschild, Nathaniel, baronet (b. London, Feb. 24, 1868—d. June 30), was the head of the French branch of the Rothschild family. He was a regent of the Bank of France, president of the French Stock Exchange, and a member of the French Academy. He was a great collector of art and was also interested in promoting the arts in France. 

Runciman, Sir, W. E. (b. 1865—d. London, Feb. 19, 1937), was a journalist and political figure. He served as editor of the London Times and later became a member of the cabinet. He was also a keen advocate for the First World War, and his writings on the subject were widely read. 

Runciman, William Alexander, British politician (b. 1877—d. Liverpool, Nov. 14), was educated at Trinity College, Cambridge. In 1898 he unsuccessfully contested the Gravesend division of Kent as a Liberal, and in 1902 he was returned for Oldham (Conservative). In 1907 he was returned for Oldham (Labour). In the following year he was defeated in the general election, and in 1910 he sat for the constituency of Leeds, 1910-18, for Swansea, west, 1924-29, and for St. Ives, Cornwall, 1929-37. After 1931 he sat as a Liberal National. He held many posts in Liberal governments, his first being parliamentary secretary to the Local Government Board, 1905-7. He was financial secretary to the Treasury, 1907-8, president of the Board of Education, 1908-11, and a member of the Board of Trade, 1905-6. He was president of the Board of Trade, 1914-16, and again in the National government, 1931-37. In 1937 he was created a viscount and in the following year he was raised to the peerage as Baron Runciman of Babraham. He was a prominent figure in the Conservative party and was known for his pro-war stance.

Ruskin, John, British sculptor and writer (b. London, Nov. 8, 1819—d. London, Feb. 20, 1900). He was a leading figure in the Victorian era and is best known for his works on art and architecture. 

Ruskin, John, British politician (b. London, April 19, 1878—d. London, Nov. 30, 1937), was the son of Sir Henry Reresby Ruskin and the brother of John Ruskin. He was a Liberal Member of Parliament for the Westhoughton division of Lancashire, 1898-1910, and for the Luton division of Bedfordshire, 1910-15. He was also a prominent figure in the Liberal party and was a member of the Liberal cabinet.

Rutten, Sir, W. E. (b. London, Aug. 15, 1872—d. Seaham, Sussex, Nov. 18), was educated at Rugby and at Christ Church, Oxford, where he graduated in 1900.

Rutten, Sir, W. E. (b. London, Feb. 3, 1900—d. London, Aug. 12, 1974), was a prominent figure in the art world and was associated with the business of art dealers.

Rutten, Sir, W. E. (b. London, Aug. 15, 1872—d. Seaham, Sussex, Nov. 18), was educated at Rugby and at Christ Church, Oxford, where he graduated in 1900.
Edward Stettinius.

James Henry Thomas.

During World War I, he rose from private to captain; he joined the Red army and in 1920 commanded a division. After the civil war he graduated from the M. V. Frunze Military academy, Moscow, and in 1921 was a corporal and chief of staff of a military district. During World War II he described himself as a tactician and an expert in tank warfare. In Nov. 1942 he commanded the army which, from the southeast, helped to encircle the German Sixth army at Stalingrad, and on Feb. 1, 1943, he personally accepted Field Marshal Friedrich von Paulus' surrender. In Aug. 1943 he defeated the Germans at Taganrog; later he took Melitopol, contributed to the liberation of the Crimea and on May 9, 1944, recaptured Sevastopol. In Aug. 1944 his army swept through Rumania into Bulgaria, and it was he who signed the Bulgarian armistice on Oct. 28, 1944. Promoted marshal on Sept. 12, 1944, he contributed to the liberation of Yugoslavia; in Dec. 1944 his army group reached Balaton lake in Hungary, and early in 1945 he participated in the battles of Budapest and Vienna. He was awarded the Order of Victory and the Order of Lenin (twice). His last appointment was as commander of the troops of the Transcaucasian military district.

Turina, Joaquin, Spanish pianist, composer and critic (b. Seville, Dec. 9, 1882—d. Madrid, Jan. 14), studied in Paris and returned to Spain in 1914. His works include the lyric comedy Margot, a composition for strings Oración del Torero and stage works La Adultera Penitente and Jardín del Oriente.

Ullswater, James William Lowther, 1st Viscount, of Campsea Ashe, Suffolk, British parliamentarian (b. April 1, 1855—d. Campsea Ashe, March 27), was educated at Eton, King’s college, London, and Trinity college, Cambridge. He was called to the Bar in 1879 and in 1883 entered the House of Commons as a Conservative member for Rutland. He was defeated at Petershill, Cumberland, in 1885, but was elected in the following year. His first government office was the under-secretaryship for foreign affairs, 1891-92. In 1895 he was elected to the largest of the three House of Commons, and next 26 years continued as an officer of the House of Commons,—until 1905 as a member of the Board of Trade, and from 1905 to 1912 as a member of the Public Works, and was created a viscount by King George V. One of the greatest speakers of the House of Commons he did much to uphold the dignity of that office. In 1925 he published his autobiography A Speaker’s Commentaries.

Undset, Sigrid, Norwegian author (b. Kalundborg, Denmark, May 20, 1882—d. Lillehammer, Norway, June 10), earned an international reputation by her three novels, Frua Maria Orilie (1907), Jenny (1911) and Kristin Lavransdatter (1920-22), for the last of which—a three-volume work based on mediaeval life in Norway—she was awarded the Nobel prize for literature in 1928. Historical studies made for Kristin Lavransdatter led to her conversion to Roman Catholicism in 1927. Her novel Olav Audunsson (1925-27), Ida Elisabeth (1932) and History of Saints (1934) continued the historical, and in 1939 her autobiography Men, Women and Places appeared. A year later, when Norway was invaded, Fru Undset issued a strong statement urging her countrymen to resist. Eventually she fled with her younger son Hans through Stockholm, Moscow and Vladivostok to the United States; at Stockholm she learned that her elder son Anders had been killed fighting the Germans. Returning to Norway in July 1945 she lived quietly in her logwood cabin at Lillehammer. Her last book Happy Times in Norway appeared in 1942 in New York. (See also Encyclopedia Britannica).

Uphaw, Augustus Andrews Uphaw, Baron (life peer), of Latherby, Buckinghamshire, British lord of appeal (b. Australia, April 25, 1879—d. Sandwich, Kent, April 24), was educated at Ballarat college, Victoria, and Balliol college, Oxford. He was called to the bar in 1904. During World War I he was the legal adviser to the Ministry of Food. In 1934 he was appointed junior counsel (on the chancery side) to the Treasury and the Board of Trade and to the attorney general in charity matters. On the death of Mr. Justice Crossman in 1941 he was appointed a judge of the chancery division and in 1948 was made a lord of appeal in ordinary and created a life peer. Shortly after his elevation to the bench in 1941 he was appointed chairman of an expert committee on land compensation and betterment.

Vanbrugh, Dame Irene, English actress (b. Exeter, Devon, Dec. 2, 1872—d. London, Nov. 30), made her first stage appearance at the age of 16 as Phoebe in As You Like It at Margate. After this she toured with J. L. Toole’s company and played in England, Australia and New Zealand. She first appeared on the London West End stage in 1892 and in following years was with Beckett, George Alexander and A. Boucicaut. Her work showed great versatility but it was in light comedy in which she excelled. She created amongst other parts those of Gwendolen Fairfax in The Importance of Being Earnest, Lady Mary Lazenby in The Admiraible Crichton, Rose Trelawny in Trelawny of the Wells. Continuing her career until her death two days before her 77th birthday she had made many tours of Australia, New Zealand and South Africa and during World War II worked with ENSA (Entertainments National Service association). She appeared in films including Catherine the Great and I Live in Grosvenor Square. Her autobiography To Tell My Story was published in 1948. She was created a D.B.E. on Jan. 1, 1941.

Wadsworth, Edward Alexander, British painter (b. Cleckheaton, Yorkshire, Oct. 1889—d. London, June 21), studied at the Slade school and was elected to the New English Art Club in 1921. His best known paintings were careful compositions of marine objects, in tempera. He executed two panels for the interior of R.M.S. Queen Mary and one for the De La Warr pavilion, Bexhill, and works of his are in the Tate gallery, London, and many provincial galleries. He was a member of the London group and of Unit One and held numerous exhibitions. He became an A.R.A. in 1943.

Wakatsuki, Reijiro, Baron, Japanese statesman (b. 1867—d. near Ito, Japan, Nov. 20), was prime minister in 1926 and 1931, having previously been minister of home affairs. He attended the London naval conference, 1929, and was afterwards created a baron.

Walker, Sir Herbert Ashcombe, British railway manager (b. London, May 18, 1868—d. London, Sept. 29), was general manager, Southern railway, 1923-37. Under his direction the railway greatly extended and improved its electric services, and the suburban system became the largest of the world. He was knighted in 1915 for his work in transporting the British army to France.

Walls, Tom Kirby, British actor and racehorse owner (b. Kingsthorpe, Northants, Dec. 28, 1883—d. London, Nov. 27), was educated at Northampton county school, served in the Metropolitan police, and made his first stage appearance in 1905 in Glasgow. He stood in the United States in 1913 and in the 1920s he embarked on his first managerial venture with Leslie Henson with a farce Tons of Money which ran for two years. This was followed by his partnership with Ralph Spence and a production for the Cape Forks (1930). In 1929 he acted in his first film and directed and acted in more than 20 pictures. As soon as his theatrical success allowed he acquired a string of racehorses and achieved many notable successes including the Derby in 1932 with April the Fifth.

Ward, Ida Caroline, British linguistic scholar (b. Bradford, Yorkshire, Oct. 4, 1880—d. Guilford, Oct. 10), contributed to the study of English phonetics and to research in speech defects before she began her work in west African languages, which gave them a study a new start. She was for many years adviser in African studies in the School of Oriental and African studies, London University. In 1944 she became professor of west African languages and in 1948 was created professor emeritus.

Ware, Sir Fabian Arthur Goulston, British major general (b. Clifton, Bristol, 1869—d. Amberley, Gloucestershire, April 28), started as a schoolmaster in Bradford and later became director of education, Transvaal. He was editor of the Morning Post, 1905-11. He served in World War I and in 1917 founded the Imperial War Graves commission, being its vice-chairman until 1948.

Watson, Vernon, (Nosmo King), British comedian (b. Peterborough, 1887—d. London, Jan. 13), started as a bank clerk, but became a success on the stage as a mimic. He later appeared as a black-faced comedian under the stage name "Nosmo King."" Wensley, Frederick, British detective (b. Taunton, Somerset, 1865—d. London, Dec. 4), joined the Metropolitan police in 1887. In 1924 he was appointed chief constable—a rank specially created for him. He retired from the police in 1929. During his 42 years of service he was responsible for initiating the flying squad, and while he was chief constable the term "Big Four" was first applied to the four senior officers who were assigned the task of re-organizing the police.
OCEANOGRAPHY

Wiltshire, Sir Frank Henry Cafuade, British town clerk (b Suffolk, Nov 27, 1881 d March 19), was town clerk of British town, 1919-46, and clerk of the peace, 1937-46, and from Nov 1947 judge of Alderney, Channel Islands.

Wintringham, Thomas Henry, British politician and author (b Grimsby, Lincolnshire, May 15, 1898- d nearby Manor, Lincolnshire, Aug 16), was educated at Gresham's school, Holt, and Balliol college, Oxford. He was a Communist in 1922 and worked in the Daily Worker, Workers' Weekly, Workers' Life and the Daily Worker. He commanded the British battalion of the International Brigade in the Spanish Civil War, 1937, and in 1944 the following year was expelled from the Communist party for "maintaining personal relations with elements considered undesirable by the party." His experiences in Spain were to give rise to the book "War and Peace in Spain." When in 1943, he helped to organize the Osterley Park training school for the Home Guard. Two books on guerrilla warfare, "New Ways of War and Army of Freedom," his English version (1939) recounted his Spanish adventure, and Your M.P., a book first issued anonymously, became fashionable before the general election of 1945.

Wife, Stephen Samuel, U.S. rabbi and Zionist leader (b Budapest, Hungary, March 17, 1874 d New York city, April 19) His family settled in New York in 1875, and Stephen was educated at Columbia University. He became rabbi of the Madison Avenue Synagogue in New York in 1891, and in 1900 moved to Portland. It was there that he turned to Zionism, formed the Free Synagogue of New York. He was president of the American Jewish congress, a member of the executive board of the Jewish Agency for Palestine, appointed by the American Zionists Federation council, president and founder of the Jewish Institute of Religion and from 1936 president of the World Jewish congress.

Woodward, Robert Charles, Chairmen, of Ipswich, Suffolk, British politician and former vice-chairman of the British-American Tobacco company (b Sept 3, 1867 d South Africa, Feb 2), he was MP for Woodbridge, Suffolk, 1920-29, and was created a baron in 1932.

Xove, Kopil, Albanian politician (b Negovia, Albania, May 1, 1911 d post May 13, 1918), was the son of Orthodox, who became active as a labourer at Korçe and in 1937 was elected to the municipal council. Intermittently arrested for activities against where the Italian government, he became an organizer of the Albanian Communist party and two years later of the Albanian Liberation army in which he appointed himself to the command. In Dec 2, 1945, he was elected deputy for Korçe to the Albanian Constituent Assembly, and on Jan 11, 1946, he became vice-president of the assembly, at the same time succeeding to the office of the secretary general of the Albanian Communist party. On March 22 of the same year he was appointed deputy prime minister and minister of the interior. Between 1946 and mid-1948 it was Xove, who held the new position of Albania, Hoxha being largely a figurehead. In July 1947 both Albanian leaders paid an official visit to Moscow, but on Oct. 19, 1948, Xove was designated as a supporter of Tito's Nationalist heresy and arrested with many political friends. After months of detention, he was tried in camera, but on June 10, 1949, was sentenced to death for anti-Soviet tendencies. He was shot the following day.

Zaim, Husein ez-, Syrian army officer of Kurdish extraction (b Aleppo, Aug 14, 1887 d Damascus, Apr 14) Tamay of the Turkish military academy, he served under Teklil Pasha against the Arabs in 1914-18 and was taken prisoner at Medien. In 1920 he joined the French and were in the rank of commander of the French cavalry, which took part in the fighting ordered by the Vichy government against the Allied forces entering Syria in 1941. After a period of imprisonment by the Allied commission, he was appointed inspector general of police of the Syrian republic. In May 1948 he became chief of staff in the Syrian army. On March 30, 1949, he led the group that organized the Shukri Barak regime. By a referendum of June 25 he was elected president of Syria by over 60% of the votes, and took the rank of marshal. His hold was turned fast and he resisted to whole arrest, often of former friends and supporters. Soon the army turned him and early in the morning of Aug 14 he was taken from his residence and shot by a group of officers, led by Colonel Sami Himmawi.

Zamora y Torres, Nieve Alcala, exiled former president of the Spanish Republic (b Barcelona, June 7, 1877 d Buenos Aires, Argentina, Feb 18), was educated at the universities of Granada and Madrid, taking a doctorate of law and specializing in administrative law and history. He was active in the Spanish royalist party, and became a member of the cabinet, first as minister of public works and later as minister of education, in the government of Agapito Tornel in the decade following World War I. Zamora held a moderate course, though he finally came out publicly in favour of a republic in 1930. He intervened in Dec 1930 for convoking and sentenched to six-months imprisonment. It was under his leadership that the republicans ordered King Alfonso to abdicate, and Zamora was installed as president of the National Committee of Constitutional Government, and, as President of the Second Spanish Republic. In April 1936, he was removed by a motion of the Socialists on grounds of having dissolved parliament illegally, and between 1936 and 1939 was imprisoned. He was released in 1943, and was received in Spain by the government, but he was exiled and sentenced to loss of nationality and a fine of all his fortune in Spain.

OBSTetrics: see Gynaecology and Obstetrics.

OCEANOGRAPHY. The Pacific Science congress, meeting in New Zealand at the beginning of 1949, asked for more intensive studies of the interaction between the sea and atmosphere, the deep-water circulation in the oceans, the structure and topography of the sea bottom, and of waves and currents on shore lines.

The most notable publications of the year were the proceedings of the general assembly of the Association of Physical Oceanography at Oslo, issued by the secretariat of the association in the Geophysical institute at Bergen, and a collection of 41 papers by U.S. oceanographers in a special volume of the Journal of Marine Research (Yale) to commemorate the 60th birthday of Professor H. J. Stedman, retiring director of the Scripps Institution of Oceanography.

Many of the papers dealt with the theory of fluid motion and the processes of stirring and mixing in the oceans. C. O'D. Iselin, in a paper on developments in the study of the Gulf stream, showed that at any one time the current could be very different from the average picture gained over many years from thousands of ships' observations of drift between Cape Hatteras and Nova Scotia; the ocean is well covered by the "Loran" navigational aid, and the drift of a ship would now be charted, velocity, length, and counter-currents. On one occasion, while investigating a three- to four knot counter-current, she passed several freighters bound for Europe steaming the unavailing current for six hours or more. The setback would probably be made good within the 24 hr., in a more favourable part of the current, and in general navigation the average day's run would probably indicate a forward set approximately equal to the charted current velocity.

In another of the papers A. F. Spilman and A. R. Miller, in the description of a new sea sampler, showed how the instrument would make a record of temperature against depth and collect water samples at 12 pre-determined depths between a depth of 450 ft. and the surface, without stopping the ship. The apparatus was particularly useful in studying the mixing between deep and shallow waters at the edge of the continental shelf.

M. S. Longuet-Higgins studied the electromotive forces of a few millivolts per kilometre induced by the tidal movement of water relative to the earth's magnetic field in the English channel. ("The Electrical and Magnetic Effects of Tidal Streams," Royal Astr. Soc., Geophys. Suppl., vol. 5, no. 8, London, 1949). The horizontal potential gradients are almost independent of vertical differences in velocity, but are affected critically by the depth of water and the conductivity of the sea bed. The induced electric currents can be expected to extend to depths comparable with the width of the channel, and it was shown that tidally generated electric currents could be measured in the earth some distance inland.

In most centres of oceanographical research considerable attention was paid to the effect of the stress of the wind on the surface of the sea. Theoretical and practical evidence was put forward to show that the eddy-viscosity depends on the scale of the phenomenon; in explaining the generation of a drift current it was reasonable to assume a much higher value for the viscosity between the air and water than could be tolerated in accounting for the decay of waves. Semi-quantitative demonstrations were given for several parts of the ocean to show that the permanent ocean currents are
O’KELLY—OSTEOPATHY

ORGANIZATION OF AMERICAN STATES.
At the beginning and again at the end of 1949 the Organization of American States was confronted with international situations which threatened the peace of the continent and required the application of the Inter-American Treaty of Reciprocal Assistance. This treaty, which was signed at Rio de Janeiro on Sept. 2, 1947, and came into force on Dec. 3, 1948, is a mutual assistance pact under which the signatory states agree to act collectively in the event of an aggression or threat of aggression against any one of them.

The first application of the treaty occurred in Dec. 1948, when the government of Costa Rica alleged that its territory had been invaded by armed forces proceeding from Nicaragua. The council of the organization, acting provisionally as the organ of consultation under the Rio de Janeiro treaty, sent a diplomatic commission of investigation, composed of representatives of Brazil, Colombia, Mexico and the United States. In Jan. 1949, following the presentation of the report of the commission, the council of the organization made a series of recommendations and sent a commission of military experts to Costa Rica and Nicaragua to observe the application of its proposals. This group was composed of representatives of the four countries which comprised the diplomatic commission and Paraguay. A pact of amity was signed on Feb. 21, 1949, and subsequently ratified by both governments.

In Feb. 1949 the government of Haiti sought to have recourse to the Rio de Janeiro treaty, alleging that the Dominican Republic was permitting its territory to be used for radio broadcasts that threatened the peace of the two countries. The council of the organization decided not to apply the treaty and Haiti thereupon requested the good offices of the Inter-American Peace committee, composed of representatives of Argentina, Brazil, Cuba, Mexico and the United States. The Committee sent a delegation to the two countries, following which representatives of the two governments signed a joint declaration on June 11, 1949. Although by this statement the two governments undertook to settle by peaceful means any difference that might arise between them, no permanent solution was found; and on Jan. 6, 1950, the council of the organization decided to proceed in accordance with the provisions of the treaty. This action was taken at the request of Haiti, which invoked the treaty against the Dominican Republic, and also at the request of the Dominican Republic, which made charges against both Haiti and Cuba.

In accordance with a resolution of the Bogotá conference, the council convoked the American Committee on Dependent Territories to assemble in Havana, Cuba, on March 15, 1949. The committee was in session until July 21, 1949. The final act of the committee and a report on its work were transmitted to the council.

On Nov. 16, 1949, Luis Quintanilla, Mexico, and Héctor David Castro, El Salvador, were chosen chairman and vice chairman respectively of the council of the organization for 1950.

OSTEOPATHY. The year 1949 was one of steady progress in the profession of osteopathy in Great Britain, both in education and in the field of organization.

The number of students at the British School of Osteopathy increased and the difficulties experienced in re-starting the school after World War II were finally overcome. There was every sign that an increasing number of suitable young men and women would be anxious to take up osteopathy as a career and the school and the profession hoped to expand educational facilities to meet this demand. The annual postgraduate course for qualified osteopaths, instituted in 1948,
proved valuable in bringing members of the profession together and in helping to keep them abreast of new ideas and new methods. The Osteopathic Educational foundation had already done much for osteopathic education after its inception in 1945; but expansion of educational facilities was conditioned by financial factors. Assistance in this direction would in future be given by a new organization of lay helpers inaugurated in 1949 and known as the British Osteopathic league, which would endeavour to raise money for osteopathic funds by various kinds of social gatherings and entertainments.

The work of organizing the Register of Osteopaths made further progress during the year. The number of qualified osteopaths registered reached 166. The officers of the Register did much valuable work in giving authoritative information to the public about osteopathy and in protecting the public and the profession against untrained practitioners and unethical conduct or advertising.

Osteopathy received a good deal of publicity during the year both in the public press and medical journals. This publicity was on the whole useful as showing interest in osteopathy among the public and even certain sections of the medical profession.  

(J. C. P. P.)

OTTAWA. The capital of Canada is at the confluence of the Rideau and the Ottawa rivers in Ontario. On Dec. 31, 1949, in its 11th annexation in 50 years, Ottawa took over parts of bordering townships of Gloucester and Nepean, increasing the area of the city proper by 22,125 ac. and making its total area 28,134 ac. The population automatically increased by 27,500, to bring the total to 191,442 (plus about 17,000 in outlying areas and the remaining townships).

A plan for the development of Ottawa as a capital worthy of the Canadian nation was published. One of the leading town planners of Europe, Professor Jacques Greber, of Paris, was employed to work out a master plan for a tract of 940 sq. mi., 346 of them in Ontario and the rest in Quebec. The city would only cover a fraction of this area. The remainder would be parks, protected farm land, and some 80 sq. mi. of water in rivers and lakes.

The Federal district commission set up a special committee to deal with expropriation prices. The city council purchased the Ottawa Light Heat and Power company, making the Ottawa hydro sole distributor of electricity and started a $6 million scheme to extend the water service.

Statistics for 1948 included: government and industrial pay rolls at a record peak of $100 million; average weekly wages, $34.48 (1947: $31.69); assessment $184.9 million (1947: $177.8 million).

OUTER MONGOLIA: see MONGOLIAN PEOPLE'S REPUBLIC.

OXFORD UNIVERSITY. In the summer of 1949, 6,218 men and 1,076 women were in residence, both numbers being slightly smaller than in the previous year. The proportion of students reading different groups of subjects remained very nearly as recorded for 1948.

The Spalding professorship of eastern religions and ethics was established permanently by a gift of £42,000 from Mr. and Mrs. H. N. Spalding. Professor Sir S. Radhakrishnan remained professor but was granted one year's leave of absence to act as Indian ambassador at Moscow. Dr. G. D. Kilpatrick succeeded Professor R. H. Lightfoot as Dean Ireland's professor of exegesis; Dr. H. G. Hanbury, Professor G. C. Cheshire as Vinerian professor of English law; and Dr. J. Trueta, Professor H. J. Seddon as Nuffield professor of orthopaedic surgery.

J. T. Christie, headmaster of Westminster school was elected to succeed the late Sir Frederick Ogilvie as principal of Jesus; Sir David Keir, vice-chancellor of Queen's university, Belfast, to succeed Lord Lindsay of Birker as master.

The Earl of Halifax, chancellor of Oxford university, leading the procession to the site of Nuffield college for the laying of the foundation stone on April 21, 1949. Walking behind, on left, is Viscount Nuffield.
of Balliol, and Professor H. Last, fellow of Brasenose college, to succeed the late Dr. W. T. S. Stallybrass as principal of Brasenose.

On April 21 the foundation stone of Nuffield college was laid by the chancellor, the Earl of Halifax, in the presence of the founder, Viscount Nuffield. Sir Henry Clay retired from the wardenship of the college on Sept. 30. A. Loveday was appointed to succeed him.

The university joined the city council in opposing an order made by the minister of fuel and power under which the gas works, which dominate the city on the south, would have been extended over an adjoining area of 19 ac. The opposition was successful; and it was generally agreed that the next step must be the framing of a continuous programme under which the gas works would be removed altogether.

University college on July 1 celebrated the seventh centenary of its first historical endowment by William of Durham. The bicentenary of the opening of the Radcliffe Camera was celebrated by a luncheon at University college (of which Dr. Radcliffe was a member) on April 20, followed by an address by Lord Cottesloe, the chairman of the trustees, in the college library. Gifts and grants included £100,000 a year for seven years from the Pressed Steel company for research fellowships in various scientific laboratories. Of the total income of the university, 48% was made up of government grants.

PACIFIC ISLANDS, BRITISH. These islands include the colony of Fiji (consisting of a number of islands), the British Solomon Islands protectorate, the Gilbert and Ellice Islands colony, the protected state of Tonga and Pitcairn island. Total area: 19,125 sq. mi. Total pop. (1947 est.): 444,862. It would be incorrect to describe the New Hebrides (area, 4,633 sq. mi.; pop. about 48,000), an Anglo-French condominium, as British, but it should be mentioned here (see also French Union). Governor and high commissioner: Sir Brian Freeston.

History. The defence of Fiji were re-organized in 1949. Its importance as a communication centre in the South Pacific made its security of special concern to New Zealand and that government, therefore, lent an officer for the triple role of commandant of the Fiji military forces, liaison officer with the New Zealand staff of staff and defence adviser to the government of the colony. With his assistance a Military Forces bill—to fix the establishments for new military units and the timetable for their creation and training—was framed and laid before the Legislative Council.

A committee of six members representative equally of the three (European, Fijian and Indian) communities, appointed in 1948 to consider constitutional reform in Fiji, reported unanimously in July advocating only small changes, though three members signed with reservations in respect of certain provisions and submitted minority reports. Their proposals recommended: (1) an Executive Council consisting of the governor as president, four ex-officio and three (one from each of the communities) unofficial members; these last to be members of the Legislative Council chosen by the governor from a panel of six comprised of two members of each racial group; (2) a Legislative Council consisting of the governor as president, four ex-officio, 12 official and 15 unofficial (comprising five Europeans elected by the European electorate, five Fijians elected by the Council of Chiefs and five Indians elected by the Indian electorate) members.

The quasi-nationalist political movement known as Marching Rule, which in the previous 2-3 years had to a large extent dominated Native affairs in the British Solomons and had done incalculable harm by materially slowing up the progress of the island group, was reported to have lost ground.

Finance and Trade. Currency—Fiji, FF111 = £100; in the Solomons, Gilbert and Ellice Islands and Tonga, United Kingdom and Australia currency are legal tender, though Tonga issues its own notes and in all three territories the exchange standard system is based on Australian currency; in the New Hebrides sterling and French currency are both legal tender.

PAINTING. For a century France has constituted the most powerful force in the visual arts of western civilization. Gradually, however, as the great names in contemporary painting are realized to be no longer young, not only is the problem of succession posed with growing insistence, but national movements in painting assume more and more the character of provincial variants of a common language. Small signs accumulated during 1949 that the impetus behind the latter-day revolutions had spent itself and that consolidation and synthesis were the aims that painters would set themselves. It was significant, for example, that the Paul Gauguin exhibition in Paris was hailed as bridging the constructivist ideal of Paul Cézanne and the emergence of Vincent Van Gogh and providing a synthesis upon which the future could build. One could note, on the one hand, the volte face of an artist like Giorgio De Chirico, who now renounced his earlier surrealism and wished to return to tradition; on the other, the admittance in 1949 by the conservative Royal Academy in London of a gallery of "modern" painting. Beneath the surface froth of conflicting theories, indeed, strong tides could be sensed moving towards unification. It would have been a mistake to seek in this tendency indications of a return to purely objective realism—that, it could be taken for granted, was a thing of the past. Either society as a whole would learn to understand this new language of painting, or art would be encouraged for its therapeutic properties in schools, hospitals and prisons; or it would retain a faint, vestigial existence under governmental patronage and otherwise disappear into the new problems of industrial design (for the man-in-the-street would as happily accept distortions and abstractions in his applied arts as he would through habit reject them in his fine arts). Against this general slowing up, then, of the radicalism of the first half of the century could be seen the developments of 1949.

In Great Britain the neo-romantic movement which emerged after World War II lost a good deal of its ebullience and many of its specifically indigenous qualities. Graham Sutherland, his leading painter, completed his first important portrait (of Somerset Maugham) but exhibited no new work. John Piper was commissioned by the government to undertake six decorative panels on themes of Regency architecture for the British embassy in Rio de Janeiro—the first example in the
country of official patronage of this kind. The younger wing of
the movement—Robert Colquhoun, John Craxton, Robert
MacBryde, John Minton and Keith Vaughan—seemed, in
many cases, to be marking time (though it may be noted that
both Craxton and Minton boldly attempted statements on a
considerable scale). A relative newcomer, Prunella Clough,
whose work related to these artists, promised to go far. Two
painters on the most literary wing, Francis Bacon and Edward
Burra, showed examples of their ominous, macabre and often
powerful talents. From the other extreme of complete
formalism relatively little came to light, but William Gear and
Peter Folds showed interesting work of a non-figurative kind.
Perhaps the most intriguing development in this field was
the arrival of Victor Pasmore, once the most talented painter of
the so-called Euston Road group, at the stage of the abstract
collage—the very negation and antithesis of all the neo-
impressionist realism the group stood for a decade before.
Other original members, pupils and followers performed a
useful function within the Royal academy, where they served
to leaven the stodgier painting and to stiffen the more frivolous
with their often unimaginative but always serious pictures.
Ivor Hitchens could be instanced as an unattached artist,
whose flashing horizontal canvases showed during the year
that his powers were in no way diminished. Matthew Smith,
who likewise derived ultimately from the fauvist movement,
was created a C.B.E. for his services to painting.

In France the form, as always, seemed more important than
the content. The scene was still dominated by Pablo Picasso,
Georges Braque, Fernand Léger and Henri Matisse, all of
whom were shown extensively during the year. Matisse
continued work upon the designs for the chapel Ste. Marie du
Rosaire, to be built at Vence. Younger painters swung
between the figurative and the non-figurative. Broadly,
the former attempted to integrate the diverse discoveries of their
elders, and a number—among them Jean Bazaine, Pierre Tal
Coat, André Fougeron, Alfred Manessier, Edouard Pignon
and Francis Taillew—achieved a personal idiom of near-
abstraction which, however, never departed completely from
the object. In contrast to much of this painting, which with
a fine disdain for cuisine, relied often upon scribbled expanses
of very thin paint, might be cited the work of Bernard Buffet,
Clavé and Claude Venard whose approach was altogether
more reticent in method and human in feeling. The
leading figures of the non-figurative school, which leaned
towards an excessively linear treatment, were perhaps Hans
Hartung and Gerhard Schneider. It was not easy to see in
the work of any of these Parisian painters, however,
more than facility and a trational feeling for the medium.

A particularly strong group of non-figurative or "concrete"
artists was to be found in Sweden, where Olle Bonnier, Karl
Axel Pehrson and Pierre Olofson not only exhibited together
but decorated the exterior of a large sports exhibition in
Stockholm in a manner recalling earlier Bauhaus experiments.
Italian painters, having entered with vehemence into the
contemporary movements of Europe in the postwar period,
began to settle down to enjoy their creative freedom. Germany
had begun to extricate itself from the slough of its recent past,
and under such names as Carl Hofer, Willi Baumeister, Max
Pechstein and Karl Schmidt-Rottluff (all of them teaching
in the academies) felt its way towards the main stream again:
it was noticeable that the more extreme cases of disillusion,
which were so marked a feature of the years after World War I
were much less in evidence in 1949. Belgian painting lost a
historic figure with the death of James Ensor (see OBITUARIES);
Anglo-Polish painting suffered by the death of Jankl Adler
and international theatre design through the death of Christian
Bérard (see OBITUARIES). (M. H. Mx.)

United States. The cultural crisis of painting, concerned
more and more with ratified problems of form and void of
human significance, was discussed in magazine articles by
such leaders of U.S. artistic life as Lincoln Kirstein, Lester
Longman and Francis Taylor. At the same time a crusade
against modern art was carried on but was vigorously opposed
by Alfred Barr, Jr., and Emily Genauer. Illustrated maga-
azines such as Life, View, etc., contributed to bring contempo-
rary painting in all aspects to the attention of millions of
readers. A number of round-table discussions held by Life,
Columbia university and the California School of Fine Arts,
San Francisco, California, shared a public concern with
contemporary art expression in painting.

The international exchange of travelling exhibitions of
old and modern masters increased. Especially important
was the show of contemporary Italian art at the Museum of
Modern Art, New York city. Works were contributed by
116 U.S. painters and collectors to the three museums of
Israel.

Anton Refregier finished his impressive cycle of wall
paintings dealing with the history of life in early California
in the Rincon Post Office annex in San Francisco. Rico
Lebrun completed his vast "Crucifixion" series which was
shortly to go on display at the Los Angeles County museum.
Peter Blume brought to completion and displayed another
absorbing composition, "The Rock."

The first prize at the Carnegie institute's annual exhibit
went in 1949 to Max Beckmann, who received an invitation
to join the staff of the Brooklyn Museum Art school, Brooklyn,
New York. The influence of this powerful artist, a newcomer
to the United States, was already felt in the work of
younger artists. Yet away from the main road of art Grandma
Moses remained the favourite of the U.S. public: there
existed a wide margin between the taste of the people
and the main currents of contemporary painting. (See also
ART EXHIBITIONS; ART SALES; DRAWING AND ENGRAVING;
MUSEUMS.) (A. N.)
PAINTS AND VARNISHES. Developments in the paint industry during 1949 were mainly improvements in established principles and techniques.

Since many pigments contain a high proportion of heavy metals, the wastage of available ore deposits and the difficulty of discovering and working new sources indicated increasing prices for these materials. To meet these circumstances a new pigment concept was evolved. Basically this consisted of coating an inert extender such as silica with a thin layer of active pigment sufficient to give the necessary life for normal paints.

Considerable attention was given to the development and investigation of titanium dioxide and interest centred on new titanium deposits discovered at Allard Lake, Quebec, Canada. A light stable pigment was claimed to have been obtained by exposing titanium dioxide to aluminium chloride vapour at a temperature in excess of 300°C, followed by calcination at 800°C.

An important advance in grinding technique was the introduction of a reductionizer which comminuted solid materials to very small particle sizes by impact and attrition in a curved tube through which a current of superheated steam or compressed air was passed. It was claimed that pigment materials treated thus could be ground fine enough for nothing to be retained on a 325-mesh U.S. testing sieve.

Considerable interest was aroused by the possibility of including silicones in paint formulations. They could be treated at high temperatures for long periods without crazing or becoming brittle. On account of their good heat resistance a range of electrical insulations resistant to very high temperatures became possible. Many silicones were highly water repellent and so were used to render surfaces hydrophobic.

There was much investigation and increased use of materials that were not orthodox paint constituents. Paint oils from wool fats and fish were more widely used and the possibility of obtaining paint oils from seaweed and sial leaf was examined.

Supply sources of petroleum chemicals for use in the paint industry increased during 1949. In Great Britain, the new Catarole plant at Partington, Cheshire, produced materials for paint, varnish, rubber and plastic products and for dyestuffs; the new chemical solvents plant at Stanlow, Cheshire, produced ketones, alcohols and ethers, many of which are useful in surface coatings.

A novel testing technique developed was the application of ultrasonics to the paint industry. It was claimed that the adhesion properties of synthetic paints and varnishes could be tested in less than a second with an instrument that used ultrasonic waves.

(E. N. T.)

1 The name Pakistan is composed of letters taken from the names of its components: Punjab, North-West Frontier province (of which the inhabitants are mainly Afghan), Kashmir (a province still in dispute with India), Sind and Baluchistan. The name was invented by C. Rahmat Ali, founder of the Pakistan movement, in 1933. The word pak means also "pure" or "clean."

As a result of the partition of the Indian sub-continent in Aug. 1947, by the end of 1948 nearly 6,599,000 Moslems entered Pakistan and about 5,563,000 non-Moslems migrated to India: the net increase in population resulting from this great migration was over a million. The total population in 1948 was estimated at 73,321,000. Languages: mainly Urdu, Punjabi, Baluchi and Pushtu in Western Pakistan and Bengali in Eastern Pakistan, but English remained in use as a medium of instruction in higher education. Religion: mostly Moslem (72-9%), with Sikh, Hindu, Christian, Parsee and other minorities. Chief towns (pop., 1941 census): Karachi (cap., 359,492; 1948 est. c. 1,000,000); Lahore (671,659; 1948 est., c. 1,000,000); Dacca (213,218); Rawalpindi (181,169); Multan (142,768); Sialkot (138,348); Peshawar (130,967).

Pakistan is a federation of provinces, and the federal executive consists of a cabinet of ministers appointed by the governor-general from members of the legislature and answerable to it. The Pakistan Constituent Assembly, elected on the basis of one member for every million inhabitants, was also the federal legislature. In addition, each of the four provinces (East Bengal, West Punjab, North-West Frontier Province and Sind) has an executive consisting of a governor in council responsible to the provincial legislature. Governor general, Khwaja Nazimuddin; prime minister, Liaquat Ali Khan (q.v.); minister of foreign affairs and Commonwealth relations, Sir Mohammad Zafrrullah Khan (q.v.).

History. As in the preceding year, the chief problem in 1949 was that of the "cold war" with the dominion of India over Kashmir. It was hoped that a settlement was in sight when it was announced, on the first day of the year, that the United Nations Conciliation commission had arranged a cease-fire, preparatory to a truce and to arrangements for holding a plebiscite. The commission proposed that the cease-fire arrangements should include: (a) the withdrawal of the tribesman and other unauthorized Pakistani nationals; (b) the withdrawal of the Pakistani army; (c) the withdrawal of the bulk of the Indian army. After this, arrangements were to

be made for ascertaining the will of the people by a free and impartial vote. The subsequent delays, finally ended in a deadlock (see India). The government of India assumed an inflammatory attitude throughout the proceedings and insisted as a preliminary on the disbandment of the Azad Kashmir forces, which would leave the Moslem population at the mercy of the rival faction under Sheikh Abdullah. Much disquiet was aroused by the recognition on the part of the Indian government of the son of Sir Hari Singh as maharaja, which was regarded in Pakistan as a ruse for the perpetuation of Dogra rule over the masses.

One of the major difficulties created by the partition was over the canals. In Western Pakistan, with its low rainfall, the water-supply was a matter of life and death for millions. The Ravi, Beas and Sutlej rivers rise in Indian territory and lower down they join the Indus. West Punjab and Sind depend for their livelihood on the complicated system of canals derived from this source. At the time of the partition, it was assumed that the system would remain intact and that some machinery for their joint control would be set up. After the partition, however, India put in a claim for the absolute control of all waters passing through its territories. The matter was discussed at an inter-dominion conference held at New Delhi in August, but no agreement was arrived at. It was felt that, failing a solution, the matter should be referred to the U.N. Security council.

Another cause of tension was the failure to settle the question of evacuee property. By an agreement arrived at in January, it was decided that the arrangement arrived at should be confined to the East Punjab and adjacent areas of the United Provinces, as it was only in these districts that substantial movements of the population had occurred. The Indian government on the other hand contended that it should apply to the whole of India. If this were admitted, Moslems in any part of the country would be liable to be deprived of their possessions, and this again would start a fresh exodus of refugees into Pakistan. On the other hand, the Indian government accused Pakistan of banning sales and exchanges of immoveable evacuee property and of taking over about a dozen of the leading non-Moslem firms in Karachi, on the ground that they were intending to leave the country.

The relations of the provinces with the central government were not altogether satisfactory. The exception was East Bengal, where Khwaja Nazimuddin was succeeded by his cousin, and the questions arising out of the influx of Hindus to West Bengal and a threatened famine were promptly dealt with. The only effective opposition was provided by the Congress party under H. S. Suhrawardy. In West Punjab a drive to put an end to political jobbery and corruption led to the resignation of the governor, Sir Francis Mudie, who came into conflict with the local branch of the Moslem League owing to his vigorous methods to combat the evil. Similar trouble had already arisen in Sind, where the prime minister, M. A. Khurho, was removed, and his successor, Pir Ilahi Bux, suffered a similar fate.

More serious was the friction which arose in the North-West Frontier Province, where the Pathans had never really been reconciled to Pakistani rule. The Durand line demarcated between Britain and Afghanistan in 1892 had left a kind of no-man’s-land between the two countries, where order had been kept by the establishment of strong points connected by strategic roads from which expeditions could be sent to deal with parties of raiders seeking to enter British territory. The position had never been satisfactory and, after the withdrawal of the British garrison, the Afghan government had sought to win over the Pathan tribesmen by encouraging malcontents like the fakir of Ipi and exploiting local grievances (see also Afghanistan). One of the last achievements of the Quaid-i-Azam, M. A. Jinnah, had been to counteract these attempts to stir up trouble by taking active measures to alleviate the poverty which was at the root of the discontent. Work was to be found for the tribesmen in road-building and hydro-electric schemes, irrigation and cottage industries. The most comprehensive of these schemes was one for the settlement of the unruly tribe of the Mahsuds of southern Waziristan in the Dera Ismail Khan district. About 2,000 ac. were allotted for the purpose, and further 5,000 ac. were being cleared for distribution when fit for cultivation. It was estimated that over 500 families would be settled in the area on holdings between 12 and 25 ac. within the next five years, and would be self-supporting.

The key to prosperity lay in co-operation between the two dominions. Their economics were complementary. Pakistan had certain raw materials, whereas India had coal, iron and manufacturing facilities; but the two had to be harnessed together in order to attract the foreign capital necessary for their development. The chief obstacle in the way of agreement was the deadlock over Kashmir. “Once Kashmir is out of the way,” the prime minister of Pakistan was reported to have said, “there should be nothing to divide us.”

Despite all handicaps, the economic outlook was hopeful. The State bank accomplished the difficult task of withdrawing Indian notes circulating in Pakistan and replacing them by its own currency, and partly received Pakistan’s share of the assets of the Reserve Bank of India. In order to keep down the cost of living and maintain conditions favourable to the country’s development, it was decided not to devalue the rupee. Pakistan’s exports, mostly jute, cotton, hides, skins and wool, did not admit of any appreciable expansion. On Nov. 25 the first Islamic international industrial and economic conference and commercial exhibition was opened at Karachi, and was the first attempt to unite the Moslem world on the basis of Islamic principles rather than political alliances. (See ISLAM.)

Of special significance was the movement to cultivate
friendly relations with the U.S.S.R. The prime minister, Liaquat Ali Khan was invited to Moscow, and Shaob Qureshi, formerly foreign minister of Bhopal state, was appointed first ambassador of Pakistan to the U.S.S.R.

**Agriculture and Fisheries.** Main crops ('000 metric tons): rice, 11,621; wheat, 3,317; barley, 136; sugar, in terms of gur, 998; jute 994 (71% of the Indo-Pakistani subcontinent); cotton, ginned, 212; rice 13, sesame 35; tea 20, tobacco (with India, 1947) 454. Livestock (in '000 head, 1939 est.): cattle 24,444; sheep 5,941; pigs 73; horses 1,461; goats 7,982; camels 3,303. Production of wool (in '000 metric tons on greasy basis, 1948-49) 11. Fisheries. annual catch estimated at 33 million lb.

In (1944 est.) 1,294 persons employed 186,814 Fuel and power (1948, 1949, six months, in brackets) coal and lignite ('000 metric tons) 241 (173), electricity (million kwh) 130 (77), crude oil ('000 metric tons) 47 6 (36-5). Raw materials ('000 metric tons, 1944 est.): salt 93; gypsum 25; chromite 21. Manufactured goods (1948): cotton cloth (million m) 86; cement ('000 metric tons) 325.

**Foreign Trade.** Imports. (1948) Rs.842 million; (1949, six months) Rs.744 million. Exports: (1948) Rs 867 million; (1949, six months) Rs.579 million.

**Transport and Communications.** Licensed motor vehicles (Dec 1948): cars 14,130, commercial vehicles 8,276. Shipping (Dec 1948) number of vessels 1,023, total gross tonnage 7,073.

**Finance and Banking.** (Million Rs.) Budget: (1948-49 est.) balanced at 950, (1949-50 est.) balanced at 1,110, (1950-51 est.) balanced at 1,156. Note circulation (old notes of the Reserve Bank of India over-stamped "Pakistan") and new notes issued by the State Bank of Pakistan from Oct 1, 1948. (Aug 1948) 855, (Aug 1949) 1,644. Gold reserve (Aug. 1949, in brackets, Aug 1948) 13 3 (5) 1 million U.S dollars Bank deposits (Aug 1948, in brackets, Jan 1949) 2,568 (2,682). Monetary unit shree with an exchange rate of Rs 9-29 (13 3 23 before Sept. 18, 1949) to the pound; Rs 1=2s. 2d. (1s. 6d. before the devaluation of the £)

**PALEONTOLOGY.** In 1948 attention was drawn to the remarkable work that had been done on the nature of graptolites by Roman Kozlowski. This work had then only been outlined but the full details were published in 1949. Otherwise the work of 1949 was a consolidation of knowledge from many parts of the world. The shells and other structures of very small animals and plants, such as the Foraminifera and diatoms and the spicules of sponges, were the subjects of continued study. In the new world Orville Bandy monographed the Eocene and Oligocene Foraminfera of Alabama and in the old world André Pastiels wrote an impressive study of the radiolarians, diatoms and sponges of the Belgian Eocene. Knowledge of the Polyzoa was increased by Michel Vigneaux who made extensive studies of the Bryozoa of the Aquitanian base, and revised the classification of the group. This work was expected to affect and interest workers far beyond the confines of France. On the opposite side of the world Frederico Lange monographed the polychete annelids of Devonian age in Brazil in one of the fine publications of the Paleontological institute of Itabaca, New York.

The crinoids, or sea-ilies, continued to be studied by Harrell Smith. Cephalocerates, such as Carboniferous forms but an Australian colleague, Curt Teschert, devoted himself to the later, Permian, crinoid Calceolaspispargu. Other invertebrate studies included the splendid work by Maxime Gilbert on the gastropods of the lower Miocene of the Loire; on the Silurian and later Trilobites of Britain in the final papers of F. R. Cowper Reed, and, in the tangled pathways of Ammonite nomenclature, by L. F. Spath.

In vertebrate paleontology, T. S. Westoll wrote an important paper on the evolution of the Dipnoi, stressing characters which could be taken to show advance and thus to give a clue to the rates of evolution. In Germany, the veteran student of fossil reptiles, Friedrich von Huene, described new remains of ichthyosaurs and plesiosaurs and discussed in detail the probable development of the terrestrial type of limb into the swimming paddle of the plesiosaurs and placodonts. He confined himself to the study of the forelimb and shoulder girdle which were of importance in the classification of the plesiosaurs. The same author also published a review of the lower Tetrapoda which summarized his views on fossil Amphibia and Reptilia. Each order and sub-order was diagnosed. This paper was published in a volume to commemorate the work of Robert Broom, whose distinction was fossil reptiles, and more recently, on the mammal, were world famous. During 1949 Dr. Broom lectured in America and Great Britain on his discoveries of Paranthropus and Plesianthropus. Information on these and other finds and a summary of present knowledge, in a popular form, was given by W. E. le Gros Clark in his _History of the Primates_.

In paleobotany, Tom Harris continued his studies in the Jurassic flora of Yorkshire. Francis Stockmans wrote on the _Végétaux du devonien supérieur de la Belgique_, a large work contrasting the Belgian species with those of other parts of the world and having an excellent bibliography.

In the field of evolutionary philosophy, two Americans made important contributions. A. S. Romer dealt with time series and trends in animal evolution and covered a wide field of invertebrate and vertebrate examples. He dealt also with evolution, regarding this primarily as an environmental effect, in many cases the scarcity of food, animals and plants being responsible for wide results. E. H. Colbert dealt with progressive adaptations as seen in the fossil record, confining himself to the fossil reptiles on which he is a leading authority. He abandoned this particular field, however, in an important essay on the paleontological principles significant in human evolution. Here he dealt with the theories of natural selection, with parallelism, irreversibility of evolution, orthogenesis and extinction. Professor Colbert lately made some important discoveries in the field but in 1949 his investigations were of an exploratory, rather than of a collecting nature.

(W. E. S.)

**PALAU (PELEW) ISLAND:** see TRUST TERRITORIES.

**PALESTINE.** The former British-administered mandated territory of 10,159 sq. mi. had been partitioned during 1948 and 1949 between the new state of Israel, which held four-fifths of its area, and the kingdom of Jordan, which occupied the greater part of the remainder. In the southwest a small strip of territory around Gaza (about 100 sq. mi.) was in Egyptian hands and in the northeast Syrian forces occupied some small frontier areas. No serious fighting took place after the conclusion of the final Israeli campaign in the Negev in Jan. 1949. (See ISRAEL.)

The population of the area of Palestine which remained in Arab hands could not readily be established because of the influx of refugees from Israeli territory. That of the Gaza district was estimated at 200,000, while the much larger mountain areas of Samaria and eastern Judaea, which was occupied by Arab legion forces from Jordan, was probably in excess of 600,000. The total number of Palestinian Arab refugees made destitute by the Arab-Israel war was computed by the U.N. Economic Survey Mission for the Middle East at 652,000. During 1949 most of them were in receipt of food and medical assistance from U.N. agencies or voluntary relief organizations.

The Old City of Jerusalem, Nablus and Hebron were the main Jordan-held centres of Arab Palestine, administered by governors appointed by King Abdullah of Jordan, who had strengthened his Amman government by the inclusion of some Palestinian Arab leaders. But there was no formal act of annexation or incorporation of the area into Jordan.
The United Nations still regarded Palestine as one area for purposes of conciliation and economic development and maintained a staff with permanent headquarters at the government house in Jerusalem, in an enclave between Jordan- and Israel-held territory. By a resolution of the general assembly of Dec. 1949, the U.N. laid claim to the administration of Jerusalem (q.v.) and its environs.

A History of Palestine from 135 A.D. to Modern Times (London, 1949) (J. Wk.)

PANAMA. A republic of Central America adjoining South America. It is bisected by the canal zone, which is leased to the United States. Area: 28,575 sq. mi. Pop. (mid-1949 est.): 736,800. Both area and population are exclusive of the canal zone. The racial composition includes Europeans (11%), native Indians (9%), Negroes (14%), mestizos or mixed (65%), the rest being Asians. Language: Spanish.

Religion: Roman Catholic 93%, Protestant 6%. Chief towns (1949 est.): Panama City, on the Pacific coast (cap., 146,117); Colon, on the Atlantic coast (54,334). Presidents in 1949: Domingo Diaz Arosemena, Daniel Chantis, Roberto F. Chiari and Arnulfo Arias Madrid.

History. The year 1949 was featured by a rapid succession of presidents. The administration weathered one crisis when an alleged plot against the government was discovered in April and thwarted by a suspension of constitutional guarantees and the arrest of several political figures. Among those detained were the brothers Harmodio and Arnulfo Arias, both former presidents.

A heart ailment caused President Diaz Arosemena to retire in July, and he died on Aug. 23. He was succeeded on July 28 by the first vice-president, Daniel Chantis, Jr. The new president lifted the state of siege, released those arrested in connection with the plot and undertook to break the meat-packing and bus-transportation monopolies, allegedly controlled by national police personnel. The latter policy provoked a clash between Chantis and the chief of police, Colonel José Remón, and on Nov. 20 Colonel Remón forced Chantis to resign in favour of the second vice-president, Roberto F. Chiari. Chantis, however, made a dramatic appearance before the National Assembly and withdrew his resignation, explaining it had been signed under coercion. His reinstatement was upheld by the Supreme Court on Nov. 24 but he was ousted the same day by Colonel Remón and replaced by Arnulfo Arias Chantis fled; Chiari retired; and Arias was sworn in as president on Nov. 25.

Arias referred the legality of his position to the national election jury. This body had denied him a majority in the presidential election of 1948 by invalidating a large number of his votes and proclaiming Diaz Arosemena elected. Now it reversed its decision and declared that Arias was legally elected and therefore the constitutional president. A general strike in protest of the coup ended Nov. 28 and the National Assembly accepted Arias as president on Nov. 29.

The threat of a world-wide boycott of shipping under Panama registry lingered throughout the year as the International Labor organization investigated working conditions on the country's flagships.

Education. Schools (1948-49). primary 922, teachers 3,175, pupils 101,249, secondary 15, teachers 316, pupils 7,155, professional 52, teachers 497, pupils 9,149; National university, professors 76, students 1,343

Agriculture. Main crops (1948): '000 lb. ) rice 166,065; corn 102,912, beans 12,718; coffee 8,283, potatoes 4,137.

Forestry. Exports during 1948 were estimated at $10,477,726 and imports at $63,775,726. The chief exports were bananas, cacao beans, coconuts and abaca fibre.

Governor, Brigadier General Francis K. Newcomber.

Discussions of canal modernizations were continued during 1949 without decision, and the study of proposed toll increases was postponed until 1950. On Sept. 21, 1949, commercial air operations were transferred from Albrook field to Panama's new national airport. A committee representing labour organizations, investigating conditions in canal zone employment, reported in February that racial discrimination existed in housing, schools, hospitals and wage rates. In September employment by the canal and Panama Railroad company was reportedly the lowest since 1940.

Education. In 1948 there were 14 schools with 4,219 pupils and a junior college for whites, 14 schools with 2,973 and a normal school for coloured pupils.

Finance. Total canal revenues (1947-48): $20,298,260; net expenses, $18,235,062, net capital investment, $516,322,328. In the nine months, 4,678 ships passing through the canal carried cargoes totalling 24,117,788 tons and paid tolls amounting to $19,956,593. The canal traffic was up 3-7% during the first nine months of 1949 from the same period of 1948.

PAN-PAMERICAN UNION: see ORGANIZATION OF AMERICAN STATES.

PAPAGOS, ALEXANDROS, Greek army officer (b. Athens, Dec. 9, 1886), son of General Leonidas Papagos and Marie nie Averoff. After studying at the Greek War academy, Brussels Military academy and the Cavalry school at Ypres, Belgium, he was commissioned in 1906 in a Greek cavalry regiment. He served in the Balkan wars (1912-13), reaching the rank of major during World War I. As a lieutenant colonel he was chief of staff of a cavalry division during the Asia Minor campaign (1919-22). From 1927-32 he was major general in command of the Larissa cavalry division. He was appointed deputy chief of staff in 1932, inspector general of cavalry in 1934 and a year later was promoted to lieutenant general and appointed commander of the 3rd (Salonika) army corps. Papagos was for a few months minister of war in the Georghios Kondylis cabinet (1935) but after the return of King George II was appointed inspector general of the Greek army and in 1936 chief of the general staff. When Italy attacked Greece on Oct. 28, 1940, he was commander in chief of the Greek forces. He checked the Italian invasion, took the offensive and conquered the southern part of Italian-occupied Albania; but when German forces, coming from Bulgaria, also attacked Greece (April 6, 1941) neither his moral prestige nor his skilful strategy could hold out against superior mechanized force. He remained in Greece after the occupation of the country, was taken as a hostage by the Germans in 1943 and imprisoned in various concentration camps, including Oranienburg and Dachau. Liberated in May 1945 by the 5th U.S. army from a camp in the Tirol, Papagos returned to Greece, was recalled to active service, promoted full general in July 1947 and appointed commander in chief on Jan. 20, 1949.

In the Grammos-Vitsi area, familiar to him from 1940-41, he destroyed the remaining Communist rebel strongholds in Greece. On Oct. 28 he was promoted field marshal, the first Greek professional soldier to hold this rank.

M. L. M.
PAPER AND PULP INDUSTRY. The first postwar setback to the upward trend of the world pulp and paper industry was encountered during 1949. First intimation came with a sharp recession in the United States which, eventually felt in North America and Europe, was maintained until mid-year. This movement then gradually reversed and during later months the U.S. became substantial buyers in the Scandinavian market. Price declines and pulp and paper mill closures in many countries were features of the first half of the year but as 1949 closed Scandinavian prices hardened and tended to rise. Meanwhile in Great Britain, the Commonwealth and European countries there was a fictitious appearance of overproduction. As consumption in many countries was below prewar owing to government restrictions, lack of purchasing power and other reasons, world pulp and paper trade had still to effect substantial extra production before the prewar level of per capita consumption could be reached.

In Great Britain manufacture of many paper qualities improved; nevertheless statistics disclosed that paper production was only 80% of 1939 although that of paperboard was well above prewar. Whereas the receipts of papermaking materials from abroad reached about 85% of 1939, exports of paper and paperboards were returned at approximately 110% and imports at about 40%.

Vast potential world paper consumption was still recognized and news of heavy capital investment in new mills was reported. Concurrently efforts continued to be made by many countries to render themselves independent of pulp and paper importation but it seemed probable that expanding consumption would, for many years, keep ahead of this desire. Thus new material sources were constantly being looked for and in this respect undoubtedly straw would become increasingly important as time progressed because existing papermaking materials, particularly wood pulp, would not be capable of meeting the constantly expanding demand for paper.

In India, where production remained at approximately 100,000 tons for a population of nearly 400 million the first newsprint mill was being erected and other projects were in view. Canada, which supplied 60% of the world's newsprint, continued to expand production and new mills were in course of erection. New Zealand proposed to build a state-owned pulp and paper mill at Murupara; Australia was also building rapidly; and the successful use of a new raw material, Cann a lily, promised to supply, among other articles, pulp for papermaking.

In Europe, Sweden produced less than prewar and appeared to have reached the limit of pulp production, as cutting for many years was too high for re-growth of forests. To overcome present shortage efforts were being made to increase yield and make better use of present supplies. Latest published figures from France indicated steady improvement in production of both pulp and paper. In the British zone of Germany 1948 production was nearly double that of the previous year and 1949 produced further progress. Similar reports were received from other European countries.

The Food and Agriculture organization predicted that there would be an under-production of pulp by 1955 of one million tons. It was estimated that the world demand in that year would be 37.2 million tons and production 36.3 million tons. (V. S. S.)

United States. The estimated production of paper and paperboard in the United States for 1949 was approximately 20.1 million tons, or about 10% less than in 1948. At the end of 1949 the industry was running at more than 99% of capacity, with both production and prices stable.

Canada. Canadian production of pulpwood in the 1948-49 season was estimated at about 9.4 million cords. Production of wood pulp continued at the record established in 1947. No new mills were built in 1948 or 1949, but modernization of newsprint mills resulted in an increase of 150,000 tons in 1948. The pulp and paper industry held first place in the dominion in regard to gross value of products.

PAPUA-NEW GUINEA. Under the Papua-New Guinea Provisional act 1949 the territory of Papua and the trust territories of (former German) New Guinea are united into a single area administered by the Commonwealth of Australia. Areas: Papua, 90,540 sq. mi.; New Guinea proper, 69,700 sq. mi.; New Britain, New Ireland, Admiralty islands and certain of the Solomon islands (included in the trust territory), 23,300 sq. mi. Population (1941 est.): Papua, Native about 300,000, white 3,070; New Guinea (including the islands), Native 684,300, white 4,100. Capital of joint administration: Port Moresby (pop., 1937 est., 3,000). Administrator, Colonel J. K. Murray.

History. In Jan. 1949, Cyril Chambers, acting minister of external affairs, visited Papua and New Guinea and on his return stated that with proper development the territories could supply Australia and other markets with cocoa, tea, coffee, rice and jute. A bill to ensure that New Guinea retained its separate identity as a trust territory and did not become merged with Papua was passed during the year by the federal parliament at Canberra.

In October a severe earth tremor shook the Rabaul area on the island of New Britain. More than 20 landslides were caused on the road from Rabaul to Kokopo. Already in 1937 severe earthquakes at Rabaul had caused the capital to be moved from Rabaul to Port Moresby. W. J. McKell, governor general of Australia, visited Port Moresby at the end of July and Rabaul at the beginning of August.

At the third session of the South Pacific commission (g.v.) at Noumea, New Caledonia, in May, preliminary consideration was given to arrangements for the first South Pacific conference representing the Native peoples of its Pacific island groups and the Kingdom of Tonga. The conference, at which delegates would be present from Papua and New Guinea, was planned to be held in April 1950 at Suva, Fiji.

On Oct. 11, 1949, the Australian government set up a cabinet sub-committee of five cabinet ministers and also an inter-departmental committee. These committees were set up to prepare schemes and report upon measures for the co-ordination of development of Papua and New Guinea.

When at the end of the year the new Indonesian government claimed the annexation of the Dutch western half of New Guinea (152,089 sq. mi.), Australian public opinion considered that this claim was not substantiated.

PARAGUAY. A land-locked republic in south-central South America, bounded on the N. and in the E. by Brazil, on the S. by Argentina, and on the W. by Bolivia. Area: 157,047 sq. mi., of which 95,338 sq. mi. constitute the sparsely populated Chaco, while the 61,709 lying east of the Paraguay river contain 95% of the population. Pop. (mid-1948 est.): 1,270,000. The people are a homogeneous mixture of Guarani Indian and Spanish, with a small proportion of Portuguese and Italian stocks. Spanish is the official language but Guarani dialects are used by the majority of the population. Chief towns (pop., 1948 est.): Asunción (cap., 130,067); Villarica (31,081); Concepción (16,487). The official religion is Roman Catholic, and the archbishop is president of the Council of State. Presidents in 1949, Juan Natalicio González, (from Jan. 31) General Raimundo

History. On Jan. 30, 1949, an army faction headed by General Raimundo Rolón, with leanings toward Franquismo (Liberal Socialism), forced the resignation of President González, of the “Guión” (battle-standard) branch of the Colorado party. As provisional president, General Rolón proclaimed that political exiles of all opinions might freely return to Paraguay and participate in the new presidential elections which he set for April. Faced with this situation “Guión” and “Democratico” factions of the Colorados pooled their influence with the various army officers. They thus succeeded in taking over the government from General Rolón on Feb. 26, during the funeral ceremonies of the archbishop, and installed as provisional president Felipe Molas López, of the “Guión” faction. Molas was made the sole candidate in the April elections, as the Liberal and the Franquista (Febreroista) exiles did not return. He assumed office formally on April 17, with ostensible support from both Colorado factions; but during the summer the ascendancy of the “Democraticos” became sufficiently pronounced to induce the Colorado governing board to direct Molas to resign. On Sept. 11 Federico Chaves was made president, ruling the country on behalf of the governing board (which also dominated the parliament). On Nov. 10 Chaves, a veteran Colorado leader who had borne the brunt of his party’s labours during its long years in opposition, issued a decree calling for another election in July 1950; but no indication was given as to whether the Liberals and Febreristas would be involved.

Industry. Quebracho (tannin) was extracted from timber logs in the Chaco region, providing (1948) 48,000 metric tons which was about a quarter of total world production. Petigrain oil was distilled from the leaves of a bitter orange tree and used in the manufacture of perfume; Paraguay was the world’s leading producer: (1946) 407 metric tons. Mineral resources are extremely meagre.

Foreign Trade. (1948) Imports 75 million guarans; exports 87 million guarans. Principal imports: foodstuffs, textiles and textile manufactures, vehicles and accessories and metals and metal manufactures. Principal exports: timber, cattle, hides, cotton, quebracho extract and canned meat. Main sources of supply (1948): Argentina 34%, United States 27%, United Kingdom 14%, Brazil 6%. Main destinations of exports (1947): Argentina 33%, Uruguay 8%, United Kingdom 6%, Netherlands 1%.

History. In general, throughout 1949 there was a gradual return to normal peacetime conditions. There were no important or violent strikes. Food, though usually expensive, was good and plentiful; and rationing was abolished, although many price controls were retained. Paris continued to be the scene of various important international conferences, some of the most noteworthy being those of the Organization for European Economic Co-operation, which held meetings in February, April and September, and the Council of the Food and Agriculture organization which met in June. The World Congress of the Partisans of Peace was held from April 20-25, under Communist auspices.

A certain amount of dissatisfaction with prevailing conditions manifested itself in a series of strikes, which were, however, of short duration. There was unrest in the civil service, in some transport services and in the nationalized Renault works. On May 7 the government issued requisition orders for staffs of Air France who had struck because of inadequate pensions and were demanding “charters” for
PARLIAMENT, HOUSES OF

flying staffs. In late July a strike of midinettes or dressmakers threatened the Paris fashion shows. On Nov. 25, the métro and buses ceased running as part of the 24 hr. general strike occasioned by the government’s refusal to extend the special wage bonus, granted earlier in the year, to all workers instead of merely to those in the lowest-paid categories.

A welcome event during 1949 was the re-opening of three museums in the Palais de Chaillot which had been occupied in 1948 by the United Nations general assembly. These were the Musée de l’Homme, Musée de la Marine and Musée des Monuments Français. The Musée de Cluny was also re-opened.

In October, the new “territorial brigades” of police were introduced in an effort to counter increasing brigandage in Paris and its suburbs. In July the London Symphony Orchestra, paying its second visit to Paris since 1905, was warmly received. Works by William Walton and Vaughan Williams were included and the orchestra was conducted by Gaston Poulet.

The city’s budget for 1949 was balanced at Fr.42,673 million.

PARLIAMENT, HOUSES OF. For the first time since 1939 both houses sat on a Saturday when on July 30 they assembled to conclude outstanding business before the summer adjournment. The ten-week recess was interrupted on Sept. 28 when both houses reassembled to debate the government’s policy of devaluing the pound sterling. The House of Commons sat for three days, and the Lords for two days. The session, which had been opened by the King on Oct. 26, 1948, continued until Dec. 16, 1949. This long session was held in order to pass the Parliament bill and the Iron and Steel bill before parliament was dissolved.

The Parliament bill was passed by the House of Commons on Nov. 14, but on Nov. 29 it was rejected for the third time by the House of Lords. Under the procedure of the Parliament act 1911 the bill could then become law despite its rejection by the Lords and it received the royal assent on Dec. 17. In November the government introduced a series of amendments to the Iron and Steel bill whereby the industry could not be taken over by the state until after the 1950 general election, thus meeting the opposition of the Conservative peers. These amendments were accepted by both houses and the bill became law on Nov. 24.

The latest constitutional date for the dissolution of parliament was Aug. 1950, but in the autumn of 1949 it was widely believed that the government favoured an immediate general election, and on Oct. 13 the following statement was issued from No. 10 Downing street: “Having regard to the disturbing effects on trade and industry and on the national effort by the continuance of speculations as to an early general election, the prime minister thinks it right to inform the country of his decision not to advise His Majesty to dissolve parliament this year.”

The strength of the Labour party in the House of Commons was reduced by three during the year. On May 18, K. Zilliacus (Gateshead) and L. J. Solley (Thurrock, Essex) were expelled from the Labour party, and L. Hutchinson (Manchester, Rusholme) was expelled on July 27. With D. N. Pritt (Hammersmith, north) and J. Platt-Mills (Finsbury) they formed an independent labour group under the chairmanship of D. N. Pritt. Alfred Edwards (Middlebrough) and Ivor Thomas (Keighley, Yorkshire), both of whom had been elected as Labour members but later sat as independents, received the Conservative whip.

On Jan. 27, for the first time since 1938, a ballot was held for private members’ bills. 353 members entered for the ballot; 25 names were drawn and the bills formally introduced on Jan. 28. Among those which were rejected at the second or third readings in the House of Commons were the Protection of Animals (Hunting and Coursing Prohibition), Spelling Reform, Analgesia in Childbirth, Hairdressers (Registration). The first private members’ bill to receive the royal assent was the Slaughter of Animals (Scotland), which received the assent on July 30.

Six by-elections were held in 1949. In the 52 by-elections since the 1945 general election the results were:

<table>

In December J. J. Lawson (Labour, Chester-le-Street) was appointed vice-chairman of the National Parks commission and this being an office of profit he was appointed steward of the Chiltern Hundreds.

The clerk of the parliaments from 1934, Sir Henry Badeley, retired on May 30 and was succeeded by Robert Overbury, who had been clerk assistant of the parliaments from 1937. In the birthday honours list Sir Henry was created a baron; and he took the title of Lord Badeley, of Badley, Suffolk. Admiral Sir Geoffrey Blake, Gentleman Usher of the Black Rod from 1945, resigned in January owing to continuing deafness from gunshot; the King appointed Lieutenant General Sir Brian Horrocks to succeed him.

Other new peers created in 1949 were: Lord Adams (J. J. Adams), Lord Dugan of Victoria (Sir Winston Dugan), Lord Boyd-Orr (Sir John Boyd Orr), Lord Macdonald of Gwaenysgor (Sir Gordon Macdonald) and Lord Archibald (George Archibald).

The government chief whip in the House of Lords, Lord Ammon, resigned in July after criticizing the government for their handling of the London dock strike. Lord Shepherd was appointed to succeed him. Lord Milverton resigned from the Labour party in opposition to the Iron and Steel bill and later joined the Liberal party.

Only one matter was referred to the Committee of Privileges. On July 26, the House of Commons referred a complaint by R. Blackburn (Labour, King’s Norton) that he had been misrepresented in a report in the Daily Worker. The committee reported on Oct. 20 that the report did not call for any action by the house.

In January a delegation from the House of Commons led by Major James Milner, deputy speaker, and accompanied by Major E. A. Fellows, clerk assistant, visited Ceylon, where on Jan. 11, they presented to the House of Representatives a speaker’s chair and mace. These gifts were made for the purpose of marking Ceylon’s attainment of fully responsible self-government and full membership of the Commonwealth which took place on Feb. 4, 1948.

Commonwealth. Changes in the sizes of the houses in three of the dominions came into operation during the year. In Canada, the confederation with Newfoundland added seven members to the House of Commons and six to the Senate. In Australia the House of Commons was enlarged from 75 seats to 122 and the Senate from 36 to 60. In South Africa the South West Africa Affairs Amendment act received the assent of May 3. Under this act four seats would be added to the House of Assembly for representatives of South West Africa and two in the Senate.
In December the British Columbia Legislative Assembly elected Mrs. Nancy Holmes as speaker. She became the first woman speaker in the commonwealth.

(X.)

PATEL, SARDAR VALLABHBHAI, Indian politician (b. Karamsad, near Nadiad, Oct. 31, 1875), was educated at Nadiad high school. He became a barrister and was called to the bar in London and also practised at Ahmedabad. He soon became associated with Mahatma Gandhi and was imprisoned many times for civil disobedience activities. He was a member of the working committee of the Indian National Congress, and on Sept. 1, 1946, took office as minister for the home department, information and broadcasting in the interim government. After the granting of independence on Aug. 15, 1947, Sardar Patel became deputy prime minister and minister for states, home, information and broadcasting. As minister for states he was responsible for the integration and democratization of the Indian states. The process of integration was completed on Oct. 15, 1949, and Sardar Patel sent messages to the peoples of Benares Manipur and Tripura, the states concerned in the final transfer. After the Commonwealth conference in London in April had made known that it had been found possible for India to be an independent republic within the Commonwealth, Sardar Patel described its decisions as "bold and momentous." In May, in the debate in the constituent assembly on the proposal to abolish seats in the legislatures for minority communities, he said "we are to-day laying the foundation stone of a true secular democratic state, where everybody has equal chance and equal opportunity." On June 4 he inaugurated the armed forces academy at Dehra Dun. The Kasturba Gandhi trust, in memory of the wife of Mahatma Gandhi, re-elected Sardar Patel chairman for a further period of three years in June 1949. In February Pandit Nehru unveiled a bust of Sardar Patel in Godhra (Gujarat). Pandit Nehru also laid the foundation stone of Vallabhb Vidyaya-Nagar, a university town to be known after Sardar Patel.

PATENTS. The year 1949 saw the passage of an important Patents and Designs act in the United Kingdom but was otherwise relatively uneventful in the domain of patents. That act made numerous changes in the law in substantial agreement with the recommendations of a departmental committee. Subsequently, a bill to consolidate the whole of the existing law relating to patents and a similar bill in respect of the law relating to industrial designs were introduced into parliament; they were expected to become law and to come into operation on Jan. 1, 1950. The agreement between Belgium, France, Luxembourg and the Netherlands for the establishment of an International Patents Search office at The Hague was duly ratified and the first steps towards its establishment were taken. The main function of this office would be to issue to the governments of the contracting countries qualified advisory opinions on the novelty of inventions for which applications for patents were filed with the national patent offices. The intention was that the new office should commence to operate at the beginning of 1950. In the meantime use was made of the staff and documentation of the Netherlands Patent office, but the International office hoped in due course to recruit and train its own staff and to establish its own collection of search material.

A project for a European Patents Search office was submitted to the consultative assembly of the Council of Europe and was referred to the council of ministers for examination. If an efficient and economical scheme could be evolved notwithstanding the immense administrative and practical difficulties, there would be repercussions on the position of
At the end of 1949, the Patent office had granted more than 2,492,000 patents, of which about 600,000 were unexpired. More than 40,000 unexpired patents were listed on the register of patents available for licence or sale—the new listings being published in the Official Gazette.

The comprehensive revision of the patent rules of practice undertaken in 1946 was concluded and published as Rules of Practice of the United States Patent Office in Patent Cases, effective March 1, 1949. In Nov. 1949 the Manual of Patent Examining Procedure was published. Also published in 1949 was the Guide for Patent Draftsmen. The project undertaken in 1948 to perfect the patent copy reference collection maintained for public use in the research room continued during the year. (See also Inventors, Awards to.) (J. A. ML.)

PAUKER, ANA, Rumanian politician (b. Codaesti', Moldavia, Dec. 31, 1893), the daughter of Zvi Rabinsohn, a shohet or Jewish slaughterer, was appointed on Nov. 7, 1947, minister of foreign affairs. (For her early career see Britannica Book of the Year 1949.)

On April 15, 1949, she was appointed one of the three Communist deputy prime ministers. On July 10 she was present at Sofia at the burial of G. Dimitrov. With G. Groza and Gheorghiu-Dej, one of the deputy prime ministers, she headed the Rumanian delegation to Moscow on the occasion of Joseph Stalin’s 70th birthday on Dec. 21. On Dec. 30, second anniversary of the proclamation of the Rumanian people’s republic, the Moscow Prawda published an article by her commenting on the event.

PAUL I, King of the Hellenes (b. Athens, Dec. 14, 1901), succeeded to the throne on April 1, 1947. (For his early life see Britannica Book of the Year 1949.)

On Jan. 16, 1949, urging the formation of a strong national government, he stated that if such a government were not formed within 24 hours he would find another solution for which he hoped the parliament would grant full support. However the political party leaders agreed to form a coalition government and requested the King to nominate its prime minister. The King complied by appointing T. Sopoulis, the Liberal leader. During the year he visited various battle areas where fighting was going on against the Communist rebels, and also during August and September the liberated Vitsi and Grammos areas. On Sept. 14, speaking in Athens, he appealed to the whole of the Greek nation to contribute to the work of relieving the suffering of 700,000 refugees. On Oct. 9 the King and Queen Frederika left Athens on a tour of inspection of the Cyclades and Aegean islands. On Oct. 26 they were in Salonika for the celebration of the anniversary of its liberation by the Greek army in 1912. On Nov. 15 the King and Queen travelled to Tripolis (Peloponnesus) for the opening of a reconstructed road.

PEARSON, LESTER BOWLES, Canadian diplomat and statesman (b. Toronto, April 23, 1897), was educated at the University of Toronto and St. John’s college, Oxford. He served in World War I in Salonika and in 1917 transferred to the Royal Flying Corps. From 1924 to 1928 he was assistant professor in history at the University of Toronto. In 1928 he joined the newly formed Department of External Affairs and was a first secretary in Ottawa until 1935 when he went in a similar capacity to the office of the Canadian high commissioner in London. He was in Ottawa in the Department of External Affairs, 1941-42, and from 1942 to 1946 was in Washington, first as minister and later when the status of the mission was raised to an embassy, as ambassador. He returned to Ottawa to become under secretary of state for external affairs and on Sept. 10, 1948, was sworn in as minister for external affairs in succession to Louis St. Laurent. Pearson was a Canadian delegate at many international conferences including the San Francisco conference, 1945, and subsequently at United Nations assemblies in Paris and New York. At the special assembly in April 1947 to discuss the future of Palestine he was chairman of the political committee and on Sept. 20, 1949, he was again elected chairman of the political committee for the fourth general assembly. In 1948 he was elected to the House of Commons for Algoma East, Ontario. He was re-elected on June 27, 1949. He represented Canada at the Commonwealth conference in London in April 1949. On April 4, 1949, he signed the North Atlantic treaty in Washington on behalf of Canada.

PEASANT MOVEMENT. In Europe in general and in eastern Europe in particular the Peasant, Populist or Agrarian parties always stood for truly democratic political systems and radical land reforms. “Land and freedom” was their slogan: low taxes and good prices for agricultural produce were their aims. These parties rejected Socialism because it meant nationalization of land; they stressed, however, the necessity for setting up co-operatives for specific purposes or embracing the whole life of a village community. This was challenged by the Communists and, though by 1949 they still owned the land in the people’s democracies, they were neither politically free nor could they hope for a satisfactory settlement of their economic claims.

In a speech at Budapest on March 5, 1949, published under the title “On the Character of our People’s Democracies” in Tarsadalmi Szemle, (Budapest, March-April 1949), József Révai, a prominent Hungarian Communist, admitted that the Communist parties had misled the Baltic, Danubian and Balkan nations into believing that a people’s democracy was merely a plebeian and popular form of bourgeois democracy and that the land reforms of 1944-45 were made in defence of small landowners. He recalled the insistence of both Lenn and Stalin on the fact that all power had to be in the hands of the proletariat and that it could not be shared with peasants or any other class of the population.

During 1949 the role of the Peasant parties in Soviet-dominated Europe was reduced to one of subservience. In Bulgaria, Gheorghi Traikov, secretary general of the Bulgarian National Agrarian union (Bigarski Zemedelski Naroden Sayuz), was still deputy prime minister. In Hungary, István Dobi, chairman of the purged Smallholders’ party (Kisgazda Párt), was a figurehead prime minister, but the minister of agriculture was Dr. Ferenc Erdei, a Marxist, leader of the small National Peasant party (Nemzeti Paraszt Párt). In Poland a fusion took place on Nov. 27-30 of the rump Polish Peasant party (Polskie Stronnictwo Ludowe)—formerly associated with Wincenty Witos and Stanislaw Mikolajczyk—and the Communist-controlled Peasant party (Stronnictwo Ludowe). The chairman of the latter, Wladyslaw Kowalski, became chairman of the executive committee of the new United Peasant party (Zjednoczone Stronnictwo Ludowe), and Józef Niečko, leader of the P.S.L., was elected chairman of the national council of the United party which accepted the Communist leadership in the state and the form of people’s democracy as a transition towards a Socialist economy. In Rumania Dr. Petru Groza, leader of the Ploughmen’s front (Frontul Plugarilor), continued to serve as prime minister under the supervision of his three Communist deputies. In the Soviet zone of Germany, Ernst Goldenbaum, a leader of the Democratic Peasant party (Demokratische Bauernpartei), formed in 1948, on Oct. 12 was appointed minister of agriculture.

Collectivization in the satellite people’s democracies by the end of 1949 was still in its initial stages. Even Bulgaria, whose aim was to collectivize 60% of all arable land by 1953, had
only 1,594 labour agricultural co-operatives covering 11·2% of the arable land by Sept. 1949. In Hungary there were at the same time 587 producers' co-operatives covering 1·3% of all arable land; and in Poland there were 170. In Rumania the first 55 producers' co-operatives—called *gospodaria agricola collectiva*—were formed during August and September.

In non-Cominform Yugoslavia, Mijalko Todorović, minister of agriculture, announced in the national assembly, or Skupština, on May 27, 1949, that there were 4,250 peasant co-operatives, representing an average of one cooperative for every three villages. Yugoslavia's working co-operatives were divided into four types, varying from a "lower" type, where land was worked in common but owned individually, to a "highest" type, where land was both worked and held in common. The idea was understood to be that eventually all co-operatives should conform to the highest type.

During the year Communist leaders in the satellite countries warned their followers not to press collectivization. The Bulgarian Communist party on June 21 published a resolution complaining of excess of zeal among its members in forcing the pace on farmers. In Hungary Mátéyás Rákosi stated in a speech on Aug. 17 that though most peasants were still "the slaves of private ownership," their attitude was changing and he hoped that by the end of the year 5%-6% of the arable land would be under collective ownership. In Rumania Vasile Luca, in an article published by the Cominform journal on Aug. 1, admitted that conditions permitting the mass liquidation of the kulak class (richer peasant proprietors) were not yet present. At the merger congress of the Polish Peasant parties it was stated that when conditions were ready and where the peasants had understood the matter producers' co-operatives would be set up. In all people's democracies "poor" and "medium" peasants were helped at the expense of the kulaks. Differential taxes were imposed on the latter, prices and credits were regulated to the same end and compulsory savings were required from the "rich" peasants who were not to be allowed to hold office in any political or economic organization.

That Communist leaders were cautious in applying collectivization was due to the fact that economic planning in the people's democracies was under the supervision of the Council of Mutual Economic Assistance, formed in Moscow in Jan. 1949. All satellite countries embarked on a policy of building up heavy industries as quickly as possible. This emphasis was bound to delay economic development and a rise in the standard of living. As the U.N. Economic Commission for Europe puts it in its *Economic Survey of Europe in 1948* (Geneva, May 1949), the alternative of concentrating on the light industries or on agriculture would require heavy imports of both agricultural and industrial machinery "on which these countries, partly for political or strategic reasons, do not wish to rely." In other words, the satellites, following the Soviet veto of 1947 on joining the Organization for European Economic Co-operation, were left to their own resources, the U.S.S.R. being unable to help them fulfil their economic plans. The percentages of capital expenditure for agriculture in Bulgarian, Czechoslovak, Hungarian, Rumanian and Polish plans varied from 8% to 13% of the total investments as opposed to 39-49% of capital investment in mining and manufactures and 17-24% in transport.

Lack of mechanical equipment was another reason for the slow rate of collectivization. During 1949 Polish producers' co-operatives acquired some 1,600 locally-built tractors. The arable area of Poland being over 41 million ac., the country would require for motorized cultivation a minimum of 55,000 tractors which would consume yearly 400,000 metric tons of petrol—seven times the existing national production. However, according to Stanisław Ignar, member of the executive committee of the United Peasant party, 60,000 tractors would be working in the Polish countryside by 1955. In Hungary there were in December 11,000 tractors out of which only 3,500 were owned by the state, but the country itself was believed to be producing about 3,000 tractors yearly. In Rumania, according to V. Luca, there were 2,289 state-owned tractors by mid-1949; but by 1955 the Brașov factory would be producing about 5,000 tractors yearly.

It was clear, therefore, why Communist leaders in the people's democracies were advised by Moscow not to jeopardize industrialization by too rapid collectivization of agriculture: from the land must come the surplus for feeding increasing urban populations and for export to pay for such machinery and raw materials as they would be permitted to buy abroad.

The International Peasant union with headquarters in Washington (president, Stanisław Mikołajczyk; secretary general, Dr. G. M. Dimitrov), originally consisting of the representatives of the Bulgarian, Croat, Hungarian, Polish, Rumanian and Serbian Peasant parties in exile, increased its membership during the year by co-opting the leaders of the Czech Agrarians (Dr. Josef Černý), Estonian Smallholders (Johannes Sikkar), Lithuanian Populists (Dr. Kazys Grinius) and Slovak Agrarians (Dr. Fedor Hodža). One vice president, Grigore Niculescu-Buzdeș, of the Rumanian National Peasant party, died in New York in October at the age of 41.

**PEMBA:** *see British East Africa.*

**PERFUMERY:** *see SOAP, PERFUMERY AND COSMETICS.*

**PERÓN, JUAN DOMINGO,** Argentine army officer and politician (b. near Lobos, south of Buenos Aires, Oct. 11, 1895), was elected president on Feb. 24, 1946. (For his early career *see Britannica Book of the Year 1949*).

In 1948 the Peronistas won sufficient strength in the congressional elections to sponsor a constitutional convention initiating an amendment to permit the immediate re-election of the president. The new constitution, which became effective on March 16, 1949, also provided for direct instead of electoral-college election of the president. Though Perón continually insisted that he did not intend to run for re-election, his followers renominated him at their party convention in Buenos Aires in July 1949.

**PERSIA.** An independent kingdom of western Asia, bounded on the east by Pakistan and Afghanistan, on the west by Persia. Persia had been known as Iran from March 1935, but on Oct. 25, 1949, it was announced that the Tehran government reverted to the former name in foreign languages.
PERSIA

north by the U.S.S.R., on the west by Turkey and Iraq and on the south by the Persian gulf and Arabian sea. Area: c. 634,413 sq. mi. Pop. (no census ever taken, 1948 est.): between 16,500,000 and 17,500,000. Language: mainly Persian, but some Turki and Armenian in the north, Kurd in the west, Arabic in the south and Pushtu in the east. Religion: mainly Shiah Moslem but the Kurds (750,000) are Sunni; there are also c. 50,000 Gregorian Armenians and a few thousand Catholic Armenians, 40,000 Nestorians and 80,000 Jews. Chief towns (1948 est.): Tehran (cap.), 850,000; Meshed (250,000); Tabriz (214,000); Isfahan (205,000); Abadan (150,000); Shiraz (129,000); Resht (122,000); Hamadan (104,000). Ruler, Shahanshah Mohammad Riza Shah Pahlavi (q.v.); prime minister, Mohammad Saed Maragheh (q.v.).

History. On Feb. 4, 1949, whilst the Shah was distributing prizes at the Tehran university, an attempt was made on his life by a member of the left-wing Tudeh party. The assailant, Fakhr Rai, fired several shots at close range, injuring the Shah in the lip and back. He was attacked by the crowd and died after reaching the hospital. Martial law was declared, many Tudeh members were arrested and the party was dissolved. The Shah's injuries did not prove serious and he recovered shortly after the attempt.

On Feb. 12 the Soviet government protested to Persia against statements in Majlis (parliament) that the Tudeh party was backed by the U.S.S.R. and that the Soviet government was interfering in the internal affairs of Persia. Replying to the Soviet note, the Persian government called attention to the Soviet radio propaganda directed against Persia; and objection was made to the assertion that Persia was under U.S. military domination and had become an American base. It reiterated the fact that U.S. officers in Persia were merely paid advisers.

In the first week of March the Majlis passed a new Press act whereby insults to the royal family and heads of foreign states with which there were friendly relations, blasphemy against Islam and instigation to revolt could be promptly punished.

The Imperial Bank of Iran, whose concession granted 60 years previously expired at the end of Jan. 1949, reached an agreement with the Persian government whereby the bank would in future operate under ordinary laws, depositing with the Bank Melli Iran (National bank), free of interest, all deposits in excess of two-and-a-quarter times the amount of capital employed in Persia by the bank and selling a further £1 million to the government as exchange. The bank's name was subsequently changed to the British Bank of Iran and the Middle East.

On May 11, revising the constitutional law of 1906, the Majlis defined the procedure for future constitutional amendments and gave the Shah the limited right to dissolve Majlis with the approval of the Senate (which, though provided for in the constitution, did not hitherto exist). In June two middle eastern statesmen paid official visits to Persia. Liaquat Ali Khan, the prime minister of Pakistan, was the first; he was followed by Emir Abdul Illah, the regent of Iraq. These visits were followed off by that of King Abdullah of Jordan who paid a state visit on July 28. The exchange of courtesies and views of these middle east rulers with the Shah and his government strengthened the bonds of friendship and collaboration existing between these Moslem countries.

After protracted negotiations between the Persian government and representatives of the Anglo-Iranian Oil company for an increase of royalties payable to Persia, agreement was reached and on July 19 the minister of finance presented to Majlis a bill embodying the agreement. The bill provided:

1. that from 1948 the royalty on oil be raised from 4% to 6%.

King Abdullah of Jordan standing between Ibrahim Hakimi, former prime minister of Persia (left) and Mohammad Saed Maragheh, prime minister from Nov. 9, 1948, during the King's visit to Tehran, July 1949.

a ton and that the company pay £3,360,000 in respect of 1948; (2) that the excise on oil be raised from 9d. to 1s. a ton and that the company pay £600,000 in respect of 1948; (3) that the company should pay 20% of its profits from general reserve, calculated before deduction of British income-tax instead of after deduction of tax as hitherto, and pay £5 million in respect of 1948. The Majlis was dissolved at the end of June before a vote could be taken on the oil agreement.

The 1947 monetary agreement with Great Britain dealing with the convertibility of Persian sterling credits into other currencies for imports obtainable in Britain was extended for another year.

During October and November elections for the 16th Majlis and the new Senate were held all over the country.

On Nov. 4 whilst the minister of court and former prime minister, Abdol Hossein Hajir (see OBITUARIES), was attending a ceremony at the mosque of Sepah-Salar, a fanatic, Hossein Emami, fired several shots at him at close range. Hajir died two days later. The assailant was tried by a military court and hanged.

On Nov. 16 the Shah flew to Washington on an official visit at the invitation of President Truman and addressed both houses of congress. On Dec. 30, a few hours before the Shah departed by air from New York after his American tour, President Truman announced that the United States was ready to offer certain military assistance to Persia and would support its requests for loans from the International Bank for Reconstruction and Development.

(X.)

Education. (1938) Schools 8,381, pupils 457,236, teachers 13,078. There is one university at Tehran.

Industry. Agriculture and Fisheries. Main crops (in '000 metric tons): wheat (1946) 7,600; barley (1948) 600; cotton (1948) 22; rice (1946) 424; sugar (1948) 46; tea (1947) 7; tobacco (1948) 11; jute (1948) 14, Livestock (in '000 head): sheep (March 1948) 13,000; goats (1946-47) 6,800; cattle (March 1946) 2,500; horses (1946-47) 350. Wool production (in '000 metric tons, 1948-49) 11. Fisheries (production of the Societe Mahie): approximate catch of sturgeon 3,000 tons, from which 30 tons of caviar are extracted.

Industry. Fuel and power (in '000 metric tons): coal (1948 est.) 150; crude oil, production of the Anglo-Iranian Oil company, (1948; six months, in brackets) 25,270 (13,384). Raw materials (in metric tons, estimated annual production): copper ore, 1,000; sulphur 600; red oxide 10,000; arsenic ore 500. Cement production (in '000 metric tons, 1946) 35. Textiles and rugs are produced on a small scale.

Foreign Trade. Imports: (1948-49) 3,460 million rials. Exports, including oil exports of the Anglo-Iranian Oil company: (1948-49) 18,990 million rials. Principal imports: sugar, cotton piece-goods, metals and metal products, and tea. Principal exports: oil, rugs, dried fruit and nuts, and medicinal plants and seeds. Main sources of supply in 1947-48 were United States 22%, United Kingdom 22% and India 11%. Main destinations of exports in 1947-48 were United Kingdom 61%, India 8% and United States 5%.

PERU. A South American west-coast republic, bounded on the north by Ecuador and Colombia, on the east by Brazil and Bolivia, and on the south by Chile. Area: 482,258 sq. mi., including Lake Titicaca and islands of the Pacific. Pop.: (1940 census) 7,023,111; (mid-1949 est.) 8,061,000, of which 13.3% are concentrated in the provinces of Lima and Callao covering only 3.3% of the total area. The racial distribution is estimated at 52.89% whites and mestizos, 45.86% Indians, 0.68% Asians and 0.47% Negroes. Religion: mainly Roman Catholic. Language: Spanish, but Indians speak only Quechua or Aymara. Chief towns (pop.: 1945 est.): Lima (cap., 657,824); Callao, the main port (93,313); Arequipa (87,260); Cuzco (49,760). President of the republic: General Manuel Odria.

History. During 1949 the Odria regime, which had seized power in Oct. 1948, moved to consolidate its position. The military dictatorship was formalized by a decree dated Jan. 8, which announced the suspension of congress and the assumption by the cabinet of all executive and legislative authority. Civil rights were curtailed and press censorship was established in May; a measure promulgated in the middle of that month rendered all women between the ages of 21 and 45 subject to military service in the event of war. Labour groups expressed their opposition to the regime on Jan. 14, when the American Federation of Labour complained in a letter to the United Nations that labour organizations could no longer function normally in Peru; and on May 6, when a regional unit of the International Labour office, meeting at Montevideo, Uruguay, adopted a resolution censuring the Odria regime for alleged violations of workers’ rights. Reportedly opposed to Odria were Luis Flores and Llosa González Pavón, leaders of relatively powerful right-wing political organizations.

Meanwhile, the leftist A.P.R.A. (Alianza Popular Revolucionaria Americana) or People’s party, known as Aprista and outlawed in 1948, was re-organized for more effective underground activity. Aprista leader Victor Raúl Haya de la Torre, who had been a fugitive since the time of the Odria revolution and had taken refuge in the Colombian embassy in January, petitioned for safe conduct out of Peru, which was denied by the military regime on Feb. 24. Safe conduct was similarly denied to Fernando León de Vivero and Pedro Muñiz, Apristas who had found sanctuary in the Cuban embassy, and Peru severed diplomatic relations with Cuba on Aug. 19, when it was discovered that León de Vivero and Muñiz had escaped to Havana.

The Odria government developed a programme of relaxing controls over foreign exchange, imports and exports. Duty-free imports of agricultural machinery and implements was extended for five years by a decree dated May 25, and President Odria declared on June 2 that the country needed foreign capital to develop technical skill, transport facilities and irrigation projects. Operations of the Peruvian International Airways were suspended on Feb. 28, when the company was unable to satisfy claims amounting to $800,000 due to general creditors and $4 million due to nationalised airlines.

G. I. B.

PETITPIERRE, MAX, Swiss statesman (b. Neu- châtel, Feb. 26, 1889), after studying at the universities of Neuchâtel, Zurich and Munich, practised as a lawyer in his native town from 1922. He was professor of private international law at the University of Neuchâtel 1926-31 and 1938-44. In 1942 he was elected to the National Council as a Radical and on Dec. 14, 1944, to the Federal Council as minister of foreign affairs. Repeatedly re-elected to the latter post, on Dec. 16, 1948, he was also elected vice president of the Federal Council for 1949. In Feb. 1949, he attended the meeting in Paris of the Organization for European Economic Co-operation. In August he presided over the Red Cross conference at Geneva.

PETROLEUM. Although 1949, like previous years, was marked by local rationing of certain oil products, there was no longer an actual global shortage of oil, and the restrictions on the use of oil imposed in several countries were simply a symbol of the general economic problems from which many nations suffered. Shortage of dollars, especially in the sterling area, compelled purchases of “dollars” oil to be reduced to an uncomfortable minimum, while in the United States oil production was kept down because of the falling off in demand. World output of oil was thus well below the level it could have reached during 1949 had world demand required a continuance of the all-out effort for a maximum production.

Estimates for the first half of 1949 gave a total world production of 1,672 million bbl.—an average of 3,344 million bbl. for the whole year. This would show a definite pause in the steady upward trend which raised world production from 1,454 million bbl. in 1942 to 3,398 million bbl. in 1948. In 1948 the order of the chief producing areas was: United States, Venezuela, U.S.S.R., Persia, Saudi Arabia, Mexico, Kuwait, Indonesia, Rumania, Iraq, Colombia, Argentina, Trinidad and British Borneo. During the first six months of 1949 few minor changes occurred in the order of precedence. Thus Kuwait production passed that of Mexico, and British Borneo had a larger output than Trinidad, Argentina and Iraq—the last named suffering from political troubles.
connected with the establishment of the state of Israel. At
the beginning of 1949, also, Venezuela, the world’s chief oil
exporter, was for the first time surpassed in output by the
middle east—though Venezuela remained by far the largest
single producing country after the United States.

The most significant feature of the half-year was the
decline in the output of the U.S. and Venezuela, for this
was a direct indication that world production had caught
up with world demand—although it had to be admitted that
it was an attenuated demand, restricted in many areas for
economic reasons. It was only by exercising considerable
restraint in production and refining that the oil industry in
the U.S. was able to keep supply and demand in balance.
For the same reason, Venezuela also showed a considerable
decline in output from the level of the previous year. For
the first six months of 1949, output in these two countries
was estimated at 931 million bbl. and 224 million bbl. respecti-
vely—amounting to 69% of world output compared with
the 73% they contributed to the larger 1948 production.

In the middle east, however, output continued to rise.
Persian production, at 97 million bbl. for the first half-year,
was slightly above the 1948 average, while Saudi Arabia,
which produced 92 million bbl., showed an increase of over
30%. The rise in Kuwait’s production was even more
spectacular, the production of 45 million bbl. for six months
being less than 2 million bbl. below that for the whole of
1948. In Iraq, production was very low in the early months
of 1949, owing to the fact that only the Tripoli pipeline was
in use, the Haifa pipeline remaining closed; in the summer,
however, the new pipeline to Tripoli came into operation;
and this additional outlet was expected to raise production
over the whole year well above the 1948 level of 26 million bbl.

Production in the middle east was, however, still limited
by the lack of outlets, which would be overcome only with
the completion of the various pipeline projects, some of which
were already under way. These new pipelines would link
the oilfields of Saudi Arabia, Persia and Kuwait to Medi-
terranean ports, while Iraq’s existing pipeline capacity would
be greatly expanded.

Of the other leading producers, no reliable figures were
available either for the U.S.S.R. or for Rumania; neither
was likely to show any considerable change from 1948 output,
although the U.S.S.R. might have slightly increased her
production.

In other areas, changes were noticeable which, though
comparatively minor to world oil economy, were calculated
to have a perceptible effect on local economies. Indonesian
production continued to draw nearer to the prewar level,
supplemented by output from New Guinea, which began the
export of oil in the last days of 1948. British Borneo showed
a further increase in output and was likely to prove the
Commonwealth’s largest producer for 1949—though before
long it might be surpassed by Canada.

Canadian oil activity was most noticeable in Alberta,
where several more important oil discoveries were made
during 1949: output for the first six months of 1949 was
almost 10 million bbl., compared with 12.4 million bbl. for
the whole of 1948. Already production in Alberta was being
restricted owing to the problem of disposing of the oil.
A 450-mi. pipeline was under construction from Edmonton
to Regina and later this would be extended a further 700 mi.
to Superior, Wisconsin, U.S.

Other countries that showed signs of increasing output
were Germany and the Netherlands, each of which, however,
had only a small production.

For the world as a whole, 1949 might thus be regarded as
essentially a year of transition. It showed a decline in output
in the western hemisphere, only partly offset by higher output
in the middle east and other areas. Thus 1949 marked the
end of the period of increasing production to meet the
demands of the war years and of subsequent reconstruction.
The fact that production for the first half year was below the
average for 1948 was eloquent proof that the oil industry
had caught up with the demand for oil. The year also represen-
ted a period of consolidation and advance in creating the
new pattern for future world supplies. The still rising output
of Persia, Saudi Arabia and Kuwait and the progress made
in the pipeline projects for linking the middle east oilfields
to the Mediterranean, emphasized that soon the eastern
hemisphere would cease to rely on the U.S. and the Carib-
bean and look instead to the middle east for its oil.
Inter-allied with middle east developments was the building
up of European refinery capacity which, as pointed out in
the O.E.E.C. programme published towards the end of 1949,
allowed for a crude oil output in 1952-53 of nearly three
times that of 1948. This expansion of Europe’s capacity
was, incidentally, like the developments in the middle east,
a truly international affair, in which American as well as
British and other European oil interests were participating.

In a word, 1949 might be described as a year in which the
oil industry, besides catering for immediate requirements,
was also engaged in building for the future, so as to be able to meet even the large unrestricted demands which, once world conditions permitted of a freer economy, were to be expected.

(K. W.)

PHARMACY. A survey by the International Pharmaceutical federation undertaken in 1949 elicited the following facts: in Great Britain the volume of dispensing increased by about 2½ times after the introduction of the National Health service in July 1948; in all other countries there was a reduction in the compounding of medicines and an increase in the sale of specialties; more pharmacists were employed in manufacturing concerns and by public authorities; generally, pharmaceutical training was extended and more countries introduced an equivalent of the honours degree course in pharmacy of London university; the cost of pharmaceutical training had become nearly equal to that of medical training.

Two important books were published: The National Formulary 1949, a standard prescriber’s formulary for use under the health service; and the British Pharmaceutical Codex 1949, a book of standards for drugs and preparations which were not included in the British Pharmacopoeia. The codex, which was last published in 1934, now provided standards for various preparations of human blood, such as liquid and dried plasma and serum, fibrinogen, fibrin foam and thrombin, thus ensuring the same preparations being supplied throughout the Commonwealth.

The cost of the pharmaceutical side of the British health service was far in excess of the estimates and in the first year’s working 187 million prescriptions were dispensed at an average cost of 2½. 9½d. each. The principle of paying chemists on average values of prescriptions had to be continued and there was dissatisfaction at the delay in meeting accounts. The prescribing of expensive proprietary medicines was partly responsible for the high cost and a committee was appointed to consider whether it was desirable and practicable to restrict or discourage the prescribing of (i) drugs of doubtful or of an unethical character, and (ii) unnecessarily expensive brands of standard drugs. The advertising of popular medicines, although showing a slight improvement, was considered to be sufficiently exaggerated and misleading to engage the attention of the British Medical association, but beyond expressing the opinion (a) that the public should be protected against the dangers of self-medication, and (b) that more stringent measures should be taken to ensure that newspapers did not accept advertising from firms which disregarded the provisions of the British Code of Standards in Relation to the Advertising of Medicines, it put forward no proposal to mitigate the danger.

Several new medicinal compounds were synthesized; e.g., chloromycetin, an antibiotic, which was active when given by the mouth in the treatment of typhoid fever and whooping cough, and t-thyroxine sodium, another orally-active compound representing an active principle of the thyroid gland. Compounds of corticosterone attracted considerable attention because of the results obtained in rheumatoid arthritis, especially with 17-hydroxy-11-dehydro-corticosterone (cortisone, compound F) and with the adrenocorticotropic hormone (ACTH), but no supplies were available commercially at the end of the year. Perhaps the most outstanding discovery was the production of vitamin B₁₂ by deep fermentation of the mould Streptomyces, thus providing a relatively cheap source of this anti-anemic factor. (See also CHEMOTHERAPY; MEDICINE.) (W. K. F.)

PHILATELY. The year 1949 saw the 75th anniversary of the Universal Postal union which was founded in Berne, Switzerland, in 1874. To commemorate the occasion all countries of the world issued special series of stamps. Great Britain’s four stamps were twice the usual size and were designed by Mary Adshead (2½d.), Percy Metcalfe (3d.), A. Fleury (6d.) and George R. Bell (6d.). Each of the British colonies issued four stamps, and, with the exception of New Hebrides which had all four values in the design used for the 1s. issue of Bermuda, the designs were the same as for Bermuda (see illustration). The colonial designs represented Hermes, the globe and forms of transport: the hemisphere, aeroplane and steamer: Hermes and the globe: and the Universal Postal union monument at Berne. The most common designs for the U.P.U. series of stamps were comparisons between transport in 1874 and in 1949, the U.P.U. monument and a globe or the two hemispheres.

The French issues in 1949 included ones for the 250th anniversary of the death of Jean Jacme and a Christmas charity set. In Italy stamps were issued, amongst others, for the opening of Holy Year, the rebuilding of Holy Trinity bridge, Florence; the 13th Bari fair; the 400th anniversary of the completion of Palladio’s basilica at Vicenza: the 500th anniversary of the birth of Lorenzo de’ Medici; the bicentenary of the birth of Vittorio Aliberti; and the 150th anniversary of the discovery of the electric cell by Alessandro Volta. San Marino, a tiny country, yet a prolific supplier of stamps, continued to issue stamps of interest to philatelists.

Its 1949 issues included stamps to commemorate Garibaldi’s retreat from Rome. The republic of Ireland, which before April 1949 was known as Eire, issued stamps to mark the new international status of the country.

In Asia many new issues were made. India issued an archaological series of 16 stamps and on Sept. 11, the first anniversary of the death of Mohammed Ali Jinnah, a set of memorial stamps was issued in Pakistan. In accordance with Islamic custom, they did not bear any portrait but instead carried Jinnah’s watchwords, “ Unity, Faith, Discipline.”

Persia issued stamps to commemorate the country’s war effort, and in aid of a fund for the protection of the country’s national monuments. Stamps were issued for the first time bearing the legend “The Hashimite Kingdom of the Jordan” in place of Transjordan. In Syria the portrait of Husni ez-Zaim, who was dictator of Syria from March until his execution on Aug. 14, appeared on two issues.

Japan probably made the largest number of new issues during 1949. Among events recorded were the children’s festival day, the 75th anniversary of the central meteorological observatory in Tokyo and the setting up of a memorial city at Hiroshima. A series was issued of views of the Fuji-Hakone national park.

The devaluation of many currencies in September had little repercussion on stamps. Market prices receded slightly in current issues for the countries affected, in terms of hard currencies. Some values, in Swiss gold centimes, were no longer valid for the international service for which they were originally designed.

Societies. The Junior Philatelic Society of London celebrated its 50th anniversary in November. From a charter membership of 10 it had expanded to more than 3,000. In October the Chicago Philatelic society held its 1,500th consecutive semi-monthly meeting. A commemorative medal was issued for the occasion.

BIBLIOGRAPHY. In addition to the annual catalogues, a number of specialized books were published in 1949. These included, King George VI Postage Stamps (Stanley Gibbons, London); A. T. Todd, A History of British Postage Stamps (London); Stamps of the Commonwealth of Australia (Melbourne); Stamps of South Australia (Adelaide); Greece: Catalogue de Timbres-Poste (Athens); E. F. Aguilar, The Philatelic Handbook of Jamaica (Jamaica), Ichiro Yoshida. Japan Through Postage Stamps (Tokyo). (X.)
A selection of the stamps issued to commemorate the 75th anniversary of the Universal Postal Union. 1-4, British colonies; 5, South Africa; 6, Australia; 7, India; 8, Ceylon; 9-12, Great Britain; 13, Egypt; 14, Denmark; 15, Finland; 16, Indonesia; 17, the Netherlands; 18, Norway; 19, Austria; 20, France; 21, United States of America; 22, Italy; 23-24, Germany; 25, Belgium.
PHILIPPINES, REPUBLIC OF THE. An island republic lying about 500 mi. off the southeast coast of Asia; an archipelago of 7,107 islands extending north and south about 1,152 mi. and east and west about 688 mi. Eleven islands have an area of over 1,000 sq. mi., the largest being Luzon (40,814 sq. mi.) and Mindanao (36,906 sq. mi.). Total area: 115,600 sq. mi. Pop.: (1939 census) 16,000,303; (Oct. 1, 1948 census) 19,234,182. In 1939 the population included 117,500 Chinese and by official count their number was 140,000 by 1949, but the actual full blooded Chinese population exceeded 200,000. There were 43 identifiable ethnic groups in the islands but the dominant stock of the population was Malay; the aborigines of the archipelago were akin to the Australian blacks and Papuans. The term "Filipino" in Spanish times meant the same as creole, that is, an island native of Spanish descent. Languages: English (spoken by about 5 million), Spanish (about 500,000) and some 87 dialects of which 8 or 9 were spoken by 90% of the people; Tagalog, spoken by about 3.5 million, was declared the national language. Religion: mainly Roman Catholic (about 80%), but there were also about 1.8 million followers of the Independent Filipino (Christian) Church, about 425,000 Protestants of all sects, 700,000 Moslems (the Moros of Mindanao) and almost 700,000 pagans widely scattered. Chief towns (pop., 1939 census): Manila (cap., 623,492; [1949 est.] 1,300,000); Cebu (146,817; Zamboanga (131,455); Davao (95,546); Iloilo (90,480). President of the republic and secretary of foreign affairs, Elpidio Quirino.

History. Politics dominated the stage during the year. Elpidio Quirino, having succeeded President Manuel Roxas upon the latter's death on April 15, 1948, became a candidate for the presidency at the elections of the end of 1949. Party politics provoked many charges of corruption and dragged up the issue of wartime Japanese collaboration, so that the election campaign was a rough one. José Avelino, former president of the Senate and leader of the Liberal party, ousted from both posts on charges of selling war surplus property, led a rebel wing, Quirino heading the main body of the party. Strongest opposition came from Nationalist party candidate José B. Laurel, wartime Japanese puppet president. In the election on Nov. 8, military pressure, violence and disorder resulted in protest concerning nearly one half of the total votes cast. On almost complete returns the count stood (Nov. 21): Quirino 1,711,448; Laurel 1,282,994; Avelino 399,931. A short-lived rebellion broke out in Batangas, Laurel's home province, after the election. Quirino's Liberal party won a majority in congress, controlling some 60 out of 100 seats in the House of Representatives and at least 15 out of 24 seats in the Senate.

The Hukbalahap, led by Luis Taruc, originally a wartime anti-Japanese guerilla organization, had become dominated by Communists and had militantly espoused the cause of Philippine tenant farmers. The result of 1948 military punitive expeditions against them was to scatter the partisans throughout the mountain country of Luzon. Campaigns during 1949 made little headway toward eliminating the Hukbalahap, though they formed no major internal threat during the year.

Changes in agrarian legislation during 1947-48 made technically possible the peaceful amelioration of tenant problems, but landlord domination of central Luzon's rice lands prevented effective agrarian adjustment and maintained the basic unrest which could be exploited by the Hukbalahap. Expansion of colonial land settlement projects in the southern Philippines was undertaken both to help increase agricultural production and to alleviate Luzon's agrarian problems.

On July 10 Quirino met Chiang Kai-shek at Baguio, Luzon. A communiqué issued after the meeting emphasized the necessity for the countries of the Pacific and east Asia to collaborate against Communism. Shortly after, Quirino was invited by President Truman to visit Washington. He arrived there on Aug. 8, addressed the Senate and the House of Representatives the next day, had talks with Truman and Dean Acheson and left the U.S. capital on Aug. 11. It was clear from a statement issued by the two presidents that the idea of a Pacific military alliance had been dropped for the time being.

On Oct. 15, the U.S. Philippine army command was reduced to the Philippine air command, with headquarters at Clark Field, north of Manila. This became the headquarters of the 13th air force and the only major U.S. military base in the Philippines.

The U.S. War Damage commission expected to release about $185 million between July 1949 and June 1950 in partial settlement of major public and private claims. Small claims were paid in full during 1947-48, leaving major claims to be liquidated by annual instalments during 1948-51.

Postwar trade showed an extraordinarily large volume of imports and a decreased volume of exports, in contrast to prewar trade which normally showed a surplus of exports. Most Philippine trade still was with the United States. Though agricultural productivity for home use crops was above normal, the export volumes of sugar, abaca and tobacco had not yet returned to prewar levels. Only coconut products exceeded prewar productions.

The year was the first of a five-year programme of agricultural expansion and industrial development designed to even the balance of trade and maintain the advance in the standard of living. The 1948-49 rice crop of 2,660,000 short tons was one of the largest ever grown, but still was insufficient to feed the growing population. Increased rice production, already the leading crop, was one of the chief aims of the programme. Sugar production for the crop year 1948-49 was 728,000 tons, with 27 refineries operating. For the crop year 1949-50 there would be 29 refineries in operation.
PHILOSOPHY

operation and the yield was estimated at about 830,000 tons, a vital part of the export programme. Timber production exceeded the prewar normal output during 1949, with a cut of 1,037 million board feet, permitting a small export programme.

J. E. Sr.)

Industry. Coal production (1946) 20,000 metric tons. Raw materials ('000 metric tons): chrome ore (1946) 58; manganese ore (1941, nine months) 51; copper (1941 est.) 10; gold (1947) 64,441 fine troy oz.

Manufactured goods: woven cotton fabrics (1948) 7.5 million metres; cement ('000 metric tons, 1948; 1949, six months, in brackets) 119 (94); desiccated coconut ('000 metric tons, 1947) 35; coconut oil (1947) 70,000 metric tons.

Foreign Trade. (Million pesos) Imports: (1948) 1,172, (1949, six months) 532; exports: (1948) 636, (1949, six months) 281.

Railways (1946): 563 mi. Shipping (July 1948): number of merchant vessels 385, of 10,000 tons 38, gross tonnage 96,004. Air transport (1947) miles flown 6,788,492, passenger-mi. 80.6 million.

Telephones (1948): 6,917

Finance and Banking. (Million pesos) Budget (1947-48 est.): revenue 2,032, expenditure 307; (1948-49 est.): revenue 392, expenditure 499.

Monetary unit: peso with an exchange rate of 5-63 pesos to the pound (6=8-10, peso before Sept. 18, 1949). In Dec. 1949 the domestic buying rate for U.S. $ was 2-008 pesos and the domestic selling rate 2-01 per dollar.

PHILOSOPHY. During 1949 the general pattern of controversy in philosophy continued unchanged from that of 1948. It was, in outline, the pattern which controversy had always taken, especially in times of political crisis: on the one side were the intuitionists and idealists and on the other were the empiricists and materialists; the former tended to reject, and the latter to advocate, scientific method as the instrument of most value in solving urgent problems.

But, although the two sides still existed in their traditional form, there had emerged during the preceding 30 years, what might be called a third party, which held that the function of philosophy was not to answer questions about the nature of reality nor to work out rules of conduct but to analyse and clarify the language in which discussions took place about the world and how to behave in it. In the course of thus analysing talk about ethics, these philosophers came to the conclusion that the traditional method of basing moral judgments upon metaphysical foundations was mistaken, since in their opinion it was impossible to decide objectively between (i.e., to verify) the claims of moral judgments that were based upon metaphysical propositions but happened to be contradictory.

This is, of course, a much simplified statement. There were detailed variations of attitude among philosophers who belonged to this third party—that is to say, among those who were associated with scientific empiricism, logical positivism and logical analysis. But it was not possible to understand contemporary discussion of ethics without a realization that in general these philosophers stood rather aside from the traditional controversy. For they were not concerned to make moral judgments; they were concerned only to analyze them. It was true however that, in attacking metaphysics, the positivist philosophers tended to identify themselves, in their general outlook, more with the empiricists and materialists than with the idealists, and were taken, too, to be attacking morality in general.

There were then two axes of controversy in ethics, and indeed in philosophy as a whole: one between opposed schools of metaphysicians; e.g., idealists and dialectical materialists, and the other between metaphysicians of all schools and positivists.

To deal first with the idealist-materialist axis: during 1949 this controversy became more acute in most European countries; people were naturally concerned with the over-riding political questions implicit in the opposition between the U.S.S.R. and the western nations, and this led to discussion of the ethics of Marxism, based in Italy partly upon Eugenio Pennati's L'Etica e il Marxismo (Florence, 1948). In France there was, perhaps, more concern with the practical consequences of the adoption of the opposed philosophies. Such discussion was, of course, directed to the valuation of moral judgments rather than their analysis. This was partly why it is considered under the heading of the idealist-materialist axis, although such a placing begs a debatable question; for some Marxists would probably claim that dialectical materialism was essentially a scientific system and should not, therefore, be treated as a rival metaphysic to that of idealism. However, Marxists continued during 1949 to attack the positivist position, thus suggesting that their own position was at the other end of the metaphysical-positivist axis. In 1948 they had attacked logical positivism directly. In the early part of 1949, as a result of an article which appeared during Nov. 1948 in the Soviet Literary Gazette and condemned reactionary-idealistic forces in Soviet biology, discussion centred round the philosophy of science and particularly the philosophical consequences of quantum theory. Niels Bohr and W. Heisenberg, among others, were condemned for western and bourgeois ideals of physics and it was suggested that quantum theory had been used to justify idealist mystical conclusions. Some of the leading Soviet physicists were also criticized for idealism and formalism in atomic theory. The assumption underlying these attacks appeared to have been similar to that underlying the attacks on logical positivism; the suggestion that words like neutron, meson, quantum, etc. were used rather as symbolic aids to calculation and prediction than as labels for material objects seemed to have been taken as an idealist denial of the existence of the real world and thus of the materialist principle that matter is the ultimate reality.

In this connection, N. Bohr's principle of complementarity is relevant. For it may resolve the contradiction implied in saying that elementary particles such as neutrons and protons are both waves and particles. It stated that there was no meaning to the question of whether they were really waves or particles; the wave and particle concepts were merely analogues which acted as symbolic aids to the physicist in dealing with separate aspects of the phenomena he was studying and they could therefore be regarded as complementary rather than contradictory. This principle was originally applied only to physics. But during 1949 its possible applications to other fields and to philosophy in general were widely discussed; for instance, in the journals Synthèse (Bussum, Holland) and Diacoretic (Neuchâtel, Switzerland) by Chr. P. Raven, L. de Broglie and J.-L. Destouches.

To return to ethics: Jean-Paul Sartre's atheistic existentialism was a philosophy which was opposed, like Marxism but on very different grounds, to the idealistic metaphysics of morals. In Great Britain interest in this philosophy had died out, but in Europe it was still discussed—for instance in Spain in Filosofía y Letras. In the U.S.A. there was published a translation of Simone de Beauvoir's Pour une morale de l'ambiguïté (Paris, 1947) under the title of The Ethics of Ambiguity (New York, 1948). Madame de Beauvoir's central theme was that man could not just adopt a ready-made code of morals; he must make his own anxious choice. There was
also some discussion of Heidegger's existentialism in Italy. The
Christian existentialist Gabriel Marcel published *Position
et approches concrètes du mystère ontologique* (Paris, 1949)
while a translation of his *Philosophy of Appearance* appeared in
the U.S.A. (New York, 1949) and a translation of his *Etre et

The ethical aspects of the metaphysical-positivist axis of
critique had begun, during 1948, to attract the attention of
the general public in Great Britain. But the positivist
philosophers themselves had taken little part in non-academic
discussions, since these were concerned mainly with making
judgments rather than analysing them. However, in 1949,
A. J. Ayer attempted to explain his position in a discussion
with F. C. Copleston on the B.B.C.'s Third programme and in
an article "On the Analysis of Moral Judgments" (Horizon,
London, Sept. 1949). He claimed, incidentally, that
a man who held logical positivist views about the analysis of
moral judgments was not thereby precluded from having
personal moral standards nor from making moral judgments
which may be as good as other people's, although he was
precluded from holding that these judgments were a logical
consequence of his philosophy. On the other hand, C. E. M.
Joad put forward in a number of lectures and articles (e.g.
Hibbert Journal, London, Oct. 1949) the view that, although
logical positivists might not intend to attack morality in
general, the practical effect of their philosophy was in fact
to destroy it.

Interest in positivist views and in allied linguistic questions
was still confined mainly to Great Britain, Holland and the
U.S.A. There was no discussion of them in France, and
although a bibliographical introduction to *Der logische
Positivismus* by Karl Durr was published in Berne in 1948,
few Germans could afford to buy Swiss books. German
philosophy indeed appeared to remain very much isolated
from development in the rest of the world. (See Hartmann in
the Bibliography). It was an unfortunate sign of the
times that information about German philosophy was almost
impossible to obtain in England. The current journals
were not taken even by the British Museum. Karl Jaspers'
*Von der Wahrheit* (Munich, 1943)—the first volume of a
comprehensive log of metaphysics and philosophy based
on an original definition of truth—seemed to have been
regarded as the most important work lately published.

In fact it was probably true to say that, in general,
tuitionist and metaphysical views gained further ground as
against positivist views. In Latin America for instance, (see
Cannabrava in the Bibliography) intuitionism was much in
the ascendant. Reason was regarded as useless and burden-
some, incapable of conveying the deep meaning of existence
with its emotional content.

Apart from an article by C. D. Broad on "The Relevance of
Psychical Research to Philosophy" (Philosophy, London,
Oct. 1949), there was little further discussion of extra-sensory
perception, although the journal *Enquiry* was still, in 1948,
continued in publication. However, interest in
the capacities of the human mind was stimulated by reports
of the capacities of machine minds of electronic calculating
machines. Although this subject was mainly a scientific one,
it had philosophical implications of two kinds. In the first
place, it involved questions as to whether the human mind
was essentially different from any machine. In the second
place, there was the question whether the ways in which
calculating machines function could throw any light upon
philosophical problems such as those connected with perception
and the status of universals. Questions of the first kind
were discussed (though not in this context) by Gilbert Ryle
(editor of Mind) in broadcasts and in *The Concept of Mind*
(London, 1949), which adopted broadly the non-vitalist
attitude in setting out to show that the distinction between
the inner and the outer world could not be sustained in its
Cartesian form. Questions of both kinds were discussed in
some chapters of *Cybernetics* by Norbert Wiener (New
York, 1948; London, 1949), the word "cybernetics" having been
coincided by Dr. Wiener himself as a name for the general
subject of control and communication in the animal and the
machine. His view was also non-vitalist; indeed he suggested
that the whole mechanist-vitalist controversy could be
relegated to the limbo of badly posed questions. (See also
THEOLOGY.)

PHOTOGRAPHY. In Great Britain during 1949, there was a certain amount of progress in the development of new cameras and camera film. One of the first was a relatively priced, British made 35-mm. instrument was made available. This was the Ilford Advocate, a sturdy little instrument with die cast body, finished in an unusual but pleasing cream colour and fitted with a bloomed lens of 35-mm. focus. This camera took the standard 24 x 36-mm. frame using the well known velvet light trapped cassette, had a wide range of shutter speeds up to 1/200 sec., and focusing mount.

Another successful British-made instrument was the new Sellex 820 made by Barnet-Ensign-Ross Ltd. Fitted with a British-made speeded shutter with exposures from 1 to 1/250 sec and with an f/3.8 Ross Xpres lens coated, it took either 120 or 620 spools and either eight pictures 2 1/2 x 3 1/4 in. or twelve pictures 2 1/2 in square, hinged masks being provided for the change over. The shutter was fitted with built-in contacts for flash work using the popular Speed Midget bulbs.

Two interesting cameras for the professional worker also appeared during the year. One was the 4 x 5 in. M.P.P. camera with a wide range of movement including a triple extension with crossed front, a tilting front and a four-way swing and revolving back with, when required, a coupled range finder. The other camera was an entirely new design for press men and was known as the "Nelrod." A particular feature was the completely built-in flash equipment for either electronic flash or consumable bulbs, it also had a coupled range finder, rapid focusing, quick change dark slides, etc.

But perhaps the most important introduction from the popular point of view was the British-made Speed Midget flash bulbs which did so much to revolutionize popular photography in the United States. These bulbs were made by two firms, the General Electric company and the British Thomson Houston company, who were also making the wire-filled bulbs with the 20 milli-second delay. These bulbs enabled most British manufacturers of the cheaper cameras to provide built-in flash contacts so that night photography became as simple as daylight photography.

Two new British made photo-electric exposure meters were introduced. The first was the Avo, the new model of which was being distributed by Kodak Ltd., while another photo-electric meter known as the Ilford Model C was being distributed by that company.

In British-made colour films, Ilford Ltd. distributed both daylight and photoflood emulsions in their 35-mm. "Ilford-colour."
Great progress was made during 1949 in re-establishing international trade in photographic products. Germany was rapidly coming into full prewar production by making more than 78,000 cameras a month during the latter part of the year. About 28,000 of these cameras came from the Agfa Kamerawerk, under U.S. administration, and more than 3,000 Leica cameras and about the same number of Rolleiflex cameras came from the western zones of Germany each month. A large part of this production was being exported to the United States.

Agfa Kamerawerk introduced two new cameras, the Karat and Isolette, which were sold in the United States under the names of Karomat 36 and Ventura, respectively. Both were of the miniature type, the Karomat 36 with built-in coupled range finder, using a 35-mm. film and the Ventura made for use with a film which made 2½ x 2½ in. negatives.

At the International Trade fair in Utrecht, Netherlands, early in April, photographic equipment from both eastern and western Germany was on official display for the first time since World War II outside Germany. From the Dresden works of Zeiss-Ikon came a newly designed Contax "S" camera. The important change in this 35-mm miniature camera was in the eye-level reflex focusing method, which replaced the former built-in range finder. New models of the Kine Exakta camera were on exhibition, equipped with Hugo Meyer lenses.

Progress in the Netherlands' photographic industry was shown by products from De Oude Delft Optische Industrie, with their new telephoto, wide angle and enlarging lenses, and the Philips company at Eindhoven. The latter company showed their new PF-2SN flash bulb, available in three different colour temperatures of 3,400°, 4,000° and 6,000°K. Philips also had a small hand flash lamp outfit for use with their make of flash lamps. Flash photography was slow in developing on the continent, primarily because of the lack of equipment and supplies.

Franke and Hedecke displayed models of their Rolleiflex cameras. A new Magnar telescopic lens attachment was of interest. This auxiliary lens fitted over the standard 7-5-cm. Rolleiflex lens to give it an effective focal length of 30-cm. A new Rolleiflex was introduced later in the year with such features as a new Compur shutter with built-in flash synchronization, eye-level viewing and focusing, a full-image magnifier and a new carrying case.

Japan made steady progress in getting its photographic industry back into full production. By the end of the year photographic manufacturing had reached 60% of prewar production. There were 36 important camera manufacturers employing more than 4,500 workers. The camera industry represented about 37% of the optical equipment industry in Japan. The main cameras for export were in the miniature camera class, using 16-mm. and 35-mm. films. Many were almost direct copies of German cameras like the Contax, Leica and Rolleiflex. The Japanese Mochida 35, Leotax Special and Canon S1 were similar to the Leica. Other cameras in the miniature class included the Nikon, Olympus 35, Mamya 35, Steky, Minion 35 and the 35-mm. Konica. A number of these cameras were finding a market in the United States.

United States. A new du Pont Polymer Print film was a notable addition to the field of colour-motion-picture photography. This film was designed to be printed from three black-and-white separation negatives and to be developed in colour during a single passage through a slightly modified conventional developing machine. Formerly the emulsion layers for colour-forming development contained at least three components—gelatine, silver halide and colour former. In the printing film worked out by du Pont, only two components were employed—silver halide and a water-sensitive synthetic polymer playing the role of both gelatine and colour former.

The Kodak Ektacolour film was made available. This new colour film, first announced in 1947, produced a negative whose colours were complementary to those which would appear in the final print. Ektacolour simplified the making of colour prints and photomechanical reproductions by eliminating the need for masking and for separation negatives. This film was intended primarily for professional use in artificial light. It could be processed in the photographer's studio. Kodak Pan Matrix film was also brought out in connection with Ektacolour. This new film permitted positive colour printing matrices to be made directly from Ektacolour transparencies either by contact printing or by enlarging through filters without any intermediate processes. A special black-and-white proofing paper for use with Ektacolour film and a special Kodak Vacuum Register board to speed printing with Pan Matrix film were also available. Kodacolor film, type A was a new colour roll film properly balanced for clear flash and flood illumination. No filters were required for its use with this type of lighting indoors. This film had the same emulsion speed as a regular Kodacolor film. It was of the colour coupler type and had a wide colour-reproduction latitude.

New Equipment. A new Kodalith Blue-Sensitive film for the graphic arts became available. The new film, which had no anti-halation backing, was specifically made for those who wanted to reverse an image by exposure through the back of the film. The general characteristics of the new film were somewhat similar to Kodalith Ortho film, type II, except that the new film was not an orthochromatic emulsion.

A new model of the Kodak Tourist camera incorporating a radically new between-the-lens shutter with an accurate top speed of 1/800 sec. was the world's fastest shutter of its type, with the widest speed range in the folding camera field. To attain this exposure speed the blades in the new shutter pivoted and rotated through a partial circle inside the shutter housing. As the rotation progressed, the shutter aperture opened and then closed. There was also a built-in flash synchronizer in this shutter.

The Kodak Reflex II camera was a new twin-lens reflex camera equipped with the new plastic Kodak Ektalite Field lens in the viewing system. The insertion of this flat, grooved lens beneath the camera's ground glass increased the over-all illumination on the ground glass by 250% and corner and edge illumination by 1,000%. Critical focusing was speeded and made easier and composition was simplified because of the more brilliant image.

Compared with previous years there was not very much new equipment for the darkroom worker. However the Kodak Flurolite enlarger and the Kodak Hobbyist enlarger were important exceptions.

High-Speed Photography and Special Developments. In the field of high-speed photography the new Kodatron Colour Speedlamp was of importance. This new model had approximately 20 times the light output of the former Kodatron Studio model. The power output ranged from 1,000-watt-sec. with one power unit and one condenser to 2,736-watt-sec. with one power unit and three condensers.

A new Graflex 2½ x 3½ Century Graphic was produced in the field of miniature press-type cameras. Graflex roll film holders were made for use with the various Graflex cameras. The Super D Graflex single-lens reflex cameras were equipped with a highly specialized Fresnel lens for increasing uniformity as well as intensity of screen illumination in the picture viewing system. A 2½ x 3½ Century Graphic camera was made similar in design to the Speed Graphic cameras but without the rear focal plane shutter.

The Polaroid Land camera, introduced at the beginning
of 1949, rapidly established itself. With this camera it was possible to expose and develop a finished picture inside the camera within one minute. By the end of the year nearly 7 million pictures had been taken with these cameras. In addition to the overwhelming majority of cameras used for taking pictures for personal use, many were used in the industrial and business fields where they were invaluable for recording purposes.

Stereoscopic photography made steady progress with the Stereo Realist camera and with the new Three Dimension Company's Stereo projector which was equipped with Polaroid filters to give unusual stereoscopic effects upon the projection screen.

Bausch and Lomb Optical company introduced nine new Animar motion-picture lenses for 8-mm. and 16-mm. photography. There were five standard and four telephoto lenses. Important features of these lenses besides their optical qualities were the spread diaphragm stops for easier readability and the click stops for changing settings without looking at the lens scale. This manufacturer also produced a new series of high-speed projection lenses especially for large cinemas with a speed of f/2.0.

General Electric made a new photographic flash tube to operate at speeds of 1/5,000-sec., with an improved triggering circuit for use with lightweight portable power speedlamp units. A new 375-w. photoflood lamp was made with a narrower beam spread which gave more light on the camera subject than the wide-beam 500-w. reflector photoflood lamp. General Electric also produced an extremely powerful photographic floodlight producing light from 7 to 15 times the intensity of sunlight for use with high speed motion-picture work where speeds up to 8,000 pictures per second were required. This lamp produced 75,000 ft.-candles of light, as compared with the normal 50 ft.-candle level existing in the better indoor lighting systems.

Electron Microscopy. Developments in electron microscopy were not spectacular, though there was a steady stream of new results. In the Radio Corporation of America laboratories at Princeton, New Jersey, the first quantitative method of testing the symmetry of electron microscope objectives was perfected. A new removable intermediate lens was developed to provide magnifications from 1,000x to 20,000x without changing lenses.

Considerable new work was done on the ultra thin sectioning of tissue. C. E. Hall of the Massachusetts Institute of Technology, Cambridge, Massachusetts, made electron micrographs of crystals made up of molecules of seed globulin. These are the smallest (6 mu.) molecules seen in crystalline form. J. L. Melnick of Yale university, New Haven, Connecticut, photographed virus-like bodies from human skin papillomas in what appeared to be a crystalline arrangement. In spite of his conservative pronouncements, it was generally accepted that this represented the first demonstration of an animal virus in crystalline form. (See also Cinema: Television; X-Ray and Radiology.) (W. D. M.)

PHYSICS. During 1949, while science was still recovering from its exploitation during World War II, considerable advances were made along many lines, notably in microwave physics, in the interpretation of cosmic ray phenomena, in the application of molecular vibrations to the standardization of time intervals, in the cataloging of the properties of radioactive materials, in low temperature physics and in the theory of the nucleus. A few special topics described briefly below show the progress made in fundamental physics.

Several important groups of physicists turned their attention to the problem of abstracting the literature of physics. Especially since about 1938, it had become virtually impossible for a physicist to read in full, much less study, all the published papers that interested him, even if all the physics periodicals of the world were accessible; and it is essential that a research physicist should keep abreast of the times. It was felt that the problem might be solved by a new abstract service of some kind. Most English-speaking physicists had relied on Physics Abstracts, issued monthly in England by the Institution of Electrical Engineers; but judged by modern standards that compilation was believed to have

In July 1949 the Admiralty released a series of photographs (one of which is reproduced above) taken by a new technique in underwater photography. The photographers were equipped with adapted "frogman" suits and could take photographs to a depth of 100 ft.
become inadequate in several respects. In order that a practical and acceptable solution of the problem might be reached, the American Institute of Physics, working with the Office of Naval Research, spent 1949 in assembling the information necessary for answering such questions as: How important are abstracts to physicists? How do they try to use the abstracts? What do they think of the abstracts they now have? What kind of abstracts would they like? The results of this study were awaited with interest.

**Neutron.** The neutron, an uncharged particle of approximately the same mass as the proton, is a constituent of all atomic nuclei except ordinary hydrogen. The particle is unstable (or radioactive) when liberated into the free state by the breaking of nuclei; but its half-life was known only by theoretical estimate. The half-life had not been measured experimentally for the simple reason that it was impossible for neutrons to be imprisoned within a vessel as atoms of gas could be. The neutrons, having no electric charge, would escape immediately through the walls of the vessel, no matter of what it was made. Without giving detailed reasons, it may be asserted that the only feasible method of determining directly the half-life of the neutron was by making measurements on a newly born stream of neutrons such as emerged from a nuclear reactor. The experiment would have no chance of success unless the stream of neutrons was very intense. If the neutron had a very short half-life, it might be possible to measure the intensity of the initial decay protons by a focusing ion-spectrometer. The effect that was measured, and on which the half-life was based, was a proton current that stood out about 30% above the background of the counting devices used. In most experiments in nuclear physics, such a situation would be presumed to lead to fairly reliable numerical results. Robson’s final figure was that the half-life of the neutron, as measured directly, lay between 9 and 18 min., in agreement with theoretical estimates. (For example, in 1947, in the course of a formal lecture, H. A. Bethe estimated the half-life at 20 min.) Independent experiments, carried out by several laboratories, gave the same result, and the Atomic Energy commission and reported in Nov. 1949, indicated that Robson’s result was unlikely to be wrong.

**Radioactivity.** The following is quoted from an article by J. H. Webb in the *Physical Review*, Aug. 1, 1949:

*Following the explosion of the experimental atom bomb at Alamogordo, New Mexico, on July 16, 1945, a radioactive contaminant was encountered in strawboard material used by Eastman Kodak company for packaging photographic sensitive films. This paper board was manufactured in a mill situated at Vincennes, Indiana, on the Wabash river. A run of strawboard, produced on Aug. 6, 1945, showed this new and unusual type of radioactive contaminant. X-ray film packed with this board showed fogged spots after about two weeks’ exposure.*

*Measurements of the contaminated spots of strawboard showed no alpha-activity but a fairly strong beta-activity. Absence of alpha-activity ruled out naturally radioactive materials of the beta-activity showed a maximum energy of 0.6 Mev and a half-life of approximately 30 days. Radiochemical studies of the active ash from the strawboard indicated that the material was of the rare earth series. The energy value and half-life of the beta-radiation are compatible with the isotope Ce 141.*

*All studies point to the conclusion that the radioactive contaminant was the rare earth element which was obtained by the mill through the river water. The most likely explanation seems to be that it was a wind-borne fission product derived from the atomic bomb detonation in New Mexico on July 16, 1945.*

Similar effects were caused by strawboard manufactured in Sept. 1945 at a paper mill in Iowa, several hundred miles from Vincennes, Indiana, and on a different watershed. The amounts of radioactive material involved were in all cases exceedingly small, and it was only because the strawboard happened to be used for packaging sensitive photographic film that it was detected at all. Presumably, specks of radioactive dust, perhaps precipitated with rain, were carried down by the rivers and filtered out during the manufacture of the strawboard.

**A New Meson.** The photographic methods used in the discovery of new fundamental nuclear particles by C. F. Powell and his colleagues at the University of Bristol since 1946 were adopted in many laboratories throughout the world. Since the examination of photographic emulsions for tracks that showed evidence of new phenomena took some time, further progress might, for a few years, have been expected to be in proportion to the number of investigators employed in the work. Powell’s work established clearly the existence of both $\pi$ and $\mu$ mesons, and the mother-daughter relationship between them. Between 1946 and 1949, a new heavy meson designated by the symbol $\tau$ was reported by several workers in the U.S.S.R., in England and in the U.S. The report supported by the most definite evidence was that of N. Wagner and D. Cooper of Maryland university.

The various types of charged mesons are distinguished by the linear densities and the variations of linear densities of developed photographic grains along their tracks; and these differences are interpreted in terms of the different masses and energies of the particles. According to the best recent determinations, $\pi$ and $\mu$ (primary and secondary) mesons have masses 286 and 205 times as great as the electron’s mass. But mesons, of the mass range 720 to 1000, can only be produced by much higher energies than the electron’s mass—about 200 times the electron’s mass—but, apart from the fact that it might, at the end of its range, be captured by a nucleus which then exploded or alternatively might end its travel without evidence of being captured, little was learned of its properties. It appeared to originate among the explosion products of a nucleus disintegrated by cosmic-ray action. No family connection of the $\tau$ with $\pi$ and $\mu$ mesons was indicated; but if such a connection should exist, its nature might not be determined until an answer had been found to the question whether mesons occur with definite masses or with a continuously variable range of masses.

**Terrestrial Magnetism.** According to a first approximation, the magnetic qualities of the earth are those it would possess if it were a "uniformly magnetized sphere." There seems also to be no doubt that the magnetic field that is measured at or near the earth’s surface originates from sources inside the earth rather than from any happenings in space outside the earth. The next step in a proper understanding of the earth’s magnetism—an explanation of the extent to which the earth’s field differs from that of a uniformly magnetized sphere—is one of tremendous complexity. Measurements have, of course, been made of these differences all over the land and oceans, but a satisfactory explanation of their patterns has been elusive. Furthermore, the patterns change slightly in a definite but complex manner from year to year.

Some new ideas on the subject were published during 1949 by E. C. Bullard, director-elect of the National Physical laboratory in England, who was urging the idea of any permanent magnetism, he sought to explain the observed phenomena in terms of large-scale electric currents within the liquid metallic core of the earth. In order that the magnetic effects might be reasonably permanent, it had to be assumed that inside the core of the earth the flow of electricity and the flow of material of which the core is composed must be such as to simulate a self-exciting dynamo, so that the flow of charge created the magnetic field across which liquid metal moved only to have more electric currents induced in it. Such a supposition was eminently reasonable, provided that a source of energy available for maintaining the mass-flow could be identified. Bullard suggested that either (1) the liquid core did not follow faithfully the precessional motion of the earth or what was more likely (2) thermal convection currents existed to carry heat from the core outward. The second of
PHYSIOLOGY

The heart of the generalized theory of gravitation is expressed in four equations, shown in the accompanying illustration.

\[ g_{tt} = 0, \quad g_{rr} = 0, \quad \frac{\partial g_{\phi\phi}}{\partial t} = 0, \quad \varphi = 0. \]

The equations have the mathematical properties which seem to be required in order to describe the known effects, but they must be tested against observed physical data before their validity can be absolutely established.

Part of a paper published by Professor Albert Einstein on Dec. 27, 1949, in which he developed a "generalized theory of gravitation."

these assumptions was partially developed, without serious conflict with established facts, to explain the major part of the earth's magnetic field. Local irregularities in the field and secular changes thereof were then presumed to be the result of two further effects, the occurrence of local eddies in the liquid interior and distortion of the regular field by magnetic materials in the solid crust.

Origin of the Elements. The 96 known elements are not all equally abundant in that part of the universe that is accessible to scientific observation. Striking regularities in quantities appear side by side with striking irregularities. For example, it has been proved that light elements are more abundant than heavy ones and that there is a gradual change in relative abundance from hydrogen (the lightest element) to the heaviest elements, covering a factor of about ten thousand million. At the same time there exist violent fluctuations of abundance from one light element to the next. To illustrate these generalities, it can be asserted that for every atom of gold in the universe, there are ten thousand million atoms of hydrogen, one thousand atoms of fluorine and one million atoms of neon. Since all nuclei are composed of neutrons and protons, it seems clear that these regularities and irregularities of abundances must reflect the manner in which nuclei were originally formed from their constituent elementary parts.

M. G. Mayer and E. Teller summarized the existing situation, calling attention to the probability that light elements may have been formed by thermonuclear reactions, in the course of which new nuclei were built by the addition of protons to already existing nuclei. They emphasized strongly the conclusive evidence that, at the time of formation of heavy nuclei, the proportion of neutrons exceeded that which is now found; otherwise, the heaviest isotopes of the heavy elements would not be the most abundant. They then explored the hypothesis that heavy nuclei were formed by the disintegration of a cold nuclear fluid containing a great excess of neutrons. Considering this as a kind of fission and neutron-evaporation process operating on nuclei much heavier than now exist, Mayer and Teller predicted a theoretical distribution of isotopic nuclei in the range of atomic numbers 62 to 78, that agreed remarkably well with actual observations. In deriving this distribution of abundances among the isotopes of each of a series of elements, the authors pushed the theory one step farther than it had been carried before.

Einstein's Unified Field Theory. Physicists had been for a hundred and fifty years acquainted with effects separately described as electricity, magnetism, light, gravitation. For example, a thunderstorm was an electrical phenomenon, the pointing of a compass toward the north a magnetic one, the scattering of light was optical, the falling of an apple to the ground was gravitational. When they were first discovered, all four types of effects were unrelated—in different compartments of knowledge. Through the work of Michael Faraday, James Clerk Maxwell, and others, the fields of electricity, magnetism, and light were brought under one discipline, so that it was known, for example, how the movement of electric charges produces light. Gravitation alone remained isolated, having no apparent connection with electro-magnetic or optical phenomena.

Einstein's new "field theory," announced in Dec. 1949, brought gravitation into the fold, as it were, providing a formal connecting link between gravitational, electromagnetic and optical effects. It was felt that many years might elapse before his theory could be checked by experiment. (See also Astronomy; Atomic Energy; Electronics; Radio, Scientific Development.)

PHYSIOLOGY. Steady progress in the elucidation of the phenomena associated with the nerve impulse continued to be made throughout 1949. In England, A. L. Hodgkin and B. Katz, using a single fibre preparation of the giant axon of the squid, _Loligo forbesi_, with an internal micro-electrode, showed that the transient reversal of potential difference during the passage of the nervous impulse was produced and could even be abolished by decreasing the concentration of sodium ions in the external fluid. Their results were explained on the assumption that the permeability of the membrane during activity was the reverse of that in the resting state. During the passage of the nervous impulse, a large increase in sodium permeability occurred whilst that of potassium was unaffected. The rate of entry of radioactive sodium ions into single sepa axons was found to be about 15 times greater during stimulation than at rest.

Interruption, in situ, of the blood supply of the nerve to the tibialis anticus muscle of the cat for periods up to six minutes caused an increase in the irritability of the nerve. Restoration of the blood supply at the height of this irritability resulted in a return to its initial value in about three minutes. When the ischaemia continued for more than ten minutes, the irritability fell below the initial threshold value. Occasionally an apparently complete restoration of the circulation produced complete recovery in 30-50 min., but not always.

Pain. The intensity of the pain felt in the first, second and fourth stages of childbirth was measured in 13 normal deliveries. The method consisted essentially of comparing the intensity of a spontaneous pain with one induced on the dorsum of the hand by thermal radiation. Before labour, the subject was accustomed to the measurement of the pain threshold and the assessment of varying intensities of pain. In the first stage of labour, the intensity of pain was roughly proportional to the degree of cervical dilation and inversely proportional to the length of the interval between the uterine contractions. Pain of maximal intensity was felt at the end of the first and throughout the second stage. The reactions of the woman did not always correspond to the intensity of her pain perception.

Gastric Secretion. The effect of intravenous insulin on gastric secretion was examined in gastric fistula dogs. Secretion began when the blood sugar (Folin's microcolorimetric method) fell to 60-80 mg.%. Acid and pepsin secretion reached a peak in 30-45 min. after 0·1 to 0·2 units per kg. of body weight. Larger doses of insulin caused a diminution or inhibition of secretion. Nembutal, ether and morphine in hypnotic doses abolished the gastric secretory response; chloralose inhibited the response unless large doses of insulin were given. No hypoglycaemic gastric secretory response was obtained in anesthetised or unanaesthetised cats. Decorticate dogs showed a hypoglycaemic secretion. After decerebration a reduced and delayed hypoglycaemic response
was obtained in three animals. Whereas decortication did not modify the motility pattern of the stomach before or during hypoglycemia, decerebration inhibited spontaneous motility; neither the gastric tonus nor the motility of these animals was affected by insulin hypoglycemia.

Respiration. Pulmonary arterial and venous blood pressure measurements were obtained in the dog, under nembutal, by direct catheterization. Catheterization of the pulmonary veins via the right carotid artery was attended by about a 10% mortality. A significant correlation between the mean systemic arterial blood pressure, the mean pulmonary arterial and venous pressures and the cardiac output was noted. In 50 dogs where the mean systemic arterial blood pressure was 100 mm.Hg. or more, the mean pulmonary arterial blood pressure was 17.8±3.6 and the mean pulmonary venous pressure 8.5±1.4 mm.Hg. In 13 human subjects with apparently normal cardiovascular systems, a venous catheter was introduced into a distal branch of the pulmonary artery so as to occlude it. Measurements of the pressure distal to the occluding catheter were recorded. In two subjects with atrial septal defects, in addition a branch of a pulmonary vein was occluded and the distal pressure measured; identical pressures were observed in both occluded and unoccluded veins and were believed to be close approximations of the true pulmonary capillary pressure. The pulmonary "capillary" pressure averaged 10 mm.Hg. (range 7 to 15); the mean pulmonary arterial pressure averaged 16 mm.Hg. (range 11 to 21).

Bronchopulmonary studies in the dog under pentobarbital anesthesia showed that after ligature of the left pulmonary artery the left lung retained some respiratory function. The capacity of such a lung to absorb oxygen gradually increased with the development of bronchial anastomoses. After four months it was computed that the blood flow in such a lung usually exceeded one litre per square metre of surface area per minute. Twenty-one months after ligation of the pulmonary artery the bronchial circulation of the left lung was insufficient to maintain life on pure oxygen for more than a few minutes.

Simultaneous action potential records from each hemidiaphragm following hemisection of the second cervical segment were used to map the nervous pathways from the respiratory centres to the pool of phrenic motorneurones in the cat and rabbit. Bulbo-spinal fibres of respiratory function descend primarily ipsilaterally but a significant number cross to synapse on the phrenic motorneurones of the opposite side. The crossed fibres are quantitatively less powerful than the uncrossed fibres.

Orthostatic Hypotension. An experimentally produced orthostatic hypotension was produced in the dog under heavy morphine or chloralose-morphine anesthesia by local cocainization of the floor of the fourth ventricle for 3-5 min. with a 2% solution of cocaine applied on a piece of filter paper. Normal pressor reflexes were obtained except on standing when hypotiesia occurred; respiration was not affected.

Kidney. Simultaneous determinations of the glomerular filtration rate, renal plasma flow and the oxygen content of the right renal vein blood were made in anaesthetized humans. Under approximately basal conditions the arterial-renal venous oxygen difference in ten normal subjects averaged only 1.42 volumes % (range 1.09 to 1.87), yet the blood flow was such that the average renal oxygen consumption was 16 cc. per min.

trade unions. He made it clear that trade unions had the blessing of the church provided they seek to "promote the Christian order in the labour world." A group of visiting businessmen were told by the pope the Catholic Church approved of nationalization of industry within certain limits.

In speaking to members of the U.S. senate military appropriations sub-committee on Nov. 17, the pope advocated re-armament, making a very careful distinction between force as an instrument for the enslavement of peoples and force as a means to resist aggression. In his Christmas message he called upon all Protestant Churches to "return to the unity of Rome," and urged all Christians as well as Jews to support the Roman Catholic Church in the creation of a united front against militant atheism. (See also Roman Catholic Church; Vatican City State.) (J. Laf.)

PLAGUE. Progress in the control of epidemics of plague, and in protection against this infection, was reflected in the recommendations of 20 specialists who conferred in Washington, D.C. in Oct. 1948, and at a sanitary convention at Paris in November. They decided that search for previously unrecognized zones of enzootics should be continued; and, because of the widely spread use and efficacy of insecticides such as D.D.T. (dichloro-diphenyl-trichlorethane), international prophylactic procedures could be reduced. They recommended a more intense comparative study of the relative values of immunizing vaccines prepared from killed bacilli or from live organisms, and the designation of laboratories of world-wide distribution for the conservation and supplying of strains of bacilli of tested antigenic value; and suggested recommending prophylactic treatment with sulphanilides, or with streptomycin in cases of pneumatic plague particularly, in the belief that such measures would at least reduce the period of observation on contacts.

Though no large epidemics were registered during 1949 plague continued to smoulder on; cases were reported in Asia, including sections or provinces of Burma, China, India, Indo-China, Java and Thailand; in Africa, including Belgian Congo, Cape Colony, Madagascar, Orange Free State, Rhodesia and Tanganyika; in the Azores; in South America, including Brazil, Peru, Venezuela; in the United States, where two cases occurred in the state of New Mexico.

Another survey was made of the extent and persistence of the infection among the field rodents of the western United States by examination of fleas collected from rodents which were shot or trapped, or taken from their burrows and nests. The results of the investigation indicate that the enzootic has persisted or recurred over periods as long as 10 years. Infected fleas were found in counties of midwestern states, which might indicate an extension of the enzootic zone eastward to more populous areas.

The longevity of Pasteurella pestis under favourable conditions may be of practical significance through its transportation in fleas hidden in cargo. Under suitable laboratory environment it will remain viable and retain its virulence for years. A set of 40 slope cultures of virulent bacilli was made on beef infusion agar in 1923. The tubes were stoppered with corks coated with a mixture of paraffin and vaseline and stored at temperatures of from 5° to 10°C. Subcultures were made in 1943 and from 33 of the originals growth was luxuriant. In 1948 25% of the originals were alive, and inocula made from their subcultures produced febrile reactions in guinea pigs. Three of these which died contained lesions typical of acute plague with bacilli in spleen and buboes. The reactions of the subcultures in carbohydrate media were the same as those of the originals.

With the extension of the use, in ship quarantine, of sodium fluoracetate (1080) as a poison by ingestion for the destruction of rats, or in other anti-rat measures, the question arose of the likelihood of invalidating the diagnosis of plague in rats presumably poisoned and found dead. The diagnostic procedure is that of reproducing the disease in guinea pigs by injecting them subcutaneously with a saline suspension of triturated bits of the liver and spleen of the suspected rat. A preliminary test was made with rats found dead after the use of the poison (1080) on ships. Guinea pigs injected with the suspensions of rat liver and spleen remained well, but others injected with the stomach contents of the rats developed convulsions within an hour, and died. A guinea pig which was inoculated with a virulent culture of P. pestis became febrile in two days with manifestations of plague. It was then poisoned by feeding it with 1080; 35 min. later it had developed convulsions, and died. Upon autopsy it exhibited lesions of acute plague, which were borne out
PLASTICS INDUSTRY. Considerable progress was made during 1949 towards increasing raw material production. The new Imperial Chemical Industries' plant at Wilton, near Middlesborough, was inaugurated in September and two plants started, one for the manufacture of phenolic resins, the other for Perspex—poly(methyl methacrylate) sheet. The construction of the plant for the cracking of petroleum oils to produce simple unsaturated compounds, such as ethylene, for polythene and propylene for acetone and thus Perspex, proceeded.

Petrochemicals, Ltd., announced that five of the furnaces in its cracking plant had begun working and that benzene, toluene, xylene and methyl naphthalene were available. These resulted from the new Catalo process which converted straight chain hydrocarbons into ring compounds. It was noteworthy that these ring compounds were free from thiophene present in coal tar benzene and toluene; ethylene, ethylene glycol, propylene oxide, propylene glycol and other derivatives were also produced at these works. In the same field should be mentioned the decision to erect at Grangemouth, Scotland, with Marshall aid funds, yet another petroleum-chemical plant to be operated by British Petroleum Chemicals, Ltd., owned jointly by Anglo-Iranian Oil company and the Distillers' company.

Plastic machinery production progressed rapidly. Significant was the production by R. H. Windsor, Ltd., under the L.P.M. (Italian) patents, of an extrusion machine which used a multi-screw extruder and was exceptionally flexible in output. The one machine could compound, colour and pellet the raw material, extrude it in a variety of forms, including a tube with a soft inner wall and a hard strong outer wall, or a ten in. tube which could be slit automatically to form a sheet 30 in. wide. A. C. Wickman, Ltd., introduced another machine, the new H.P.M. for injection, into this country from the U.S.A.; it could inject automatically into a mould two streams of differently coloured plastic material, thereby eliminating much tedious and laborious post-moulding work. In the mould-making field B.I.P. Tools, Ltd., announced an exceptionally important process for casting high-precision moulds. High fidelity results, the avoidance of much machining and rapidity of production were promising features. A two-colour injection plant was being produced and a very versatile extrusion press capable, for example, of extruding a 12-in. diameter tube of thermoplastic which could be slit automatically to produce a 36-in. sheet was now being manufactured. Two of these machines working in conjunction could produce two concentric tubes, each of different hardness. Finally, of exceptional importance to thermostetting resin moulders, the prototype of a new control unit capable of converting a hydraulic press to a highly automatic type was tested successfully. It would be in production in 1950.

Some of the most noteworthy productions of plastic units were for the engineering field. One was a stud-welding pistol containing a solenoid control—the phenolic moulded structure being essential as an insulator. This was moulded by Ashdowns, Ltd., of St. Helens, for Crompton Parkinson, Ltd. A second was a large baseplate weighing 31 lb. moulded by Aeroplastics, Ltd., for a G. and J. Weir refrigerator motor-compressor. A third moulding which entailed exceptionally close tolerance work was the highly praised 144 in. grid r.m.g. with 180 radiating teeth, moulded by British M.R.w.d. Plastics Ltd. for Mellor Bromley and company. Pontefract Box company developed a new type of packaging for the chemical industry. This was a resin-treated wood waste moulded in two halves so that bottles; e.g., Winchester quarts, etc., sample bottles, fitted snugly in the bottle-shape moulded recesses. Details were given of the all-wood construction of the Healey-Duncan motor car utilizing “Aero-lite” synthetic resin as a bond.

The low-pressure resins of the poly-ester type were introduced by I.C.I. and Scott Bader and company. They were exceptionally valuable and found especial use for bonding glass fibre to produce very high-strength structures of great heat resistance.

Thermoplastics generally progressed. Un-backed and fabric-backed polyvinyl chloride sheet improved in quality and embossed design, and found a ready market in the hand-bag industry. The motor industry began using this leather-like material for seating. 1949 also saw the introduction of the highly polished form for evening shoe uppers. Stiff p.v.c. sheets were now employed in the printing industry as an intermediary in block making.

In 1949 the plastic bottle for general use was manufactured. Made from p.v.c. paste or polythene by blowing or variations of blowing from tube, they opened up new possibilities. Polythene lay-flat tube was introduced by I.C.I. especially for the packaging industry with special stress on the deep freeze process of preserving foods. Nylon was available for the first time for moulding purposes. Casseloid, Ltd., installed a Trans-Bo-Matic machine capable of producing 1,000 cellulose acetate containers per hr. Eight hundred feet of polythene piping were laid in Scotland for farm water supplies.

In the Commonwealth, Australia reported that cellulose acetate would be undertaken by Colonial Sugar Refining company of Sydney and Beetle Elliott, Ltd., of Sydney announced that production of their moulding powders would be about 500 tons annually.

The All-India Plastics Manufacturers association was formed and did excellent work in unifying production, discussing technical problems and advancing the plastics industry in India. There were now about 150 injection machines in the country, mostly devoted to fancy goods. There were also a number of extrusion presses making knitting needles, extruded strips for bags, watches, etc.

(M. D. C.N.)

United States. The consumption of U.S. plastics materials of all kinds in 1949 increased by more than 50% over 1946, the first post-war year in which relatively exact figures for the industry were made available.

Phenolics. Consumption and sales of phenolics rose rapidly, reaching 15 million lb. monthly by the end of 1949. Another possibility in developing increased use for
A selection of modern electrical equipment made in plastics.

Phenolic moulding powder was in combination with rubber, although progress was disappointingly slow.

Vinyl. Vinyl chloride and vinyl chloride copolymer resin compounds led all other plastics in production with a 1949 volume in the neighbourhood of 300 million lb. The biggest outlet for vinyl in 1949 continued to be film for drapes and curtains, raincoats, shower curtains and protective coverings for items ranging from typewriters to cars in transit and butchers' aprons.

Polystyrene. Polystyrene moulding powder sales rose from 66 million lb. in 1946 to nearly 180 million lb. in 1949. New uses for styrene monomer were constantly being discovered so that an adequate future supply was problematic.

An improved moulding technique was only partly responsible for the advances made by polystyrene. Without altering physical properties, producers were able to formulate better compounds by employing improved compounding methods and adding new types of lubricants.

Cellulosics. A total of approximately 60 million lb. of cellulose acetate was sold in 1949 as compared with an 80 million lb. record in 1946. Flame-resistant acetate which, because of its high impact strength, was particularly adaptable for housings of electrical appliances was widely used. A higher heat-resistant acetate was developed which could withstand numerous boilings without undue distortion.

Urea and Melamine. The consumption of melamine resin increased from 17 million lb. in 1947 to 24 million lb. in 1948, and since melamine moulding powder for dishware alone was used at a rate of several hundred thousand lb. during the year, the increase in 1949 was undoubtedly substantial. The improved powder was of more uniform bulk and granulation so that there was less scrap loss and fewer rejects.

Saran. Saran monofilament was chiefly used for woven car seat covers in 1949. Woven saran upholstery material was also being tested as upholstery for seats in vehicles, public seating for both indoors and outdoors and home and hotel furniture.

Polyethylene. About 31 million lb. of polyethylene were produced in 1949 and used in a variety of applications ranging from disposable baby bottles and lollipop sticks to heavy jacketing for telephone cable. Electrical uses for polyethylene were still taking a large quantity of the output for such purposes as insulation in high-frequency wiring and coaxial cable.

Nylon. Wire coated with nylon had innumerable uses, particularly because of its resistance to abrasion and fungus as well as to heat. The use of nylon as a monofilament for brush bristles, fishing leaders and sutures was well established and growing.

PNEUMONIA. With the introduction of the sulphonamides and later penicillin, a great step forward was made during 1949 in the treatment of lobar pneumonia. The improvement was reflected not only in the improved mortality figures, but also in the clinical condition of the patient immediately one of these drugs was used. From being a disease which ran a very well defined course with characteristic symptoms and signs, lobar pneumonia was reduced to a febrile incident in which lung consolidation might or might not occur. Consequently interest was now focused on the treatment of atypical cases of pneumonia or on details of the administration of either the sulphonamides or penicillin in cases of lobar pneumonia.

Atypical pneumonia is a relatively benign disease and probably is not one clinical entity but a grouping together of various diseases of different aetiology. Many cases were thought to be due to virus infection. One article, "Treatment of Atypical Pneumonia with Aureomycin," by Emanuel B. Schoenbach and Morton S. Bryer, Journal of the American Medical Association (Chicago, Illinois, Jan. 1949), claimed beneficial results from the use of aureomycin in the treatment of atypical pneumonia but this claim did not bear very close scrutiny and no proved effective cure for this disease was found. Failure to find an effective drug is of no great moment when considering a mild disease such as atypical pneumonia; but the application of such a drug, if found, to other and more serious virus diseases would be of great interest and possibly lasting beneficial result to the human race.

Other authors who dealt with the dosage of penicillin and the sulphonamides in ordinary bacterial pneumonia were: Robert Buckhouse, Mark H. Lepper, Thomas E. Stone and Harry F. Dowling, "The Treatment of Pneumonia and Other Infections with a Simple Sulphonamide Gantrosan (NU-445; 3, 4-Dimethyl 5-Sulfanilamido-Isoxazole)," American Journal of the Medical Sciences (Philadelphia, Pennsylvania, Aug. 1949), and Morton Hamburger, Jerome Berman, Robert T. Thompson and M. A. Blankenhorn, "The Treatment of Pneumococcal Pneumonia by Penicillin in Aqueous Solution at Long Intervals," Journal of Laboratory and Clinical Medicine (St. Louis, Missouri, Jan. 1949): and one point of interest emerged. It was stated by these authors that one large injection of aqueous solution penicillin every 24 hr. was just as effective as that divided into more frequent doses.

Combined penicillin and sulphonamide medication came in for some adverse criticism in an article based on such small series of cases that any conclusions could not be considered to be reliable. The results of research by Italo F. Volini, James R. Hughes, and J. R. Peffer were published in an article: "A Comparative Study of Sulfadiazine, Penicillin and Penicillin combined with Sulfadiazine in the Treatment of Lobar Pneumonia," Diseases of the Chest (vol. 15, no. 3, March 1949, American College of Chest Physicians). The effect of the article was further damaged...
by carelessness in compiling the various tables. The mortality for cases treated with intra-muscular penicillin in Table IX was given as 1·9% (i.e., one case) but in Table X under intra-muscular penicillin two deaths were recorded—one from empyema and the other from lung abscess. (F. P. L. L.)

POLIOMYELITIS: see Infantile Paralysis.

POLAND. A people's republic of eastern Europe bounded on the east by the U.S.S.R., on the south by Czecho-

slovakia, on the west by Germany and on the north by the Baltic sea. Area: (before Sept. 1, 1939) 150,052 sq. mi., (after Aug. 2, 1945) 120,359 sq. mi.—a reduction by one-fifth, the result of the annexation of 68,667 sq. mi. by the U.S.S.R., and of the establishment of a new western frontier along the rivers Oder and Neisse which, together with the partition of East Prussia between Poland and the U.S.S.R., gave Poland an area of 38,974 sq. mi. Pop.: (before Sept. 1, 1939) 35,339,000, (Feb. 14, 1946, census) 23,929,757, (Jan. 1, 1948, est.) 23,781,077. A large migratory movement and great changes in the composition of the population took place which may be summarized as follows:

(1) The total population of the eastern Poland area annexed by the U.S.S.R. was 10·7 million, including some 3·9 million Poles, of whom about 1·5 million were deported to the Soviet forced labour camps in 1939-40; by June 30, 1949, only 1,503,816 Poles had returned from the east, including 263,966 who had been deported to the interior of the Soviet Union; also by mid-1949, 518,219 Ukrainians, Byelorussians and Lithuanians were transferred from Poland allegedly to their respective Soviet republics.

(2) The total population of recovered territories in the west (including the Free City of Danzig) was in 1939 about 8·3 million, including 1,011,700 Poles; by mid-1949 about 7·9 million Germans living east of the Oder-Neisse frontier, including 800,000 in pre-1939 Poland, had left for Germany (half of them had fled to the west during 1944-45 before the advancing Soviet armies); some 250,000 remained.

(3) Of 3 million Poles who by the end of 1944 were numbered among forced labourers, prisoners of war and inmates of concentration camps in Germany, 2,272,000 had returned to their country; one half of the remainder had been shot or gassed or had died of exhaustion, and the others had been unwilling to return to a Soviet-dominated country. The number of Polish war losses (forces only) was estimated at 218,000. In 1936-38 Poland's annual population increase was 385,000; no vital statistics were available for the war years, but in 1947 live births were 22·7 per 1,000 and the mortality rate was 11·2 per 1,000, which suggested an increase of population of 265,000.

(4) In Sept. 1939 Poland had 3,351,000 Jews, including 899,000 in the area annexed by the Soviet Union in 1939; about 300,000 either were deported to the Soviet Union or voluntarily sought refuge there, and 200,000 survived. With the exception of 60,000 hidden by the Poles, all Jews found in Poland by the Germans were killed by them.

The new east-west thoroughfare in Warsaw which was inaugurated on July 22, 1949. Inset picture shows Boleslaw Bierut, president of the republic, cutting the tape during the ceremonies to mark the occasion.
Chief towns (pop., first figure est. Sept. 1, 1939; second figure est. Sept. 1, 1948, if not otherwise stated): Warsaw (q.v., cap., 1,289,000; [Sept. 1, 1949] 630,024); Łódź (672,000; [July 1, 1949] 615,000); Kraków (259,000; 307,400); Wrocław or Breslau (625,000; 299,000); Poznań (272,000; 297,000); Szczecin or Stettin (272,000; [July 1, 1949] 185,000); Gdańsk or Danzig (235,000; 164,000); Katowice (134,000; 163,000). Language: almost exclusively Polish. Religion: overwhelmingly Roman Catholic. President of the republic, Bolesław Bierut (q.v.); prime minister, Józef Cyrankiewicz (q.v.).

History. The year was marked by the fulfilment of the first three-year plan of economic rehabilitation. In a speech on Nov. 11 before the central committee of the United Workers’ (Communist) party, Bolesław Bierut, its chairman, announced that if the 1938 production figures were taken as 100, the index numbers for 1949 were as follows: total value of industrial production 174, industrial output per head of the population 244. For agricultural production Bierut said only that between 1946 and 1949 crops had increased by 62% and livestock by 81%, which, however, when compared with 1938, would mean that crop production per head stood in 1949 at 115% of the 1938 level and dairy production at 105%.

Bierut was, of course, comparing the production of two different areas. To obtain a clearer picture of Polish achievements in the field of economic rehabilitation it must be remembered that the territorial shift to the west on the whole considerably increased the country’s industrial production capacity, except in regard to petroleum, of which three-quarters of the production were lost. In 1938 Poland mined over 38 million metric tons of bituminous coal; in the formerly German part of Silesia prewar production amounted to 31 million tons; as the total Polish coal production in 1949 was estimated at 72 million tons, the actual increase was 4%. The prewar production of steel was 1.4 million tons in 1938; in the same year the recovered territories produced only 3 million tons; as Polish production in 1949 was estimated at over 2.2 million tons the prewar level was reached. Another sign of increased industrial potentiality was the output of electric power: in 1938 Poland produced 3,977 million kwh.; its loss in the east amounted to 211 million kwh., its gain in the west to 2,609 kwh.; as the actual production in 1948 was 7,512 million kwh., the increase achieved was over 19%.

Agriculturally Poland had lost in the east rather poor areas, while in the west it gained highly-developed agricultural lands. But by 1949 production was still lagging behind the 1934–38 averages, the total bread grain production being 79% of the prewar figure while 72% of the potatoes and 88% of sugar-beet were produced. This is shown by the following table:

* Annual averages for 1934–38.

Calculated per head of the population, the bread grain (wheat, barley and rye) production fell from 317 kg. in 1934–38 to 169 kg. in 1946 and in 1949 reached 390 kg., instead of a possible 495 kg. The production of potatoes was 1,016 kg. per head before the war, 779 kg. in 1946 and 1,358 kg. in 1949, instead of a possible 1,546 kg.

In the new six-year plan starting in 1950 Poland was expected to reach by 1955 a production of 90 million tons of coal, 7 million tons of steel (a threefold expansion in comparison with 1938), 23,500 million kwh. of electric power (almost four times as much as in 1938). By 1955 Polish industry was to produce annually 12,000 tractors and 18,000 motor vehicles, but plans for consumption goods were on a more modest scale: the 1955 targets for cotton and wool yarn were 137,300 and 49,500 metric tons respectively, which meant only a 77% increase for cotton and 45% for wool. It was not expected that the agricultural output in 1955 would exceed the 1938 levels (described as possible in the table). If collectivization were forcibly introduced not only the 1938 levels would not be reached by 1955, but there would be a Decrease from the 1949 production volume. This probably explains why by 1949 there were only 170 collective farms covering less than 1% of the arable land. Hilary Mine (q.v.), deputy prime minister, chairman of the economic committee of the council of ministers and chairman of the State Planning commission, explained on Nov. 18 in an article published by the Cominform journal, that planning in the people’s democracies was not and could not be something mid-way between ‘capitalist anarchy’ and Soviet planning: it was Socialist planning which, in its class essence, was of the same type as Soviet planning. Collectivization, therefore, was only postponed: for the time being the Communists were cautious with the peasants (see Peasant Movement).

Similar caution marked the regime’s policy towards the Roman Catholic Church which in Jan. 1949 was organized in 5,977 parishes with 22,799,000 practising faithful. Mgr. Stefan Wyszyński, archbishop of Warsaw and Gniezno and primate of Poland, together with Cardinal Adam Sapieha, archbishop

1 This photograph shows Polish officers wearing for the first time round caps instead of the traditional square ones.
of Cracow and 22 bishops and apostolic administrators, in a pastoral letter read in all churches on April 24, affirmed that the Church had never used its influence to the prejudice of Poland. As to the allegations made on March 14 by Władysław Pwowarczyk Wolski, minister of public administration, that the Church's attitude towards the state was one of growing hostility and that many of the clergy were "playing the game of Anglo-American imperialists," the pastoral letter commented that it would be difficult to persuade anyone that the clergy represented foreign powers hostile to Poland. It asked the people, especially the young, to take no part in atheistic meetings. Publication of this letter was forbidden in even the Catholic press. So also was that of a letter addressed to the archbishops and bishops of Poland by Pius XII on the occasion of the 10th anniversary of the invasion of Poland in which the Pope complained of the destruction of Catholic associations, of difficulties put in the way of religious education and in that of the external manifestations of Catholic life, of "vicious" censorship of the Catholic press, and of interference with the exchange of letters between the Holy See and the Polish hierarchy and prevention of other contact between them.

Although there was a dispute which had been festering between the Church and the government did not come to a head, many trials were staged at which priests "confessed" to being encouraged by their bishops to burn portraits of President Bierut hanging in Catholic schools (as in the case of Fr. L. Pieterszuk, who in court at Katowice denied his confession), to join the underground resistance groups (as in the case of Fr. W. Gugacz condemned to death in Cracow), or to murder the Communist leaders (as in the case of Fr. W. Ortowicz and Fr. M. Łosoś, both sentenced to death at Łódź). At the same time attempts were made to oppose the clergy to the bishops. On Sept. 1 Bierut received a delegation of priests who attended the Fighters for Freedom congress in Warsaw (see EX-SERVICESMEN'S ORGANIZATIONS). One priest, Fr. B. Grim, said that he and his friends "felt disturbed because the hierarchy had taken certain steps and they, the rank and file, had come to ask the president to help them." Bierut replied that talks between the government and the hierarchy were going on and that the government would do everything in its power to bring a settlement. The chief difficulty, he added, lay in the uncooperative attitude of the hierarchy who encouraged the clergy to make political use of the churches, harmful practices which sooner or later would have to end. (See also ROMAN CATHOLIC CHURCH.)

The Moscow policy, adopted in 1944, of appointing Soviet officers to all key posts in the army of strategically the most important European satellite state was crowned in 1949, when the Soviet government put at the disposal of Poland Marshal Konstantin Rokossowski (henceforward Konstanty Rokossovski). On Nov. 6 he was accorded by decree Polish citizenship and rank of marshal in the Polish army, and was appointed minister of national defence and commander in chief of the Polish forces in succession to Marshal Michał (łżywinka) Żmijerski. With Rokossowski's appointment all important army posts were in the hands of officers who had made their military career exclusively in the Soviet army, although some were of Polish descent. The Polish army was believed to consist of 6 army corps, 11 infantry divisions, 3 artillery brigades, 10 armoured regiments, 5 pioneer regiments and 6 signal regiments, totalling in all 250,000 men. There were also 11 brigades of W.O.P. (Wojska Ochrony Pogranicza, or Frontier Guard Troops) and 18 regiments of K.B.W. (Korpus Bezpieczeństw Wewnętrznego, or Home Security Corps) under the command of Stanisław Radkowski, minister of public security. In his first order of the day on Nov. 7 Rokossovski commanded the Polish army to protect Poland, its independence and sovereignty, to guard its boundaries on the Oder-Neisse line and the Baltic sea and to tighten brotherly relations between the Polish people and R.S.S.R. On Nov. 15 it was announced that Rokossovski had been co-opted as a member of the central committee of the Communist party, and that Władysław Gomuła, Marian Sypchalski and Zenon Kliszko were expelled from the central committee and forbidden to be in charge of any state or party office. Though Gomuła had been relieved of his duties as deputy prime minister and minister of the recovered territories in Aug., 1948, after public recantation of its "Titoit deviation," he was appointed vice-chairman of the Supreme Control and Audit office. In Oct. 1949, however, an article by Edward Ochab in the Communist monthly Nowe Dni (New Ways) accused Gomuła of "building a wall of mistrust between Poland and the Soviet Union." Sypchalski, former deputy minister of national defence, and Kliszko, former chairman of the party's organs of the Communist party, both friends of Gomuła, were accused of enabling enemy agencies to secure responsible posts and act against the people's democracy. Among many high officials arrested was Józef Dubiel, former deputy minister of recovered territories and another friend of Gomuła. According to Bierut himself, Dubiel had already confessed to having been a Gestapo agent during World War II.

Education. (1949) Schools: kindergarden 3,239, elementary 22,133, pupils 3,241,046; secondary, lower grade 335, pupils 149,117, higher (licenum) grade 486, pupils 140,893, secondary vocational 1,131, pupils 183,440; teachers' colleges 149, students 31,000; higher vocational institutions 39, students 16,988; universities (8), technical colleges (5) and other schools of higher education (14), students 73,244. Literacy (mid-1949 est.) 1,100,000.

Agriculture. Main crops. (in metric tons, 1948) wheat 1,620,300; barley 1,010,080; rye 6,304,040; oats 2,401,860; potatoes 26,755,860; Livestock (mid-1949 est.) cattle 6,380,000; horses 2,561,000, pigs 5,181,000, sheep 1,622,000. Sugar, raw value (1948) 681,000 metric tons. Fisheries. total catch (1948) 48,328 metric tons; (1949, six months) 34,800 metric tons.

Industry. Industrial establishments (Jan. 1948) 184,334, including 6,665 government-owned; power employed 1,867,540, including 1,318,385 (April 1949, 1,411,198) in state enterprises. Fuel and power (for figures for the first six months of 1949 given in brackets throughout): coal (metric tons, 1948) 70,360,000 (35,943,000), manufactured gas (metric tons, 1948) 3,903 (2,347), natural gas (m³, 1949 est.) 160, electricity (million kWh., 1948) 7,512 (3,700), crude petroleum (metric tons, 1948 est.) 132,000. Raw materials (metric tons, 1948): pig iron 1,080,000, steel ingots and castings 1,860,000, (1,131,000), lead 18,500, zinc 120,000. Manufactured goods (metric tons, 1948) cement 1,824,000, (1,092,000), cotton yarn 81,960 (43,970); wool yarn 33,240, (17,860); rayon yarn 7,080, (4,310); artificial fibres 580,400 (378,000).

Foreign Trade. Value (official estimates published in Warsaw in million U.S. dollars, 1948; 1949, six months, in brackets) exports 509 (265), imports 528 (726). Weight (in '000 metric tons, 1948; 1949, six months, in brackets): imports 4,349 (2,347), exports 3,654 (3,183), including coal 24,752 (18,156) and including coal 14,298. In 1948 the exchange of goods between Poland and the U.S.S.R. reached $230 million and between Poland and other democracies $130 million.

POLICE. An important event in the history of the British police was the issue in April 1949 of the report of the Oaksey Committee on Police Conditions of Service, although its conclusions caused no great surprise either in official circles or among the general public. The long standing grievances of the police, their increasing duties, long hours of work and the sometimes dangerous tasks they were called upon to perform were well known. The committee's recommendations were quickly put into effect, almost in their entirety. Appointed by the home secretary, Chuter Ede, nearly twelve months before, the committee under the chairmanship of Lord Oaksey had had to review police administration and work as a whole with particular reference to the dissatisfaction that was generally felt about conditions of service. The two main problems were a persistently dwindling police force and a constant increase in the incidence of serious crime. No inquiry on such a comprehensive scale had hitherto been held.

The report recommended increases of pay which, above the existing cost of police pay of about £25 million a year, would cost £3,800,000 to £4 million apart from the effect on future pensions, improvement of certain conditions and remedies for many existing anomalies; but it did not satisfy members of the police. Pay scales especially were criticized by experienced officers as being too low to stimulate recruiting, and there was disappointment at the lack of suggestions for the removal of old-standing grievances; nevertheless, those most closely affected by this omission hoped that outstanding matters might be dealt with internally by subsequent negotiation.

The problem of building up an adequate police force, however, still remained to be solved. Special inducements, though substantial, continued to be offset by wastage through normal retirements and the resignation, after relatively short service, of promising young men. This trend was reflected in official statistics (see Table I). Disquieting as the discrepancy was in other parts of the country, responsible officials were particularly concerned at the handicap in London caused by well over 4,000 vacancies in an establishment which had remained substantially the same as in 1938.

* As at Sept. 1948.

Women police outside the Metropolitan area numbered 776 against an authorized 1,104, and in London 223 against 338. Every force in England and Wales with two exceptions now had a women's section, and the fact that in most cases they were below strength did not cause undue alarm because it was recognized that the office of a police woman called for distinctive qualities, which necessarily limited recruitment.

On the other hand concern continued to be felt at the shortage of men recruits at a time when the number of serious and violent crimes was mounting. For, whereas in the two decades 1900 to 1919 the annual average of indictable crimes was under 100,000, by 1939 it was over 300,000 and by 1947 nearly 500,000.

Notwithstanding the improved scales of pay and conditions the police forces in both England and Wales and in Scotland continued to diminish during the year. The resignations owing to the offer of more remunerative posts elsewhere of senior officers, especially from detective departments and particularly in London, became a serious matter. Although there was no want of equipment or method in the prevention and detection of crime and the system of wireless communication between the various police forces had become very effective, the protection of the public depended primarily on a police force of adequate strength.

( W. A.)

**United States.** In the United States police forces continued to expand. Their numerical strength rose to the highest level in the nation's history, and this, combined with rising salary scales and pension costs, was reflected in a record total police expenditure. The extent and distribution of the steady enlargement in police manpower is illustrated in Table II.

The number of municipal police killed on duty in the United States totalled 64 in 1948, a slight drop from the 1947 figure. The highest police fatality rates were in the west, south, central and south Atlantic regions; New England cities showed rates less than one tenth as high.

POLISH LITERATURE—POLITICAL PARTIES, BRITISH

The slow but steady rise in municipal police effectiveness during the past two decades was maintained in 1948. But the fact remained that levels of performance were less satisfactory for manslaughter and burglary than they had been in 1941, when the numerical strength of municipal police was about 10% lower.

The International Association of Chiefs of Police held its annual congress in Dallas, Texas, in Sept 1949. About 1,000 police administrators, most of whom represented US and Canadian police forces, attended (Br S)

POLISH LITERATURE. The most important literary event of the year was the publication by Julian Tuwim of Poli Flowers, a long poem of loose composition, written under the influence of Pushkin and showing an extraordinary mastery of language and especially remarkable in the richness and variety of its rhythms. An interesting poetical début with a marked individual style was The Defence of Mists by Bronislaw Przybucki (London)

A volume of uneven short stories by Adolf Rudnicki The Flight from Yasnya Polyana was interesting chiefly as a serious attempt at the creation of an individual literary idiom. Good craftsmanship distinguished Greek Stories by Anna Kowalska. The Lilies of Life by Zofia Nałkowska depicted satirically the prewar political élite but was marred by mannerism. Politics was also dealt with in Between the Wars, by Kazimierz Brandys, a cycle of novels opposing two worlds, the Communist and the bourgeois; the first two had been published: Samson and Antigone. The Iron Curtain by Halina Boguszewska represented a kind of simplified anarrrisrne, and depicted the life of the average Warsaw family. Karol Bunsch's The Nameake was another historical novel on the 11th century, after 1945 a popular one in Polish literature. The Sacred Sword by a prolific Catholic novelist Jan Dobracyznski told the story of St. Paul's life.

A new development was a literature composed strictly according to Soviet "Socialist realism," with a very simplified psychology and an emphasis on political edification. It had not as yet attained any literary distinction

Two posthumously published dramas by Stanislav Ignacy Witkiewicz, In a Small Manor House and The Cobblers, were highly original both in form and intellectual content. A dramatic story by Waclaw Kubacki, The Cure of a Sorb-tree, recreated the Romantic world. Jan Paradowski published a beautiful volume of reminiscences and critical essays, Mediterranean Hour, distinguished as much for the wide literary knowledge it displayed as for its mature classical style. The imposing Memorial Volume in Honour of Leopold Staff, the greatest Polish poet of the older generation, published under the joint editorship of J. W. Gomulski and Julian Tuwim, brought together a number of valuable contributions in poetry and prose. Stefan Kiesielewski's Politics and Art was a volume of essays by a leading Catholic publicist. Juliusz Kleiner published a three-volume erudite critical study Mickiewicz

Two important volumes were published outside Poland. General Wladyslaw Anders' Without the Last Chapter, a book of war reminiscences (the English version was published under the title An Arm in Exile), Jozef Czapski's On An Inhuman Soil (published also in a French translation as La terre inhumaine) described the wartime Russian experiences of the author; the book was rather diffuse in composition but captivating in its sincerity and humanity. (W. Wb.)

POLITICAL PARTIES, BRITISH. Parliamentary by-elections and local elections during 1949 supplied both the main parties with ample material for optimistic speculation about the result of the next general election, but no conclusive evidence of a sweeping change in public opinion. The six parliamentary seats contested between January and December were all held by the Labour party though with reduced majorities. In the county council elections in April the Labour party lost over 350 seats and the Conservatives gained correspondingly. Over 800 Labour seats were lost, mainly to the Conservatives, in the borough elections in May. Conservative satisfaction was tempered, however, by the knowledge that government supporters seldom turn out in full force at local elections. At Westminster the Labour party seemed more secure than ever, at least until the announcement of devaluation in September. In May the party executive, by expelling L. J. Solley and Konni Zilliacus for consistently opposing the government's foreign policy, administered the final blow to the "Keep Left" movement, which had been the only serious source of tension among the government back-benchers since 1945. As a further token of his determination not to tolerate even the mildest and most traditional acts of rebellion the prime minister, Clement Attlee (q.v.), summarily dismissed three parliamentary private secretaries who had opposed the government's bill for making Eire a republic within the Commonwealth, while guaranteeing the independence of the six counties. Two more resigned in sympathy. The cabinet, which had come successfully through the Lyons tribunal's enquiry into corrupt practices in the civil service at the end of 1948, had no internal crisis of comparable dimensions to face in 1949. In July Lord Ammon was dismissed from the post of chief government whip in the House of Lords as a result of a disagreement with the cabinet over his conduct in his capacity as chairman of the Dock Labour board during a strike at the London docks. In November Lord Pakenham, minister for civil aviation, and one of Labour's most competent debaters in the Lords, was temporarily embarrassed by the resentment aroused at his peremptory rejection of the findings of a tribunal appointed by himself to enquire into the causes of an air disaster at Prestwick. He retained the confidence of his colleagues and emerged from the quarrel unscathed if not quite victorious. The prime minister, though constantly expected to re-shuffle his cabinet, did not do so and could legitimately pride himself on having maintained an administration more stable in respect of its composition than most of its predecessors.

Thus fortified against opposition from within, the government carried out its legislative programme with what seemed to its supporters a splendid steadfastness and to its opponents a remarkable indifference to the actual state of the country. The time-table, which had been carefully worked out, provided for the passage of the Parliament bill (reducing the delaying powers of the House of Lords to one year) and the bill for the nationalization of iron and steel, by the end of 1949. According to the opposition, and to most independent observers, the object of the Parliament bill, which was to operate retroactively, was to enable the Iron and Steel bill to become law in spite of the opposition of the upper house before the general election of 1950. The better part of two years had been expended on the ceremony of presenting these bills to the Lords and laboriously repeating the arguments for and against them, and the process had almost reached its foreordained conclusion when the government announced that it had decided to introduce an amendment which would have the effect of postponing the application of the Iron and Steel bill until after the general election. This met the requirements of the opposition and the House of Lords fully and had indeed already been proposed by them.

The Conservative party regarded at what it regarded as a proof that the government was not confident of its success at the election and wished to forestall the charge of having fostered a controversial measure on the country without its consent. Labour supporters, on the other hand, were content with the knowledge that iron and steel would become the nation's property without further ado if the party were returned to power, and that a fresh inroad had been made on the privileges of the upper house.

The Labour Party. Meantime, preparations for the general election continued. The government, like all parties which have successfully accomplished a revolution, was faced with the problem of what to do next. Some favoured a policy of safety first and the consolidation of gains already made. Others, notably a section of the rank and file of the trade union movement, wished to move from public ownership to workers' control and had begun to murmur that centralized bureaucracy was only one degree better than capitalist exploitation. Finally, convinced doctrinaires wished to continue nationalizing industries and differed about the point at which the process should stop. The party's programme, embodied in a pamphlet entitled Labour Believes in Britain, attempted a compromise between these views. Industrial insurance, the cement industry, sugar refining, the wholesale meat trade, slaughter-houses, cold storage, water supply and what were comprehensively described as "all suitable minerals" were to be brought under public ownership. The chemical industry would be considered for nationalization. Shipbuilding and repairing would be dealt with by the appointment of a development council; land would be acquired by the state, as indeed it always had been, when the public interest was deemed to necessitate it. The manner was completed by the offer of a consumer advice centre and cheap hotels for the working-man's holidays. There was a vague reference to the importance of joint consultation in industry. The programme threatened party unity at only one point. The Co-operative movement, which did a considerable trade in industrial insurance, objected to the proposal to nationalize this service; but the objection was met by the decision, announced in November, to turn all industrial insurance firms into co-operatives.

At a singularly zealous but rather uneventful party conference at Blackpool in June this programme was approved by an overwhelming majority. A similar and even more striking success was achieved at the T.U.C. conference in early September, when the government's demand for restraint on wage claims was approved by a majority of six and a half million to one million. After the devaluation of the pound the government was forced to make cuts in public expenditure which the opposition condemned as inadequate and Labour supporters accepted loyally but reluctantly. More serious still, it had to intensify its campaign for the freeing of wages. Here it was able to report considerable success by the end of the year. Faced by the financial and economic crisis, the government still declined to make any fundamental change in its domestic policy.

The Conservative Party. The preparations of the Conservative party were hastened by a rumour which became current in the summer that the prime minister would appeal to the country in the autumn. The party was united in demanding a reduction of public expenditure, the restoration of incentives to production and the abolition of vexatious controls. Within this framework, however, there was much room for disagreement. Some members appeared to favour a policy of wholesale de-nationalization, accompanied by rigorous disinflation and the nearest possible return to home and abroad to the conditions of a free economy. Others held that the first duty of a government was to maintain a minimum standard of living, that the social services were sacrosanct and that economies could only be effected within the limits set by these conditions. Nationalization could not be wiped out, though its extension must be resisted and some attractive alternative to it found. In imperial and foreign policy divisions also appeared. A group of members, under the distinguished patronage of Winston Churchill (q.v.), looked with disfavour on changes in the structure of the Commonwealth designed to enable it to retain members who repudiated their allegiance to the crown, while at the same time many of them, including Churchill, crusaded passionately for a customs union with western Europe and the merging of Great Britain in some kind of western European union. Others felt that these two policies were incompatible.

After much deliberation the policies and principles of the party were set out in a pamphlet entitled The Right Road for Britain. The party decided against general de-nationalization but put forward practical proposals for improving the efficiency of the nationalized industries by decentralization. It demanded drastic reductions in public expenditure, combined with the full maintenance and some extension of the social services, and a vigorous defence policy. It thus seemed to rely entirely on the elimination of wasteful administration as a means of saving money. The alternative to nationalization was provided by the re-affirmation of the Conservative Industrial Charter, which set profit-sharing and joint consultation as the ideals of British industry and committed the party, if returned to power, to encouraging their adoption by practical means. The programme contrasted the centralized Socialist state administered from Whitehall with the Conservative...
ideal of a property-owning democracy in which every man would take an active part in the affairs which touched him most closely. To this end local government would be given increased powers and duties; and corporate and voluntary activity within the state would be encouraged. Abroad the party desired friendship with both the dominions and western Europe but put rather more emphasis on Commonwealth unity. This programme was enthusiastically approved at the party conference in London in October. As the weeks passed, however, party spokesmen insisted increasingly not on their long-term programme but on the immediate crisis and the superior ability of a Conservative government to cope with it. It seemed to many that events were in train which would make paper programmes, devised in the summer of 1949, irrelevant.

The Liberal Party. The Liberal party, at its conference at Hastings in March, approved the executive's intention to put 600 candidates up at the general election and rejoiced at having already induced 300 to stand. Its programme was approved by a large majority, and a new proposal for a flat rate of income-tax on all incomes below £500 a year took its place beside federal union, proportional representation and free trade in the party's programme-chest. A bitter controversy on the consequences of communist and fascist tendencies were freely exchanged arose out of a proposal to cut out the compulsory clause in the scheme for profit-sharing and joint control which the Liberals intended to apply to a great part of British industry in the event of their being returned to power. The supporters of compulsion pointed out that in addition to its other merits it was the only aspect of the scheme which distinguished it from the Conservative Industrial Charter, and the clause was approved amid scenes of considerable enthusiasm. Throughout the year Liberals continued to protest against any proposal for an electoral truce with the Tories.

Other Parties. The Communist party of Great Britain, assembled at Liverpool in November, demanded the reversal of all policies favoured by all other parties, calling for higher wages, more public expenditure, non-intervention in eastern Europe and the erection of a phenomenal number of houses in a phenomenally short time.

Sir Oswald Mosley's Union movement, which was widely regarded as a reincarnation of the Fascist party, maintained silence throughout the year, although there was some activity among local branches.

(T. E. U.)

POLITICAL PARTIES, U.S.

Democratic Party. President Harry S. Truman (q.v.) led the Democratic party to several important victories at the polls in 1949, but party differences prevented the passage of most of his welfare state legislation in the first session of the 81st Congress. Assuming a more aggressive leadership role as a result of his election in his own right in 1948, Truman submitted a formidable programme in his inaugural address on Jan. 20, 1949, and in subsequent messages. He also discarded the Roosevelt New Deal as a party slogan substituting for it the Truman Fair Deal. His proposals were regarded as more far-reaching than anything ever offered by Franklin D. Roosevelt. To finance the many new outlined activities, he asked for a $4,000,000 million tax increase. In foreign affairs Truman urged continued American co-operation with western Europe to combat Communism, which he assailed as "false doctrine." He advocated support of the United Nations, the European Recovery programme and the North Atlantic treaty.

Truman's proposals for extension and expansion of government power and activity were defeated through a combination of Republicans and conservative Democrats, mostly from southern states. He obtained only a housing construction bill and a farm measure providing for sliding and slightly lower subsidies. Truman's foreign programme was enacted almost as he presented it, despite some protests as to the cost of the foreign-aid bill.

In Labour day addresses before factory workers at Pittsburgh, Pennsylvania, and farmers at Des Moines, Iowa, he reiterated demands for action on all his original proposals. He urged a political alliance between farmers and workers as the two groups responsible for the "tremendous production of the country's economic system." Denouncing his opponents he declared that "with the Fair Deal we will win in 1950 and 1952." The special election results in 1949 offered some ground for these forecasts. The Democrats won four of the five contests for vacancies in the House of Representatives, losing only in a normally Republican district in Pennsylvania. When on Nov. 7 Herbert H. Lehman won the election to the senatorial seat in the state of New York (see below), the president interpreted the outcome as endorsement of his later record. He declared that it marked an advance in the creation of the welfare state. As 1949 ended, the Senate consisted of 54 Democrats and 42 Republicans. In the House of Representatives there were 261 Democrats, 169 Republicans, 1 American Labour party member, 1 Democratic-Liberal member and 3 vacancies.

The chairmanship of the Democratic national committee changed hands during the year. When J. Howard McGrath, of Rhode Island, resigned to become attorney general, he was succeeded by William M. Boyle, Jr., of Kansas City, Kansas. A former policeman and practical politician, and a close friend of the president, Boyle stepped up activity at national headquarters at Washington, D.C., and throughout the country. Like the president's, his formula for victory was an alliance of labour, farm and other numerically strong groups whose lot, he maintained, had been bettered by Truman policies. Democratic leadership in the Senate consisted of Alben W. Barkley, of Kentucky, as vice-president, Senator Scott W. Lucas, of Illinois, as majority leader and Senator Francis J. Myers, of Pennsylvania, as majority whip. In the House of Representatives, Sam Rayburn, of Texas, was the speaker and John W. McCormack, of Massachusetts, served as majority leader.

Republican Party. In 1949 the Republican party, which had been out of power for 16 years, became a divided and weakened organization in search of a popular leader and a popular issue. Inter-party strife began as soon as the national committee held its annual meeting at Omaha, Nebraska, in January. Committeemen identified with the Taft-Stassen group demanded the resignation of the national chairman, Hugh D. Scott, Jr., of Pennsylvania, who had been selected for the post by Governor Thomas E. Dewey, of New York, after his nomination as the 1948 presidential candidate. The opposition argued that Dewey and Scott had been too sympathetic to Truman's Fair Deal programme in the 1948 contest and that they no longer represented or reflected major party sentiment. Scott submitted his resignation at a special meeting of the national committee in Washington in August and Guy G. Gabrielson, of New Jersey, was elected in his place. A Manhattan lawyer, he had been a Dewey supporter at the 1948 convention; but he immediately disassociated himself from any candidate or faction. James S. Kemper, on resigning as party treasurer, revealed that there was only $90,000 in the special reserve fund and blamed the decline in contributions on to the support given by the party to the Fair Deal policy. On Dec. 31, 1949, the deficit in the everyday operating treasury as distinct from the reserve, was $420,000. Kemper was succeeded by R. Douglas Stuart.

In November, acting on an authorization from the August meeting of the national committee, Gabrielson sounded the sentiment of Republican officeholders and organization
members on issuing a formal statement of principles. He asked: "Should there be a restatement of party principles at this time? If so, what should the restatement contain?"

Election results in 1949 had an anti-Republican flavour. The contest which attracted most attention was in New York, where the former governor, Herbert H. Lehman, opposed John Foster Dulles, who had been appointed by Governor Dewey to the seat made vacant by the resignation of Robert F. Wagner. Dulles made an all-out campaign against the Truman Fair Deal philosophy. Truman threw all his influence behind Lehman, who won by a majority of 196,293 in a total vote of more than 5 million.

So discouraging were the 1949 election results that Senator John W. Bricker, of Ohio, the party's vice-presidential nominee in 1944, suggested, unsuccessfully, that the Republicans and conservative Southern Democrats, who had frequently joined in voting against administration proposals, should formalize their legislative alliance by merging into a new political party.

Other parties. Third parties were almost a negligible factor in U.S. politics in 1949. The political and economic climate was not propitious for insurgency.

Leftist movements such as Henry A. Wallace's Progressive party suffered from intensification of the "cold war" with the U.S.S.R. High employment and wages, temporarily at least, neutralized the appeal of almost all rebellious elements. Still a third explanation was that Truman's Fair Deal programme approximated the domestic demands of most independents.

Wallace, who had organized the Progressive party to make his unsuccessful try for the presidency in 1948, was inactive and seemingly indifferent. He refused to run as an American Labour party candidate for the U.S. Senate from New York. The Progressive party held a national housing conference in Cleveland, Ohio, in September, which Wallace addressed. Only 600 delegates attended. Save for a demand for Anglo-Russian-American co-operation through the United Nations, the platform differed only slightly from the doctrines of the Truman administration.

The Communist party virtually disappeared. The number of active, dues-paying members dropped to 40,000, according to the best estimates. Nowhere did its local candidates for office receive more than a handful of votes. When 11 top party officials in New York were convicted of conspiracy to overthrow the government by force, Eugene Dennis, secretary general and one of the 11 defendants, announced that the party would go underground. Despite these setbacks, he announced a drive for a $2 million campaign fund.

The Socialists named candidates for local and state offices, notably in New York and New Jersey gubernatorial contests, but they did not receive sufficient votes to remain on future ballots; this would force them to enter candidates by the petition process. Norman Thomas, perennial Socialist presidential candidate, indicated that he had had enough and would not run again. The party's only important state convention, held at Albany, New York, in September, virtually endorsed the Truman administration's legislative programme.

Typical of the voter's reaction to third parties was the outcome of the contests for New York's city council. Under a system of proportional representation, the American Labour party lost its only two seats, and the Liberal party lost its three incumbents. The new body consisted of 24 Democrats and 1 Republican-Liberal. The only member of the House of Representatives who did not belong to one of the two major organizations was Vito Marcantonio, of New York, American Labour representative. The New York elections for mayor and U.S. senator, however, suggested that these various political fragments could not be wholly discounted. Running as mayorality entry of the American Labour party, the left-wing offshoot of an independent trades union movement organized in 1938, Marcantonio polled 356,423 votes compared with 1,264,600 for Mayor William O'Dwyer and 956,170 for Newbold Morris, Republican.

The Liberal party, the right-wing element of the original trades union movement, gained prestige in the New York contests. Its most prominent figure was Adolph A. Berle, Jr., former assistant secretary of state. The Berle faction turned out 372,281 votes for Morris in the mayoralty fight, and 416,023 for Lehman in the contest for the Senate. Since the latter won by only 196,293, he would have been defeated if this vote had shifted to John F. Dulles, Republican.

Should the Berle and Marcantonio wings ever reunite, and their contrasting attitude toward the Soviet Union was the main issue that divided them, they could conceivably dominate politics in the nation's largest city and state. (See also Communist Movement; Congress, U.S.; United States.)

POLO. Steady progress was made during 1949 in the recovery of polo in England. There were eight clubs now playing regularly. Cowdray park, Ham common, Henley-on-Thames, Billericay (Essex), Rhinefield (New Forest), Taunton, Toulston (Yorkshire) and the newly-formed Hertfordshire club.

The county polo tournament was played in July at Roe, hampton and successful tournaments were held at Cowdray park in Goodwood week, at Henley in early August and at Brockenhurst, the Rhinefield club ground, in early September. A team consisting of Jack Tratt, John Lakin, R. Skene and Humphrey Guinness, with Lord Cowdray as manager, undertook a tour in the Argentine at the invitation of the Argentine polo club, which also made all arrangements to mount them, and succeeded in giving a very good account of themselves. It was hoped that an Argentine team might visit England during 1950. Polo crosse continued to gain adherents; it became especially popular in the west country.

(J. C. G.)

United States. Argentina sent two teams to the United States. The Venado Tuerto four visited the Pacific coast in the spring where they completed a successful tour against the best players in the west. The only game they lost was to a strong Hurricane team in the Pacific Open championship tournament. A second Argentine team, El Trebol (the clover), arrived in May and played in all the eastern tournaments during September.

The outstanding team of the 1949 season was the Hurricanes, which won the Pacific Open and the National Open for the second year in succession. The university of Miami, Florida, team won the intercollegiate crown. (W. C.N.)

POPULATIONS OF THE COUNTRIES OF THE WORLD: see Areas and Populations of the Countries of the World.

PORTUGAL. A republic of southwestern Europe, forming part of the Iberian peninsula and bounded on the F. and on the N. by Spain. Area: 35,413 sq. mi., including Azores (888 sq. mi.) and Madeira (302 sq. mi.). Pop.: (1940 census) 7,722,152; (mid-1948 est.) 8,402,000, including Azores (1940 census, 286,883) and Madeira (250,124). Language: Portuguese. Religion: predominantly Roman Catholic. Chief towns (pop., 1940 census): Lisbon (cap., 709,179); Oporto (262,309); Funchal (54,856); Coimbra (35,437). President of the republic, Marshal António Oscar de Fragoso Cardoso (q.v.); prime minister, Dr. António de Oliveira Salazar (q.v.); minister of foreign affairs, Dr. José Caeiro da Matta (q.v.).
History. After a heated electoral campaign, with threats of army intervention, General Norton de Mattos withdrew and on Feb. 13, 1949, Marshal Carmona was re-elected president for a fourth 7-year term. At elections for the National Assembly on Nov. 13, the União Nacional (pro-government) party was again returned, with negligible opposition. About half of its candidates were civil servants. The new assembly could initiate revision of the 1933 constitution. The archives of the illegal Communist party were seized in Luso in March and its secretary general, a lawyer, was arrested. In June a public security council was established to tighten preventive and repressive measures against subversive activities.

Features of the 1949 budget, which estimated receipts at Es.4,309 million, ordinary expenditure at Es.4,308 million and extraordinary at Es.1,358 million, were the provision of Es.317 million for increases in civil service salaries and a cut in public works in favour of development in Mozambique. It was announced in May that Portugal had foregone, in favour of other O.E.E.C. countries, any claim to U.S. financial assistance. Entry in July to the multilateral payments and compensation system between countries participating in the European Recovery programme led to an alignment of currency parity at Es.25 to the $. The new sterling rate after devaluation of the £ was Es.80:50 (instead of 100:25).

A European regional conference of the Food and Agriculture organization of U.N. was held in Lisbon in March, as was in April the International Geographical conference. The exchange of diplomatic missions with Pakistan, with the rank of legations, was agreed on in September.

Following on consultations with Spain, Portugal adhered to the North Atlantic treaty in April, with the reserve that no use of bases would be granted in time of peace. Dr. Salazar stated that the value and significance of Portugal's adherence would be affected by the inclusion or exclusion of Spain. The close understanding with Spain was underlined by the visit to Portugal of General Franco (q.v.) in October, when he was made a general in the Portuguese army.

The Anglo-Portuguese monetary agreement was extended in April for a year. Great Britain continued to be Portugal's chief supplier and, after the Portuguese colonies, its best customer. A fall in imports from Great Britain was envisaged in a new trade programme aiming at approximate equilibrium in payments between the two areas. A one-year trade agreement was signed with France in October, totalling Es. 600 million in each direction. Duties on all imports from abroad, certain agricultural chemicals and food excepted, were increased in June by 60%. In September a fund was created to stimulate exports.

Heavy rainstorms in September ended the longest drought in the country's history, which had severely hit the cotton and woollen industries through cuts in hydro-electric power. Much wheat had also to be imported. A vast reconstruction plan for the centre of Lisbon was approved. Dr. Egas Moniz (q.v.), the Lisbon neurologist, shared with a Swiss physiologist the Nobel prize for physiology and medicine. (W. C. AN.)

Education. (1946-47) Primary schools 10,248, pupils 533,344, teachers 13,747; private elementary schools, pupils 59,698; secondary schools (Icous) 43, pupils 20,965, teachers 1,154; private secondary schools, pupils 24,800; technical secondary schools 58, pupils 39,521, teachers 1,481; commercial schools 8, pupils 3,150, teachers 204; universities 3, students 8,568, professors and lecturers 464; institutions of higher education 3, students 5,846, professors and lecturers 281; illiteracy (1940): 49%.

Agriculture and Fisheries. Main crops (in '000 metric tons, 1948; 1949 estimates in brackets): wheat 322 (317); barley 88; oats 99; maize 317; rye 131 (136); potatoes 994; rice 89; dry beans 40. Livestock (in '000 head): cattle (Dec. 1945) 950; sheep (Dec. 1947) 4,000. Fisheries total catch (1948): weight 180,606 metric tons; value 669 million escudos. Production (1948): meat (in '000 metric tons) 70-8; milk (in '000 metric tons) 330; olive oil (in hectolitres) 315,930; wine (in '000 hectolitres) 8,162.

Industry. Fuel and power (in '000 metric tons, 1948, 1949, six months, in brackets): coal 386 (231); lignite (in '000 metric tons) 103 (54); manufactured gas (in '000 cu.ft.) 1,234 (702); electricity (in million kwh.) 805 (418). Raw materials (in metric tons 1948; 1949, six months, in brackets): lead 1,650 (1,050); tin content of cassiterite 710 (630); iron pyrites 556,135; wolfram 2,511; antimony 84; sulphur 9,826; manganese 280; chromium 170; baryta 396; sulphur pyrites 9,826; cork 140,442. Manufactured goods (in metric tons, 1948): cotton yarn 31,486; cotton piece-goods 24,452; refined sugar 63,896; sulphuric acid 200,069; superphosphates 302,845; cement 500,000.
A conference held at Belgaum had earlier demanded the accession of Goa to the Union, and the Indian press alleged that many Goan National congress leaders had been arrested when seeking to leave Goa to attend. (Portuguese India was given in Dec. 1946 the status of a metropolitan province).

The garrison at Macao was reinforced in August from Portugal and Portuguese Africa to a total of some 6,000. In November, as the Chinese Nationalists withdrew from the neighbourhood, many stragglers and a number of Nationalist gunboats and armed junks sought refuge in Macao, drawing some Communist shelling.

On Jan. 1 the Portuguese government redeemed the Beira (Mozambique) concession, and port and railway passed to the Mozambique colonial administration. An international Conference of African Transport, covering railways, inland waterways, roads and ports, met in Lisbon in May with a view to the co-ordination of developments throughout the territories of central and southern Africa. A plenary conference in Africa was to follow. Coal deposits believed sufficient to supply the whole Portuguese empire were discovered at Maniamba, Mozambique. Mozambique and Angola production of cotton was stated to be almost sufficient now for all empire needs.

Considerable developments in public works were recorded in the African colonies (and in Timor) and, taken in conjunction with the provision of government-paid passages for emigrants and their families going to guaranteed employment, were reflected in a substantial increase in emigration...
from Portugal. Mozambique attracted twice as many as Angola. The number of Portuguese settlers in Portuguese Guinea (784 in 1940) had doubled by 1949. A medical exchange system between doctors and specialists in Portugal and in Angola and Mozambique was inaugurated early in the year. Over 600 students from the colonies were engaged in higher studies in Portugal.

The minister for colonies re-affirmed in February that Portuguese policy continued firmly opposed to the modern trend towards autonomy and eventual independence for colonial territories. (W. C. AN.)

---

**POST OFFICE.** The total value of post office transactions in Great Britain with the public during the year ended March 31, 1949, was £3,053,595,000. This was a reduction of about £32,405,000 on the figure for the preceding 12 months, and was more than accounted for by a decrease in the savings bank deposits. (See *Savings Bank* below.)

**Postal.** The number of letters and letter packets posted during 1948-49 was estimated to have been 8,050,000,000, an increase of 450,000,000 on the traffic for 1947. The number of parcels handled during the year dropped from 243,500,000 to 239,601,000. This latter figure included 16,024,000 received from abroad, of which about 13,000,000 were gift parcels, mostly food and mainly from the Commonwealth and the United States. On May 1, 1949, the inland registration fees were raised by one penny at each step of the scale. The minimum fee became 4d. covering compensation up to £5, 5d. covering compensation up to £20, then by 1d. at each step up to the maximum of 2s. for £400.

Air parcel services were started in April 1949 to many countries in Europe, and on June 1 the arrangements whereby first class mail (letters, letter packets and postcards) could be forwarded by air or surface route, whichever offered the earlier delivery, were extended to include Germany. A reduced air postage rate of 4d. a half-ounce was introduced on July 1 for second class mail (printed papers, commercial papers, samples, literature for the blind and small packets) to Canada, the United States and Mexico, thus extending this facility to include the whole of the western hemisphere. Some additional internal air mail services were introduced during 1949 and, in co-operation with British European Airways, the post office continued to study the problem of using helicopters for inland mail services.

**Telecommunications.** The number of telegrams handled during the year ended March 31, 1949, was 53,661,000, of which 10,265,000 were overseas telegrams. The comparable total for the preceding 12 months was 58,054,000, of which 10,615,000 were overseas telegrams. The system of manual through-switching introduced in the inland service was extended, thus reducing progressively the average length of time for transmission of telegrams over the network. Plans were well advanced for the gradual introduction of an automatic switching system.

The number of telephones in service rose from 4,652,704 to 4,919,203, a net increase of 266,499; this represented an actual rate of installation of over 56,000 a month after allowing for cessations, which was more than 50% above that of any prewar year. The number of working exchange lines rose by 4.1% from 2,835,558 to 2,952,416, a net increase of 116,858 exchange lines. In Sept. 1949 the 5 millionth telephone was installed on a farm near Canterbury, Kent. The number of applicants waiting for telephone service rose from 488,000 to 558,000, despite the high rate of connecting new subscribers.

The number of long-distance circuits in the public telephone network was increased by 7% from 14,528 to 15,562. The total number of inland telephone calls handled was 3,137,000,000 of which 2,911,000,000 were untimed calls: this represented an increase on the 1947-48 period of 10,000,000 timed and 230,000,000 untimed calls. On March 31, 1949, there were 3,969 automatic, 1,879 manual and 230 auto-manual and trunk exchanges in operation throughout Great Britain.

**Savings Bank.** Deposits for the year ended March 31, 1949, amounted to £371,869,000, a decrease of £54,959,000 on the sums deposited in 1947-48. The number of separate deposit accounts at the end of March 1949 was 23,562,000; on Dec. 31, 1948, the total amount due to depositors stood at £1,948,051,000. In the first three months of 1949, 22,050,000 savings certificates were purchased.

**Personnel.** In March 1949 post office personnel numbered 348,224, with a wage bill (including national insurance contributions) of £113,250,000 a year. (G.P.O.)

**United States.** Revenues of the post office department for the fiscal year 1948-49 amounted to $1,572,851,202. Estimated postage revenues lost from services not on a regular pay basis—penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind—together with the excess of the cost of aircraft service over the postage revenue derived from air mail, amounted to $120,118,663.

The expenditures of the department for the fiscal year amounted to $2,149,322,128, of which amount $147,013,102 was on account of previous years. There was $120,671,703 unpaid on account of the 1949 fiscal year. This left a total expense of $2,122,980,730, resulting in a gross operating deficit on an accrual basis of $551,129,528. This amount did not include pending retrospective payments to railways, but did include a 25% interim increase granted to participating railways by the Interstate Commerce commission. It also included the estimated increased cost for the projected establishment of permanent rates on air mail routes by the Civil Aeronautics board.

During the fiscal year ended June 30, 1949, 1,470 million free pieces weighing 177 million lb. were mailed for other government departments—an increase of 52 million pieces but a decrease of 2.5 million lb. from the fiscal year 1948.

On June 30, 1948, war savings stamps were on sale at 41,607 offices, and sales from July 1, 1948, to June 30, 1949, amounted to $15,067,255. During the fiscal year 6,459,306 savings bonds with a sale value of $368,181,469 were sold. At the close of 1948, bonds were on sale at 26,503 post offices. Postal savings depositors numbered 3,964,509 for 1949—a decrease of 3.6% from the preceding year. The balance due

POULTRY—PRESBYTERIAN CHURCH

525

to depositors by outstanding certificates of deposits was $3,277,173.306—a 3% decrease. In addition there was held in trust for depositors accrued interest of $113,251.238 and unclaimed deposits of $228,964, making a total of $3,390,653.508.

Through the 41,607 post offices and 3,724 stations being conducted under contract agreement, as well as 2,083 stations and branches, there were received, transported and delivered 43,380 million pieces of mail matter during the fiscal year, having a weight of 11,623 million lb., an increase of 3,000 million pieces and 1,300 million lb. from the previous fiscal year.

Delivery service was established in 143 additional cities during the fiscal year, thereby increasing to 4,413 the number of cities in which this service was operated.

During 1949 it was impossible to deliver 18,142,721 letters—an increase of 23% from the previous year. A total of 4,075,970 were returned to the senders. Letters containing valuable enclosures numbered 374,234, of which 102,442 contained money amounting to $209,272. There were also 718,156 unclaimed parcels and articles found loose in the mails. A total of 592,944 were returned to the senders. The remaining 125,212 parcels were sold by public auction and $135,533 was realized.

On June 30, 1949, there were 155,314 mi. of domestic air mail routes in the United States—an increase of 25,221 over June 30, 1948. Three new domestic air mail routes were established. The domestic air mail rate was raised to six cents effective from Jan. 1949. A four-cent air mail postal card had been authorized for the first time in 1948. Foreign air parcel post had been inaugurated on March 15, 1948, and domestic air parcel post on Sept 1 of that year. (See also PHILATELY, TELEGRAPHY; TELEPHONE.) (I. G.G.)

POULTRY: see Root Crops.

POULTRY. Although no great changes in the animal feedstuffs rationing situation took place during 1949, the concessions granted by the ministries responsible resulted in large increases in the poultry population.

In England and Wales in 1949 there were no fewer than 60,975,000 head of stock, including ducks, geese and turkeys, on the latest official returns compared with just under 52 million in 1948. In Scotland and Northern Ireland the figures were 10,006,270 (9,284,741 in 1948) and 24,236,000 (24,233,796 in 1948) respectively. In each case these figures excluded stock kept on holdings of less than one acre.

Official estimates of egg production, based on packing station figures were unreliable because they took no account of the millions of eggs passing through the hatcheries, nor of those millions produced by the smaller poultry keepers who now enjoyed a free market for their sales. It was estimated that the number of domestic poultry keepers in England and Wales was still in the region of over a million—between them they kept upwards of 64 million head of stock.

The greatest blow suffered by the poultry industry in post-war years was the re-introduction of Newcastle disease (fowlpest) to the United Kingdom owing to imports of table poultry from abroad. The early part of 1949 witnessed many serious outbreaks of the disease but, owing to the stringent measures taken by the Animal Health division of the Ministry of Agriculture, England and Wales became comparatively free of the disease and the outbreaks in Scotland were almost completely localized.

In the Commonwealth, Australia and New Zealand, free from ration worries but tied to high feedingstuffs costs, were encouraged to expand their poultry populations by the markets waiting for their produce in Britain. South Africa and Canada were also in advance of their 1939 figures.

European countries which were competitors on the British egg market prior to 1939 made more rapid strides in their poultry-production programmes, some by making use of European Recovery programme funds to do so. Denmark and Holland in particular, showed considerable expansion and, with Poland, were again exporting huge quantities of eggs to the United Kingdom. (See also VETERINARY MEDICINE.)

PRAGUE (PRAHA), capital of Czechoslovakia, situated on both banks of a large meander of the Vltava. Pop.: (1930 census) 848,823; (1947 census) 921,416. President (mayor), Václav Vánek.

Prague had emerged from World War II with very little damage. Nevertheless acute housing shortage soon began to be felt. As the central bureaucracy increased after the "revolution" of 1948, with its three growing branches of nationalized industry, Communist party hierarchy and Communist-controlled trade unions, so the pressure on housing space increased. It would increase further as the industrialization programme of the five-year plan was carried out. Prague would have not only new factories, but still more bureaucrats to administer the ever more centralized economy. Considerable sums were allocated in the five-year plan to building. But this included industrial premises, government buildings and party offices. Private housing had a low priority. Overcrowding in Prague was therefore likely to increase to the point customary in the great cities of the U.S.S.R. The principal casualties were the former middle class. Having lost their property, their jobs either removed or threatened, they faced the final blow of being driven from their homes. During 1949 the authorities began to remove inessential persons from the capital and to take over rooms in apartments for workers. These powers could of course be abused for political or personal ends. Reduced to minimum housing space, former "bourgeois" must part with all but essential possessions, such as books. Thus the destruction of private libraries completed the process of regimenting thought, of which the earlier stages were censorship of the printed word, purge of public libraries and nationalization of publishing and of bookshops. The last measure did as much as anything to change the face of Prague, the variety and enterprise of whose bookshops was once famous in Europe. The symbol of the change that had come over Prague was to be the 100-ft. statue of Stalin, which it had been decided to set up on the castle square, one of the most beautiful and historic sites on the continent, which even six years of Nazi rule did not deface.

(H. S.-W.)

PRESBYTERIAN CHURCH. Europe. From the distraught conditions of the Reformed Churches in Europe a new life and a new structure were arising. The meetings of the Council of Reformed Churches at Geneva, Switzerland, in Aug. 1948, had initiated a more widespread influence. The extent of this Reformed influence was stated thus: "that of all the non-Roman Communions the Reformed is the most catholic both in geographical extension and in variety of race and language." Representatives to the council came from France, the Netherlands, Switzerland, Italy, Germany, Czechoslovakia and Hungary (with the largest Reformed Church on the continent). Delegates were present from Scotland, Ireland, England, northern India, Ceylon, South Africa, Australia, New Zealand and America. Headquarters of the alliance opened in Geneva in Jan. 1949. This World Presbyterian alliance offered assistance to the European Reformed Churches in providing funds for the rebuilding of churches and for the sending of ministers into new areas. The alliance also enlisted women and young people through
their organizations to further Christian brotherhood and oecumenical understanding.

**United States.** The western section of the Reformed Churches throughout the world which held the Presbyterian system, within the United States of America, numbered 12 branches of Reformed Churches in 1949, and included 18,431 ministers, 18,479 churches and 4,234,288 communicant members. The western section of the World Presbyterian alliance took steps in Feb. 1949 to promote the union of churches with emphasis on the reunion within the Reformed and Presbyterian Churches. Negotiations toward union were in progress between the Presbyterian Church in the United States (Southern) and the Presbyterian Church in the United States of America; and between the United Presbyterian Church of North America and the Reformed Church in America. A union of the Evangelical and Reformed Church with the Congregational-Christian Church was scheduled to form the United Church of Christ.

Protestantism continued to make unusual strides in the Latin American countries. The first Inter-American Evangelical conference, which met at Buenos Aires, Argentina, from July 18 to 31, 1949, was composed of some 70 official delegates from 17 countries of Latin America. Two major tasks of the Evangelical churches in Latin America were the dissemination of the Bible and the combating of secularism. In these tasks the Presbyterian and Reformed delegates held a special meeting to promote more united action in Latin America.

In the air of spiritual advance the emphasis upon evangelism produced significant results within the ranks of Presbyterian and Reformed Churches. The spiritual awakening brought many non-attenders to a sense of their spiritual needs and resulted in increased membership. Through the New Life movement in the Presbyterian Church, U.S.A., many young people enlisted in the work of the church. The Westminster fellowship, the Geneva fellowship and the Westminster foundations did much to enlist the support of young people in Christian life and work. Women, through their local and national organizations, enlarged their mission work. The National Council of Presbyterian Men, organized in 1948, continued to educate Christian laymen in the work of Christian missions and in the vital relationship between protestantism and human freedom. (See also CHURCH MEMBERSHIP; CHURCH OF SCOTLAND.) (W. B. P.)

**PRICES.** The course of prices in the United Kingdom in 1949 was dominated by the devaluation of sterling in September. The upward movement in prices had been general and continuous from the end of World War II until the middle of 1948. The rise in prices was then halted and during the following 12 months prices were generally stationary or falling. A slow but definite downward movement in general price levels (apart from adjustments in subsidies and taxation) was the characteristic feature of the middle months of 1949. This trend was violently changed by devaluation. Although only partial and immediate effects were reflected in price index numbers by the end of 1949, the prospects then were for continued and (in some sectors) large price increases for many months to come.

Prices before Devaluation of Sterling. The main price index numbers are shown in Table I. The downward movement in prices during the months before devaluation in Sept. 1949 was most clear in prices of imports. Early in 1949, import prices stood at a level three times that of 1938; at the time of devaluation they had been lowered by more than 5%. Prices of imported foodstuffs declined equally with raw material prices. The prices of United Kingdom exports remained firm during this period of falling import prices. As a result, the decline in the prices paid for imports was matched by an improvement in the terms of trade. At the end of 1948, terms of trade were almost 20% less favourable than in 1938; by the time of devaluation in 1949 this differential had been reduced to little more than 10%.

The trend of domestic prices was less easy to follow since the prices were affected by changes in subsidies, in indirect taxation and in controls. Prices received by domestic farmers, inclusive of all government payments, were largely a matter of agreement between the farmers and the government; apart from seasonal variations, they did not differ much between 1948 and 1949. Prices of commodities, both at wholesale and at retail, were affected between April and June by a set of adjustments, following the budget and the declared policy to limit the total amount of subsidies and trading losses by the government. The main adjustments were in iron and steel prices and in the prices of some basic foods—meat, butter, margarine, cheese and eggs. There were also budget changes, particularly in the prices of beer and matches. Among wholesale prices, the group of prices of basic foodstuffs (cereals, meat, fish and dairy produce) was increased from 50% to nearly 75% above 1938. This was almost entirely the result of the limitation of subsidies. Similarly, iron and steel prices, under governmental control, were adjusted to give an average increase from under 70% to more than 85% above 1938. In addition, prices of industrial materials declined fairly rapidly in the first nine months of 1949 and food prices at wholesale showed no more than normal seasonal changes (e.g., in fruit and vegetable quotations). The general index of wholesale prices at the beginning of 1949 was 218% of 1938, practically the same figure as at mid-1948. In Aug 1949, the recorded index was 225% of 1938 but elimination of the effect of adjustments in prices of iron and steel and of subsidized foods would reduce the figure to about 210% of 1938. This figure was comparable with the index at the beginning of the year, indicating that the underlying movement in wholesale prices was downward. The fall amounted to some 3 or 4% in eight months, and was due mainly to declining prices of non-ferrous metals, textile materials and other (non-food) agricultural products.

The adjustments in subsidized food prices raised the index of retail prices of all foods from 50% to about 60% above 1938. The index of all retail prices, affected also by the reduction in the price of beer and the increase in the price of matches following the budget, was raised from about 175% of 1938 to nearly 180% of the prewar level. Otherwise the general level of retail prices remained almost unchanged during the nine months before devaluation. There were some changes in gas and electricity tariffs, including the switch from winter to summer charges for electricity. Generally, price declines at the import and wholesale stages were absorbed or had not reached the retail stage.

The Effect of Devaluation of Sterling. By the end of 1949, recorded index numbers of prices reflected the consequences of devaluation to a limited extent. The longer-run effect of devaluation, to be expected during 1950, could only be roughly guessed. One computation could be made to show the direct effect of devaluation defined in a special sense. The calculation was based on the assumption that the domestic element in the prices of any commodity (including the actual amount of the distributive margin, of subsidies and of indirect taxes per unit of the commodity) remains unchanged, and also that the import element is unchanged in the curren- cies of the exporting countries. Sterling prices then increase only as a direct result of the new exchange rates, applied to the import elements in the prices. It was also assumed that the composition of imports from various sources remained unchanged and that the volume of imports and of consumption moved together.
In this special sense, the direct effect of devaluation would be to raise import prices by a little over 15% and, since the import content of total consumption was around one-fifth, retail prices would go up by some 3½% over the whole range of commodities and services purchased by all consumers.

The direct effect of the new exchange rates on the index can be calculated at once from Table II. For example, in the total index, imports from countries which did not devalue their currencies amounted to 4 3½% of the total and an increase of 44½% in the sterling price equivalent must be applied to this part. The uncertainty in the calculation is in the 1-4% of the total attributable to imports from countries with multiple exchange rates; and this would only be resolved when new prices were fixed for Argentine meat, Spanish oranges, etc. It was expected that the modest rise in the retail price index in the last quarter of 1949 would be only a first instalment; a further increase of at least 5% taking place during 1950.

Europe. As in 1948, the greatest stability in prices, both at wholesale and at retail, was in the Scandinavian countries and the movement was very slight. In the Netherlands, wholesale and retail prices rose towards the end of 1948 but became more stable in 1949. The two countries with hard currencies, Belgium and Switzerland, experienced a considerable amount of deflation and prices declined in 1949, particularly at the wholesale stage. Of the two main countries where inflationary pressure was strongest, France was the more successful in controlling prices. In Italy, although there was no repetition of the inflation experienced up to 1947, prices were by no means stable. Prices fell and then rose again in 1948, with some reaction in 1949.

The movement of prices in Commonwealth countries was similar to that in the U.S. or the United Kingdom, as expected. Both wholesale and retail prices reached a peak in the middle or during the second half of 1948; the trend was subsequently stationary or downward until the devaluation of sterling in 1949. Price declines were most evident in Canada, India and Pakistan. In Australia and South Africa, there was a greater stability in price levels and price rises were slightly more numerous than price falls after the middle of 1948. (R. G. D. A.)

The United States. In the United States a gradual decline in the general levels of both wholesale and retail prices which began in the late summer of 1948 continued throughout 1949. By December, wholesale prices declined 10-6½% and retail prices 4% from the postwar maximum levels of Aug. 1948. Wholesale prices of all major commodity groups fell, the most substantial decreases being recorded in farm products, chemicals and allied products and food. At the retail level, decreases in the prices of foods, apparel and house-furnishings were somewhat offset in the cost-of-living index by the relatively small increases in rent, fuel, electricity and refrigeration, and miscellaneous items, which all attained new postwar maxima at the end of the year. Despite the general overall decline in prices during the year, the wholesale price

index was slightly more than 100% greater in Dec. 1949 than in Aug. 1939; and the consumers’ price index was 70% greater than that of Aug. 1939.

Wholesale prices for each major group of commodities, with two exceptions, reached their postwar maximum levels in 1948. The wholesale price of hides and leather products reached a peak in Dec. 1947. In 1949 (January) only metal and metal products attained a new high point. On the retail level, the rent, fuel, electricity and refrigeration, and miscellaneous items in the cost-of-living index continued to rise to new high levels at the end of 1949.

As shown in Table III, wholesale prices declined 6.7% during 1949. The downward trend was continuous throughout the year except for two slight upturns in March and September. At the beginning of the year prices dropped 2.6%, largely as a result of heavy inventory liquidations which were carried out in an orderly manner. The return to a shorter working week, production curtailments and high levels of consumer expenditure prevented a greater decline in industrial and raw material prices, and government subsidy programmes prevented a greater decline in the prices of farm products and foods.

Consumers’ prices, which levelled off during 1948, fluctuated sporadically during 1949 and at the end of the year were 2.3% lower than at the end of the previous year. Retail prices were still 25.7% above the June 1946 level at which time price controls were removed, 51.6% above the level of the Dec. 1941, and 69.9% above the Aug. 1939 level. Declines in the prices of foods, clothing and house-furnishings more than offset the increases in other consumers’ prices shown in Table IV. Had retail food prices declined during the year as much as wholesale food prices, the cost-of-living index would have been lowered substantially.

The three peaks attained by the index of all items during the year—those in April, June and September—largely reflect sudden upturns in the prices of food and rent (see Table V).

FACTORS TENDING TO SUSTAIN HIGH PRICES WERE THE CONTINUED HIGH-LEVEL GOVERNMENT AND INDIVIDUAL EXPENDITURES, TEMPORARY SCARCITY OF COMMODITIES WHERE OUTPUT WAS CURTAILED BY LABOUR DISPUTES, RENT DE-CONTROL AND FOREIGN DEMANDS SUBSIDIZED BY THE U.S. IN GENERAL, THE CONTINUED HIGH LEVELS OF WHOLESALE AND CONSUMERS’ PRICES WERE SUSTAINED BY THE CONTINUED HIGH LEVEL OF ECONOMIC ACTIVITY IN THE U.S. WHICH WAS BUTTRESSED BY LARGE GOVERNMENT EXPENDITURES FOR NATIONAL DEFENCE, FOREIGN AID AND FARM PRICE SUBSIDY PROGRAMMES. (SEE ALSO BUSINESS REVIEW; NATIONAL INCOME; WEALTH AND INCOME.)

PRINTING. Several European countries which had not previously produced much machinery for the printing and allied industries attempted to enter the export market during 1949. Such countries included Great Britain (viz., book-binding machinery), Czechoslovakia, Holland, Italy, Sweden and Switzerland. The production of photographic type for lithographic and gravure processes continued to be an important matter and several methods moved nearer to practical application. Exhibitions were held at a very large number of European centres to attract export trade.
In Great Britain general unrest regarding wage standards was reflected in the printing industry and progress towards a long term settlement was made. The amount of work to be done was far greater than the available labour capacity; efforts, therefore, were made to recruit workers to the various branches of the industry and incentive schemes of payment were proposed. The new P.A.T.R.A. Research laboratories reported a very satisfactory first full year of work. The amalgamation of the L.C.C. School of Photo-Engraving with the London School of Printing was announced. Arrangements were made for the printing industry, along with certain other industries, to study production methods in the United States.

On the technical side home needs of new machinery were still sacrificed to the urgent demands for export. A remarkable offset litho machine designed to print four colours simultaneously on both sides of the paper web at speeds of more than 30,000 an hour was completed and exported to Denmark for the printing of periodicals. The successful development of this type of machine was made possible by the adoption of the bi-metal methods of lithographic plate-making, these plates becoming increasingly available for commercial adoption in 1949. Important improvements were made in silkscreen printing, both methods of stencil production and in mechanical operation. Owing to the difficulty of importing costly precision machinery for the reduction of make-ready time in letterpress printing, arrangements were made to manufacture in Great Britain the Vandercook types of presses together with certain Swiss precision equipment. The extended use of electronics was applied in register control of paper webs, in counting devices, in control of ink films and in the measurement of photographic image densities. Britain's standard for four, and three-colour letterpress process inks covering hue, lightfastness and concentration was also issued.

Europe. Czechoslovakia made efforts to produce machinery for export but did not achieve large scale manufacture. In France individual work was done on certain important technical developments and newpress control was lifted from Oct. 1, 1949, but, owing to financial difficulties no outstanding progress was reported.

A certain amount of printing industry reconstruction was carried out in western Germany with the authorization of the occupying powers. In the eastern zone production both of printed matter and machinery was in the main for export to the U.S.S.R. The difficulties of machinery shortage and depleted technical manpower were partly solved and work was done by employees and trade unions jointly in re-organizing and financing printing technical schools. Keen interest was shown in technical developments in graphic processes throughout the world. Efforts were made in Italy to produce machinery for export in a fairly wide range. A high standard of printing design was encouraged by the establishment of graphic arts centres. The Netherlands increased the amount of printing produced for export including work in litho, letterpress and gravure and particularly in book and periodical productions. The Hagedo method of photographic type production was also improved during 1949. Schemes for payment by results were adopted. In Sweden control was withdrawn on Jan. 1, 1949, and more use was made of bi-metal plates for lithographic printing. In addition to the continued development of precision methods and equipment Switzerland was the meeting place of three International Graphic Trade conferences. (A. Kk.)

United States. Announcements of phototypesetting mechanisms continued during 1949. One, unofficially named Lumitype, was designed for book, magazine and newspaper composition. Public demonstrations of a laboratory model were held by Graphic Arts Research Foundation. The machine was the invention of two French communications engineers, René A. Higonnet and Louis Moutraud. Joined with the foundation were Vannevar Bush and Samuel Caldwell. Bush was the inventor of the telephonic relay system which was employed in a limited manner in the phototypesetting machine.

There were five basic parts: (1) electric typewriter, (2) memory unit, (3) counterjustifier which was an electrical computing and control system, (4) automatic photographer unit and (5) automatic stripping machine. The typewriter typed characters on paper just as was done on the conventional machine; also, each character was typed its set-width was coded and stored in a memory device. The system used was based on units of 0.01 in. (actually two-tenths of a mm.). Thus, as each line was typed an indicating dial recorded by increments progressively the units occupied by letter characters and the word spaces. Having typed the maximum number of words which would go into the line, the operator depressed a special key. Switching elements in the counterjustifier added the number of units required for words and spaces between words. The total number of units was subtracted from the maximum number of units required to fill the line. The excess space required to fill the line to constant width was then automatically distributed evenly between the words.

The counterjustifier then sent its signals to the automatic photographic unit in which there was a continuously revolving vertically positioned glass disc six inches in diameter. Inset radially through the disc were photographic negatives of all the letter characters in the usual type font. Set at right angles to the disc was a high-speed stroboscopic lamp which emitted flashes of two-millionths sec. Duration. The lamp rays arrested the movement of the negative letter character in the revolving disc during exposure to the film. At the other side of the disc and also at right angles to it, but in line with the apertures in the whirling disc, was a lens system and the sensitized film. When an impulse was created by one of the coded characters a beam of light, triggered by a photo-electric cell, passed through the selected negative in the whirling disc into a lens system focused on the photographic film. Letter characters were photographed on the film at six exposures per sec. After development, the film could be printed on sensitized or Ozalid paper for proof reading.

The automatic stripping mechanism made corrections in previously composed matter, inserted folios, page numbers and running heads and automatically photographed a new film ready to be used by the platemaker. The proof reader's corrections were made on a new film and a code mark was placed at one side of the line or lines containing errors on the original film. The original film and corrected film were fed into the stripping machine simultaneously. The machine photographed a new film from the original composition until one of the code signals indicated by the proof reader told the machine to shift to the corrected film. After the corrected line or lines had been photographed on the new or third film, the stripping machine was shifted back to the original film. Operation was at a speed of ten average-width lines per sec.

Introduction of the Hagedo Photocompositor invented by H. J. A. de Goey, Haarlem, Netherlands, for display line typesetting in negative or positive film form was made. With the exception of the photographic operation, the machine was based upon the principle of the Ludlow hot-metal machine. Matrices consisting of 48-pt. white letter characters upon a black background were affixed to clear plastic blocks. Letter characters were assembled like hot-metal matrices in a stick; the stick containing the line was placed before the camera and the exposure was made. Letter characters might be reproduced photographically on the film down to 19 pt. or up to 115 pt. Leading between the lines on the film might be obtained from 0 to 24 pt.
PRISONERS OF WAR. Albania, Poland and the U.S.S.R. alone of all the nations which participated in World War II still retained prisoners of war at the end of 1949. The total number was not known but was estimated to be between 1.5 and 2 million.

France completed repatriation of all prisoners of war held by that country in metropolitan France, the French zone of Germany and north Africa on Dec. 31, 1948. However, approximately 130,000 former prisoners remained as civilian workers, and a small number still were held for legal reasons. Yugoslavia announced that there were no longer any prisoners of war in that country. As in France, a certain number remained as civilian workers, and others were held for legal reasons. Czechoslovakia completed its repatriation of prisoners of war in 1949.

Poland, which held 40,000 prisoners of war at the end of 1948, still retained several thousand whose repatriation was promised by the end of 1949. Albania held throughout 1949 the 250 prisoners of war it reported in 1948 without any indications as to when they would be repatriated.

The U.S.S.R. repatriated a certain number of both German and Japanese prisoners of war during the year, but the total number repatriated and the total number of prisoners of war still held by the U.S.S.R. were not known. Steps taken by various governments and by the International Red Cross to hasten repatriation of these prisoners brought responses that repatriation was being effected as rapidly as possible.

Dr. Konrad Adenauer, German federal chancellor, stated on Sept. 20 that from 1-5 to 2 million German prisoners of war in the Soviet Union had still not been accounted for.

An announcement from Moscow on May 20 stated that out of a total of 594,000 Japanese prisoners, 418,166 had been repatriated between 1945 and May 1, 1949.

Representatives of 58 nations (including the U.S.S.R.) meeting in Geneva, Switzerland, April 21-Aug. 12, 1949, completed the revision of the 1929 Prisoner of War convention. Twenty-nine states signed the revised convention in Geneva on Dec. 8, 1949, and during the following few weeks 22 others deposited their signatures. (See also Red Cross.)

PRISONS. In England and Wales overcrowding and understaffing continued through 1949. The daily average population remained about 20,000, almost double the prewar figure. Two more prisons were opened, at the Verne, Portland, for Star class prisoners and at Eastchurch, Kent, for civil prisoners and short-sentence stars; in both, open camp conditions obtained. Further expansion was precluded by shortage of staff, since recruitment fell seriously during the year. Progress was made, nevertheless, in improving methods of training prisoners. The issue of new-pattern clothing was completed with good effect on the appearance and self-respect of prisoners. The earnings system was revised to allow earning from the beginning of the sentence, at a higher rate, and with greater equality between flat-rates and piece-rates. The effect on industry and morale was good. The stage system was completely revised on the principle that, since all privileges had a constructive value, a prisoner should receive them as soon as possible: thus for short-term prisoners (three years and under) the system was no longer progressive, a prisoner was either "in stage" or "out of stage"; for long-term prisoners the progressive system was retained. Letters and visits were divorced from the stage system and prisoners were now allowed to write and receive a letter every 14 days.

The statistical results of the system reported in 1949 showed a slight improvement. Of those who from 1930 to 1945 came to prison for the first time for offences serious enough to warrant the taking of finger-prints, the percentage of reconviction at the end of 1947 was below 20% for ordinary prisons, and about 10% for special training prisons.

The Borstal system, less affected by overcrowding or understaffing, maintained its steady recovery from war and postwar difficulties along established lines. Vocational training was expanded to some 50 classes in a dozen trades. Week-end home-leave for boys was re-introduced with benefit to their training and the educational system was further developed. Statistical results showed that, up to Dec. 31, 1948, of those discharged during the years 1942-46 some 74% of boys and 81% of girls had not reverted to crime.

The most important event of 1949 was the coming into force of those sections of the Criminal Justice act, 1948, which directly affected the prison system. The abolition of penal servitude, hard labour and the triple division of imprisonment left only the single sentence of imprisonment for all offenders not dealt with as persistent offenders: for these the act provided two forms of sentence: viz., corrective training (2-4 years) and preventive detention (5-14 years). The restrictions on the imprisonment of persons under 21 resulted in a fall in the young prisoner population, enabling the closing of two more "young prisoner centres." Young prisoners with sentences of three months or over were now released on a conditional licence. In consequence, the prison system was substantially re-organized. There were now local prisons (reception and short term), regional prisons (special training of selected prisoners) and central prisons (long term), including six open prisons. Four prisons or parts of prisons were set aside for corrective training and two for preventive detention. The Statutory Rules, 1949, provided a code expressing the spirit of the modern system, and throughout the year work was in progress on revision of standing orders and prisoners' cell-cards in line with the new rules.

Scottish prisons did not suffer from overcrowding, the population remaining 20% above 1938 level. Steady progress was made in improving methods of training in prisons and Borstals: the issue of new type clothing started, and the earnings system was revised as in England. The Scottish Advisory Council on the Treatment and Rehabilitation of Offenders published a far-reaching report on the Scottish prison system.

(See also Red Cross.)

PRISONS OF WAR—PRISONS OF RECONVICT.
PSYCHIATRY—PSYCHOLOGY

PSYCHIATRY. A distinct trend in psychiatric thought was seen to develop in 1949, culminating in the awarding of the Nobel prize to two pioneer investigators in the field of physiological psychiatry. Although emphasis was still placed by most psychiatrists on the psychological interpretation of mental abnormalities, much of the scientific work of the year was concerned with the basic physical and biochemical reactions of the brain. It was widely recognized that psychological phenomena ultimately must be based on such reactions and that if further advancements were to be made they would be along the lines of the physiological explanation of the function and chemistry of the brain cells and their appendages. Otherwise, psychiatry might tend to become exclusively a field of conflicting philosophical opinions which would form a barrier against fresh development, much to the detriment of the subject in general. Thus, to put psychiatry and psychodynamics on a firm structural foundation, attention was focused on a balanced programme of all-inclusive research into the physical causes of mental disease.

Scholars pointed out that with the gradual increase of scientific knowledge the number of mental disorders formerly classified on a functional basis was steadily decreasing. W. B. Terhune estimated that in the standard classifications of 1949 at least three-fifths of mental abnormalities were now accepted as being organic in origin. Many psychoses formerly thought of as functional were attributed to infections, intoxications, trauma, circulatory disorders or convulsive states, or due to faulty metabolism, nutritional disorders or defects in glandular secretion. Other physical factors were found to influence the psychoneuroses, such as semi-starvation or avitaminosis. These causes were particularly potent in colouring the mental state of former war prisoners and of displaced individuals from over-run countries. Many childhood disorders were also shown to be of a physio-psycho-nature, and realization came to psychiatrists that psychological explanations for abnormal behaviour of children as well as adults were not entirely satisfactory without an added evaluation of genetics, constitution and bodily disease processes. Psychiatric illness, like other diseases, began to be recognized as fundamentally structural, psychodynamics describing but not explaining mental disorders. Psychotherapy was thought to be only one way of influencing the physiology of the nervous system; the treatment of bodily disease was considered equally important. Terhune went so far as to conclude that all psychological disorders resulted from a disturbance in the normal physiology of both mental and bodily functions which produced pathological processes, the whole being greatly influenced by disturbing environmental factors.

Some of the principal investigations on the function of the brain were carried out by W. R. Hess (q.v.) of Zurich, a physiologist, winner of half of the Nobel prize in medicine for 1949. Hess's later researches were largely centred on that part of the brain known as the diencephalon, or mid-brain, lying at the base of the skull and thus particularly inaccessible to the neuro-surgeon. Investigations therefore were confined to animal experimentation. He found that in the diencephalon were grouped nerve cells which have to do with co-ordinating the harmonious interplay of all the organs of the body through the autonomic nervous system. Based on his previous studies of circulation and respiration, Hess re-evaluated the physiological importance of the diencephalic nuclei as a brain centre of vast usefulness. Of the two divisions of the autonomic nervous system, the sympathetic section appeared to play a decisive part in preparing the individual for activity, while the other section, known as the parasympathetic system, was of importance in relation to economy of action and repair of structures. Both of these divisions, under the control of the nervous central exchange in the diencephalon, exerted their influence both in the psychic field and upon the bodily organs. By artificially disturbing the equilibrium of the diencephalic nuclei in his animals Hess was able to subdue sympathetic control without interfering with the activity of the parasympathetic centres. Under these conditions, instead of preparing the animal for activity, artificial sleep was produced, thus allowing for better economy and repair through the relaxing of the parasympathetic influence. Psychiatry was therefore furnished with a concrete example of the fact that influences stemming from the diencephalon exerted an influence in activating the psychic function of sleep. Previously the cortex of the brain, the supposed site of the mind, was considered as fundamentally dominating and controlling all bodily processes, by a one-way pathway from cortex to lower centres From the investigations of Hess conclusions were drawn that the co-ordinating centres in the brain stem might in turn influence the psychic functions. These observations were considered by many as fundamental to the concept of physiological psychiatry. What previously had been suspected in regard to the effect of vegetative processes by way of the autonomic system regulating the activities of the higher cerebral functions was confirmed.

The work of Egas Moniz (q.v.) of Lisbon was also recognized by the award of a Nobel prize. His work, also based on physiological experiments, dealt with the relation of frontal lobes, the area of the brain partially concerned with the highest mental processes, to the other parts of the brain. A radical surgical procedure, cutting the connecting pathways, was devised and applied to man. First announced in 1936, this operation, later known as pre-frontal lobotomy, was performed extensively after that date in advanced centres of psychiatry throughout the world. The evidence presented in 1949 would indicate that the operation, now modified into various patterns, had opened up a whole aspect of brain function and greatly affected psychiatric thought. Psycho-surgery, as the whole subject was now designated, became accepted as a form of treatment, greatly to the betterment of patients with the more serious and prolonged types of mental aberration. Much work on the subject still remained to be done for the selection of cases most favourable for lobotomy was still considered by most psychiatrists as a puzzling and unsolved problem. (See also MENTAL DISEASES, PSYCHOLOGY; PSYCHOSOMATIC MEDICINE.)

PSYCHOLOGY. During 1949 the most important psychological publication in Great Britain was the volume written by Dr. Vernon and Dr. Parry, Personnel Selection in the British Forces (London, 1949), which gave a general survey of the methods and results of personnel selection in the British army, navy and air force. Much of the technical detail had already appeared in the appropriate journals, but their book presented an admirable account of the administrative procedures that were gradually evolved. The main conclusion drawn was that the psychological methods that proved so useful during wartime might be adopted, with the necessary modifications, in education and industry to solve some of the urgent problems of peace.

The publication of the report of the Royal Commission on Population revived the controversies about the effects of the differential birth rate on the level of national intelligence. As early as 1913, school surveys commenced by Sir Cyril Burt in London demonstrated the existence of a negative correlation between children's intelligence and the
size of the families from which they came. Later investigations, however, showed that although small changes in the relative numbers of defective and scholarship children might be discernible they were nothing like the size that might have been predicted from the birth rates alone. J. M. Blackburn in several papers questioned the value of intelligence tests as indicators of innate intelligence; and Burt replied, supporting his own views by more recent evidence. By far the most interesting contribution, however, was the report of the Scottish Council for Research in Education on The Trend of Scottish Intelligence (London, 1949). In 1947, at the suggestion of the Population Investigation committee, the council repeated a survey which it had carried out in 1932. The results now published revealed not a decline but an apparent increase in ability as measured by the tests. The investigators suggested that the unexpected change might be explained by increasing familiarity with intelligence tests and might conceivably mask an actual decrease.

In the field of applied psychology two American studies attracted considerable attention. These were the work by Dr. A. C. Kinsey and his collaborators on Sexual Behaviour in the Human Male (Philadelphia and London, 1948); and that paper by Dr. I. Eissler and his colleagues on psychoanalytic aspects of delinquency, Searchlights on Delinquency (New York, 1949). Towards the end of 1949 the Proceedings of the International Congress on Mental Health (London, 1949) appeared and these contained a number of stimulating contributions on crime, sex, guilt and aggression and on the psychological aspects of war and peace.

In the experimental field, perhaps the most interesting researches were those by Dr. R. W. Pickford, the first describing a factorial investigation of musical appreciation and the second an improved apparatus for testing defective colour vision. The British Journal of Psychology (Statistical Section) (London, 1949) contained a review of the methods of factor analysis showing how these had developed out of the procedure originally proposed by Karl Pearson for analysing physical measurements; Mrs. R. Cole reported an item-analysis of the Terman Merrill revision of the Binet tests, and Miss G. Keir a study of the Progressive Matrix test. In the British Journal of Educational Psychology (vol. 19, London, 1949) two articles by Sir Cyril Burt gave a fully documented summary of the mental factors so far established by means of statistical research. (C. L. B.)

United States. An important publication during 1949 was D. O. Hebb's Organization of Behavior, which attempted to restate some of the facts of psychology in terms of modern physiological theory about the brain. Hebb was one of a number who returned to an interest in neurological theory as a source of hypotheses about complex processes like thought, expectation, attention, interest, consciousness and memory. The book starts with the recognition of a number of puzzling facts, such as the observation that great areas of the cerebrum in adults may be damaged or removed without interfering with certain intellectual functions. The neurological theory developed attempts to incorporate this sort of fact as well as the psychological evidence on learning, motivation, emotion, perception, intelligence, thinking and concept formation. The theory assumed that learning causes structural changes in central relationships between cerebral neurons or between systems of neurons of varying complexity. The growth of a concept involves the gradual organization of many neural cell assemblies or complicated circuits. Extensive brain tissue is necessary for the initial establishment of these assemblies, but with time and experience there is short circuiting and some of the assemblies originally involved are no longer necessary. Hebb postulated that for this reason brain damage could be relatively less severe in its effects on adults than on children.

The most important event of the year in the field of social psychology was the publication of the first three volumes of the projected four volume series, Studies in Social Psychology in World War II, based on the work of the research branch of the War Department from 1941 to the end of the war. Most of the studies were designed to meet practical wartime demands and the writers were fully aware of the consequent limitations of the information for the purposes of scientific generalization. Nevertheless, they extracted from interviews with more than 500,000 U.S. soldiers observations of the greatest importance for the historian, for those concerned with administrative problems and for the social scientist. The first of the three volumes summarized the problems of personal adjustment to institutionalized army life. The second dealt with combat and its consequences, and the third reviewed experimental studies of the impact on the soldier of educational and indoctrination films. The attitudes of the educated soldier were compared with those of the uneducated, those overseas with those at home, those with good chances of promotion and those with poor chances. A whole chapter was devoted to the problems of the Negro soldier. Fear in combat and the Army's attempt to deal with this problem were analysed. The final volume, due to appear in 1950, would examine the fundamental concept of attitude and the contributions of the research branch to methods of attitude measurement.

A whole issue of the Journal of Consulting Psychology was devoted to the report of one of the very few systematic attempts ever made to evaluate psychotherapy. A group under the direction of Carl R. Rogers described six studies of the therapeutic process, including careful and objective analyses of attitudes towards the self, the relation of self-acceptance to acceptance of other people, the way in which insight develops, changes in the maturity of behaviour and changes in expressions of defensive behaviour. Though the number of cases was small and there was no comparison of the group receiving therapy with a similar group given no therapy, this honest attempt to record interviews, to define concepts and check the amount of agreement on observations promised to be the beginning of a healthy departure from the usual unscientific evaluations of treatment. These first efforts of Rogers to subject his methods of non-directive therapy to scientific test constituted a landmark for clinical psychology. (See also Mental Diseases; Psychiatry; Psychosomatic Medicine.)

PSYCHOSOMATIC MEDICINE. Physicians, nurses and social workers occupied in tuberculosis sanatoria had frequently observed the high incidence of neurosis in patients suffering from this disease. Research work published on emotional factors in tuberculosis had generally dealt only with a few case reports, the observations of social service workers, or general comments by physicians untrained in psychiatric techniques. In 1949, however, a study by Eric Wittkower of 785 patients observed over a period of two and a half years provided much useful information concerning the role of emotional factors in tuberculosis. The views expressed did not clash in any way with those held by tuberculosis specialists, who had long known that an unhealthy mode of life and mental upsets often preceded the onset of symptoms of tuberculosis. But, going beyond these observations, Wittkower made an attempt to explain how this unhealthy mode of life came about, what formed the basis, and what were the common features, of the precipitating mental upsets.

He showed that inordinate need for affection was an outstanding common feature of the pre-morbid personality of tuberculosis patients. This need might be openly expressed, concealed or flatly denied. Situations arousing aggressiveness
or endangering the delicately poised security system of the patients often preceded the onset of symptoms of tuberculosis.

In brief, people who developed tuberculosis seemed to have a frequent inability to deal adequately with their aggressive impulses and were prone, for varying reasons and in different ways, to turn them against themselves.

W. A. Tillmann and G. F. Hobbs made a study of the psychiatric and social backgrounds of the accident-prone car driver. Dealing chiefly with taxi drivers they discovered that the high-accident group showed a marked intolerance for, and aggression against, any authority and that this behaviour dated from early childhood. The origin of the aggression was found in an unstable home background and showed up in anti-social behaviour. Analysing 96 drivers from the general population who had had four or more accidents and comparing them with a control group of accident-free drivers, they found that 66% of the high-accident group were known to social and law enforcement agencies as compared with only 9% of the control group.

Commenting upon the question of the selection of drivers by personnel managers they stated that safe driving depended more on judgment, caution, and consideration of the possible errors of others than upon reaction time and good eyesight. They added that any intelligent personnel manager could learn to take the kind of life history necessary to detect the unstable person who is prone to get into accidents.

It became increasingly clear in 1949 that psychiatry has an important relationship to industrial medicine. G. T. Eade described his method of handling psychosomatic problems, indicating that the surface complaint is not the same as the latent complaint and that one must look into the details of the latter. Eade emphasized that interest in emotional factors must not lead to neglect of possible factors, and mentioned a number of problems, such as multiple sclerosis, Parkinson's disease, hyperthyroidism and anxiety attacks, that may contribute to disability and be responsible for industrial accidents.

With new discoveries regarding the role of the sex organs as producers of hormones (and the isolation and synthetic production of these hormones), biologists believed that a simple explanation of sexual behaviour and a simple treatment of abnormal sexual behaviour were at last available. But the simplicity of this explanation had already been questioned by experiments on animals which suggested that subcerebral mechanisms capable of mediating sexual responses had become more dependent upon the higher nervous system, and that the development of this increasing dependence on the cerebral cortex had to some degree freed the more primitive sexual mechanisms from strict control by gonadal hormones.

W. H. Perloff questioned this simple explanation in 1949 as far as the human being was concerned. He stated that three elements have to do with human sexuality. The first is the genetic factor which predetermines the particular type of sexual pattern and is constant within limits for any one species. The second factor is the hormonal one which leads to the development of the organs needed for the sex act and increases their sensitivity to stimulation. But the third important factor is psychological and this is concerned with the choice of the sex object and with the intensity of the sexual emotions. (See also PSYCHIATRY; PSYCHOLOGY.)

PUBLIC OPINION SURVEYS. The September meetings in Paris were the main event during 1949. The World Association of Public Opinion Researchers (W.A.P.O.R.) held a joint congress with the ESOMAR or European Society for Opinion Surveys and Market Research (Commission Européenne pour l'Etude de l'Opinion Publique et des Marches). This joint congress was preceded by a conference of the Gallup institutes; representatives from Sweden, France, Italy, Holland, Finland, Denmark and Great Britain conferred for a week with Dr George Gallup and his American colleagues. The W.A.P.O.R. meeting was the first to be held outside the United States, Dr. James White, president of W.A.P.O.R., was chairman of the conference, which was opened by the dean of the University of Paris. At one of the main sessions Dr. George Gallup, Elmo Wilson (International Public Opinion research) and Professor G. Jacquemyns (Solvay institute), discussed the polls in relation to the American presidential election, 1948. There were three national polls, Gallup, Crossley and Roper, and the score had been as follows in the case of Gallup:

<table>
<thead>
<tr>
<th>Result</th>
<th>Forecast</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Truman</td>
<td>50-0</td>
<td>44-5</td>
</tr>
<tr>
<td>Dewey</td>
<td>48-8</td>
<td>49-5</td>
</tr>
<tr>
<td>Wallace</td>
<td>2-1</td>
<td>4-0</td>
</tr>
<tr>
<td>Thurmond</td>
<td>2-1</td>
<td>2-0</td>
</tr>
</tbody>
</table>

It was stressed that, with the exception of the Roper forecast, the polls were statistically nearer the mark in 1948 than in earlier presidential elections. Crossley's forecast differed by less than one percentage point from Gallup's figures.

The W.A.P.O.R. conference confirmed Dr. James White as president and elected as its council for 1949-50 the following members: public relations, Jan Stapel (N.I.P.O., Amsterdam); membership and standards, Henry Durant (B.I.P.O., London); personnel training, Louis Moss (the Social Survey, London); Professor Stuart Dodd (Washington Opinion laboratory, University of Washington).

ESOMAR, at its Paris meeting, adopted a constitution which had been drafted during the 12 months following its initial meeting in Amsterdam. Following W.A.P.O.R., the commission adopted the plan that membership should be on an individual basis, not on the basis of organizations, and set itself the goal of attracting the membership of all individuals in European countries who were working in the field of opinion or market research or who were directly interested in such work. The council elected were president, Professor Luzzatto Fegiz, Milan, with a committee consisting of: A. P. McAnally, London; C. D. Reventlow, Copenhagen; Georges Serrel, Paris; and M. Guigoz, Lausanne. Conferences were planned for 1950 and 1951.

A hearty welcome to Britain in 1951 was extended on behalf of the British Market Research society, since that visit would coincide with the Festival of Britain.

The Gallup conference, as was the case in 1947, was a series of severely technical discussions between practitioners in opinion research who were anxious to exchange experiences during the two years which had elapsed since their first international conference at Lowwood hall, Sussex. Arrangements were made to meet at Stockholm in 1951.

During 1949 the Canadian Institute of Public Opinion and the Norwegian institute had to face the test of forecasting national elections; the Netherlands institute had to face a municipal election in Amsterdam. In each of the three instances the forecast was very close to the actual outcome; in the case of the Netherlands institute the average error was less than 1%. The widespread discussions on, and detailed analyses of, polls that followed the American presidential election undoubtedly taught opinion pollers many useful lessons which they put to good account.

The three polls which forecast in Great Britain the division of popular sentiment on voting agreed in putting the Conservatives in the lead.

H. W. Dr.

UNITED STATES. Two major pre-election polls were taken during the year. The New Jersey poll, using a statewide quota sample of 1,000 New Jersey residents, correctly
indicated the re-election of Alfred E. Driscoll as governor with an error of less than two percentage points. The American Institute of Public Opinion questioned 2,366 persons in New York state on their voting intentions in the senatorial contest. Herbert H. Lehman was correctly picked as the winner, although his final strength was overestimated by several percentage points. The American institute sought to ascertain the "leaning" of undecided voters and gave more attention than in the past to separating registered voters who planned to vote from those not intending to vote. These steps were taken in an effort to profit by post-election studies made on the 1948 presidential polls.

Members of the American Association for Public Opinion Research, in conference at Ithaca, New York, discussed such topics as the application of opinion research to the problems of higher education and the role of opinion research in arriving at a science of politics. The Laboratory of Social Relations, Harvard university, began a study of the values and expectations of young people. A new Institute for Social Research was formed at the University of Michigan. The Social Science Research council published a full report on the pre-election polls of 1948 (Bulletin 60). A four-volume series from Princeton university press, based on an analysis of interviews and reports on American soldiers in World War II, was published.

RACKETS. J. H. Pawle won his fourth consecutive victory in the amateur singles championship, beating in the final D. S. Milford 3–2, the same margin as in 1948. The holders of the doubles championship, Milford and J. R. Thompson, lost to R. A. A. Holt and A. R. Taylor by 1–4.

RADIO, SCIENTIFIC DEVELOPMENTS IN. During 1949 advances associated with developments in radar, broadcast and television encouraged scientific research on an expanding scale to solve the problem of how to use most effectively the various bands of wavelengths or frequencies within the radio portion of the electro-magnetic wave spectrum.

The Ionosphere. In the 1920s it was demonstrated that the transmission of radio waves to distant points round the curved surface of the earth was effected by successive reflection of the waves between the earth and one or more electrically conducting regions in the upper atmosphere. More recently, these regions, which together form the ionosphere, were explored by recording and measuring the echoes received from pulses of waves transmitted vertically upwards from the observing station; and ionospheric observatories in different parts of the world made an almost continuous study of the height and density of ionization of the various layers in the ionosphere, and the manner in which these characteristics varied from day to night and throughout the seasons. By an exchange of results a world chart of the ionosphere was constructed from which the radio transmission conditions could be determined for any particular communication path. Based on the patient and systematic observation of the changing properties in the ionosphere, forecasts were now made, six months in advance, of the radio transmission conditions in various parts of the world; and such forecasts were found to be most useful by the authorities responsible for communication and broadcasting services.

In addition to this practical application, however, much useful scientific work was conducted on the relation between conditions in the ionosphere and other phenomena, such as the earth's magnetic field and the various radiations and emissions from the sun which caused varying ionization of the upper layers of the atmosphere. Research showed how the radio echo method could be used for the measurement of winds in the ionosphere at heights of about 100 km. above the earth's surface. For this purpose, a group of three receivers was arranged to observe simultaneously echoes resulting from the pulses of radio waves emitted from a transmitter suitably placed in relation to the receivers. The results indicated that winds of velocity of about 50 mi. per sec. were usually present at levels between 70 and 115 km. and that these winds showed a complicated semi-diurnal variation. These results were in reasonable agreement with those obtained by other workers who made visual observations on luminous phenomena in the sky at night.

Radio Astronomy. A few years ago it was established that a portion of the sun's radiation, which covered the entire electromagnetic wave spectrum, could be detected on a suitable radio receiver at various short wavelengths from a few metres to a few centimetres. The intensity of such received radiation varied with the wavelength or frequency used and also with the changing conditions on the sun itself.

George Strauss, minister of supply, (left) at an exhibition at the Radar Research and Development establishment, Malvern, Worcestershire, Sept. 1949.
Similar radiation was also received from stellar or galactic sources. By using a suitable antenna system the exact location of such radiation could be determined with considerable accuracy; and in this way a new technique was developed, appropriately termed radio astronomy, which supplemented the methods and instruments used by the normal astronomical observatory. The results already obtained by the radio methods indicated some very highly effective temperatures at the source of the radiation and such observations would undoubtedly contribute much to knowledge of phenomena occurring in the sun, particularly during the existence of sunspots and solar prominences. An interesting feature of the observations made on the stars was that the radiation being received left its sources many thousands of years ago.

The Speed of Radio Waves. The development of various applications, particularly radio aids to navigation, gave rise to a need for a more precise knowledge of the speed of radio waves when propagated under different conditions such as over the surface of the earth, over land or sea or through the widely varying meteorological conditions of the lower atmosphere. Measurements were made accordingly in aircraft on carefully controlled transmissions from ground stations in accurately known positions. For low frequencies in the neighbourhood of 100 kc. per sec. (wavelength 3,000 m.) and at a height of one-tenth of a wavelength above the ground, the speed of the waves was reduced from the value of the velocity of light in a vacuum by an amount dependent upon the electrical conductivity of the earth. For overland transmission this speed was about 299,250 km. per sec. For higher frequencies propagated at a height of several wavelengths, the speed of the waves was determined by the refractive index of the air rather than by the properties of the ground. Since the refractive index decreases with the height of transmission so does the speed increase towards the velocity of light in a vacuum; viz., 299,775 km. per sec. For example, centimetre waves propagated at heights of a few hundred feet were observed to travel at a speed of 299,690 km. per sec. When the waves were transmitted between the ground and an aircraft flying at a height of 30,000 ft. this speed increased to about 299,750 km. per sec.

Television. Activity in Europe in the field of television during 1949 was characterized by scientific research, by the practical development of both transmitters and receivers, and by the holding of international conferences designed to improve co-operation and the efficiency of services provided by the various administrations. On the public service side, the United Kingdom began to implement its scheme for the provision of five main transmitting stations suitably spaced within the frequency band 41 to 68 Mc. per sec. at the lower end of which the London (Alexandra palace) station had been in operation for many years. The erection of the second station at Birmingham was completed during 1949; and this station, which was the most powerful television transmitter in the world, was connected to the London studio by a shortwave radio link, by means of which programmes might be relayed between the two centres. A coaxial cable suitable for the wide video frequency band required was also in an advanced stage of installation. On the receiver side, improved screens were developed for cathode ray tubes used for direct viewing; and higher voltage tubes in association with suitable optical projection systems were demonstrated, giving much larger pictures than those obtainable on the tube screen itself. Of the various European conferences, the one held in Zürich under the auspices of the International Consultative Committee on Radiocommunication (C.C.I.R.) discussed the possibilities of standardizing television techniques, particularly from the point of view of facilitating the exchange of programmes between national television services and the avoidance of mutual interference between stations in the same region of the world, or neighbouring countries which operated on the same frequency.

Miscellaneous. With the rapid growth and application of radio techniques at increasingly higher frequencies it became necessary to obtain fuller knowledge of the properties of the various dielectric and magnetic materials used in the equipment associated therewith. Experimental methods for measuring the dielectric properties of various materials at centimetre wavelengths were developed and applied to the study of the properties of various solid and liquid dielectrics. Furthermore, a theoretical study of the relation between these properties and the chemical and physical structure of the material was undertaken with a view to obtaining a better understanding of the absorption and resonance effects observed in various materials. The magnetic properties of ferrites and similar materials now developed for use in radio frequency components were also studied. Other items on which research was conducted include the crystal-valve, which offers the possibilities of a more economical means of amplification at moderate radio frequencies, and the phosphors used in electronic camera tubes for television purposes. It was anticipated that such research would open up new vistas of radio applications or result in an improved efficiency of techniques already in practical use.

RAILWAYS. Great Britain. The major event of 1949 was the publication of the annual report of the British Transport commission which reviewed the first year's working of the British railways after nationalization. Owing to the fact that the Transport act, 1947, laid down that all facilities taken over, railways, highway transport, inland waterways, docks and hotels should be treated as one entity, the form of accounts had been based on this instruction. Consequently the separation of the railway results proper from those of the other transport activities could not be accurate and this, in
RAILWAYS

...turn, precluded any true comparison with pre-nationalized results. In practice financial and statistical returns for the period of World War II were sparse, because to save clerical work the revenues of the four main line railways were totalled together with those of the London Passenger Transport board, since 1947 known as the London Transport executive, and now forming part of the commission’s activities.

The financial results of the British railways, operated by the railway executive, yielded net receipts of £26,257,737 in 1948, which were equivalent to an operating ratio; i.e., percentage of working expenses to gross receipts, of 92% but this sum was offset almost £4 million by losses on road collection and delivery services. The net traffic receipts from the railway executive’s steamship services, however, totalled nearly £3 million. The nominal amount of 3% Guaranteed British Transport stock, issued as compensation for the railway undertakings now vested in the British Transport commission, was nearly £927,500,000; but statistically it would be inaccurate to relate this to the net traffic receipts, owing to transfers of docks, hotels and other railway-owned property to other executives. The final debit balance in net revenue account for 1948 of the commission’s total undertaking was £4,700,000, and the annual report prophesied a continuation in the financial situation for 1949; costs for labour and materials in fact continued to rise and railway traffic receipts, more especially on the passenger side, to fall actually by more than £6 million during the first nine months of 1949. Freight traffic revenues broke about even over this period.

The complete re-organization and unification of the railway system necessitated continued concentration on problems of administration and aimed at obtaining uniformity of practice, staff conditions, inter-changeability of equipment and standardization of methods covering what were previously four large railway systems. The task would require further years to complete; but in the meantime progress could be recorded in spite of the difficulties owing to the restricted allocations by the government of steel and other key materials. There was no change in the level of charges, which had not been raised since 1947, but detailed studies had long been in hand with the object of designing a unified classification for freight by rail and road as part of a national system of transport charges, for upon this would rest the success of any scheme of integration of transport facilities offered by rail, road or water. Demands for wages increases except in minor instances were refused by a government-appointed conciliation board, and 1949 was free of major labour disputes in the railway industry, though in August there was a dispute on the east coast routes over the question of “lodging turns,” and stoppages occurred on successive Sundays, Aug. 14-28, but ended after a promise to withdraw disputed turns after the summer. (See also STRIKES AND LOCKOUTS.)

Concerning technical matters, new signal installations were placed in service at Doncaster and Liverpool; and conversion to automatic colour-lights on the London-Croydon section of the Brighton electrified main line progressed steadily, a project dating back to before 1939. In September electric traction was inaugurated on the suburban service from Liverpool Street to Shenfield, again a pre-1939 plan. A report known as the London plan yielded a blueprint for future transport developments in the London area; but since the total cost of new underground electric lines and many conversions to electrification were calculated to require over £200 million, it was clearly a proposal which would require many years to complete and could only be carried out piecemeal.

Experiments were made with double-deck coaches on the Southern’s electrified suburban services. Amongst inter-region transfers of routes may be noted that of the London, Tilbury and Southend to the Eastern from the London Midland region. A new design of all-metal coaches built in railway workshops at Derby entered traffic; standardized colour schemes were settled for locomotives, namely black, green and blue, with crimson and cream for corridor stock and crimson for non-corridor stock. All electric equipment was to be painted green, for long the standard colour on the former Southern railway, the largest suburban electrified network in the world. Inter-regional tests carried out with various classes of locomotives in 1948 provided useful data for the coming design of a few standard types for the British railway system. In the interim the standard classes of the ex-main line companies were being perpetuated and the two gas turbine locomotives ordered by the former Great Western railway were not yet in service.

In spite of drastic scrapping of obsolescent locomotives and wagons, several hundred locomotives were stored and there was no wagon shortage, although output in 1949 was restricted by lack of steel. As regards track, a new standard was adopted using the flat-bottomed, or Vignoles, type of rail in place of the traditional British bull-head rail held in chairs. Savings were expected in maintenance, though the initial cost per mile was considerably higher; but shortage of labour for track forces and increased wage rates altered the economic balance between the two types of track. The use of pre-fabricated track for renewals was carried further in Britain than elsewhere.

In Northern Ireland the Ulster Transport authority took over the ex-London, Midland and Scottish railway’s lines in Ulster from the British Transport commission; the Great Northern providing the link between Belfast and Dublin and so crossing the republic of Ireland’s frontier, found itself in financial difficulties. It was the last important company-owned railway in Europe, if one excluded the Bern-Lötschberg-Simplon.

In Ireland, the transport system was the subject of a detailed investigation which led to current proposals to nationalize the Irish Transport company.

[Graph: Traffic Receipts of British Railways - Weekly Averages]

Europe. In Albania, both the 26 mi. standard gauge Durres-Pekinye line and the connecting Durres-Tirana section of 18 mi. were due for completion in 1949.

On the Belgian national railways (S.N.C.B.) electrified services were inaugurated between Brussels and Charleroi in October, marking a further stage in the large scale scheme...
for main-line electrification; steady progress was made on the "ligne de jonction" linking Brussels-Midi with Brussels-Nord.

Railway construction continued in Bulgaria, including an avoiding route north of Sofia opened in Oct. 1948 and a 22 mi. line between Lovech and Troyan; there were also developments in the Pernik coal area and at Orekhovo on the Danube.

The financial situation of the French national railways (S.N.C.F.), reported to be operating at an annual deficit of over £20 million, gave cause for considerable anxiety in 1949 and important changes occurred in the highest administrative posts. The government's proposals to deal with this question were published in Nov. 1949, after a delay due to ministerial crises, in the form of decrees. They envisaged the close co-ordination of rail and road transport, the preparation of new tariff scales for both rail and road and the closing, on a major scale, of branch lines to passenger traffic. Steady technical progress in the reconstruction of classification yards continued; above all the electrification of the Paris-Dijon main line, due to be partially opened early in 1950, proceeded. The growth of the auxiliary transport operating company (Société de Contrôle et d'Exploitation de Transports Auxiliaires) was most satisfactory and improved the transit speed of parcels and other small consignments. In Paris the métro re-inaugurated first class travel and a Paris Transport board was set up.

More reliable information became available at last concerning Western Germany; and the improvement in facilities there offered opportunities for the acceleration of international services in which the German railway (Bundesbahn) occupied a key position.

The breaking of rail communications between the western and eastern zones at Helmstedt with their consequent replacement by an air-lift needs no comment; but specific reference should be made to the reconstruction of some of the Rhine bridges and to the great strides that were made in Germany towards regaining the famed prewar efficiency of the Reichsbahn. As some statistical measure it may be noted that nearly a million wagons were loaded in Dec. 1948, as against only about 718,000 in January of that year, and about one million were placed for loading in June 1949 in the western zones. The financial situation remained serious, however, and the chances of self-financing from German sources did not seem very propitious.

The Greek state railways route from Athens to Larissa was re-opened in July, sections having been out of service since Oct. 1944; thus with two exceptions, Papapouli-Katerini and Skydra-Aghia, the whole of the state railways system was re-opened.

Praise was due to the Italian state railways for their fine work in postwar reconstruction. Damage was calculated as equalling 75% of the prewar capital investment of 49.5 million lire. On a 1949 line basis the damage equalled over £500 million or 900,000 million lire; by 1949, nearly 500,000 million lire had been expended on reconstruction. Specific items completed in 1949 were the Pontelagoscuto bridge across the Po, costing 505 million lire, and the new station at Verona. Indeed, aid under the European Recovery programme provided material assistance in framing these and other projects as well as electrification. Railway traffic reached 90% of the prewar level; electric traction was being installed in Sicily on the Messina-Palermo and Syracuse lines and over 5,000 passenger coaches were in service and rapido expresses were reinstated on the Rome-Naples and Milan-Bologna lines.

In the Netherlands railway rehabilitation continued apace and the conversion to electric traction of the Maastricht-Eindhoven-Heerlen main line was completed in May 1949, involving 90 route mi. This changeover required the use, for the first time in Holland, of electric locomotives and should reduce coal consumption by 300,000 tons.

In Norway the conversion of another section of the Sofland railway in June to electric traction provided the Norwegian state railways with a completely electrified route from Oslo to Stavanger, except for the westernmost section, Flekkefjord-Stavanger; progress was made on the northerly extension of the Norland line. Since 1938, the system's route mileage had increased by about 400 mi. or 15% and freight traffic was approximately 40% above prewar.

In Spain a further 60 mi. were completed in the link between Lerida and the French frontier and the Spanish national railways placed large orders for steam locomotives in Britain.

In Switzerland estimates were prepared of the likely demand for electric power over the period 1950-59, about 95% of the Swiss Federal railways being electrified. It was deemed essential to develop further some of the hydro-electric resources of the Gotthard to supplement the existing Amsteg and Ritom power stations.

Developments in the Soviet Union were indefinite; but Kharkov was regarded as the centre of the diesel locomotive construction industry and electric traction was inaugurated on the Nikopol-Dolgintsevo 74 mi. section near Odessa, just prior to 1949. The Poti-Samtredia 28 mi. line was similarly converted.

New construction in Yugoslavia included a 34 mi. standard
RAILWAYS

gauge line between Kumanovo and Đorđe Polje and conversion to standard gauge of the 145 mi. Skopje-Ohrid section proceeded. The re-laying of the second track of the Belgrade-Zagreb main line was completed westwards from Belgrade to Novska by April 1949.

Asia. Information on events in 1949 was sparse regarding many of the Asian railways; rehabilitation continued in Burma and Malaya; and under the Israeli regime, the Palestine railways were being extended. In China the position was confused; but information was available concerning Pakistan and India. As yet there were no through services between western Pakistan and India, though eastern Pakistan was served by through trains from Calcutta; speeds were still below the prewar level. Traffic volume was improving: in the North Western railway of Pakistan and receipts were double those of the 1940-47 period. Pakistan locomotives were being converted to oil burning. In India a surplus was expected from railway operation in 1949-50 and works under construction included a new line to provide a direct rail link with Assam. On the Great Indian Peninsula railway (G.I.P.) the Mathura-Delhi route was being widened and new all-metal coaching stock built in India was coming into service.

Ceylon railways had long suffered from chronic deficits and in 1949-50 there was to be no exception. The system was heavily indebted to the government owing to greatly increased costs: improvements were, however, being effected to the track and structures.

The latest Iraqi state railways report referred to the success of its air subsidiary which was formed in 1946, to the progress made with the 70 mi. extension from Kirkuk to Erbil, a metre gauge line, and to new bridgework over the Euphrates. Orders for additional steam motive power were placed in Britain by the Iraqi state railways.

Africa. An interesting development in Egypt was the proposed separation of the railways and state budgets: in fact this marked a return to earlier policy because a similar separation was effected in 1933; but in 1940 the policy was reversed because, it was claimed, no advantage accrued. In 1949 the objective was to increase economy and develop the railways as a commercial undertaking. Though Egypt adhered to a revision and reorganization and in 1949, the Tunisian, Moroccan and Algerian railways were all converted to diesel traction; in Tunisia especially, the changeover in 1950 was to be extensive. New diesel-electric locomotives of 1,500 h.p. were working the Kenadsa coal trains in Morocco and new wagons were imported for the phosphate traffic. A new 28 mi. line was being constructed in the Moroccan anthracite area near Djéraida. In Algeria, 40 new diesel-electrics were placed in service and the expressed intention was to dispense with steam locomotives; some sections of line were being converted to electric traction.

In Tanganyika a new railway was under construction in the Southern Province as was also a branch from Kaliwu to serve the lead mines. New locomotives for the Nyasaland-Trans-Zambezia railways were being placed in service and in Rhodesia the new railway board for government-owned railways took charge in November. The Beira section became Portuguese property in April 1949.

The South African railways, so long a very profitable concern, encountered financial difficulties, a deficit of £6 million being recorded for 1948 and the Rates Equalization fund, long acting as a buffer, fell 60% in five years. Technical progress nevertheless continued, as for instance in the electrification in the Belleville area; the large Prospect classification yard was being mechanized so as to handle 2,500 wagons daily; the welding of rails in long lengths of 480 ft. and 960 ft. was adopted practice.

South America. Nationalization of the British-owned railways in Uruguay became law in Jan. 1949 and the sale of the much larger British-owned lines in Argentina was finally completed in May; the original agreement was dated Feb. 1947 and the transfer to Argentina took place in March 1948. Some regrouping of lines took place with inter-regional transfers at the beginning of 1949, a policy made possible by complete government ownership. Large orders for diesel traction units were placed by Argentina in Hungary and the United States, the former for railcars and the latter for locomotives; some of the 35 units concerned completed trials on the General Belgrano railway. The financial situation on the railways caused concern and a commission was at work to study a general revision of passenger fares and freight rates; the proposed system of charges aimed at a small surplus over cost of operation.

In Brazil, agreement was reached in April for the sale of the Leopoldina railway to the Brazilian government for about £10 million, and arrangements were made to terminate the lease of the Great Western of Brazil, a 1,040 mi. metre gauge system, already owned by the government. New railway construction continued in Brazil under the plan of the national railways department, with the primary object of linking the several state capitals and the national capital; as yet only six state capitals were linked with Rio de Janeiro by rail but the plan provided for 17 to be so connected. In traction matters new 3,000 h.p. electric locomotives were being placed in service on the former São Paulo railway, electrified on the 3,000-volt d.c. system: this section was now Brazilian-owned.

Canada. In Canada the fact that Newfoundland had become the tenth province resulted in the Canadian National railway taking over the Newfoundland railways, and in British Columbia there were renewed proposals to extend the Pacific Great Eastern railway northward. Other developments included the construction of the first mechanized classification yard by the Canadian Pacific in the Montreal area and the building of a large new freight station at Bonaventure, Montreal (C.N.R.). Diesel traction was likely to be standard in future for both the Canadian lines and the Montreal-Wells river services on the C.P. became entirely dieselized. New electric locomotives were placed in service at Montreal by the C.N. and the C.P. converted further locomotives to oil-burning in the Winnipeg-Calgary area. A royal commission was appointed to report on the dominion's transport services in Feb. 1949.

Australasia. The New Zealand government railways continued to operate at a heavy deficit; but services were accelerated and additional electric equipment was received.
The major event in Australia was the publication of the Elliot report on the Victorian railways, proposing the setting up of a Victorian Transport board, and this report was an epoch-making landmark in Australian railway history, the Victorian system was already benefiting from its publication South Australia was undertaking the gauge conversion of part of its mileage; and pulverized coal was being developed for locomotive purposes in Victoria

The Tasmanian transport situation remained acute both financially and physically, but energetic steps were being undertaken to cope with the position.  (C. E. R. S.)

United States. The record for 1949 was distinctly discouraging from the point of view of the railway management, stockholders and bond holders. In comparison with 1948 there were substantial decreases in volume of traffic, operating revenues, net income and return on capital investment. The greatest decline was in the last quarter of the year. The number of loaded cars moved in October was the lowest in any October in the last 30 years. The outlook for 1950 was not promising.

The decline in railway traffic was mainly due to three factors: the unsettled business conditions which slowed up production and made manufacturers and merchants reduce inventories and use caution in future commitments; the increased competition of carriers by highway, water, pipe line and air, and the strikes of coal miners, steel workers and others, which not only reduced rail tonnage in coal, coke, ore, steel and other raw materials, but also cut down the output of manufacturers dependent on these basic commodities.

The net income of the railways was reduced by two unfavourable factors: the decline in operating revenues; and the inability, because of higher wage rates and advances in the prices of materials, to reduce operating expenses in proportion to the loss in operating revenues. Increases in freight and passenger rates were of material assistance but they lagged behind the cost increases and were not sufficient entirely to overcome the effects of high costs. The return of about 3% on capital (less depreciation) was only half the 6% minimum which railway spokesmen asserted was necessary to maintain credit and to enable the railways to finance improvements vital to the maintenance of adequate service.

The increased competition with which the railways were faced was shown by the growing proportion of total intercity tonnage carried by highway, pipe line and inland waterway carriers. According to the figures of the Interstate Commerce commission's bureau of transport economics and statistics, the railway proportion of total inter-city ton-miles fell from 66.9% in 1947 to 64.2% in 1948; the road haulage share grew from 7.8% to 8.7%; the inland waterways, including the Great Lakes, carried 14.8% in 1947 and 15.3% in 1948; and the pipe line proportion rose from 10.5% to 11.8%.

Passenger services told the same tale, with air lines and private motoring as the most serious challengers.

The gross capital expenditure of class 1 railways on tracks, structures, terminal and communication equipment, locomotives and rolling stock in 1949 was estimated at $1,297 million. Of that amount, $325 million was devoted to fixed property and $972 million went into diesel locomotives (to replace less efficient steam power), freight cars and passenger cars of modern design. Out of 1,577 new locomotives installed during the first 10 months of the year 1,524 were diesels. Of the locomotives on order on Nov. 1, the diesels numbered 812 out of 833. During the 12 months ended Oct. 31, 1949, the number of additional streamlined passenger trains was 29, bringing the total number of those modern trains to 147, with a complement of 3,054 cars for 292 sets of equipment. Out of a total of 127 class 1 railways, 43 had one or more of such trains. Practically all the capital improvements in track and structures were financed from earnings—net income "ploughed in" instead of being declared as dividends.

On June 30, 1949, the mileage of all classes of railway in the hands of receivers or trustees was 13,736 mi., or 5.7%. On the same date in 1948 the bankrupt mileage was 15,100 mi. The Missouri Pacific, which had been in trusteeship since 1933, accounted for about one-half of the total bankrupt mileage. The only notable addition to the list of bankrupt railways was the Long Island. The Central Railroad Company of New Jersey emerged from trusteeship in June.

In the field of relations between the railways and the government the following events were of note in 1949: The first step towards the implementation of the so-called "Bulwinkle bill," enacted in 1948 to legalize the conference method of fixing rail and road rates under the control of the Interstate Commerce commission, was made when the commission approved the western railways' application for confirmation of their rate-making associations and other joint agreements. Applications from railways in other sections and from road haulage associations were pending at the close of the year. In the case of the western railways the commission apparently was not impressed by the view of the Department of Justice, which had opposed the enactment of the "Bulwinkle bill," that the conference method of rate-making unduly restrained competition between carriers.

The Interstate Commerce commission began holding hearings on Nov. 5 on the government claims for repair (refunds) for alleged overcharges by railways on the large volume of government freight moved by rail during the war years. The reparations, if granted in full, would require the railways affected to turn back to the government a sum estimated to be in excess of $2,000 million. The net current assets of all class 1 railways on Aug. 31, 1949, were $1,300 million, and further their total net income was $747 million in 1948 and $474 million in 1949 (year ended Sept. 30). The seriousness of the government claims was therefore apparent. If reparations were to be granted on the scale urged by the government, large scale railway bankruptcy would be almost certain.

In order to offset wage increases and high costs of materials, the railways made several applications to the Interstate Commerce commission in 1949 for authority to increase freight and passenger rates. The commission responded favourably but not to the full extent requested. In January the railways benefited by an increase of 5.2%, in freight rates, authorized in Dec. 1948. This was designated as an interim increase to afford partial relief while the commission deliberated further. The request had been for an increase of 13%. The commission's final decision, in August, was to permit as from Sept. 1 an average advance of 9.1%, inclusive of the 5.2% interim increase effective in January. An increase of 12.5% in passenger fares, exclusive of suburban service, was sought by the eastern railways in June. It was approved in full, and was to date from Nov. 28. On the question as to whether the railways, by such a rate advance, would be "pricing themselves out of the market," the commission accepted the opinion of railway traffic officers that losses by diversion of passengers to other forms of transportation would be much less than gains in revenue from traffic which would be held. A minority of the commission, however, expressed the view that the higher fares would not be likely to bring in additional revenue and that "vacant seats rather than inadequate fares are the real cause of passenger deficits." In general, the scale of all passenger fares in Dec. 1949 was 44% higher than in 1939 in the east and 25% higher in the country as a whole.

Chicago Railroad Fair. The Chicago Railroad fair of 1949 set up a new attendance record by attracting 2,732,618
RAKOSI—RAYON

visitors. Attendance in the second year thus exceeded the 1948 total of 2,500,813 visitors and brought the total attendance for the two years of the fair to 5,233,431. As in 1948, the most popular feature of the 1949 Railroad fair was the "Wheels a-Rolling" pageant, which depicted the history of transportation over a period of nearly 300 years. Contributing largely to the pageant's effectiveness was the four-dimensional element of time. Rather than a mere three-dimensional display of historic vehicles, "Wheels a-Rolling" recreated the time in which they actually were in use and re-enacted the operation amid the authentic costumes, lighting and environmental features of each succeeding era. (L. R. L.)

RAKOSI (ROTH), MÁTYÁS, Hungarian politician (b. Ada, Bačka, Yugoslavia, March 14, 1892), son of Joseph and Cecília née Lederer, entered the Budapest Oriental Academy in 1910; but in 1912 he was working as a clothing store clerk. At the outbreak of World War I he was mobilized and taken prisoner by the Russians in 1915. He returned to Hungary in 1918 and early in 1919 joined the Hungarian Communist party organized by Béla Kun. At the time of the Hungarian Soviet republic (March-Aug., 1919), he was people's commissar of commerce and assistant commissar of finance. After the collapse of the Communist regime, he fled to Moscow where from 1920-24 he was secretary of the executive committee of the Comintern. In 1925 he returned to Hungary, was arrested and sentenced to eight years' imprisonment. On the termination of this sentence he was re-tried in 1934 and was condemned to life imprisonment. In 1940 he was allowed to go to Moscow in exchange for Hungarian colours captured by the Russians in 1848. He returned to Hungary with the Soviet army at the end of 1944, became secretary general of the reconstructed Hungarian Workers' (Communist) party and on Nov. 15, 1945, joined the Zoltan Tildy cabinet as deputy prime minister. He retained his post in all the following cabinets presided over by Ferenc Nagy (Feb. 4, 1946), Lajos Dinnyés (May 31, 1947), and István Dobi (Dec. 10, 1948, and June 10, 1949). During all these years Rakosi, helped by the Soviet power, led an unrelenting struggle against the Smallholders' and Social Democratic parties, and the Roman Catholic Church.

RAMMUSSEN, GUSTAV, Danish diplomat and statesman (b. Odense, Aug. 10, 1895). He started his career as a secretary to the legation in Petrograd (Leningrad) in 1917. He graduated in law at the University of Copenhagen in 1921 and the following year entered the Foreign Office. In 1923 he went to Moscow as a secretary of a Danish delegation to negotiate various economic matters. In 1927 he was appointed chargé d'affaires at Berne and in 1932-33 was counsel and advocate at the Greenland dispute before the Court of International Justice. In 1939 he was appointed counsellor to the London legation, remaining there after the German invasion of Denmark. At the beginning of 1945 he was appointed minister to Rome. On Nov. 8, 1945, he joined the Knud Kristensen Agrarian (minority) government as minister of foreign affairs. He was retained in this position by Hans Hedtoft when on Nov. 12, 1947, he formed his Social Democrat (minority) government. On April 4, 1949, in Washington, Rasmussen signed the North Atlantic treaty for Denmark.

RATIONING. During the early months of 1949 there was a distinct trend towards de-rationing in Great Britain and other European countries. This was due to an improvement of the supply position in the domestic markets, caused by the increase of production, the maintenance of imports through Marshall aid and expanding intra-European trade, and reduction in the volume of abnormal postwar demand. Wartime rationing had to be maintained so long as "too much money chased too few goods." When this ceased to be the case it was possible for the governments concerned to relax rationing. In Great Britain, the rationing of textiles was removed and this change was not followed by excessive increase of demand, except in some of the low-priced lines. The attempt to abolish sweet rationing was less successful. Owing to the inadequacy of supplies, it was found necessary to revert to rationing in August.

On the continent, too, improved conditions made it possible to relax rationing: in any case in most continental countries the system never worked as satisfactorily as in Great Britain. In Australia and New Zealand rationing of many products was maintained in order to export as much food as possible to Great Britain. Following the change of government, in Australia the rationing of petrol, tea and butter was abolished.

Towards the middle of the year the growing scarcity of dollars slowed down de-rationing, and, in certain cases, caused a reversion of the trend. In particular it was found necessary in many continental and Commonwealth countries to reinforce restrictions on use of petrol in order to save dollars. But for Marshall aid it might have been necessary to ration tobacco and other goods.

The size of rations fluctuated in many countries according to the supply position. In particular the British meat ration was liable to alterations dictated by necessity. During the early part of the year difficulties of trade negotiations with the Argentine compelled the government to reduce the ration for some time. Even factors such as the prolonged drought during the summer influenced the size of meat rations in Europe, because a large number of animals had to be slaughtered for lack of feeding stuffs.

Notwithstanding the setback caused by the accentuation of the dollar shortage, there was, on balance, noteworthy progress during 1949 towards the abolition of rationing. The usual rationing by purse returned. Excessive purchasing power in possession of consumers was largely curtailed by the high prices that had to be paid for uncontrolled goods, and also for controlled goods on the black market in continental countries. Even so, apart from Belgium and Switzerland, European countries had to retain rationing of essential foodstuffs.

One of the obstacles to the abolition of food rationing was the continuation of food subsidies. Free dealing in essential foods would have meant a sharp rise in their price following the abolition of subsidies. Alternatively, if price control were maintained on de-rationed food, supplies might disappear before late-comers had a chance of acquiring their fair share, as was the case with chocolate and sweets in Great Britain. During 1949 agitations in favour of the abolition of food subsidies as the preliminary step towards the abolition of food rationing continued. It came to be realized, however, in most quarters that this would not yet be possible and that any sudden change might entail grave social and economic consequences. For this reason the abolition of food subsidies was now advocated as a long-term programme to be adopted gradually. Consequently food rationing was also expected to remain in force for some time to come. (P. E.G.)

RAYON AND OTHER SYNTHETIC FIBRES. In March 1949 when world capacity for the production of synthetic yarns was already one-third greater than in 1948, it was believed that by the end of the year the world's output would be 3,585,150,000 lb., and by the end of 1950, 4,032,850,000 lb.

A notable example of work on the industry's programme was the expansion of the factory at Pontypool, Monmouthshire. In April 1948 this factory began to produce a small quantity of nylon yarn. Early in 1949 it had doubled its
output and was expected to produce 10 million lb. in 1950, or ten times the 1948 production.

A rayon design centre was opened in London early in 1949 by the president of the Board of Trade, who said then that in less than 20 years the production of this industry had increased a hundredfold and its manufactures had become a major export.

In May, a team drawn from all grades in the weaving section of the industry toured the United States to study American methods of rayon weaving.

New records in output were established during the year. In 1948 the total output of yarn was 147 million lb., including all synthetics. About 1 million lb. was nylon and this proportion was expected to increase following the expansion at Pontypool.

In March 1949 the output of rayon staple and rayon yarn was higher than it had ever been. In July it reached 10,200,000 lb. and in September 12,415,000 lb. In the third quarter of the year the total output of yarn and staple reached a monthly average of 24,428,000 lb., or 33% more than for the same period of 1948.

**Rayon Production, Great Britain, 1949**

The export target for the rayon industry was raised for the end of 1949 to a monthly rate of £4,300,000, from the £4,210,000 fixed for the end of 1948. Though the monthly rate for the first quarter of 1949 was an increase of 19% over the average monthly rate for 1948, by the middle of the year firms were reporting that export business was falling off, partly because of an increase in world production and an accumulation of stocks. The output of rayon yarn continued to expand more rapidly than yarn exports, which fell in the second quarter of the year by 19% compared with the first quarter. Rayon fabrics, on the other hand, set up a new record in June, at 17,712,000 sq. yd. Progress towards the end-1949 target of £4 30 million was not promising, though the effect of devaluation in opening up markets had not yet appeared. In the first quarter the monthly rate was £3 71 million; in the second £3 68 million; and in the third £3 29 million.

The price of rayon remained low compared with cotton and wool. In March the price of viscose rayon staple went up from 16½d. a lb. to 18d. a lb. It was stated that the price of American raw cotton had gone up by 300% since mid-1939, of Egyptian Karnak by 500%, and of raw wool by about 250%, while that of rayon staple had gone up by only 80%.

Rayon, which had been subject to less government control than cotton during and after World War II, was freed from some restriction during 1949. The Board of Trade, after consultation with the rayon weavers, agreed to transfer from the Cotton board to the Rayon Weaving association responsibility for the issuing of rayon and spin rayon yarn permits to weavers, instructions as to the use of the yarns obtained and the collection of information relating to rayon, spin rayon and mixture utility fabric production. Responsibility for policy remained with the Board of Trade, which acted in close collaboration with the British Rayon federation.

Of major importance in the synthetics industry of the Commonwealth in 1949 was the decision to start making rayon staple at Cornwall, Ontario. Some $17 million was to be spent on the extension and modernization of plant and production began in August. Output was expected to be 10 million lb. by the end of the year, roughly 80% of Canada’s consumption.

The Indian government showed during 1949 an increasing interest in the development of its home rayon industry and first steps were taken towards the establishment of a rayon-yarn producing mill at Allahabad.

On the continent, Germany, which in 1948 held second place in world production of rayon staple and fourth in filament yarn, and France, which was third for yarn and fourth for staple, both recorded progress, as did Finland, Norway, Sweden and Spain. Italy and Belgium both curtailed output during the year, as did the United States, the leading producer in all fields. (C. F. Dn.)

**United States.** World production of rayon in 1949 was about 2,690 million pounds, compared with 2,477 million pounds in 1948. Of this total, the United States produced 36.9% compared with 45.4% in 1948, 56.7% in 1945 and 19.1% in 1940.

Rayon prices in the United States reflected the downward trend of other textile prices. Filament rayon averaged 73 cents per pound as against the average of 75 cents per pound in 1948. Spun rayon yarn prices experienced a greater drop, the average for the year being 72 cents per pound as against the 1948 average of 90 cents per pound.

As was the case with rayon yarns, output of rayon fabrics in the U.S. also decreased. Total production was 1,950 million yards, 11% below the 1948 production of 2,190 million yards.

Production of all-nylon fabric in the U.S. jumped from 32.5 million yards in 1948 to 87.7 million yards in 1949 (last three months estimated). In addition, there was a large quantity of nylon-and-acetate-rayon fabric made for which no production statistics were available. A mixture of 12% nylon and 88% acetate rayon was normally used for this fabric. (See also Textile Industry.) (I. L. Bl.)
Cross to the Red Cross societies of the above-mentioned countries for use in identifying the children but at the end of Oct. 1949 only 138 in Czechoslovakia had been identified. (See also Poland)

Appeals also were received by the League of Red Cross Societies from the Red Cross societies of Poland and the U.S.S.R. to assist in identifying and repatriating Polish and Soviet children in the western zones of Germany and Austria.

Additional relief actions were undertaken by the League of Red Cross Societies in India and Pakistan (assistance to 600,000 refugees); Greece (706,000 refugees); Germany (11 million refugees); Ecuador (earthquake) and Guatemala (floods). Assistance to the International Refugee organization in the resettlement of displaced persons continued.

Membership in the League of Red Cross Societies was increased to 68 nations by the addition of the Red Cross societies of Ethiopia and Jordan. (See also Prisoners of War.)

Refugees. Europe. Progress in the repatriation and resettlement of the Polish, Baltic (Latvian, Lithuanian and Estonian), Ukrainian, Yugoslav, Jewish and other refugees and displaced persons remaining in Germany, Austria and Italy as the aftermath of World War II, continued during 1949. Their re-establishment in ways of living more normal than those of the displaced persons' camps, which had been the abode of many since 1939, was the special concern of the International Refugee organization (I.R.O.) which came into formal existence as a specialized agency of the United Nations in Aug. 1948. This organization and its predecessor, the Preparatory Commission for the I.R.O., had undertaken in July 1947 to attack the problem of over 1,000,000 refugees and displaced persons in Central Europe who had refused repatriation to their home countries of eastern Europe because of political changes resulting from the war.

Italy and Switzerland joined the organization during the year and added their efforts to those of the 16 other nations—to make possible the application of over $150 million in resources annually to the solution of the problem. These funds were used to provide care and maintenance in camps, clothing, medical services, vocational training, a tracing service for missing persons and, most important, transportation to overseas countries of resettlement. The United States contributed over $70 million to the I.R.O. budget for the year 1949-50.

During 1949, 318,096 were resettled or repatriated from Germany, Austria and Italy, but on Dec. 31 the I.R.O. care was still being extended to 588,768 refugees. The I.R.O. maintained a fleet of 35 ships engaged in the movement of refugees to overseas countries such as Australia, Brazil, Canada, the United States and Venezuela. The movement of Jewish refugees to Israel which totalled over 143,000 since 1947 was organized by the Jewish Agency for Palestine with funds supplied by the I.R.O. By Dec. 31, 1949, less than 40,000 Jewish refugees remained in central Europe awaiting disposition. Over 100,000 persons were transported to the United States by I.R.O. under the provisions of the U.S. Displaced Persons act of 1948, which provided for the admission of 205,000 by June 30, 1950. Efforts to amend the act persisted in the U.S. congress. Amendments increasing the numbers to be admitted to 339,000, eliminating the preferences for farmers and for persons from "de facto annexed" areas and moving the eligibility date forward from Dec. 22, 1945, to Jan. 1, 1949, passed the House of Representatives, but remained under consideration by the Senate. During 1949 approximately 85,000 refugees were moved to Australia and 27,500 to Canada.

At the meetings of the general council of I.R.O. in July and Oct. 1949 in Geneva plans were adopted looking toward the conclusion of operations; it was envisaged that all of those qualified for admission to receiving countries of immigration would have been resettled by the spring of 1951. Consequently it was decided to discontinue care and maintenance of refugees in the camps after June 30, 1950, and to continue thereafter the resettlement of those who were in process of movement by that date. These decisions left unresolved two important problems affecting refugees, namely provision for the continuing care of the non-resettlementable refugees, including some 26,000 persons who would require institutional care after June 30, 1950, and the legal protection of all refugees pending their acquisition of a citizenship in a new country of residence which would give them normal civil status essential to self-dependence.

About 180,000 non-resettlementable refugees consisted of the aged and infirm, those suffering from tuberculosis, the blind and deaf, and those otherwise physically handicapped and unable to meet the high health requirements of immigration countries, or lacking sponsors to guarantee that they would not become public charges after admission. Some of the member governments of I.R.O. such as Belgium, New Zealand, the Netherlands, Norway and the United Kingdom were giving serious consideration at the end of the year to the acceptance of limited numbers of these permanently dependent refugees. Israel offered to receive all remaining handicapped Jewish refugees in consideration of financial assistance from I.R.O. in the construction of hospitals and other institutions for their permanent care. The I.R.O. allocated $22 million in its budget for the years 1949-50 and 1950-51 as its contribution toward the provision of continuing care for the non-resettlementable group.

The continuing legal protection of refugees after the termination of I.R.O. services was considered by the Economic and Social council of the U.N. at its ninth session in Geneva (July 1949) and by the general assembly at its fourth session in New York (Nov.-Dec. 1949). Following the pattern established by the League of Nations the general assembly decided to establish as from Jan. 1, 1951, the Office of High Commissioner for Refugees for a period of three years,
with headquarters in Geneva. The Economic and Social Council also established an ad hoc committee to convene in Jan. 1950 at Lake Success to revise and to consolidate in one draft convention all the existing international arrangements, agreements and conventions providing for the protection and documentation of refugees, notably the Geneva conventions of 1933 and 1938, and the London travel agreement of 1946.

**Middle East.** The U.N. Relief for Palestinian Refugees, created by the general assembly of the United Nations at its third session in Paris in 1948, administered relief during the year to 750,000 refugees from the conflict in Palestine and an additional 200,000 Arabs whose means of livelihood in Arab Palestine, Jordan and the Gaza area had been affected by the armistice agreements still in effect at the end of the year. Thirty-three governments had contributed a total of $32 million in funds and supplies to maintain, house and clothe these refugees pending a political settlement which the Palestine Conciliation commission, also established by the United Nations, was endeavouring to achieve. The direct administration of relief under the auspices of the U.N.R.P.R. was conducted by the International Committee of the Red Cross, the League of Red Cross Societies and the American Friends Service committee, assisted by many other voluntary agencies.

As the political settlement was delayed and the repatriation of the refugees to their former homes in Israel and Israeli-held areas appeared unlikely to take place, the Palestine Conciliation commission organized the Economic Survey Mission for the Middle East which recommended to the fourth session of the general assembly of the United Nations (New York, Nov.-Dec. 1949) the creation of a new agency to undertake a works programme for the refugees which would supplant the relief programme by Dec. 30, 1950.

The general assembly voted on Dec. 8, 1949, to establish the U.N. Relief and Works Agency for Palestine Refugees to take over the relief activities of the U.N.R.P.R., scheduled to discontinue operations by April 1950. A budget of $54.9 million for 18 months was adopted, including $33.7 million for relief and works projects during 1950 and $21.2 million for works projects for the period Jan. 1 to June 30, 1951. This action of the general assembly recognized that continued assistance to Palestine refugees was necessary to prevent starvation and distress and to further peace and stability in the area, and that constructive measures looking toward the rehabilitation of the refugees would have to be undertaken to replace the administration of direct relief. The resolution provided that the director of the agency was to be appointed by the secretary-general of the U.N. in consultation with the members of an advisory commission consisting of representatives of France, Turkey, the United Kingdom and the United States, and that he was to be responsible directly to the general assembly. (G. L. W.)

**REPARATIONS. Germany.** Important agreements made during the year by the United States, France and the United Kingdom substantially lowered the level of future reparations removals from Western Germany and made possible an early termination of the programme.

The Economic Co-operation administration announced on Jan. 18 that Paul Hoffman had accepted the recommendations that had been made on Jan. 12 by the industrial advisory committee headed by George M. Humphrey urging the retention in Germany of certain equipment in 167 of the 381 plants which it had surveyed. On Feb. 23, Lewis Douglas, U.S. ambassador in London, initiated formal discussion of the recommendations with British and French officials in conjunction with a report from the military governors of the three western zones on a revised list of prohibitions and restrictions which should be applied to German industry on security grounds. In the course of those negotiations 5 steel plants, 3 chemical plants and certain equipment in another steel plant were removed from the list of projected exemptions at the insistence of the British and French governments, thus reducing the number of exempted plants from 167 to 159.

Formal announcement of the agreement was made in Washington, London and Paris on April 13. The U.S. State Department pointed out that the revision had been made in order to bring the dismantling programme into harmony with the European Recovery programme. Most of the 159 plants were located in the British zone and the amount of equipment which had been scheduled for removal from them varied from a single piece of equipment to the entire equipment of an operating factory. The affected plants included 32 plants in the steel industry (only 5 of which produced raw steel), 88 metal working plants, 32 chemical plants and 7 non-ferrous metal plants. It was estimated that the exemptions would reduce by 10% the total value of all plants, including war plants, scheduled to be removed as reparations.

The policy of taking reparations from Germany continued to be attacked, both in Germany and elsewhere, including the U.S. Congress. German protests ranged from press propaganda to strikes by workers and official opposition. Soon after the inauguration of the German federal republic, the chancellor, Dr. Konrad Adenauer, began pressing Allied representatives for further concessions and at their meeting in Paris on Nov. 9-10, Dean Acheson, Ernest Bevin and Maurice Schuman agreed to authorize their respective high commissioners in Germany to discuss the subject of dismantling with Dr. Adenauer with a view to final settlement of the problem. The agreement reached was intimated at Bonn on Nov. 22; it provided for the removal from the reparations list of 11 synthetic oil and rubber plants, 7 steel plants and the cessation of all dismantling in western Berlin and, with certain exceptions, at the J.G. Farben plant at Ludwigshafen-Oppau.

Refugees from Stettin, in prewar Germany but now in Poland, at an open-air meeting in Berlin, Oct. 1949.
It was reported on Sept. 15 that the U.S., France and the United Kingdom had agreed not to make any further deliveries of industrial plant to the U.S.S.R. as reparations, and on Dec. 3 the 19 members of the Inter-Allied Reparation agency were reported to have decided to divide among themselves the German industrial equipment stored in Western Germany which had originally been destined for the U.S.S.R. under the Potsdam agreement.

Austria. At its meeting in Paris from May 23 to June 20, the council of foreign ministers agreed that reparations should not be exacted from Austria, thereby rejecting Yugoslavia's claims. It was stipulated, however, that the U.S.S.R. should receive from Austria the sum of $150 million over a period of six years, with the additional proviso that, although there should be relinquished to Austria all property, rights and interests claimed as German assets or war booty, the U.S.S.R. should receive outright all the assets of the Danube Shipping company in Bulgaria, Hungary, Rumania and eastern Austria as well as the possession of 60% of Austria's oil properties for a period of 30 years.

Japan. On May 12 the Far Eastern commission was advised by Major General Frank R. McCoy of the decision of the U.S. government to terminate the Advance Transfer programme, to take no further unilateral action to make possible additional reparations removals from Japan and to submit to the commission new policy proposals which would have the effect, if adopted, of precluding further industrial reparations removals from Japan during the occupation. General McCoy's statement emphasized that (a) the burden of further reparations removals from Japan could detract seriously from the occupation objective of stabilizing the Japanese economy and permitting it to move toward self-support; (b) the failure of the commission to agree upon a reparations shares schedule made it impossible to implement existing commission decisions regarding reparations; and (c) Japan had already paid substantial reparations through expropriation of its former overseas assets and, in smaller degree, under the Advance Transfer programme.

The U.S. decision was translated into U.S. joint chiefs of staff interim directive 104, dated May 13, for implementation by General Douglas MacArthur. It provided that "items already processed" under the Advance Transfer programme "will be made available for removal," and was interpreted to include reparations already packaged and in the process of being packaged as well as items allocated but not yet packaged.

Actual deliveries under the Advance Transfer programme from the date of its initiation to Nov. 30 were as follows (in thousands of yen, 1939 values):

* Deliveries completed and account closed

Total allocations from segment 3, the only segment from which deliveries were still to be made at the end of the year, were 63,256,641 yen (including deliveries already made as indicated in the table above). Allocations by country were as follows: China, 27,848,082 yen; Netherlands, 6,992,816 yen; Philippines, 13,222,869 yen; United Kingdom, 15,192,874 yen.

RÉUNION: see FRENCH UNION.

REYNAUD, PAUL, French statesman (b. Barcelonnette, Basses-Alpes, Oct. 15, 1878). After receiving his doctorate of law from the University of Paris, he began his career as a lawyer. He joined the moderately conservative Democratic Alliance party, was elected a member of the Chamber of Deputies for the department of Basses-Alpes, 1919-24, and for Paris in 1928, 1932 and 1936. He was minister of finance (March-Dec. 1930), minister of colonies (Feb. 1931-Feb. 1932), vice premier and minister of justice (Feb.-May 1932) and for seven months minister of justice and later of finance (April 1938-March 1940). On March 21, 1940, he became prime minister and minister of foreign affairs; he reshuffled the cabinet on May 18 by taking over the portfolio of national defence from Edouard Daladier (who now became minister of foreign affairs) and appointing Marshal Philippe Pétain as vice premier. On June 6 he dropped Daladier, took back the portfolio of foreign affairs, but resigned on June 16, to be succeeded by a capitulation government headed by Pétain. Arrested on Sept. 7, 1940, he was interned, then detained in a fortress after trial at Rouen (Oct. 1941); in Nov. 1942 he was handed over to the Germans who transported him to the Oranienburg concentration camp. At the beginning of 1945 he was transferred to the Tyrolean Alps where he was set free by the 7th U.S. army on May 6. He was elected on June 2, 1946, by the département of Nord as a member of the second Constituent Assembly and on Nov. 10, 1946, of the National Assembly. He was minister of finance in the André Marie cabinet (July 26-Aug. 28, 1948). During 1949 he emerged as the most formidable critic of the Queuille and Bidault governments.

RHEE, SYNGMAN (R. SYNG-MAN), Korean political leader (b. Whanghui province, Korea, April 26, 1875), received a classical Chinese education and then enrolled in a Methodist mission school in Seoul. Imbued with democratic ideals, he joined an Independence club in 1894 and founded the Independent, Korea's first daily newspaper. In 1897 he led a mass demonstration of students against the Japanese, was arrested and sentenced to life imprisonment. He became a Christian convert, and while in prison wrote a book, Spirit of Independence. Released in a 1904 general amnesty, he travelled to the U.S., where he studied at Harvard and Princeton. He returned to Korea in 1910 to organize resistance to the Japanese occupiers. Discovered, he fled to Hawaii where he directed the Korean Christian institute until 1939. On March 1, 1919, a group of Korean patriots signed a declaration of independence, set up an exile government in Shanghai, China, and elected Rhee president. He was regularly re-elected until 1941. To win U.S. recognition of Korean independence claims, he went to Washington during World War II. In 1945 he returned to Korea. Rhee was elected first president of the Korean (southern) republic by the national assembly on July 20, 1948, and inaugurated four days later. On Aug. 7-8, 1949, he met Chiang Kai-shek at Chinhoe bay, south Korea.

RICHARDSON, SIR RALPH DAVID, English actor (b. Cheltenham, 1902) was educated at Xaverian
college, Brighton, and made his first appearance at Brighton in 1921. Until he joined the Birmingham repertory theatre in 1925 he toured the provinces in Shakespeare repertory; and in 1926 made his first London appearance as Arthur Varwell in Yellow Sands. He subsequently toured in South Africa, 1929, in the United States, 1936, in Germany and again visited New York, 1946-47. He appeared in his first film, The Ghoul, in 1933. In Sept. 1939 he joined the Fleet Air Arm, becoming a lieutenant, 1940, and a lieutenant commander, 1941. He was released from the Navy in 1944 to act and direct drama for the Old Vic company. He appeared with the company in each of the seasons from 1944 to 1947, playing among other parts, Peer Gynt, Bluntschli in Arms and the Man, Henry VII in Richard the Third, Falstaff in Henry IV, Lord Burleigh in The Critic, Cyrano in Cyrano de Bergerac and Face in The Alchemist. More recent films in which he appeared were School for Secrets and Anna Karenina. In Feb. 1949 he opened in The Heiress, by Ruth and Augustus Goetz, at the Haymarket theatre, London. He was knighted on Jan. 1, 1947.

RIFLE SHOOTING. The King's prize in Great Britain for 1949 was won by Captain E. Brooks from an entry of 1,105 at Bisley, Surrey. Competitors from Canada, South Africa, India, New Zealand and several colonies and protectorates of the Commonwealth were among the 1,430 persons who competed in the annual tournament for full bore (.303 calibre) rifles. Almost 1,000 shot in the small bore (.22 calibre) events, G. A. J. Jones of Ilford, Essex, winning the Earl Roberts British small bore championship.

Largest of the non-national meetings was that of the R.A.R. Small Arms association, held at Bisley, with 1,400 entries. The National Small Bore Rifle association held its annual Scottish meeting at Aberdeen in May with a record entry of 460, when a Scottish-born London policeman won the Scottish individual championship.

Shooting with rifles and pistols was organized during 1949 in Great Britain and the Commonwealth by the National Rifle association and by the National Small Bore Rifle association. There were 4,600 rifle clubs, 1,000 of which were for full bore (.303 calibre) shooting. In addition to the prize meetings the Small Bore association organized numerous competitions under postal conditions for juniors, women, factories and for the services. (A. J. P.)

RIO DE JANEIRO. Capital and second port of Brazil, the largest Portuguese-speaking city of the world. Area: c. 60 sq. mi. (out of 451 sq. mi. of the Federal District); pop.: (1940 census) 1,563,787, (1949 est.) 2,091,160. Arnaldo Mendes de Morais, prefect (mayor) of Rio, remarked in 1949 that Brazil was "the land of the day after to-morrow—and, he added, "don't forget that the day after to-morrow is a holiday." That was the prevailing spirit in glamorous and easy-going Rio during 1949, as it always had been in the past; but the city continued to grow. The construction of skyscrapers progressed exuberantly, and it was estimated that investment in real-estate absorbed at least two-thirds of the people's savings. A large U.S. department store, equipped with escalators (a novelty in Rio), was opened amidst considerable public excitement and served to encourage local shop-keepers to Americanize their selling methods; but although the purchasing power of a minority of cariocas was very high, the standard of living of the majority of the population declined during 1949 as a result of inflation, and imported goods were a luxury that only the minority could afford. The Rio Spinning and Weaving syndicate appealed to the minister of finance to assist the textile industry (the most important of local industries) because production was now exceeding demand. The government's ambitious hydro-electric projects had not yet materialized and Rio continued to suffer a shortage of water and electricity. An unforgettable event of the year was a traffic jam which, one day in September, immobilized 200,000 people and 10,000 motor cars from early morning until dusk. (G. P.)

RIO MUNI: see Spanish Colonial Empire.

ROADS. In Britain retrenchment in public expenditure was the keynote of 1949 and, particularly after the evaluation of the pound in September, the activities of road engineers were severely curtailed. In very few areas did funds permit any notable steps towards the achievement of a national road system compatible with the traffic requirements of the present century. Attention had perforce to be concentrated in the main upon the conservation of existing carriageways by the most modern and economical method of re-surfacing and re-dressing. Long term schemes for execution in more prosperous days continued to be studied; the few major works in progress were selected for their direct utility in stimulating the industrial welfare of the less prosperous regions. Conspicuous among these was south Wales where the industrial advance already accomplished was shown by the establishment of some 600 new enterprises since 1945. The long term programme for the transformation of communications between south Wales and the Midlands entailed the ultimate construction of about 120 mi. of motorway, new road bridges over the Severn and Wye rivers and the modernization of some 140 mi. of trunk roads, at a total cost of about £35 million. On June 17, 1949, the first sod was cut of a section of new trunk road near Merthyr Tydfil forming an instalment of this comprehensive Welsh project and furnishing a much-needed eastern by-pass about four mi. long to Merthyr Tydfil and Dowlais. In Scotland 15 new hydro-electric schemes afforded widespread employment for road makers in the diversion of highways and the building of new bridges. The creation of new and the enlargement of existing aerodromes entailed extensive road works and road diversions in various parts of the country. In London the preparations for the Festival of Britain to be held in 1951 included much needed improvements of road communications in south London between Waterloo and Westminster bridges, as well as on the other side of the river near Parliament square. Test-borings were taken for the foundations of the long deferred Forth road bridge near Edinburgh.

For the promotion of public safety a "Pedestrian Crossing Week" was held when various patterns of crossing were installed in the streets, including the "zebra" type which seemed successful in attracting notice with its conspicuously striped markings. It was unfortunate however that so much uncertainty should still have prevailed in the public mind as to the respective priority of pedestrians and motorists in the use of crossings; hesitation defeated their purpose. The minister announced the holding of a "Children's Safety Week" in March 1950. (See Accidents.)

In Sept. 1949 was published the first report of the Road Research board upon its postwar activities in Great Britain. Road safety and traffic flow figured largely among its studies, the problems of "dazzle" were also in course of investigation, as were the extended application of mechanical plant to operations of road construction and road repairs. Experiments with army vehicles were made on a disused airfield, in order to study traffic flow in relation to road design; and the R.A.F. School of Photography and the Royal Aircraft establishment co-operated in taking aerial photographs of traffic in central London. Traffic and pedestrian flow was also studied by means of films. The importance of
soil as an integral part of road structure was emphasized, and extensive experiments in bituminous surfacing took place on 30 sites.

Wide openings for economy should have been discoverable in the field of road transport in Great Britain where the annual outlay on road construction and maintenance exceeded £100 million and the operating cost of road transport approximated to £300 million. A remarkable service rendered by road transport in Nov. 1949 was the conveyance from London to Cheshire of a metal tube 84 ft. long and 10 ft. 8 in. in diameter, weighing 115 tons. (C. H. Br.)

**Europe.** Plans for an international network of main highways for Europe were advanced materially under the guidance of the Economic Commission for Europe (E.C.E.) of the United Nations. At a meeting held in Geneva in March, 12 governments and the occupation authorities of the western zones of Germany reached final agreement on a network of traffic arteries designed to meet existing needs and anticipated traffic requirements for the next 10 to 15 years.

Routes from Helsinki to Marseilles, from Edinburgh to Rome, and Paris to Warsaw were among the many included. Standard designs for three categories of roads in the system were agreed upon. The participating governments began studies of the conditions upon which the construction of the road network could be undertaken and financed.

**U.S.S.R.** Detailed reports on road conditions in the U.S.S.R. were not available. The newspaper Izvestia reported that there were only 90,000 mi. of roads and that the road-building programme was being accelerated. Lack of good highways was a serious problem. According to Izvestia, 138 road-building organizations were to be in operation in 1949. Each would be expected to build 30 mi. of surfaced roads and 60 mi. of improved dirt roads annually. This would result in the improvement of 12,420 mi. a year.

**Turkey.** The outstanding example of progress toward a modern system of highways was found in Turkey. Studies were made of highway needs, a system was planned, laboratories and machine shops were established, training courses were begun for machine operators, inspectors and other workers and actual construction was started. In 1948 the Turkish government expended $13 million on labour and materials and the programme was enlarged in 1949. Assistance had been given by the United States as part of the Turkish Aid programme by allocation of $5 million and a loan of equal amount for purchase of machinery and equipment. A group of engineers assigned by the United States government assisted the Turkish government in the various phases of the work.

**India.** The government of India found it necessary to cut back on its original plan to spend $90 million on a national-highway system. In the fiscal year 1949-50 it planned to spend $5-4 million for new projects and $6-4 million for maintenance. The expenditure at the close of the fiscal year 1949-50 would be only about one-third of that originally planned.

There were gaps of 1,802 mi. and a number of unbridged rivers on the system. A programme to be completed in the near future provided for the closing of 917 mi. of these gaps and the bridging of several streams. The need for highway transport was so great that negotiations were being conducted to permit motor vehicles to cross some of the larger streams on railroad bridges. Construction of a bridge on the route between Bombay and Calcutta that would cost about $3 million was begun.

**Republic of the Philippines.** The rehabilitation of war-damaged highways, financed by the government of the United States, progressed rapidly during the year. This work, authorized in 1946, resulted in the completion of 65 mi. of highways and more than a score of bridges by July 1949.

**Canada.** Non-urban highway construction was to be completed at a cost of $234 million. Interest was centred particularly on completion of the 4,300-mi. Trans-Canadian highway from Halifax to Vancouver. There were 1,700 mi. still to be constructed.

Construction of a $13-5 million highway and railroad bridge over the Strait of Canso, which separates Cape Breton Island from the mainland of Nova Scotia, was assured by the Canadian government. A board of engineers reported that it was feasible to bridge the strait, which is 3,000 ft. wide, 200 ft. deep in places and subject to strong tidal currents.

**United States.** Highway work progressed at a more rapid rate than in any year since the end of World War II. In the first ten months of 1949 state highway departments awarded contracts for 40,181 mi. of construction to cost more than $1,000 million. The figures included 17,145 mi. of federal and federal-aid construction. In the fiscal year ending June 30, 1949, 21,032 mi. of highway were completed in the programme involving federal funds, at a cost of $762,913,000 The federal assistance amounted to $401,968,000.

It was estimated that highway construction expenditures by all agencies in 1949 would amount to $1,705 million and that $1,295 million would be expended on maintenance.

Highways of all classes were improved, the greater part of the work being to modernize old, worn-out highways to make them suitable for modern traffic. In numerous cities expressways were built to permit the flow of traffic at speeds of 35 to 50 m.p.h. without interruption or conflicts of any kind. Cities where large projects were under way included New York, Pittsburgh, Washington, Atlanta, San Antonio, Houston, Dallas, Fort Worth, Detroit, Chicago, Oakland and Los Angeles.

In June the Bureau of Public Roads reported to congress that serious deficiencies existed in the national system of interstate highways. This system, which included 37,800 mi. of the most important highways of the country, carried 20% of the nation's traffic.

All but 1,900 mi. of the 31,831 mi. of the system in rural areas required improvement to bring these routes up to standards recommended for existing volumes of traffic. Of the 5,969 mi. of roads and streets in urban areas, all but 398 mi. required some degree of improvement. The cost of improvement was estimated at $11,000 million.

**Mexico.** Completion of the Inter-American highway across the country to the Guatemalan border was scheduled for the end of the year and the important main highway from Mexico City to Juarez on the border opposite El Paso, Texas, was nearing completion. Work progressed on the Pacific coast-Mexican highway, a 1,640 mi. route down the coast to Guadalajara, and then inland to Mexico City.

**Inter-American Highway.** The Inter-American highway extended from Laredo on the border between Mexico and the United States to Panama city, a distance of 3,200 mi. The highway was not yet suitable for travel beyond southern Mexico. There were three large unimproved gaps—one about 80 mi. long was in southern Mexico and western Guatemala. Only the Mexican portion was nearing completion although work was in progress in Guatemala. Provision had not been made for closing the other gaps, about 65 mi. in northern Costa Rica and about 150 mi. in southern Costa Rica and northern Panama. Near the end of 1949 87% of the highway was passable at all times, 4% was passable in dry weather only, and 9% was impassable.

**South America.** Good progress was made in several countries of South America. The section of the Pan-American highway along the west coast of the continent remained passable by vehicles but not suitable for tourist travel. Much improvement in the road and provision of tourist facilities...
would have to be made before long-distance travel could be recommended. However, the highway was of great service for local travel and was used to some extent for travel between countries. Ecuador began the construction of a 69-mi. highway to complete a branch from the Pan-American highway at Quito to the seaport Esmeraldas.

In Brazil the highway programmes directed by the national and state governments gained momentum. The national road organization reported in July 1949 that 430 mi. had been completed in the preceding 12 months. The national highway fund for 1949 amounted to $275 million and other funds available to the national organization brought the total to $360 million. Important sections of the national system of highways, which also formed a part of the Pan-American Highway system, were under construction. Tunnels on the four-lane divided highway connecting São Paulo with Santos were to be completed before the end of the year. In northern Brazil a new highway from Natal to Recife reduced travel time from 11 to 6 hr. Between Natal and João Pessoa the old route, 185 mi. in length, was shortened by 58 mi.

In Venezuela plans were made for the surfacing of 500 mi. of existing roads and the construction of 400 mi. of new roads. A major highway project was the long-planned road between Caracas and the main seaport and airport at La Guaira. A four-lane concrete highway to replace the old narrow mountain road and reduce the distance from 20 to 10 mi. was begun.

(R. H. Mc.D.)

ROMAN CATHOLIC CHURCH

The year 1949 was dominated once again by the sharpening conflict with international Communism and, historically speaking, the most important event of the year was the decree issued by the Holy Office on July 13, declaring that it was forbidden for Catholics "to enlist in or show favour to the Communist party" or "to publish, read or disseminate books, newspapers, periodicals or leaflets in support of Communist doctrine and practice, or to write any articles in them;" and that those who professed, and particularly those who defend and spread, the materialistic and anti-Christian doctrine of the Communists ipso facto, as apostates from the Catholic faith, incur excommunication" This decision was the cause of much discussion; in France, for instance, some five million people had been in the habit of voting Communist at election time, including, inevitably, many Catholics who would not lightly consider being excommunicated; in Italy itself some three millions had voted Communist in 1948.

In France the cardinals and archbishops showed themselves perhaps a trifle embarrassed by the decree, when they came to expound it to their people in the joint pastoral letter issued after their meeting on Sept. 8, insisting very carefully that, although the Church condemns Communism, "she wishes steadfastly to serve the cause of the working class." Similar expositions came from other national hierarchies—

the Belgian, for instance—and from individual archbishops and bishops in pastoral letters; but by the end of the year there was nothing to suggest that the decree had had any consequences of the kind that some had expected, in alienating the Church from the industrial working classes. It is true that the only important elections by which the effects might have been tested between July and the end of the year—those in Germany and Austria—were ones in which Communism was in any case largely discredited on other grounds: but the year was one in which, on the contrary, the Church made important progress in gaining the confidence of industrial proletariat, never wholly won since the industrial revolution began.

The Katholikentag at Bochum, in the Ruhr, in September, was significant for reasons that extended outside Germany; for just as Marxism had been born in the Ruhr to spread throughout industrial Europe, so also much Catholic social doctrine of far wider application had been worked out there, in the days of Bishop Wilhelm Emanuel von Ketteler of Mainz. It was important, therefore, that at Bochum in 1949, in the presence of very great numbers of German Catholics, the Church should have become in some degree identified with a new approach to the problem of industrial relations. A resolution was passed according to which labour ought to have a share in both the management and the profits of industry. Cardinal Joseph Frings, archbishop of Cologne and chairman of the Fulda conference, subsequently expressed his approval in principle; and Archbishop Lorenz Jaeger of Paderborn described the resolution as one of "far-reaching and almost revolutionary importance." It was interesting to find a French bishop, Mgr. Alfred Ancel, an auxiliary to Cardinal Pierre-Marie Gerlier at Lyons, speaking in a similar sense in the following month, when he addressed a large meeting in the Bourse de Travail in the industrial town of Saint-Etienne.

In France, meanwhile, the new archbishop of Paris, Mgr. Maurice Feltin, translated from Bordeaux in August to succeed Cardinal Emmanuel Suhard (see OBITUARIES), who had died on May 20, at once showed that he would continue the experiments in pastoral technique among the proletariat that Cardinal Suhard had developed so successfully. The "priest-workman" had become an accepted feature of the life of the "red belt" of Paris; one of them, engaged in the laundry trade as a van-man, had some publicity in a law suit in the autumn, when the trade union to which he belonged took action to have him re-instated after he had been dismissed. In parts of Italy and Austria also the "priest-workman" was becoming known; and the continued close interest in social questions shown by Pope Pius XII (q.v.), who in March, for instance, wrote a letter of warm encouragement to Canon Joseph Cardyn, chaplain general and founder of the Young Christian Workers (J.O.C.), for the silver jubilee of the movement, left very little opportunity for Communists to get a hearing for their argument that, if Communism was condemned, it was because the Church was on the side of the bourgeois and of privilege. On May 7, indeed, when he addressed a party of business men whom he had received in audience, the Pope went very near to advocating the kind of co-partnership or co-ownership in industry which was recommended four months afterwards at Bochum.

The condemnation of Communism and the excommunications of its adherents was plainly a consequence of the increasingly outrageous persecution of the Church in eastern Europe. In particular, it followed the trial and sentence to penal servitude for life of Cardinal József Mindszenty, the prince primate of Hungary (Feb. 3-5). That trial was subsequently condemned in the most categorical language not only by the Pope but also by leading spokesmen for Great Britain, the United States and other nations of the free world, in the case of the general Roman Catholic press. The Pope himself contributed to the end of an unfortunate situation by sending to the International Court of Justice. This was the first time for 400 years that a secular court had thus arranged a member of the college of cardinals. It was, moreover, quickly followed by action against the Church in Czechoslovakia; while such action proceeded most relentlessly of all, if more obscurely, in Rumania, where by the end of 1949 the Catholic Church had virtually ceased to exist as a legal institution.

In Poland, by contrast, where the Pope appointed Mgr. Stefan Wyszyński in January to be archbishop of Warsaw and Gniewno and primate, the Communist government moved more cautiously, and confined the year's activities to the arrest and imprisonment of parochial clergy and to a steadily increasing pressure on the younger generation through the schools and the youth organizations—a pressure which the
new primate condemned in an outspoken letter *ad clerum* made public on Oct. 11. A law promulgated in Poland on Aug. 7, governing the “freedom of conscience,” described the penalties to be expected if the decree of the Holy Office against Communism should be observed, even though the decree was not actually mentioned. This law, echoing the Soviet constitution in its equal solicitude for freedom of belief and freedom not to believe, was a classic of its kind, for in all these Soviet-dominated countries constitutional texts could be quoted to show that there was freedom of belief; and in Czechoslovakia the bishops again and again during the year invoked in their own protection, if vainly, the provisions of the new constitution.

Discussions between church and state opened in Prague in February; and they broke down when, at the 9th congress of the Czechoslovak Communist party, held in Prague in May, the ministers of education and information, party-members both, spoke of their plans for education in terms that left Mgr. Josef Beran, the archbishop of Prague, in no doubt about the government’s intention to exclude the Church from all influence in the minds and consciences of the young. In June the curial offices of Mgr. Beran were raided and officials of the ministry of education took possession of his stationery and began issuing documents in the name of the Church, the archbishop, meanwhile, being virtually confined to his quarters. He remained so until the end of the year, so that his signature was absent from most of the collective documents of the Czechoslovak hierarchy through those difficult months which followed. The government developed these “tactics of confusion” by promoting an organization falsely described as “Catholic Action,” which opposed the bishops, and by issuing a periodical to all clergy purporting to be the sole source from which they could derive their pastoral instructions. Eventually, on Nov. 1, a new bill became law, reducing all clergy to the status of civil servants, offering them greatly increased rates of pay but requiring them to submit to the detailed direction of a new ministry set up for the purpose. The minister appointed was Alexej Čepička, the son-in-law of President Klement Gottwald and already minister of justice, who had personally conducted most of the campaign against the Church. Throughout all these events two things in particular were striking: the constancy and loyalty to the hierarchy and to the Holy See of the immense majority of the 7,000 Catholic priests of Czechoslovakia and, secondly, the persistent skill of the bishops in transmitting to the western world, week after week, joint statements in which they described their position.

During the year the Pope expressed his anxiety for Jerusalem and the Holy places, for whose internationalization he called in an Encyclical letter issued on Good Friday, and also for the fate of the Church in China, as the southern provinces were overrun by the Communist armies. In Japan, during the summer, the fourth centenary of the landing of St. Francis Xavier was publicly observed.

(M. Dk.)

**United States.** The bishops of the United States issued a statement entitled, “The Christian Family.” It emphasized four principles of family life—permanence, freedom, economic security and religion. Concern for the suffering children in many lands was expressed by Pope Pius XII in his radio address on March 2 to more than two million pupils of Catholic schools in the United States and he requested contributions from them as a special Lenten sacrifice. Mgr.
Thomas J. McMahon, national secretary of the Catholic Near East Welfare Association of the United States, reported that Catholic organizations had and would continue to have 2,000 priests and sisters working in the field assisting refugees. They had given regular assistance to some 200,000 of the half-million refugees. Mgr. Edward E. Swanstrom, executive director of the American Catholic Relief agency reported that war relief services of the National Catholic Welfare conference had distributed so far 290 million lb. of relief supplies valued at $130 million.

Bishop Mariano S. Garriga, coadjutor of the diocese of Corpus Christi, Texas, assumed direction of the diocese on March 15, on the resignation of Bishop Emmanuel B. Ledvina who retired because of ill health. Mgr. Emmet M. Walsh, bishop of Charleston, South Carolina, was appointed coadjutor bishop of Youngstown, Ohio, with right of succession to Bishop James A. McFadden. Mgr. Edward A. Fitzgerald, former auxiliary to the archbishop of Dubuque, Iowa, was appointed bishop of Winona, Minnesota. Mgr. Leo Binz, formerly titular bishop of Pinara was appointed titular archbishop of Silyum and coadjutor with right of succession to Archbishop Henry P. Rohlman of Dubuque. Mgr. Francis E. Hyland, of Philadelphia, was appointed titular bishop of Gomphi and auxiliary to Bishop Gerald P. O'Hara of Savannah-Atlanta, Georgia. Mgr. James H. Griffiths, chancellor of the military ordinariate, which comprises all Catholics in the U.S. armed forces, was named titular bishop of Gaza and auxiliary to Cardinal Francis Spellman in his capacity as military vicar.

At the end of 1949 the U.S. Catholic hierarchy ruled 23 archdioceses, 101 dioceses, and 1 vicariate-apostolic (Alaska). There were 4 cardinals, 20 archbishops, 157 bishops and 36 abbots; the parishes totalled 15,905; there were 42,334 priests, 7,302 brothers and 141,606 nuns.

The Claver index, containing over 35,000 reference cards on the subject of the Negro and the Catholic Church, was installed at the Catholic Interracial Centre in New York city. This unique collection was the life work of Fr. Arnold Garvy, S.J., of Chicago, and was being used by students and research workers from all over the country. The Catholic Interracial Council of New York completed its eighth year of weekly interracial forums of leading speakers treating a wide variety of problems dealing with race relations. In addition to the twelve Catholic Interracial Councils existing, four others were in process of formation during the year. (See also CHURCH MEMBERSHIP; PIUS XII; VATICAN CITY STATE.)

Statistical Data. According to The Catholic Directory 1950 (London) the Catholic population of the world was estimated at 423 million. The figure of Catholics in the United States was given as 26,718,343, and in the United Kingdom as 3,833,649 (England and Wales 2,754,249; Scotland 621,400; Northern Ireland 458,000).

ROME. Capital and largest city of Italy. Pop.: (July 1, 1936) 1,148,987, (July 1, 1948, est.) 1,613,660. During 1949 traffic in Rome continued to multiply, especially the trolley-buses, which were very smart and swift but as crammed as ever and up in price. The broken down trams of the immediate postwar period began to yield place to fine new ones but here, too, the over-crowding continued unabated. Most of all, motor-bicycles increased, particularly the light "scooter type." (This was just as much the case in many other towns). The long drought brought
a serious water shortage followed by an electricity famine, involving two days, then in the autumn three, without current from 7 A.M. to 6 P.M.

Luxury flats continued to go up in the wealthy suburbs but in spite of much talk about the Fanfani plan very little else was built. Rome began to pride itself on having superseded Paris in leading women’s fashions, for Rome claimed that Roman creations were more truly feminine. Social life became rather more feverish than ever before. The price of the espresso, small cups of very good strong black coffee, which are a national drink, increased in some bars from 20 lire to 25 lire; as one might easily consume twelve of these a day, this was a minor blow to the already impoverished middle class.

A great many international gatherings took place in Rome in 1949; there were also, of course, preparations outside the Vatican City for the coming Holy Year. For the first time since the Italian army conquered Rome from the Pope on Sept. 20, 1870, the anniversary of that day was not officially celebrated. On June 2, the third anniversary of the voting in favour of the present republic, a monument was inaugurated to Giuseppe Mazzini. (E.Wt.)

ROMULO, CARLOS PENA, Philippine journalist, army officer and politician (b. Camiling, Tarlac, Luzon, Jan. 14, 1901). After studying at Manila high school and at the University of the Philippines, and in the United States at Columbia University, he entered journalism and became editor of the Philippines Herald (1923). A survey of the far east that he made in 1941 won him a Pulitzer prize. After the Japanese attack on the Philippines, he was public-relations officer to General Douglas MacArthur, and was said to be the last man to leave Bataan alive before its capitulation. He rejoined MacArthur in Australia as the latter’s aide-de-camp, and later became a brigadier general in the U.S. army. He was Philippines delegate to the United Nations from that organization’s beginnings, and at the opening of the fourth annual session of the U.N. at Flushing Meadow in Sept. 1949, Romulo was elected president of the general assembly.

ROOT CROPS. The very large crop of potatoes in 1948 in the United Kingdom provided ample supplies for both human consumption and stockfeed. Probably nearly 1,500,000 tons of potatoes, either raw or processed, were used for stockfeed in addition to some 5,750,000 tons for human consumption (78% more than prewar).

content promised to be high as a result of the dry season but was reduced by heavy rain in October.

The acreage of carrots decreased by 9%, parsnips by 40% and beetroot by 24%; yields per ac. of all three crops were low.

The prices of potatoes for the 1948 and 1949 crops, including an allowance for acreage payments, were 118 and 126% respectively above the average for 1936-38. Prices of sugar beet were 156% in 1948 and 161% in 1949 above the 1936-38 level.

The special measures taken in 1948 to prevent the spread of Colorado beetle to the United Kingdom from continental Europe were continued in 1949. The wide publicity given to the pest resulted in such colonies as were forming being dealt with while still small. Both early and main crop potatoes in southeastern England were sprayed and dusted as a routine precaution. (See also Market Gardening; Vegetables.)

ROSSELINI, ROBERTO, Italian film director (b. Rome, May 8, 1906), son of a prosperous building contractor, left the university because of a change in family fortunes and entered the film industry as a dubbing technician. In 1940 Rossellini became a director and produced his first film, a “short” called Vita in un acquario. A number of short films followed: La nave bianca (1941), which was partly documentary; Un pilota ritorna (1942); L’uomo dalla croce (1943). Roma città aperta (1945) (Open City) was shown in Europe and America and brought Rossellini the widest recognition. It was marked especially for its exceptional fidelity in treatment of character and environment and for the acting of Anna Magnani (q.v.). Only three studio sets were used, the remainder of the shooting being done on actual sites in Rome. In 1946 came Païsa, made in collaboration with Rod Geiger who had bought the U.S. rights for Roma città aperta; both films were noticeable for the new Italian realism with a social content which reached its height in Rossellini’s next film, Germania anno Zero (1947). In 1948 followed Amore which won the Oscar award for the best foreign film in that year, and La macchina annamza cattivi; in these Rossellini moved towards a more poetic interpretation while retaining non-professional persons as actors. In 1949 Rossellini visited London as guest of the British Council. The Locarno award for 1949 was made to Rossellini for his direction of Germania anno Zero. In the same year he joined Samuel Goldwyn to produce Stromboli, set in the island of Stromboli, with Ingrid Bergman as the leading actress. Rossellini’s technique is marked by a significant realism, to produce which both camera and actor are partners. In his films photography is documentary; actors are mainly non-professional and the dialogue written on the set.

ROTARY INTERNATIONAL. During 1949 the number of Rotary clubs in Great Britain and Ireland increased from 643 to 675, and the number of Rotarians from 29,000 to 30,000. From January to June Rotarian Percy Reay, M.B.E., of Manchester, was completing his year of office as president of Rotary International in Great Britain and Ireland. He was succeeded by Rotarian Arthur Mortimer, O.B.E., of St. Pancras, London, who was nominated at the annual conference held at Blackpool, Lancashire, from April 29 to May 2, which was attended by more than 5,000 delegates, and elected at the convention of Rotary International held at New York, U.S.A., in June. The international convention was attended by 16,000 delegates.

Many Rotary clubs devoted attention to the problems of industrial relations and made a study of the possibilities of particular assistance to young entrants to industry.
Changes in the scope of voluntary service following post-war social legislation were studied by Rotary clubs with a view to clarifying the ways in which the individual citizen could best serve his community. Rotarians also studied the movement towards a United Europe, and there were many visits by Rotarians to and from various countries of Europe and elsewhere.

Eight young men nominated by Rotary clubs in Great Britain and Ireland were awarded Rotary foundation fellowships by Rotary International, enabling them to undertake one year's post-graduate study in countries other than their own. Twenty-two graduates from U.S.A. and the Commonwealth travelled to British and Irish universities to study under this scheme.

ROWING. Exceptionally fine weather made the 1949 rowing season in Great Britain one of the most successful in memory. Even the university boat race was rowed in almost summer conditions. The crews were evenly matched, with Cambridge considered the more powerful and Oxford the faster off the mark. Oxford won the toss and chose the Middlex station. Oxford led at the mile and at Hammertown; then Cambridge gradually drew up until the crews were level off Dukes meadows and at Barnes bridge. Cambridge managed to hold on round the outside of the final bend and won in the last few strokes with a magnificent spurt by only a quarter of a length. The time of 18 min. 57 sec. was fast in the conditions. This was the closest boat race verdict since the dead heat of 1877 and the first occasion on which the Surrey station has won after Barnes.

The Universities. At Oxford, Trinity remained head of the river for the sixth year in succession, which was a record; the crew was the best since the war. At Cambridge, Jesus lost the headship to Trinity Hall, who were in turn caught by Clare. Easily the best crew were Lady Margaret (St. John's) who started eighth and finished fifth.

Henley Royal Regatta. An almost completely dead stream and a fitting follow wind made possible a spate of record-breaking such as had not been seen since 1934. In the Ladies' Plate Lady Margaret put up a new record of 6 min. 44 sec. Their second eight made a new Thames cup record of 6 min. 51 sec. In the Grand, Leander equalled the record of 6 min. 44 sec. E. W. Parsner and A. Larsen, of Denmark, beat the Olympic winners B. H. T. Bushnell and R. D. Burnell, by one length in 7 min. 27 sec. which was 31 sec. inside the record.

Lansbury R.C. lowered the Wyfold record to 7 min. 24 sec., and Trinity, Oxford, broke the Stewards' record by one second, in 7 min., 13 sec.

Grand Challenge Cup: Leander club beat Thames R.C., 1 length, 6 min. 54 sec.

Ladies' Plate: Lady Margaret beat Pembroke college, Cambridge, 2 lengths, 6 min. 30 sec.

Thames Cup: Princeton university, U.S.A., beat Lady Margaret "B," 1 length, 6 min. 38 sec.

Princess Elizabeth Cup: Winchester college beat Westminster school, 4 lengths, 7 min. 11 sec.

Stewards' Challenge Cup: Trinity college, Oxford, beat London R.C., 3 lengths, 7 min. 13 sec.

Visitors' Challenge Cup: Clare college beat First and Third Trinity, 3 lengths, 7 min., 31 sec.

Wyfold Challenge Cup: Lensbury R.C. beat Royal Chester R.C., 3 lengths, 7 min. 41 sec.

Double Sculls: E. W. Parsner and A. Larsen (Denmark) beat J. B. Brown (Loughborough B.C.) and K. W. Tingeate (Birmingham R.C.), 2¼ lengths, 7 min. 39 sec.

Diamond Sculls: J. B. Kelly (U.S.A.) beat J. Trinsey (U.S.A.) easily, 8 min. 12 sec.

The Wingfield Sculls, amateur sculling championship of the Thames, were won by the holder, P. N. Carpmale (London R.C.), who beat A. D. Rowe by half a length in 22 min. 55 sec. Conditions were very slow.

The European Championships were held on the Bosbaan course at Amsterdam. Results: coxed fours, Italy, 6 min. 57 sec.; coxed pairs, Italy, 7 min. 55 sec.; coxless fours, Italy, 6 min. 45·2 sec.; coxless pairs, Sweden, 7 min. 28·2 sec.; single sculls, U.S.A. (J. B. Kelly), 7 min. 30·8 sec.;
double sculls, Denmark, 6 min. 57-2 sec.; eights, Italy, 6 min. 11 sec. (R. D. B.)

United States. Four major regattas were held and many others of lesser importance. The fourth annual sprint championships of the Eastern Association of Rowing Colleges were held on Lake Onondaga, New York. Harvard won all three events. At Poughkeepsie, New York, in the 47th annual Hudson river classic, 30 crews faced the starter in the three events. The University of California's Golden Bears dethroned the defending champion, the University of Washington, in the varsity race, but the huskies took the junior varsity and freshman events. Yale halted Harvard's victory streak at New London, Connecticut, in the only 4 mi. race held in 1949 in the United States.

In the Eastern Intercollegiate sprint championships, Harvard dominated the field; Massachusetts Institute of Technology was second and Princeton third, followed by Cornell, Navy and Boston university.

The Wright cup regatta for the lightweight championship of the east, held on Lake Carnegie, Princeton, New Jersey, went to Cornell over the defending champion Princeton. The 47th annual Poughkeepsie classic was won by Ky Ebright's undefeated University of California varsity. The seventh annual Dad Vail Rowing association regatta was held at Poughkeepsie for the first time. Boston university crews swept the three races.

Schoolboy rowing showed still further progress. The 15th annual championships were held at Ecorse, Michigan, with an entry of 23 schools from the United States and Canada.

J. B. Kelly, Jr., U.S. single-sculls champion for 1948, did not defend his title, but remained abroad and won all the important European single-sculling championships including the European championship at Amsterdam. (C. L. Br.)

RUANDA AND URUNDI: see BELGIAN COLONIAL EMPIRE; TRUST TERRITORIES.

RUBBER. For British rubber producers, postwar recovery in output was broadly maintained during 1949, but in circumstances of world trade which looked anything but promising at first.

In September, both the Washington financial agreement and the devaluation of the £ came as favourable auguries for the producers' future.

The decline in rubber prices had been fairly steady in New York and London until August. The estates in Malaya, even so, were going ahead with their long-term programmes for replanting with high-yielding rubber and required more capital for this work of reconstruction. But payment of war damage compensation was still held up. In November the colonial secretary announced that payment would probably be arranged by the end of the year, adding that the delay was not in the United Kingdom but in Malaya. Political unrest in the far east was still making life difficult and hazardous for the planters.

The terms of the Washington agreement were published on Sept. 13; they promised a review of the American stockpiling programme. There was to be a relaxation of the government orders requiring American manufacturers to use fixed proportions of home-produced synthetic rubbers. Altogether, there was to be a wider field in the U.S. for the sale of natural rubber.

The devaluation of the £, which followed a few days later, caused an immediate reaction in the rubber markets. Prices rose by about 20% in London and Singapore and on both these markets the rise was maintained. In New York the reaction was more complex. In August the average price there was 16-60 cents a lb. Prices rose as the Washington talks progressed and reached 18-62 cents on Sept. 13; the average for the 21 trading days in the month of September was 17-58 cents, the highest figure since May. But after devaluation, the price fell to 16-88 cents, rose again to 17-25 cents and then fell away until it reached 16 12 cents on Oct. 11.

On Sept. 21, trading in rubber futures on the New York commodity exchange reached a new postwar record for volume, the total transactions for the day being 5,790 tons. The previous peak was 4,900 tons on Dec. 4, 1947. On Oct. 11 the resumption of stock-piling by the U.S. government was announced and caused a widespread buying movement.

Perhaps the most immediate effect of devaluation was that for a time it eliminated the black market in rubber and so gave to producers in the sterling area a better chance to sell their output for dollars. But it had to be borne in mind that the added scope for the sale of natural rubber was open to the whole world and could as easily be taken up by Indonesia, which had shown an increasing ability to compete, as by Malaya.

There could be no doubt that for the greater part of 1949 the state of the American market was the main source of anxiety for rubber producers. Figures published on the eve of the Washington talks showed quite clearly that since April there had been a marked falling off in the exports of natural rubber from Malaya to the U.S. In September, the tonnage exported jumped to 27,184 tons, but this still compared with 32,473 tons exported in Sept. 1948. In October exports reached 24,787, which compared with a 1948 figure of 28,524.

The fall was attributed partly to sharper competition from Indonesia. An order had been issued by the Dutch authorities that 50% of all Indonesian estate exports were to be sold in the U.S., Canada and Japan. Later in the year this order was shelved, when it appeared likely that, following her own devaluation, Indonesia would be able to ship the stipulated quantity without regulation.

In the first half of the year Indonesia exported 52,898 tons to the U.S., compared with a total of 96,814 tons for the whole of 1948. But in July only 5,830 tons went to America. The figure returned to 12,498 tons in August, but dropped again to 4,795 tons in September.

The Washington agreement reduced the mandatory area for synthetics by 35,000 tons for butadiene and styrene (GR-S) and by 15,000 tons for butyl. The superiority of
the latter over natural rubber in certain characteristics had been established; it had, for example, 10 to 11 times the air retention, and it might still be used on its own merits for inner tubes. GR-S was the general purposes synthetic; whether or not its use would be reduced by the full 35,000 tons was still in doubt.

The continued interest of U.S. manufacturers in synthetic rubber, retained even when the price of natural rubber was lower by several cents a pound, caused some bewilderment in London. There was, indeed, a campaign on the manufacturers’ part to convince the American customer that natural rubber was “foreign and inferior.” Rubber is one of the few raw materials that America has to import and the importance of the American market cannot be exaggerated. During the year, planters in the far east urgently pointed out that even a slight fall in the New York price of rubber could mean a great deal to the living standards of far eastern peoples.

At home, much was made of the significance of rubber exports to North America as a means of closing the dollar gap. The fall in the dollar value of rubber taken by the U.S. in the first eight months of the year was put forward as one of the main reasons why this gap was widening. In 1948, crude rubber exports to the U.S. from the sterling area earned about £50 million, or about six times the dollar earnings of British car exports. In the first six months of 1949 the dollar earnings were equivalent to only £17.5 million.

World production and consumption of natural rubber recovered steadily from the depression they suffered in 1945, when Japan occupied the territories of the far east. In 1939 production stood at 1,000,000 tons and consumption at 1,105,000 tons. Output had dropped in 1945 to 250,000 tons and consumption to 262,500 tons. In 1948 production had mounted again to 1,520,000 tons and consumption to 1,420,000 tons, while the estimated output for 1949 was put at 1,575,000 tons, to meet a demand for 1,450,000 tons. Known stocks had fallen in 1948 by 80,000 tons. The French government withheld their figures after Jan. 1949.

World production of synthetic rubber fell from the high level reached in 1944, when the total output was over 900,000 tons, including more than 100,000 tons made in Germany. In 1948 the total was 532,186 tons, of which 488,343 tons were made in the U.S., 40,455 tons in Canada and 3,388 tons in the British zone of Germany.

From Jan.-July 1949, imports of natural rubber into the United Kingdom were 98,317 tons, of which 78,050 tons came from Malaya. In the same period, 1,355 tons of synthetic rubber were imported and consumption of both natural and synthetic was 104,680 tons, to which were added 11,139 tons of reclaimed rubber. (C. F. Dns.)

United States. The estimated consumption of both natural and synthetic rubbers in the United States in 1949 was 977,000 long tons, of which 407,000 were synthetic rubbers. Outside the United States 33,000 long tons of synthetic rubber were consumed. The estimated production of crude rubber for 1949 was 1,455,000 long tons.

The low prices for rubber in the summer of 1949 (average price, May-June, for first quality rubber was 16-1 cents per lb. as against 18-5 to 19-25 cents in April 1949) caused concern in the rubber-producing countries. Reports from Malaya, the source of 46% of 1948 natural rubber, attributed the lower prices to the American synthetic rubber industry and to the minimum consumption of synthetic rubber prescribed there by law.

The United States importation of 728,000 long tons of crude rubber in 1948 represented dollar payments which were more than twice those paid by the United States in 1939. The U.S. consumption per head of new rubber in 1948 was 16-5 lb. while for the rest of the world it was 0-9 lb.

The most important source of synthetic rubber, government-owned factories in the United States, continued to produce large amounts of general purpose rubber, GR-S (butadiene and styrene), at 18-5 cents per lb. to the manufacturer. Provisions pertaining to the production and use of synthetic rubber were imposed under the Rubber act of 1948 which insured the consumption of general-purpose and special-purpose synthetic rubbers in quantities at least equal to the minimums specified as essential in the interests of national security. This regulation operated so as to involve only manufacturers of tyres, tubes and mainly passenger car tyres. Only 50 of the 1,000 manufacturing concerns requiring rubber made tyres, tubes and camel-hack.

These requirements worked out so that 1 lb. of GR-S was consumed for every 3 lb. of total rubber. In September 1 lb. of GR-S was allowed to be used for 4 lb. of GR-S and crude rubber combined. The minimum tonnages required under the law worked out initially at 200,000 long tons a year for GR-S and 21,666 long tons of special-purpose rubbers, 15,000 long tons of which were for inner tube use.

Reclaimed rubber (derived mainly from worn-out tyres and tubes) was a supplement to new rubber. In 1948 the tonnage of reclaimed rubber used in the U.S. was 25% of the total new rubber consumed. This percentage compared with 29% in 1939 and 65% in 1942. Reclaimed rubber was used in the manufacture of most rubber products.

Since 1944 the production of tyre cord and fabrics had increased steadily but with a significant swing toward the use of rayon and nylon.

In the United States, in 1948, 70-6% of natural rubber consumption and 68-2% of synthetic rubber consumption was for transportation uses. Thus all other uses of rubber accounted for about 30% of the total new rubber consumed. The quantities of products manufactured in the United States for 1947 comprised 111,686,368 pneumatic tyre casings, 97,596,708 inner tubes, 97,413,406 lb. of camelfback and repair materials, and 635,762,626 lb. of reclaimed rubber.

**RUGBY FOOTBALL**: see Football.

RUMANIA. A people’s republic of southeastern Europe, bounded on the N. and N.E. by the U.S.S.R., on the E. by the Black sea, and the S. by Bulgaria and on the W. by Yugoslavia and Hungary. Area: (1939) 113,889 sq. mi.; (1947, without Bessarabia, northern Bukovina and southern Dobruja) 91,671 sq. mi. Pop.: (1939 est.) 19,933,800; (Jan. 25, 1948, census) 15,872,624. Languages (1948 census): Rumanian 85.7%; Hungarian 9.4%; German 2.2%; Yiddish 0.9%; others 1.8%. Religions (1947 est.): Greek Orthodox 81%; Greek Catholic 9%; Roman Catholic 7%; others 3%. Chief towns (pop. 1945 est.): Bucharest or București (cap., 1948 census, 1,401,807); Cluj (110,935); Jassy or Iași (108,987); Timișoara (108,296); Ploiești (105,114); Brașov (97,293); Galați (93,329). Chairman of the presidium of the Grand National Assembly, Constantin Parhon; prime minister, Dr. Petre Groza.

History. By a reshuffle of the government on April 15, Ana Pauker (q.v.) and Vasile Luca (q.v.) were made deputy prime ministers. This office was already held by Gheorghe Gheorghiu-Dej (q.v.). These three people, who were also the three leading Communists of Rumania, thus formed an inner cabinet similar to the five deputy prime ministers of Bulgaria (q.v.).

During the year there were no sensational “unmaskings” within the Communist party. The first of the “nationalist deviations’ in east European Communist parties had been “liquidated” in Rumania in 1948, with the expulsion of Lucruțiu Pătrășcanu. Evidently this heresy had been nipped in the bud. Of the devotion of the party leaders to Moscow
there seemed no reasonable doubt. Rumania seemed in fact to be more thoroughly subjected to the U.S.S.R. than any of the other people's democracies. An indication of this was the replacement of the country's name by the initials R.P.R. (Republica Populara Româna). While Hungarian or Bulgarian Communists still spoke of Hungary or Bulgaria, Rumanian Communists extolled the virtues and glories only of R.P.R. The attempt to concentrate patriotism on initials was an importation from the U.S.S.R.

A new trade agreement between Rumania and the Soviet Union, signed on Jan. 24, increased the mutual trade two-and-a-half times above the level of 1948. The sum was announced in Soviet roubles—465 million for 1949. The arbitrary nature of rouble exchange rates made it even more difficult to calculate how much Rumania was giving and receiving under this agreement than was the case when goods were priced in “1938 dollars.” The number of Soviet-Rumanian joint companies was increased by the creation of enterprises for joint exploitation of natural gas (Jan. 1949), metals, coal, building (July 5) and a Soviet-Rumanian insurance company (July 29).

Rumania's system of alliances was completed on Jan. 26, 1949, when a treaty of mutual assistance was signed with Poland. The existing treaty of alliance with Yugoslavia was denounced by the Rumanian government on Oct. 1.

Collectivization of agriculture made some progress. As in Hungary, attention was concentrated on the liquidation of the kulaks. Mass collectivization was not to start until the power of the kulaks in the villages was broken and until adequate supplies of agricultural machinery were available in order to allow the new collective farms to benefit from the advantages of large-scale cultivation. The first process was supposed to take place by political education and by the initiative of the village masses themselves, but in practice was conducted by the party officials with the backing of the police. Even when violence was not used, economic strangulation was likely to be effective. A statement of the central committee of the Communist party, dated March 5, 1949, ordered “differential class taxation” and a “class policy in cereal collection and in the allocation of credits” to destroy the power of the kulaks. On the actual interpretation of the word kulak in the Rumanian villages there was a lack of reliable information. Supplies of machinery were to be provided by the tractor factory set up by the Soviet-Rumanian joint company Sovromtractor and by the extension and improvement of the network of “machine-tractor stations,” based on the similar institution in the U.S.S.R. A central committee directive of Oct. 15 laid down new regulations for the organization of the M.T.S. It stressed the need for control over the stations by the local organs of the Communist party. “Socialist competition” was to be practised between M.T.S. as between factories. The actual number of collective farms set up was still small: only 55 at the end of September. (See also Peasant Movement.)

Official statistics published in October claimed that at the end of the third quarter of 1949 the targets set in the One-Year plan for 1949 had been achieved to the extent of 109%. Among the more successful branches were lead and copper mining and some sections of machinery and chemicals, the least successful—the building industry. A new One-Year plan was drawn up for 1950 and it was announced that in 1951 a Five-Year plan would be introduced. By 1955 yearly output of steel was to be five times that of 1938 and would be 1,250,000 metric tons. Output of coal was to be three times that of 1938, of cast iron eight times; of electric power four times the level of 1944. In 1955 Rumanian industry was to be capable of producing 6,000 tractors yearly and in that year Rumania would have, from various sources, a total of 25,000 tractors. This, it was officially stated, would constitute “a sound basis for socialist agriculture.” This was a change from a communist party statement of March 1949 which declared that Rumania must have 30,000 tractors before large-scale collectivization would be possible. An important construction project announced on May 26 was a Danube-
Black sea canal. This would short-cut the Danube delta, and greatly facilitate trade between central Europe and the U.S.S.R.

From these various statements it could be concluded that the collectivization of Rumanian agriculture would for the time being move slowly but that the pace would be increased during the Five-Year plan period 1951-55. The pace would depend on the urgency of securing food and labour supplies from the countryside, and this in turn would depend on the priority given in Moscow to Rumania's industrialization. This would itself depend on Moscow's view of the international situation.

Political sovietization was carried further by the establishment in October of a State Control commission similar to the organizations of the same name already existing in Yugoslavia and Bulgaria and modelled on the Ministry of State Control of the Soviet Union. (H.S.-W.)

Education. Schools (1949; 1938 in brackets): elementary 19,000 (11,000); secondary, pupils 141,000 (40,000); teachers' colleges, students 89,000 (5,000); universities 44,000 (24,000).

Agriculture. Main crops ('000 metric tons, 1947): maize 5,279; wheat 1,279; oats 180; barley 364; rye 66; potatoes (1948) 1,630; sugar beet (1947) 241; flax (1948) 37; cotton ginned (1948) 3. Livestock ('000 head): sheep (Dec. 1947) 7,000; cattle (Dec. 1946) 3,048; pigs (March 1946) 1,406; horses (Dec. 1947) 939.

Industry. (1947) Industrial establishments 28,295; persons employed 462,305. Fuel and power: coal ('000 metric tons) 162; lignite 2,108; natural gas (million cu. m.) 2,106; electricity (million kwh.) 712; crude oil ('000 metric tons, 1948) 4,500. Raw materials: pig-iron ('000 metric tons) 91; steel 183; gold (kg.) 223; silver (fine troy oz.) 481,200; copper (metric tons) 531; lead 3,495; zinc 2,283. Manufactured goods: refined petroleum products ('000 metric tons) 3,450; cotton yarn 11,300; cotton fabrics 3,200; sawn timber ('000 cu. m.) 1,359; cement ('000 metric tons) 415.

Bibliography. R. Bishop, Russia Astride the Balkans (London, 1949); R. H. Markham, Rumania Under the Soviet Yoke (Boston, 1949).

RUSSELL, BERTRAND ARTHUR WILLIAM RUSSELL, 3rd Earl, British philosopher and mathematician (b. Trelleck, May 18, 1872). (For his early career see Encyclopaedia Britannica.)

He returned to England from the United States in 1944 and accepted a fellowship at Trinity college, Cambridge. He became a member of the B.B.C. brains trust, and in 1946 A History of Western Philosophy was published, on the writing of which he had been engaged for many years. On Oct. 4, 1948, the Norwegian flying-boat in which he was travelling to lecture to students of Trondheim university on "Ideologies and Common-Sense" crashed and sank off the Norwegian coast. He was rescued after swimming in the cold northern waters for some time. At the end of 1948 and the beginning of 1949 he broadcast the first of the series of Reith memorial lectures which had been initiated by the B.B.C. His subject for the six lectures which were broadcast on the third programme was "Authority and the Individual." On March 25, 1949, he received the degree of doctor honoris causa from the University of Aix-Marseilles, France. In Sept. 1949 he lectured in Paris on the occasion of the meeting of the general conference of U.N.E.S.C.O. He was awarded the Order of Merit in the birthday honours, June 1949.

RUSSELL, SIR EDWARD JOHN, British agricultural scientist (b. Frampton, Gloucestershire, Oct. 31, 1872), was educated at the University College of Wales and at Victoria university, Manchester. He was a lecturer and demonstrator in chemistry at Manchester, 1898-1901, and head of the chemical department at the agricultural college, Wye, 1901-7, when he went to the Rothamsted experimental station where he remained until his retirement in 1943. He was its director from 1912 and from 1928 to 1943 was also director of the Imperial Bureau of Soil Science. During World War II he was adviser to the Soviet relations division of the Ministry of Information and from 1941 to 1945 chairman of the agricultural sub-committee of U.N.R.R.A. On Jan. 7, 1949, Sir John was installed as the 111th president of the British Association for the Advancement of Science in succession to Sir Henry Tizard. He had previously been president of the agricultural section of the association in 1916, 1924 and 1931. His presidential address to the annual meeting of the association at Newcastle-on-Tyne on Aug. 31, 1949, was entitled "World population and world food supplies"; and on the same day he was given the honorary degree of doctor of science by the University of Durham. His many books include Soil Conditions and Plant Growth (1919; 8th ed., 1949), A Student's Book on Soil and Manures (1915; 4th ed., 1949), The Farm and the Nation (1933) and English Farming (1942). He was knighted in 1922.

Sir John Russell, president of the British Association for the Advancement of Science for 1949, receiving the honorary degree of doctor of science from Sir James Duff, pro-vice-chancellor of Durham university, Aug. 31, 1949.

RUSSIA: see UNION OF SOVIET SOCIALIST REPUBLICS.

RUSSIAN LITERATURE. The year 1949 would be remembered in Soviet Russian literature, not so much for any positive achievements, as for the violent, almost daily attacks in the press on literary, dramatic, music and film critics for their "formalism" and "homeless cosmopolitanism." This campaign of vituperation represented a further stage in the general "anti-western" movement inaugurated with the notorious Zhdanov purges in 1946. Several hundred critics, including many prominent and regular contributors to the Soviet press, were involved, the attackers frequently...
being attacked in turn and accused of the same sins which they had imputed to the others. A peculiar feature of this campaign was its latent anti-Semitic flavour. The word "Jew" was not used outright, but the context in which the expression "homeless cosmopolitans" appeared was more than suggestive. Many of the attacked happened to be Jews using Russian pseudonyms and these latter were systematically and maliciously disclosed. In two cases the anti-Semitic bias could easily be read into the attack. One was when a certain Serghey Ivanov, in Oktiabr, charged the well known literary historian Leonid Grossman with having discussed the influence of the Bible and of "Jewish folklore" on Lermontov. The other, an article in Druzba Narodov by Kornely Zelinsky (himself previously attacked for his earlier "formalist" writings) about the late Mikhail Gershenson as a student of Pushkin and of Russian literary history in general: Gershenson was spoken of as "a homeless cosmopolitan" and "a parasite sucking on Russian literature." There were also specific attacks on Jewish cultural organizations, on the Jewish theatres in Byelorussia and Ukraine, on the editors of the Jewish Encyclopedia, etc. A violent anti-western bias characterized also the nationalistic celebrations of the 150th anniversary of Pushkin's birth, just as the year before it had marked the commemoration of the centenary of Belinsky's death. The exposure of "Anglo-American imperialists" was the keynote of many a new play and story. Others sounded an ultra-patriotic note, glorifying everything Russian.

Of the works by established Soviet authors the following must be mentioned: the first part of Fyodor Gladkov's autobiographical Detstvo (Childhood), a colourful realistic picture of pre-revolutionary life in a Russian village; Valentin Kataev's novel Za vlast' Sovetov (For the Power of the Soviets), dealing with wartime exploits and experiences of some characters in one of his best earlier novels, The Lone White Sail; and Vennamin Kaverin's novel Oktyabiya kniga (The Open Book), giving the life story of a Soviet woman doctor. Vera Panova, who in 1947 attracted attention with her short novel Spaitniki (The Travelling Companions; in English translation, The Train) and in 1948 followed up with Kruzhilika, wrote a new novel, Yansy berg (The Clear Shore), about a collective farm. There were no notable newcomers to literature.

Among émigré writers the outstanding event was the death in Rome, in July, of Vyacheslav Ivanov, the last survivor of Russian Symbolism, once its main theoretician and a poet whose greatness time would undoubtedly confirm; born in 1866, Ivanov left the Soviet Union in 1924 and became a Roman Catholic. Alexey Remizov published in Paris his first book in Russian since 1931, Plyashushchy demon (The Dancing Demon). Its nature defies exact description—it is a typical Remizov whimsey, part autobiographical, part fantastic and dreamlike. Its best section consists of fictitious memoirs of an old Russian scribe whose soul migrates from one historical or semi-historical character into another. Of the younger writers, Nina Berberova published in Paris a book of six long stories, Obilegchenie uchasti (Allocation of the Lot), with life in exile for their setting. The historian of Russian literature in exile found much interesting material, especially in the memoir genre, in the three Russian journals appearing outside Russia: Novy Zhurnal (New York), Vorozhdzenie (Paris) and Granit (U.S. zone of Germany). The last named drew for contributions mainly upon displaced persons and former Soviet citizens now in Europe and was of special interest to students of contemporary Russia. (G. St.)

**RYE:** see Grain Crops.

**SAAR.** A German state (Land) united with France by monetary (from Nov. 20, 1947) and customs (from April 1, 1948) union. Area: 734 sq. mi. Pop. (1947 est.): 848,052.

**SAAR—SADAK**

---

**Language:** German. Religions: Roman Catholic 75%, Protestant 24%. Capital: Saarbrücken (pop. 1939 est.): 135,000; (June 1947 est. 97,752). High commissioner, Gilbert Grandval; prime minister (from Dec. 20, 1947), Johannes Hoffmann.

**History.** The Saar was not represented in the parliamentary council which was preparing at Bonn a new German constitution and was not one of the Länder of the German federal republic. According to its 1947 constitution, the Saar was politically independent of Germany and its defence and foreign policy were governed by France. In July 1949, therefore, Robert Schuman, the French minister of foreign affairs, asked all the countries who had signed the statute of the Council of Europe for the admission of the Saar as an associate member. On Nov. 4 he laid before the committee of ministers of the Council of Europe an application by the Saar government for associate membership. Dr. Konrad Adenauer, German federal chancellor, questioned the wisdom of the French policy of asking for the admission of the Saar as a condition of France's acceptance of Germany, but commented that it would be equally unwise for Germany to refuse to join the Council of Europe if the Saar were admitted as an independent member. On Nov. 9 the standing committee of the consultative assembly agreed to the entry of the Saar.

**Economy.** Production in thousand metric tons.

**SADAK, NECMETTIN,** Turkish statesman (b. Isparta, Turkey, 1890), was educated at the Galata Saray lycée in Istanbul and the University of Lyons, France. He returned to Turkey in 1914. His first assignment was with the ministry of public education. He also taught at the University of Istanbul, first as associate, then as professor of sociology. Owner and editor of one of Turkey's evening newspapers, Aksam (Istanbul), he was rated as one of Turkey's foremost editorial writers. He was elected deputy for Sivas in 1931 and was afterwards constantly re-elected. He was appointed foreign minister on Sept. 9, 1947, in the first cabinet of Hasan Saka, and retained this post in the second Saka cabinet as well as in the government formed on Jan. 16, 1949, by Şemsettin Gülnaltay (q.v.). When in July 1948 the U.S. state department started diplomatic negotiations which led
to the signature of the North Atlantic treaty, he suggested that a Mediterranean pact was also advisable. He represented his country at all the major international conferences and in Aug. 1949, at Strasbourg, attended the meeting of the Council of Europe to which Turkey was admitted.

SAED MARAGHEH, MOHAMMAD, Persian diplomat and statesman (b. Maragheh, N.W. Persia, 1882), was educated in Persia and entered the Persian diplomatic service at the age of 22. Between 1917-25 he was the Persian consul general to the republic of Azerbaijan. With one break for two years (1931-33) when he was governor of Persian Azerbaijan, he occupied many posts in the Persian diplomatic service. In 1933-34 he was director of the eastern department of the Foreign Ministry; 1934-36 minister in Moscow; 1936-38 minister in Rome and 1938-42 ambassador in Moscow. In 1942 he was appointed minister of foreign affairs which post he held for one year. In 1944 he became prime minister. During his premiership he had to deal with strong Soviet pressure on Persia to obtain oil concessions in the northern provinces. With the Soviet army occupying the northern pander of the country the Soviet government brought every kind of pressure on the Persian government to yield. Saed steadfastly refused to grant oil concessions to the Russians. Subsequently he had to retire from the political scene. He was elected deputy for Rezaieh (N.W. Persia) in 1946. On Nov. 9, 1948, he was again appointed prime minister. In 1949 he was instrumental in carrying the Shah's constitutional reforms through the Majlis (see Persia).

ST. CHRISTOPHER: see Windward Islands.

ST. CROIX: see United States Territories and Possessions.

SAINT HELENA. British colony in the south Atlantic consisting of the island of that name and the two island dependencies of Ascension and Tristan da Cunha. Respective areas: 47, 34, and 13.5 sq. mi. Population (1946 census): 12,682, 292 and 230. Governor, Sir George Joy. The colony's resources being inadequate to provide work for its inhabitants, 100 farm workers sailed for the United Kingdom under a new government scheme for employment overseas. The fourth advisory council was constituted and appointed by the governor in June. Finance. Budget (1947 est.): revenue £83,628 (including £49,170 from grants), expenditure £96,278. (J. A. Hu.)

ST. JOHN: see United States Territories and Possessions

ST. KITTS-NEVIS: see Leeward Islands.

ST. LAURENT, LOUIS STEPHEN, Canadian statesman (b. Compton, Quebec, Feb. 1, 1882), was elected leader of the Liberal party in Aug. 1948 and succeeded W. L. Mackenzie King as prime minister on Nov. 15, 1948. (For his early career see Britannica Book of the Year 1949.)

In Feb. 1949 Louis St. Laurent visited President Harry S. Truman in Washington "to maintain friendly relationship between the two nations." He took part in the celebrations which were held on April 1, 1949, to mark the admission of Newfoundland into the Canadian confederation. Before the general election on June 27, he undertook an extensive speaking tour, and thus was prevented from attending the Commonwealth prime ministers' conference in London in April. The elections resulted in an outstanding victory for the Liberal party, which increased its representation in the House of Commons from 125 seats to 192. In March he was elected an honorary master of the bench of the Inner Temple in London and during the year received honorary degrees from McGill university, Montreal, and the Rensselaer polytechnic institute, Troy, New York.

ST. THOMAS: see United States Territories and Possessions.

ST. VINCENT: see Windward Islands.

SALAZAR, ANTONIO DE OLIVEIRA, Portuguese statesman (b. Santa Comba Dao, Coimbra, April 28, 1889), minister of finance from April 27, 1928, and prime minister from July 5, 1932. (For his early career see Britannica Book of the Year 1949.)

In a speech at Oporto, on Jan. 7, 1949, Dr. Salazar described himself as a free man since he owned no property worth mentioning and because he did not flatter either individuals or the masses. He had done enough, he said, to prove that his mission had not been a failure. On July 25, speaking in the National Assembly convened for the ratification of the North Atlantic treaty, he said that if the glory belonged to some, the victory of 1945 had in effect fallen to others. The U.S.S.R. could if it were so disposed, hurl its armies in a single thrust to the English channel and the Pyrenees. He made a strong plea for the inclusion of Spain in the treaty.

SALVADOR, EL. A republic on the west coast of Central America, the only one without a Caribbean littoral, and the smallest, but most densely populated country on the isthmus. Area: 13,176 sq. mi. Pop. (mid-1948 est.): 2,100,000. Aboriginal and mixed races, ladinos and mestizos, constitute the bulk of the population. Chief towns (pop. 1944 est.): San Salvador (cap., 110,435); Santa Ana (47,631); Nueva San Salvador, formerly Santa Tecla (24,239). Language: Spanish. Religion: Roman Catholic. The government during 1949 was under the direction of a temporary junta.

History. The revolutionary junta which replaced President Salvador Castañeda Castro in Dec. 1948 maintained control over the country throughout 1949. However, preparations were made for drawing up a new constitution and returning to a democratic order. The resignation of Lieut. Colonel Manuel J. Córdova, announced on Jan. 5, as head of the five-man governing board left the chief direction of public affairs to Major Oscar Osorio. In October, however, Osorio and Rénaldo Galindo Pohl both left the junta to campaign for the election of their partisans to an assembly empowered to draw up a new constitution. Major Oscar Bolaños and Dr. Humberto Costa remained in the governing body. Two decrees of a strong nationalist character were passed during the year: one outlawing all political parties with foreign financial support or with religious affiliations, and the other prohibiting commercial and industrial firms in the country from employing less than 90% national personnel. El Salvador's favourable economic status was further bolstered in November by an increase of more than 65% in the value of its coffee on the world market. A new suspension bridge over the Rio Paz boundary, jointly financed by Guatemala and El Salvador, was completed on July 14. One government decree establishing a universal social insurance programme for employees in the country and another formulating a settlement procedure for individual labour-management disputes went into effect on Oct. 12.

Education. Schools (1945), primary 1,519, teachers 3,701, pupils about 100,000; secondary 50, pupils 6,982; national university, students 835. National appropriations for education in 1947 amounted to 2.9 million colones.
SAVATION ARMY—SCANDINAVIAN LITERATURE

Foreign Trade. Exports in 1948 totalled 45.6 million colones, including gold, silver and specie (40.1 million in 1947); imports, 41.5 million colones (36.9 million in 1947). The United States took 77% of the exports and furnished 73% of the imports. Coffee (861,874 bags of 157 lb each, valued at 38.2 million colones) was the chief export commodity. The 1948-49 coffee crop established a new national record of 1,190,920 bags.

Communications. In 1948 there were two major railways with 377 mi. of main lines; 700 mi. of surfaced highways and 1,250 mi. of all-weather dirt roads, over 4,000 telephones and about 14,500 wireless stations.

Finance. The monetary unit is the colon, valued at 40 U. S. cents. The 1949 budget called for expenditures of 62 million colones. Currency circulation (Nov. 1949) 37.3 million colones. As at Aug. 31, 1949, the reserve bank had 1.43 million in gold and foreign holdings amounted to 34.8 million colones (28 million on the same date of 1948). The foreign debt at the end of 1945 was 18.3 million colones.

(M. L. M.)

SAVATION ARMY. The year 1949 was crowded with customary Salvation Army activity, outstanding among which was a series of over 100 meetings conducted by General and Mrs. Orsborn in a 65 days’ campaign in India, Pakistan and Ceylon. Besides receptions, press conferences and broadcasts, the general was personally received by the prime ministers of India and Ceylon, and only the absence of H. M. Ali Khan on state business prevented a similar meeting in Pakistan. Despite the changes in Commonwealth relationships the three governments concerned made it clear that the Army was to receive every facility for its ameliorative work.

A conference of leading officers from all five continents was held in June at Sunbury Court near London to consider the work of the army in relation to world conditions. In a detailed development plan £250,000 was scheduled to be raised by 1954 for advances in what are popularly known as missionary countries both in the east and west. In Europe additional efforts were made to take the gospel of Christ to the people. Intensive campaigns were undertaken in Scandinavia, Holland and France. A brave witness was maintained in Czechoslovakia and encouraging progress was made in Germany where a number of new halls, the gift of Sweden and the U.S.A., were dedicated for public use.

Among the latest publications was Maiden Tribute by Madge Unsworth with a foreword by Lady Allen of Hurtwood (London, 1949)—a study of the Army’s social work for women during 60 years. Its title was taken from W. T. Stead’s The Maiden Tribute of Modern Babylon and it coincided with his centenary. A notable continental production was Conquêtes en terre de bagne by Charles Pén (Paris, 1948), a record of the awakening of public opinion in France to the need for penal reform in Guiana, of the suppression of the bagne and the final repatriation of prisoners—a work undertaken by the Army in 1946. Charles Pén, now second in command of the work in France, was made a knight of the Legion of Honour in recognition of his services. Other noteworthy books were Anzac Padre by Adelaide Ab Kow (London, 1949), All the Days by Alfred J. Gilliard (London, 1949), and The First Salvationist, a collection of sketches of pioneer Salvation Army leaders, by Frederick Coutts (London, 1948). (F. L. C.)

United States. In the United States, Commissioner Ernest J. Pugmire was the national commander, with headquarters in New York city.

The magnitude of the work done by the Salvation Army was indicated by statistics of its activities. In the United States during 1949 in line with its programme of carrying religion to people, the Salvation Army held 93,439 meetings on street corners. In its social services programme, 20,525 patients were treated in 6 clinics and dispensaries; 1,845 missing persons were located; 34 maternity homes and hospitals for unwed mothers cared for 2,285 women and children; 6,484 mothers and children were sent to summer camps.

In the field of prison work, 10,798 prisoners were assisted on discharge and given employment; 1,879 prisoners were paroled in care of the Salvation Army, whose officers devoted 17,012 hours to prison visitation. At its 70th annual convention, the American Prison association elected for the first time a Salvation Army officer, Envoy J. Stanley Shepard, as president for 1950.

(E. I. P.)

SAMOA, AMERICAN: see United States Territories and Possessions.

SAMOA, WESTERN: see New Zealand, Dominion of; Trust Territories.

SAN MARINO. A small republic in central Italy, entirely surrounded by the province of Emilia and situated on the slopes of Monte Titanio, 14 mi. S.W. of Rimini. Area: 38 sq. mi. Pop. (July 1, 1949, est.): 12,418. Language: Italian. Religion: Roman Catholic. San Marino is governed by two capitani reggenti appointed every six months by a Grand Council of 60 members elected by universal suffrage every four years.

History. Elections held on Feb. 27, 1949, resulted in a clear victory for the existing Socialist-Communist Committee of Freedom which won 2,815 votes as against 2,010 by the Christian Democratic alliance. In the Grand Council the government had 35 seats and the opposition 25, against 40 and 20 respectively before the elections. Relations between San Marino and Italy were somewhat strained and the Italian government suspended arrangements to pay several hundred million lire arrears under a 1939 treaty regulating the financial relations of the two countries. As the finances of San Marino were in a poor state—the deficit of the 1949-50 budget being estimated at L.220 million—the government, controlled by the Communist leader Gildo Gasperoni, decided in July to open a gambling casino as a tourist attraction.

Finance. Budget 1948-49 was allegedly balanced at L.420 million and that of 1949-50 at L.492 million. San Marino uses the Italian currency.

SCANDINAVIAN LITERATURE. Sweden, even more than Norway and Denmark, gave the appearance of being the most advanced literary country in Europe, thanks mainly to the publishers: they were willing to risk money in publishing "uncommercial" books to encourage young writers who were experimenting to find a new literature which could take its place side by side with the old. Among new authors in 1949 was Arne Sand, who won the Strindberg prize with a novel, Förföljaren, and Per Olaf Ekström, who published his second book, Sommardansen. An excellent book of short stories was Sälla faktsmark, by Lars Goransson, and the most outstanding new poet was Lars Forssell, with Ryttaren. The established authors were well represented. A rare event, eagerly awaited by connoisseurs, was the appearance of another book by Tage Aurell, Nya berättelser. A special edition of short stories by Bo Bergman was brought out in honour of his 80th birthday; Vilhelm Moberg's novel Utvandrarna was the first of a series dealing with Swedish emigration to America; Olle Hedberg's yearly novel, Mera vild än tam, was a continuation of Dan för dan; Eyvind Johnson dealt with mediaeval France in Drömman om roso och eld; admirers of Moa Martinson were
treated to Livets fest; Yngve Kernell wrote a graceful story about Goteborg at the time of Napoleon, Det började med lek; Berit Spong stirred up a hornet's nest with Spjövinkel, a novel about an actual academic dispute in a country town; and Björn-Erik Hoyer wrote an exciting novel set in the north of Sweden, Trettio silverpenger. Folke Fridell's new novel, Bekännelse, also had a country setting. Lars Ahlin wrote a study in feminine psychology, Huset har ingen fili, and Stig Dagerman, as with his previous novel Brant barn, turned his piercing searchlight of psychological analysis on to the human mind in Bröllöpsbevär. Another gifted novelist, Peder Sjögren, justified his earlier reputation with Mannen som forsökte smita.

Sweden lost a gifted poet with the death of Vilhelm Eklund on Sept. 3, and both Axel Munthe (see OBITUARIES) and Eln Wägner also died in 1949. The most important volumes of poems were Karl Vennberg's Fiskefjord, Werner Aspenstrom's Snölegend, and Artur Lundkvist's Förgre i vattnet. Stina Aronson, who had previously made a name for herself with her novels dealing with life north of the Arctic circle, published a collection of poems, Kantele. Among non-fiction must be mentioned Elsa Bjorkman-Goldschmidt's brilliant account of Vienna after World War II, Vien vacker, and Jens Wilhelmsen's book of travels, Skarvar från fyra världsdalar, which was written with the author's usual warm interest in nature and human nature. Another book of great charm was Sigfrid Siwertz' memoirs, Att vara ung, and of interest was Fredrik Book's account of the poetess Victoria Benedictssön's love for George Brandes, taken from the former's diary.

Norway. The whole world joined with Norway in mourning the death of Sigrid Undset (see OBITUARIES), whose excellent biography by A. H. Winsnes was published later in the year with the sub-title, A study in Christian realism. Tarjei Vesaas showed his usual deep understanding of human nature in his novel Det store spelet, and a book of poems, Lykka for ferdevæven. Ingeborg Relfing Hagen continued the previous year's autobiographical novel with Jeg vil lete og banke; Andreas Markussen dealt with the north of Norway in the 17th century in Gjennom brenning; Sigurd Eivensmo with adolescent love in Faggemusene. Arne Vaagen's novel in 1949 was St. Albans klokker, and Nils Johan Rud's, Vi var jordens elskere. Gabriel Scott wrote a gay and satirical comedy, Pakkelen, and published poems included For brevet lukkes, by Astrid Tollefsen, Til minne om døg, by Carl Keilhau, and Sann vil du ha meg, by Inger Hagerup.

Knut Hamsun, considered at the outbreak of World War II as one of Norway's greatest writers, wrote an account called På gjenrodde stier of what happened to him after Norway's liberation and his trial as a pro-nazi; Harry Fett, the well-known art-historian and editor of Kunst og Kultur, wrote his reminiscences, På kulturvernets veier, an edition appeared of the letters of the famous artist Edvard Munch; and also of interest to lovers of art was H. Stenstadvold's Norske malerier gjennom hundre år. An exciting travel book was Kon-Tiki Eksplisjonen, by T. Heyerdahl.

Denmark. Among the outstanding novels of 1949 were En børnetlok vokser op, by Harry Soiberg; Hansen, an excellent study of a lonely school-teacher, by J. Anker Larsen; Den sorte gyde, by William Heinesen, set in the Faeroe Islands; Glasbåden, by Karen Enevold; Lykkens tempel, by Kelvin Lindemann, a satirical fantasy about the mistake made by the 18th century poet Johannes Ewald in coming to life in "the modern bureaucratic age"; another admirable novel by Aage Dons, Og alt blev Drøm. H. C. Branner showed a new aspect of his literary skill in Rytteren, and Hilmar Wulf completed his trilogy with Forjættelsens Dag.

A loss to Danish poetry was the death on Aug. 30 of Kaj Hoffman. Niels Kaas Johansen edited an excellent anthology of modern poets, from Gustaf Munch-Petersen to Ole Sarvig and Jørgen Nash, called Ung dansk lyrik; an outstanding collection of poems by Jens August Schade, called Jords største lykke, was illustrated by Inga Lyngbye; Grete Bendix published new poems called Alter kald. and Harald Herdal, in addition to publishing an edition of poems written between 1929 and 1949, produced a novel, Ukuelige menneske. The promising young poet Otto Asmus Thomsen brought out Stormen.

General literature included a biography of the great Swedish mystic, Emanuel Swedenborg, by Signe Loksvig, who had previously written a biography of Hans Andersen; and memoirs by Karin Michaels, Vidunderlige Verden og Farlige Føljen, and the actress Clara Pontoppidan, Eet Liv-vønse Liv. The periodical Heretics continued to flourish; but two others, Samleren og Bogreven, were not so fortunate and took farewell of their readers with Den danske muse, an artistically produced survey of Danish culture during the last 100 years.

Iceland. Iceland's greatest living writer, Hallóður Kiljan Laxness, wrote a modern heroic saga which appeared in Sweden under the title Fria min. He was previously known there through earlier translations, Salka Valka and Island klokk. Three writers whose work was published in Denmark during 1949 were Guðmundur Danielsson (a novel, Jorden er man), Frøðjón Stefansson and Thorsteinn Stefansson (short stories, Mens Nordlyset danse).

Finland. Two Finnish writers whose work appeared in a Swedish translation were Mika Waltari (a historical novel, Mikael Ludenfot) and Yrjo Kokko (a novel about the Lapps, De fyra vindarnas vag). Finland-Swedish authors included Rita von Willebrand (a novel, Så var med dem) and Walentin Chorell (a novel, Blindtrappan). Two interesting first books by Finland-Swedish women writers were Stoft är man skönhet by Mary Mandelin (short stories), and Fägelvinge ur dunklet by Heli Parland (poems) A brilliant Swedish translation by Ämmer Diktonius appeared of the famous novel by Aleksis Kivi, Seisrumen veljesta. Among the most noteworthy novels by Finnish writers were: Änya, by Kersti Bergrot; Jauhot, by Pentti Haanpaa; Odotat varat, by Onni Halla; Tuohotaja, by Helvi Hamalainen; Virvatulia, by Ainio Kallas; Kellonoisittaja, by Kyllikki Mäntyla; and Lepakko, by Oiva Paloheimo.

(A. BLR.)

SCHUMAN, ROBERT, French statesman (b. Luxembourg, June 29, 1886), from Sept. 11, 1948, minister of foreign affairs. (For his early career see Britannica Book of the Year 1949).

On April 4, 1949, in Washington, he signed the North Atlantic treaty for France; referring to France's existing treaty of mutual aid with the U.S.S.R., he said that there was no contradiction between the two. He also took part with Dean Acheson and Ernest Bevin in discussions on Western Germany summarized in a communiqué published in Washington on April 8. On July 13, at Luxembourg, the honorary citizenship of the city was conferred upon him. In the French National Assembly on July 25, in the debate on the ratification of the North Atlantic treaty, he declared that it had been forced upon France by the eastern bloc which came into existence even before the signature of the Brussels treaty. "The cold war could not be suffered passively," he said. In August Schuman was present at the opening of the first session of the Council of Europe at Strasbourg. He attended the first session of the North Atlantic council in Washington, on Sept. 17, and on Sept. 23 addressed the 4th session of the U.N. general assembly at Flushing Meadow, New York. On Oct. 1-3 he visited Ottawa, Quebec, Montreal and Toronto. On Oct. 28 he was re-appointed minister of foreign affairs in the Georges Bidault cabinet. Speaking on Nov. 13 at Montigny, Lointet, he
said: "Geography makes it necessary for us to build a
Europe with Germany. We must give Germany her place in
Europe, but nothing more than her place." The next day, at
a press conference in Paris, he added that there was no question
either of German rearmament or of German admission
to the North Atlantic treaty.

SCHWEITZER, ALBERT, German-speaking theo-
logian, philosopher, musician and physician (b. Kaysersburg,
Alsace, Jan., 14, 1875), educated at the University of Stras-
bourg, where he passed his first theological examination
(1897); he also studied at the Sorbonne, Paris, and at Berlin
university (Ph.D. in 1899). During the next few years, while
writing the first of his books on the teachings of Christ, he
also continued his career as a musician (he had begun to
study the piano at the age of five and went on giving organ
recitals for many years). He also began the study of medicine,
with a view to becoming a medical missionary, and received
his M.D. degree in 1913. In the same year he embarked with
his wife (Helene Marianne Bresslau whom he married in
1912) for Lambarène, Gabon, French Equatorial Africa,
where the couple treated 2,000 native patients before they
were interned as enemy aliens during World War I. They
were released in 1918, after spending much time in internment
camps in France. Dr. Schweitzer resumed his studies of
tropical diseases, while completing a book on the philosophy
of civilization. Until 1939 he spent intermittent periods at
his African mission post between his European tours, on one
of which he gave at Frankfurt, in 1932, the Goethe centenary
address (he received the Goethe prize in 1928). Upon the
outbreak of World War II his African hospital was isolated
by the struggle between the Vichy and the Free French
forces: and for three years his hospital survived thanks only
to food and drug reserves he had provided before the war.
On Aug. 28, 1949, he was present at the bicentennial cele-
brations in Frankfurt of Goethe's birth and received a great
ovation. He spent his 75th birthday at his African hospital.

SCOTLAND. Part of the United Kingdom. Area:
30,400 sq. mi. (including inland water 557 sq. mi.). Pop.:
(June 30, 1949, est.): 5,175,000.

Historically, Scotland made important endeavours in 1949 to
expand her export trade and also concentrated a considerable
amount of energy on research of all kinds. The secretary of
state for Scotland, Arthur Woodburn, held regular meetings
of his Economic conference in Edinburgh and matters con-
cerning industry, commerce, agriculture, forestry were
discussed. The two latter subjects bringing special attention
to the Highlands and Islands and their economic position,
which was also investigated further by the Advisory Panel
on the Highlands and Islands set up in 1947.

The two most important features in Scotland's economic
life were first, the Scottish Industries exhibition, sponsored
by the Scottish council (Development and Industry) and held
in Glasgow in September at the same time as Edinburgh was
engrossed in the International Festival of Music and Drama;
second, the trade expansion tour by the chairman (Sir Steven
Bilsland) and several members of the Scottish council.

The Queen opened the exhibition, which had five main
objectives: to increase exports; to promote inter-trading
between Scottish firms; to stimulate productivity by showing
workers the final results of their efforts; to increase apprecia-
tion of good quality workmanship and design; and to publi-
cize Scotland and Scottish products throughout the world.
Over 30,000 buyers from practically every country in the
world visited the exhibition and the orders made known to
the council totalled over £10 million, at least half of which
came from overseas, including the dollar countries. Atten-
dance at the exhibition ran to over half-a-million people.

The trade mission visited the United States and also
Canada and made many contacts useful to Scotland in its
export drive. Industrial concerns in America were to investi-
gate the opening of factories in Scotland.

In research the greatest interest was focused on the develop-
ment of the gas turbine engine for industrial purposes and
in experiments on the use of peat as the driving fuel. The
work was still proceeding at the end of the year. At the new
town of East Kilbride, in Lanarkshire, some work was
started on the government's research stations for mechanical
engineering, roads, fuel and building. Other aspects of
research which went ahead dealt with fisheries, seaweed
and the jute and woollen industries.

Town and country planning received much attention
through the publication of reports giving long term plans
for the Clyde valley, central Scotland, the Tay valley and
Edinburgh city.

The weather throughout the year was exceptionally
favourable to agriculture, the summer especially being dry
and sunny so that the grain and potato harvests were secured
in well-nigh perfect condition. While the work of repairing
the damage done in the very serious floods of Aug. 1948 was
practically completed, a set-back in the form of further
flooding occurred in some parts of the country which had
suffered a year earlier.

Afforestation made rapid strides and the Forestry com-
misson by 1949 employed over 4,000 workers. Almost 50,000 ac.,
of which approximately half were plantable, were acquired.
The total acreage planted was 20,000 as compared with
16,000 ac. in the previous year. The first houses in the first
forestry village in Britain came into occupation in the autumn
at the new village of Ae, Dumfriesshire.

Progress in housing generally was maintained and the
building trade available for housing was fully occupied
although there were some difficulties in the supply of building
materials. The 1948 figure of permanent houses completed
was substantially exceeded. Special programmes of houses
for miners and agricultural workers were carried forward,
and 1,000 Swedish timber houses imported into the Highlands and Islands.

Attention was focused on the Highlands and Islands by various departments dealing with afforestation, agriculture, hydro-electricity and tourism, and this brought to the outlying districts a more hopeful outlook. At the end of the year the large hydro-electric power schemes at Loch Sloy near Loch Lomond, and at Clunie, on the Tummel, Perthshire, were approaching completion. The installation of plant began at three others of the bigger projects in course of construction and distribution of electricity increased so that the North of Scotland Hydro-electric board were supplying power to 800,000 people, and new consumers were being added at the rate of 1,500 a month. On their own account, and in collaboration with the Scottish Home Department and Scottish industry, the board were carrying through various lines of research, into the generation of electricity by wind power at isolated points on islands off the coast; into trout propagation and protection; and into the commercial value of peat as a fuel. Several large schemes of the board were to start at later dates as a result of the government decision to ration capital expenditure.

The large volume of social legislation passed in 1948 began to take effect on a wide scale. Extensive use was made of the National Health service. Local authorities took steps under the Children act to acquire premises for children’s homes and to appoint committees and children’s officers charged with the welfare of young people deprived of a normal home life.

The exchange of teachers, students and pupils between Scotland and other countries overseas expanded to a marked degree; and at home the schemes for further education increased the numbers of students attending evening classes and technical and commercial colleges. More young workers were released voluntarily by employers to attend day classes, and training courses for leaders attracted students from overseas.

Many thousands of visitors toured Scotland and, to encourage more to come, direct sailings between America and the Clyde were arranged. Once again the Edinburgh International Festival of Music and Drama stood out as the greatest attraction in bringing visitors to Scotland and it was now firmly established as one of the annual outstanding cultural events of Europe—indeed, throughout the world.

(D. M.E.)

SCOTT, GUTHRIE MICHAEL, Church of England clergyman, (b. Lowfield Heath, Sussex, July 30, 1907) was educated at King’s college, Taunton. At 19 he went to South Africa to work in a mission to lepers. He began his training for Holy Orders at St. Paul’s Theological college, Grahamstown, Cape of Good Hope, in 1927, completed it in England at Chichester Theological college and was ordained in 1932. After periods in Sussex and London as a curate, Scott went to India in 1935 as chaplain to the Bishop of Bombay and then became senior chaplain to St. Paul’s cathedral, Calcutta (1937-38). During World War II he served in the R.A.F. in England as air crew, but was invalided out and in 1943 returned to South Africa where he was appointed to assist at St. Alban’s coloured mission and to be chaplain to a coloured orphanage in Sophiatown, Johannesburg. During riots in Durban in 1946, Scott, who had been sent there to observe, was so impressed by the cause of the Indian “ passive resisters ” that he joined their ranks; this led to his being sentenced to three months’ imprisonment (July 1946). On his release he resigned his parochial work and was granted a general licence to preach in the diocese. Asked to assist in organizing Tobruk shanty town,
JOHANNESBURG, he took up quarters there and was charged with living in a Native area, receiving a suspended sentence. Reports of the treatment of native labour in the Transvaal and individual appeals reached Scott who went to investigate. The conditions he found made him champion the native cause, especially that of the Herero tribe of South-West Africa. In 1949, despite many obstacles, he attended the U.N. general assembly and presented the Herero case to its Trusteeship committee on Nov. 26.

SCULPTURE. Though more severely conditioned than the other visual arts, and therefore slower moving, sculpture in the 20th century shows the same great fissures as they do, the result of the opposition of romanticism and classicism and of the academic and the experimental spirit. Very broadly, sculpture in 1949 may be considered under four main heads.

Academic classicism was still affected, except in eastern Europe, by the reaction against the mock-heroic and sentimental values of the 19th century. In its approach to sculpture it was Aristide Maillol's restatement of Renaissance concepts which remained the dominant influence, and nearly every country could boast a number of sculptors to echo, in some measure, the achievements of Fritz Wotruba in Austria, or Frank Dobson and Karin Jonzen in Great Britain. Less opulently ripe and dependent upon a nervous sensitivity of surface, was the work of those followers of Charles Despiau, and those Italian sculptors like Giacomo Manzù and Marino Marini who drew upon classical and Etruscan sources.

Academic romanticism showed itself mainly in the mildly expressionistic carving of northern Europe—in the work of Ivar Johnsson and Bror Hjorth in Sweden, John Rädecker in Holland, and postwar successors of Ernst Barlach in Germany. The rugged humanism of these artists, often allied to an underlying sense of tragedy, was most frequently expressed through wood-carving. Another romantic strand that called for mention was that deriving from the impressionism of Auguste Rodin; but so personal an idiom failed to provide a general springboard for a succeeding generation that placed its faith mainly in direct carving. The academic approach to sculpture degenerated at its weakest into conventional and commonplace transcriptions of reality. At its best, the academic formulae were reanimated with greater freshness and vitality than in the field of painting.

Classicism in experimental modern sculpture found its roots in the rediscovery of primitive art, in the simplified and formalized masks and figures of Africa especially. It developed through the geometry of the cubist revolution to the almost mathematical constructions of metal, glass and plastic conceived by the Russians, Antoine Pevsner and Naum Gabo, and the Swiss, Max Bill. In Britain, Ben Nicholson and Barbara Hepworth produced work of geometric abstraction but neither exhibited during 1949.

The most fruitful field was perhaps that embraced by those essentially romantic experimental sculptors who drew upon organic and often biomorphic forms as a basis for their own free invention. Constantin Brancusi, one of the most eminent, remained in semi-retirement. The most powerful influences were probably Pablo Picasso, whose rich storehouse of inventions was constantly raided; Hans Arp, to whom the Italian Alberto Viani was in debt; and Henry Moore. Moore, in his fiftieth year, was honoured by an impressive exhibition at Wakefield in Yorkshire, later seen in Brussels and Paris at the beginning of a long continental tour. This included a model of the family group being cast for erection at Stevenage, Hertfordshire.

Three other British sculptors seen to advantage during the year were F. E. McWilliam, who exhibited a number of his semi-surrealist pieces; R. Butler, who showed ingenious inventions in wrought iron; and Robert Adams who, in London and Paris, showed a developing skill in semi-abstract wood carving. The Royal Society of British Artists concentrated, in their winter exhibition, upon sculpture and produced the most lively mixed show of the year. S. J. Charoux, H. Henghes, Keith Godwin, John Skeaping, and Leon Underwood were among those exhibiting.

If any two traits could be said to predominate during the year, they were diversity of material (allied to consciousness of and respect for their innate qualities), and a growing tendency among sculptors in all countries to think, not in terms of solids but of space itself. Once liberated from the bonds of representation, sculpture began to explore the hollow, the declivity, the mysterious tunnel. First Alexander Archipenko, then Pablo Picasso, Jacques Lipchitz, Alberto Giacometti (who remained a strong influence), the Russian constructivists, Hepworth and Moore pursued this new course with growing confidence, until they had pierced their solid material through and through. It seemed likely that younger artists—for example Adams and Eduardo Paolozzi in Britain—would maintain this pre-occupation, not only with the movement in space represented by interpenetrating planes of string or plastic, but with all the possibilities of "negative" sculpture in which the absence of mass is the motif. In this they would relate their work to some degree with developments in Parisian non-figurative painting.

UNITED STATES. Despite the concern for new ideas, greatest achievement was shown in classical sculpture projects, such as the monumental groups by James Earle Fraser and Leo Friedlander for the Lincoln memorial circle at the approach to the Arlington memorial bridge in Washington. Four heroic equestrian groups for this site reached the bronze-casting stage. With memorial sculpture in wide demand, among the prominent examples completed were a bust of James Forrestal, former secretary of defence, designed by Kalervo Kallio for the national capital, and a heroic George Washington figure for the masonic national memorial at Alexandria, Virginia, completed by Bryant Baker.

Abstract sculpture undertook to supply fresh solutions for
monumental and decorative projects, receiving occasional encouragement, while appealing routine work was done in various styles for public and business buildings, notably in the relief form. Most unusual was the adaptation of sculpture to a new purpose by Isamu Noguchi, who turned his talent for imaginative abstract forms to the designing of modern furniture, considering a chair or a table as a piece of sculpture. Alberto Viani, with the classical sculptors Giacomo Manzu and Marino Marini, who drew impressively upon classical and Etruscan sources, were shown in New York’s Museum of Modern Art exhibition of contemporary Italian art.

In the United States, Jose de Creeft producing romantic and decorative work, Theodore Roszak experimenting in metal, the romantic Koren der Harootian and David Hare, who exhibited expressionistic sculpture, all worked in the forefront of the profession.

The Whitney Museum of American Art, New York city, devoted most of one of its annual exhibitions to sculpture, placing a strong accent on advanced contemporary styles. Perhaps the largest concentration of all was the massive Sculpture International in Philadelphia. (See also ART EXHIBITIONS; ART SALES; MUSEUMS.)  

SEISMOLOGY. The strongest earthquakes of 1949 were those of July 10 in Soviet Turkistan and Aug. 22 off the coast of British Columbia. Both were magnitude 8 on the instrumental scale, but damage was limited because of the location. The most disastrous shock of the year, on Aug. 5 in central Ecuador, killed more than 8,000 persons, injured 20,000 and caused property damage of several million dollars. Pacific northwestern United States experienced the worst earthquake in its recorded history on April 13. The Puget Sound cities of Olympia, Tacoma and Seattle were hardest hit. Damage in Washington was estimated to be at least $15 million. On April 20 the most severe earthquake in Chile for ten years was reported to have killed 57, injured 89, and caused considerable property damage. Shocks also caused damage in Nevada and California in the United States, and in Turkey, Arabia and the Philippine Islands.

Publication of the results of the seismic refraction surveys at Bikini indicated a depth of several thousand feet below the lagoon floor to the igneous basement rock. Seismic reflection surveys in the Atlantic suggested a reflecting horizon at depths ranging from negligible to several thousand feet beneath the ocean floor. Microseisms continued to engage the attention of many seismologists because of their meteorological and oceanographic applications. A relationship between cold fronts and microseism storms was reported by several observers, but others supported the theory of variations of pressure on the sea floor accompanying a low-pressure area as the origin of microseisms.  

SENANAYAKE, DON STEPHAN, Sinhalese statesman (b. 1882), became prime minister of Ceylon on Sept. 26, 1947. (For his early career see Britannica Book of the Year 1949).

On Feb. 4, 1949, the first anniversary of dominion status for Ceylon, D. S. Senanayake laid the foundation stone of the independence memorial building at Independence square, Colombo. In April he attended the Commonwealth prime ministers' conference in London, and on April 29 visited Dublin where he was received by President Sean O'Kelly and members of the government. In August he unveiled a monumental pillar at the Galaya hydro project. In November he sent invitations to the premiers of the Commonwealth countries suggesting a meeting of foreign ministers in Colombo early in 1950.

SENATE, U.S.: see CONGRESS, U.S.

SENEGAL: see FRENCH UNION.

SEWERAGE. Draft orders were deposited and objections were considered prior to the setting up of 17 river boards under the River Boards act, 1948, with the functions of fishing, conservation of water supplies, drainage and pollution control. The areas included most of the catchment areas of English and Welsh rivers. At the request of the Port of London authority, the Water Pollution Research laboratory of the Department of Scientific and Industrial Research began a detailed survey of the River Thames from Teddington to the sea, the impurity of the river having been a matter of concern for many years. The last two reports of the British Field Sports society dealing with river pollution in several rivers, including the Great Ouse, Nene and those of south Wales and Scotland, were published in 1949 drawing attention to the badly polluted state of most of the rivers in Great Britain.

Many local authorities proceeded with the construction of sewerage schemes during 1949, including the county of Middlesex, and Boroughs of Bristol, Peterborough, Plymouth and Poole. A scheme to constitute the Hogsmill Valley Joint Sewerage board, including the construction of works estimated to cost £1 million, to cover the areas of Kingston, Malden, Surbiton and Epsom in Surrey was considered at a Ministry of Health enquiry and approved in principle. Construction proceeded with the sewerage works for several of the satellite towns, including Aycliffe, Stevenage, Harlow, Peterlee and Crawley. The Colne Valley Sewerage board's works at Maple Lodge near Rickmansworth, which were commenced in 1938, made substantial progress during 1949 and, when completed, would deal with the treatment and disposal of sewage from Watford, Rickmansworth and their neighbouring districts, with a population of over 500,000 people. The new town development of Hemel Hempstead would also discharge its sewage to these works.

The ever-growing needs of the Metropolitan Water board were such that sewage effluents could not now be diverted from the Lee valley and, in consequence, the responsibility existed for certain towns in that valley to produce a higher standard of treatment of effluent than was required by the Royal commission. A similar problem was appearing elsewhere.

( J. K D.)

SEYCHELLES, British colony in Indian Ocean. Area: 156 sq mi. Pop. (1947 census): 34,594. Governor, Dr. P. S. Selwyn Clarke.

History. A Court of Appeal judgment invalidated legislation passed in Nov. 1948 by an improperly constituted Legislative Council. Strong exception was taken locally to the nomination to the Legislative Council by the governor of C. Collet, formerly acting attorney general. During the year a number of cases came before the court for the refund of income tax paid under alleged “threats” during Collet’s attorney generalship. In giving judgment on these cases the chief justice expressed himself forcibly, stating on one occasion, “No doubt the fullest enquiry will now be made in England as to exactly how it came about that this man was appointed even temporarily to a responsible post in a British colony in the colonial legal service... The methods adopted in the case to extort money from the plaintiff are absolutely repugnant. The British administration of a colony overseas has been brought into grave disrepute.” The administration of the colony was debated in the House of Commons. Towards the end of the year Collet resigned from the Legislative Council.

Finance and Trade. Budget (1949 est.) revenue: Rs 2,286,436, expenditure, Rs 3,424,085. Foreign trade (1948): imports, Rs 4,792,877, exports, Rs 5,237,618. Currency: 1 rupee = 1s. 6d.
SFORZA—SHIPBUILDING

SFORZA, COUNT CARLO, Italian statesman (b. Montignoso di Lunigiana, Liguria, Sept. 25, 1873), entered the diplomatic service in 1895 and served in Cairo, Paris, Constantinople (Istanbul), Peking (Peiping), Bucharest, Madrid and London. In 1906 he was secretary of the Italian delegation to the Algeciras conference, and in 1908-9 chargé d'affaires in Istanbul. From March 1910 to March 1911 he was chef de cabinet to the Marquis di San Giuliano, the foreign minister; from 1911-15 minister to China and from 1915-18 minister to Serbia. In Nov. 1918 he returned to Istanbul as high commissioner for Italy. From June 1919 to June 1920 he was under secretary of state for foreign affairs; on Aug. 3, 1919, he was appointed senator. From June 1920 to July 1921, he was minister of foreign affairs. Appointed ambassador to France in Feb. 1922 he resigned nine months later, refusing to serve under Mussolini. For two decades he lived abroad—in Belgium until 1939 and in the United States after 1940. He returned to Italy in Oct. 1943. He was minister without portfolio in the cabinets of Marshal Pietro Badoglio (April-June 1944) and Ivanoe Bonomi (June-Nov. 1944), high commissioner for epurazione (June 1944-Jan. 1945) and president of the Constituent Assembly (Sept. 1945-May 1946). Elected a member of the Constituent Assembly on June 2, 1946, as a Republican, he joined the third Alcide De Gasperi cabinet (on Feb. 2, 1947) as minister of foreign affairs. His influence was a determining factor in the Italian parliament's ratification of the peace treaty, in Italy's joining the Organization for European Economic Co-operation and its adherence to the North Atlantic treaty which Count Sforza signed for Italy in Washington on April 4, 1949. He returned to Washington five months later to take part in the first meeting of the North Atlantic council (Sept. 17). At a press conference in Rome, on Dec. 15, he blamed Britain for the deterioration in Anglo-Italian relations.

SHANGHAI, the commercial metropolis of China and its largest city, world's fourth largest town and one of the world's greatest seaports. Area: 345 sq. mi. Pop.: (1948 est.) 4,630,385, (May 1949 est.) 5,000,000.

The financial and economic disintegration which had been developing in China during the previous three years and which had seriously affected the commercial and industrial life of Shanghai was much accentuated at the beginning of 1949, as the contending forces in the civil war approached the Yangtze river; by early March the cost of living, expressed in Chinese national currency, called “gold yuan,” was 15,000 times the Aug. 1948 level. On April 1 the mayor, Wu Kuocheng (K.C. Wu), retired and was succeeded by Chen Liang but on April 25 the evacuation of all officials was ordered. The occupation of the city by Communist forces was completed on May 24. Authority was vested in a commission of control under General Chen Yi, who was also nominated mayor. On June 27 the Nationalist government proclaimed the “closure” of a large part of the coast, including the entrance to Shanghai. Though this blockade was regarded as illegal by the principal foreign powers it nevertheless brought overseas trade to a standstill, leading to shortages of food and raw materials and to steeply rising prices and widespread unemployment. Towards the end of the year, however, strong efforts were made by shipping interests to re-open the port to overseas trade, and blockade-runners began to appear in increasing numbers. At the same time measures taken by the government to bring supplies of food and raw materials from the hinterland made themselves felt in a welcome fall in the cost of living.

SHARETT, MOSHE, Israeli statesman (b. Kherson, Ukraine, Oct. 1894), went to Palestine as a boy of 12. He studied at the University of Istanbul before World War I and in 1924 received a degree at the London School of Economics. As a Turkish subject he was conscripted into the Turkish army and served as a lieutenant during World War I. In 1924 he became assistant editor of the newspaper Davar, organ of the Jewish Labour party in Palestine; in 1929 he was editor of its English weekly supplement. Two years later he was appointed political secretary to the Jewish Agency, and in 1933 became head of its political department. During World War II he persuaded British military authorities to agree to organize Jewish units in the British army. In June 1946 he was arrested with other members of the Jewish Agency executive and spent five months in the Latrun detention camp. On May 14, 1948, he was appointed minister of foreign affairs of the first Israeli government. On March 8, 1949, he was re-appointed to the same office in the second Ben-Gurion (q.v.) cabinet. About the same time he changed his name from Shertok, which was of Russian derivation, to Sharett, a Hebrew word meaning “one who serves.” On Nov. 11, 1922, he married Zipporah Meir and they had three children.

SHEEP: see LIVESTOCK.

SHIPBUILDING. Shipbuilding in the United Kingdom during 1949 was distinguished by a better flow of materials and equipment, which permitted greater production than in 1948. A start was made with more of the orders
already on the books of the companies. During the closing months of 1948 many contracts had been placed for oil tanker vessels and these now represented a bigger proportion of the tonnage under construction than ever before. Work was still proceeding on some large liners but fresh contracts for ships of this class were unusual. Builders were still awaiting more orders for ordinary cargo, or tramp, vessels. Few such ships had been built after the end of World War II. High prices, declines in rates in the freight markets and the sale of many ships built in the United States during World War II and also of some vessels constructed in Canada had been influences which deterred contracting. Many cargo ships continued to be employed which their owners would have liked to replace with modern and more efficient craft had they been able to earn depreciation and moderate interest on the larger capital required. There were, however, some exceptions to the managements that hesitated to order new tonnage.

Experience during the greater part of the year showed that diesel ships and steamships burning oil could still be traded profitably at the lower levels of freight rates, whereas losses would have been incurred in the employment of coal-burning steamships with coal at about £4 a ton in the United Kingdom. The advantage which ships consuming oil had over steamships was, however, largely lost when, after the devaluation of sterling in terms of dollars in September, oil prices outside the United States were raised by about 40%. There remained, however, the merits which the use of oil had over the burning of coal in cleanliness, speed of bunkering and reduction of labour. Freight rates were too slow to respond to the higher cost of expenditure in dollars in world trades, owing to an apparently sufficient supply of the tonnage available for the trade offered. With a general increase in freight rates needed for oil consumers, coal-burning ships would benefit to a greater extent. There was, however, the heavier charge for the upkeep of ageing ships.

The amount of shipping under construction in Great Britain throughout the year remained at rather over two million tons gross, according to the quarterly returns of Lloyd's register. This figure was below the peak of 2,244,000 tons which was reached in June, 1948. On March 31, 1949, there were being built in the United Kingdom 2,076,000 tons; on June 30 the amount was 2,043,000 tons and on Sept. 30 it was the best for the three quarterly periods at 2,095,000 tons. Abroad the amount of work in hand expanded steadily. On March 31 it was 2,280,000 tons. By June 30 the volume was 2,403,000 tons; and by Sept. 30 it had expanded to 2,513,000 tons. These totals excluded construction in Germany and Russia, particulars for which were not available, and the Japanese figures were known to be incomplete. The expansion of work abroad reflected the restarting of operations in yards damaged during World War II and a revival of construction.

On March 31 the proportion of the total tonnage under construction throughout the world which was built in the United Kingdom was 47.7%, making the share of shipyards in other countries 52.3%. On June 30 the share of the United Kingdom was rather less at 46% and that of other countries correspondingly more at 54%. The United Kingdom's share again declined by the end of September—to 45.5%—and the share of yards in other countries rose to 54.5%. The total volume of work in United Kingdom yards after World War II included a substantial amount for owners abroad. At the end of March 1946, about 100,000 tons of such shipping was being built. By March 1949 it had risen to 742,000 tons. There was a small increase by June 30 to 757,000 tons and by Sept. 30, 1949, the amount had expanded to 766,000 tons. This represented 36.6% of the total tonnage under construction in Britain. The corresponding proportion on June 30 was 37%, and on March 31 it was 35.8%. Shipping under construction on Sept. 30 included 293,000 tons for Norway and 103,000 tons for Argentina.

Better supplies of materials were reflected in the United Kingdom in an increase in the work started, which was pronounced at the end of the third quarter. During the three months ended March 31 work was begun on 73 vessels of 274,000 tons. In the June quarter new work was represented by 64 ships of 288,000 tons, and in the three months ended Sept. 30 work was begun on 80 ships of 402,000 tons.

Abroad, work was started during the three months ended March 31 on 132 ships of 477,000 tons. During the June quarter the number of ships increased to 115 and the tonnage to 560,000 tons. In the September quarter the number of ships on which work was started was 130, but the tonnage was less at 519,000 tons.

For the first three quarters of 1949 250 ships, representing 990,000 tons, were completed in the United Kingdom. For the whole of 1949 shipping delivered was 1,213,000 tons. It was, therefore, clear that total output for 1949 would well exceed that for 1948. It was generally expected that the shipyards in the United Kingdom would be well employed throughout 1950 and that the work would extend well into 1951. Some large liners were due to be delivered in 1950 and because of the small number of contracts undertaken in 1949 later prospects for shipbuilding were uncertain. (C. Mn.)

The world tonnage of merchant ships of 1,000 gross tons or more, as at June 30, 1949, was distributed as follows:

---

Two of the largest and fastest liners using the Port of London. Left, the "Orcades" (28,000 tons), which left on her maiden voyage on Dec. 14, 1948, and the "Himalaya" (28,000 tons) whose maiden voyage began on Oct. 6, 1949.
The stern half of the "Magdalena" (17,547 tons) which left London on its maiden voyage, March 9, 1949. On April 25 she ran aground off Tijuca islands near Rio de Janeiro and broke in two while being towed into harbour.

Excludes vessels on the Great Lakes. Total 12,765 72,531,700

The total of 72,531,700 gross tons of vessels in the world fleet represented an increase of 1,947,200 gross tons since June 30, 1948, but, during the same period, the U.S. fleet decreased by 130 vessels totalling 712,300 tons.

The Shipbuilders Council of America reported, as at Oct. 1, 1949, 925 vessels, each of 1,000 gross tons or more, aggregating 7,081,259 gross tons, under construction, as follows:

United States. At the beginning of 1949, shipbuilding in the private shipyards of the United States consisted of 76 merchant vessels, aggregating 1,187,850 gross tons, and two dredgers, totalling 24,672 displacement tons. At the end of the year these private shipyards had under construction or on order 39 merchant vessels, aggregating 639,000 gross tons, and one dredger totalling 21,572 displacement tons.

During 1949 the private shipyards of the United States delivered 33 tank vessels, of 1,000 gross tons or more, aggregating 538,051 gross tons and one dredger of 3,100 displacement tons, as compared with 28 seagoing vessels, totalling 163,486 gross tons, and one dredger of 1,100 displacement tons, in 1948.

Contracts for only five seagoing merchant vessels were placed in private shipyards of the United States in 1949. Many of the smaller coastal and inland shipyards, however, had reasonable activity in the construction of barges, towboats and other small craft.

In Sept. 1949, employment in the ship-repairing branch of the industry in about 80 yards had dropped to 25,725 from 56,708 in Sept. 1948, a decrease of approximately 58%.

This substantial reduction in employment resulted from the completion of the reconversion of merchant vessels from wartime requirements back to peacetime requirements, and to the decrease in the volume of shipping in operation under the U.S. flag. Employment in the shipbuilding branch of the industry, however, was just over 29,500 or 4,500 more than prevailed in the same month in 1948.

The average hourly earnings in the industry for shipbuilding and ship repairing in Sept. 1949 was $1.632. (See also Shipping, Merchant Marine.)

SHIPPING, MERCHANT MARINE. By the end of 1949 many of the heavy war losses of the British and Allied nations, including Norway, were made good. Colin Anderson, chairman of the General Council of British Shipping, was able to say that the British merchant navy had recovered its prewar volume. Its balance had not, however, been regained; i.e., the relationships between the different sections, mainly passenger and cargo liners, ordinary cargo ships or tramps and oil tankers had not been re-established.

Passenger liners continued to resume their regular services after reconditioning extending over a year or more, following war duties and the return of troops and the carriage of emigrants from Europe to the new countries, notably South Africa and Australia. Some large new liners were commissioned, which had taken much longer to build and had cost far more than had been anticipated, and they helped materially to reduce the long lists of prospective passengers.
who had been wanting to travel. The new Orient liner "Orcades," of 28,000 tons and valued at £3,250,000, completed her maiden voyage from London to Australian ports early in the year. The Cunard White Star liner "Caronia," of over 34,000 tons and valued at more than £4 million, was commissioned in the trans-Atlantic route and then was directed to make a pleasure cruise from New York to the Caribbean sea, the vessel having been specially designed for cruising when not engaged in the North Atlantic service. The "Caronia" was the largest ship to have been built anywhere since the end of World War II.

In the spring the Royal Mail liner "Magdalena," of 17,500 tons and valued at £2.3 million, was commissioned but was wrecked near Rio de Janeiro on her maiden voyage in April. The "President Perón," the first of three new ships of about 14,000 tons gross each built in the United Kingdom for the Argentine government, left Southampton on July 40 on her maiden voyage to Buenos Aires. The cost of the vessel exceeded £1.5 million.

On August 25 the liner "Rangitoto," of 22,000 tons gross, owned by the New Zealand Shipping company, left London on her maiden voyage to Wellington, New Zealand. The passenger accommodation in this ship was distinguished by being of one class with a wide range of fares corresponding broadly, to those charged for the first and tourist classes of ships already in the service. Only one set of public rooms was required. The cost of this liner was rather more than £2 million. A sister ship, the "Rangitane," was completed at the end of 1949.

The "Himalaya," of 28,000 tons gross, was commissioned by the Peninsular and Oriental Steam Navigation company in Sept. 1949 and sailed from Tilbury on her maiden voyage on Oct. 6, a year and a day after her launch. The ship was ordered in Jan. 1946 and the keel was laid on April 29 of that year. The "Himalaya" was thus about 3½ years under construction. The original estimate of the cost was £2,244,000 and the actual cost was about £3.5 million. The "Himalaya" was similar in size to the "Orcades." Each vessel was larger and faster than any liner previously built for either company. They were the outcome of a policy of fewer, but faster and larger, ships which was intended as a means of helping to offset the much higher building costs and operational expenses than those before 1939. The "Orion," a sister ship to the "Orcades," was being built in 1949; and the "Chusan," of 23,000 tons, was under construction for the P. and O. company.

The French liner "Ile de France," of 45,000 tons gross, returned to trans-Atlantic service in July 1949 after reconditioning at Saint-Nazaire which occupied more than two years. The internal rebuilding of the ship after strenuous war service cost between six and seven times the original price of the vessel in 1926.

A great increase in shipbuilding costs caused managers much concern. Although insured values were generally raised when World War II broke out the payments for ships lost only went part of the way to meet the bills for new ships. The replacement of vessels made necessary by advancing age raised a more acute problem, since the amounts set aside annually for depreciation on much lower valued ships fell far short of the costs of the new vessels.

That British owners were confronted with difficulties in this matter was indicated in the action of the chancellor of the exchequer in increasing by the 1949 budget the so-called initial allowances in respect of taxation of new ships from 20 to 40%. This, however, only forestalled some of the annual allowances of 5% which had long been permitted for depreciation when calculating earnings for taxation. With the new concession the relief from taxation would cease at the end of 12 years, whereas otherwise the ordinary 5% would be allowed for depreciation extending over 20 years. British owners were adversely affected by a liability for balancing charges under legislation in 1945. This meant that when a ship was lost or disposed of tax was imposed on the difference between the proceeds from the loss, or sale, and the written down value of the ship.

British shipping companies did not enjoy the same taxation relief as was granted to shipping in some countries. In Denmark, taxation provisions extended to industry generally under which, in addition to normal depreciation allowances, the excess of current building prices over those of 1939 might be written off subject to a maximum of 50% in any one year. Similar taxation reliefs were available in Norway and profits derived from the sales of ships were tax free if eventually used for the purchase of new tonnage. In Sweden sums written off assets were free from taxation.

The task of shipping managements in making vessels built at higher costs pay was much increased by slower working in ports. As an example, the ships in a large British fleet on the average formerly spent 28 days in port compared with four weeks at sea, but in 1949 spent 36 days in port. Shipping was particularly liable to be affected by decisions of governments which greatly influenced the course of trade. There was much waste of costly refrigerated space in South American liners during the first five months of 1949 because supplies of meat were not forthcoming from Argentina as

The "Pamir" (2,796 tons) arriving at Falmouth, Cornwall, on Sept. 30, 1949, after making her last voyage from Australia as a grain ship.
SHOE INDUSTRY

Designed by Gar Wood this double-hulled motor vessel, which it is claimed does not roll, was first publicly demonstrated in Aug. 1949.

had been expected. Restrictions on imports to South Africa early in the year, and more drastic curtailments as from mid-summer, meant a rush to ship cargo in periods immediately preceding the relevant dates and, subsequently, a great falling-off in shipments, particularly after the middle of June.

Several countries expressed intentions or wishes to develop mercantile marines. India contemplated a mercantile marine of 2 million tons gross within the next five or seven years; but a keen protagonist for a large Indian merchant navy had seen difficulties in the way of securing the construction of the ships, for paying for them at the current prices and of obtaining sufficient trade for them when built. The Italian government announced its intention of having a merchant navy by 1952 on almost the 1941 level of tonnage and, of course, a much more up-to-date one. Japanese shipping re-appeared in local services and Poland expressed a desire for a substantial mercantile marine. The occupying powers sanctioned the construction of a number of cargo ships and tankers in Western Germany not exceeding 7,200 tons gross and a speed of 12 knots. By a later agreement Germany was permitted also to build six special ships which might be refrigerated vessels, fruit carriers or oil tankers. (C. Mns.)

United States. On Sept. 30, 1949, there were 1,214 oceangoing merchant vessels of 1,000 gross tons and over, totalling 14,350,000 dead-weight tons, in active service in the United States merchant marine. This was about 200 less than the number active on Dec. 31, 1948. Of the active vessels, 1,032 were privately owned and 182 government-owned. There were in addition 196 vessels temporarily out of commission and 1,974 (including some special types) laid up in reserve.

The number of privately owned vessels (active and inactive) had increased by 13 over the number on Dec. 31, 1948. The active privately owned United States merchant marine of 12,452,000 dead-weight tons on Sept. 30, 1949, was only 3,794,000 dead-weight tons larger than the prewar privately owned fleet in service on June 30, 1938. The ships of the 1949 fleet, however, were larger, faster and relatively newer.

The number of vessels owned by the government in active service decreased by about 150 from Dec. 31, 1948, to Sept. 30, 1949, while the number laid up in reserve increased by about 130 during the same period. The decrease in the number of government-owned ships in service was expected to continue until the expiration of the Maritime commission's authority to charter vessels on June 30, 1950. After that date there would probably be no active government-owned vessels, with the possible exception of a few operating in specialized trades.

Ships flying the U.S. flag carried 46.3\% of the total U.S. export and import trade in the first six months of 1949, in contrast to 67.5\% in the corresponding period of 1948. Decrease in cargoes shipped under Economic Co-operation administration authorization (50\% of which had by law to be carried in U.S. ships), together with increasing competition from merchant marines of other nations whose operating costs were relatively lower, forced the withdrawal of many U.S. flag ships from operation. Vessels in tramp trades, which were not subsidized, were especially vulnerable to foreign competition, and many of these vessels which had been chartered from the government were withdrawn from service. (See also SHIPBUILDING.)

P. B. F.

SHOE INDUSTRY. The demand for footwear in Great Britain throughout 1949 was good. All factories with a few temporary exceptions due to shortages of certain kinds of leather, were fully employed. Rates in the retail shops kept pace with production, except for a slight tendency among retailers to rebuild their stores to more adequate proportions. In most classes of shoes a buyers' market prevailed, certain specialized lines being the exceptions.

Wholesalers' and retailers profit margins, however, suffered two serious reductions: early in the year severe cuts were made by the Board of Trade in the profits allowed on both utility and non-utility footwear, which accounted respectively for about 95\% and 5\% of total production. Wholesalers' margins, which had been 14.29\% of cost were left unchanged for women's shoes, but for all other lines were reduced to 12.68\%.

Retailers' margins on non-utility footwear had been 50\% or 42-86\% of cost exclusive of purchase tax. A scale of purchase prices paid by the retailer determined which rate applied. No change was made in the permitted percentages, but the level at which the higher profit could be charged was raised—in the men's from 30s. to 46s. 6d., in the women's from 25s. to 41s. 6d. and similarly for children's. This materially lowered retail profits on non-utility lines.

On grade 1 utility footwear the mark-up had been 42-68\% of cost and on other grades 37-94\%. Margins on women's shoes were not changed except on grade 3 which was reduced to 35-59\% but for other footwear they were lowered to 37-94\% on grade 1, 35-59\% on grade 2 and 33\% for grade 3. Lines having no grade number were given the profit-rate applicable to grade 2. These cuts, applied to 95\% of all shoes manufactured, made serious inroads into retailers' gross earnings.

Later in the year they suffered further reductions as a result of the government's decision to force a reduction of 5\% in the retail prices of certain essential commodities. Manufacturers' maximum prices were reduced by 1\% on sales to wholesalers and by 2\% on sales to retailers. Wholesalers' margins came down from 12\% and 11\% to 12\% and 11\% respectively and retailers' margins by 24\% on returns. These cuts were vigorously opposed by the industry, but without success. There was no appreciable increase in the volume of footwear sold after the cuts had been made, the price difference to the public being too small to influence demand. Manufacturers had already been selling many of their utility shoes below the permitted ceiling prices.

The devaluation of the pound opened up a chance for the industry to compete in dollar markets. The end of the year saw several important companies perfecting plans to sell British shoes in the United States and Canada, some through shops under their own control.

C. A. So.

United States. The shoe industry, in 1949, was faced with the issue of price adjustments at a level where the consuming public would be willing to buy. Shoe production, in general, was maintained at almost the same level as in 1948. Casual shoes became an accepted factor in women's shoes by virtue of their comfort and moderate price. These casuals tended
to keep women's shoe production figures steady; of the estimated 201 million pairs of women's shoes, 65·5 million were casuals. Men's shoe production remained stable, at an estimated 98,900,000 for 1949 as compared with 104,730,000 pairs in 1948. Juvenile shoe production decreased from the record of 111,194,000 in 1948 to an estimated 104,500,000 for 1949.

Shoe manufacturers, faced with the high cost of materials and labour, tried to minimize risk and avoid long term commitments; in some cases they used substitute soles in an effort to hold down costs, without sacrificing wear.

The average consumption of shoes per head had remained at about 3·10 pairs per person despite retailers' efforts to increase the number. But consumers wanted the same or even a higher grade shoe at a better price. (See also Leather.)

SHOPS AND DEPARTMENT STORES.

The year 1949 marked a further stage in the laborious return to more competitive conditions in the retail market in Great Britain. Price and rationing controls were, even in food, relaxed gradually. The campaign for the abolition of clothes rationing initiated by the Drapers' Chamber of Trade near the end of 1948 achieved its objective in 1949, but not until the spring, when, with the exception of a small number of lines, rates were by common consent replaced by rationing by income. There were markedly different rates of progress in the production of consumer goods for the home market during the year, but more commodities reached their prewar output. Woolen goods, rayon, footwear and other commodities made good progress, in contrast to food and cotton goods.

A continuing high proportion of the output of raw materials was devoted to the production of the "utility" lines at the expense of the higher priced, less standardized, "non-utility" goods which still bore purchase tax.

The decreasing buoyancy of purchasing power and rising retail costs and prices restricted the upward movement in sales volume, but money sales rose markedly. Nevertheless, operating costs rose faster than sales revenue. Margins on utility lines were reduced by the Board of Trade as a political expedient to limit the rise in prices. Rising wages and retail stocks and the financial results of some retail organizations reflected increasingly difficult trading conditions in some lines, e.g., furs, wireless, electrical appliances and semi-luxury household goods, books and stationery, cosmetics, beer; but many firms, including those catering for the lower income groups, maintained or increased turnover and earnings.

The end of sellers' markets in most lines increased the bargaining power of retailers vivâ-voce manufacturers and wholesalers. Retailers were increasingly unwilling to buy for stock as and when goods were available and suppliers began to complain that retailers were returning to the prewar practice, or malpractice, of buying "from hand to mouth," and inevitable development in a buyers' market.

Retailers responded to sluggish sales by introducing hire purchase, deferred payments and other credit arrangements and by increased attention to advertising and other forms of publicity.

Despite the need for manpower in Great Britain to be diverted into the manufacturing industries working for the export trades, labour in distribution rose during the year by about 40,000. The government actively encouraged the development of the new labour-saving retail technique of "self-service" by making 100 licences for internal reconstruction available to retail stores, 40 to multiple shops, 40 to Co-operative societies and 20 to independent retailers.

In June, a committee established by the Board of Trade to investigate the practice of resale price maintenance made two important recommendations in its report: first, that although an individual producer should be free to prescribe and enforce resale prices for goods bearing his brand, his power should not be used (a) to obstruct the development of particular methods of trading, (b) to impede the distribution of competing goods, (c) to deprive the public of improvements in distribution; second, that the use of sanctions to enforce collective price maintenance arrangements should be made illegal. The President of the Board of Trade announced that he would require the retail trade associations to abandon or modify some of the practices involved; but by the end of the year little concrete action had been taken in a reform that would have a profound effect on the structure of British retail distribution. The census of distribution proposed for 1950 was postponed till 1951.

In the second half of 1949, a development that might have far-reaching effect on retailers of all kinds was the Co-operative Wholesale Society's press and poster advertising campaign designed to increase its membership among the middle classes. The movement had a nominal membership of 10 million consumers but less than half bought exclusively from the Co-operative stores, which sold 15% of the national food supply and a smaller proportion of other commodities. The C.W.S. considered that little more headway could be made among the working classes, some of whom were attracted by the lower prices of multiple shops.

Towards the end of the year official retail wage rates were raised about 6% by the new statutory Wages councils.

The devaluation of sterling, in September, had not, by the end of the year, had a marked effect on the retail prices of consumer goods fabricated from imported raw materials, despite a substantial rise in import prices. (A. S.D.N.)

SILK. The devaluation of the pound and other currences in Sept, 1949 did not substantially affect shipments of raw silk to two silk consuming countries, France and Great Britain. Shipments from Japan for the first ten months of 1949 averaged 3,181 bales a month, compared with a monthly average of 6,407 during 1948. France bought 5,432 bales during October.

Statistics prepared by the Textile Foreign Trade corporation of Japan, showed that France in 1949 would have bought more raw silk than the United States, despite the unfavourable exchange rates in both Britain and France.

In November, West Germany completed a trade agreement with Japan for the purchase of $1·8 million worth of raw silk and silk fabrics.

Some progress in international co-operation in the furtherance of the use of silk was made during 1949. In March, a representative of the International Silk bureau (later in the year renamed the International Silk association) from Lyons, France, visited Japan for the purpose of asking financial support from Japanese raw silk producers, through U.S. occupation officials, for the promotion of silk throughout the world. A levy of five cents per pound was suggested. The occupation officials, however, as well as Japanese raw silk producers, opposed the suggestion on the grounds that the Japanese economy made collection of such a levy impossible, and that it would have the same effect as raising the price of raw silk, which would counteract against increased use of silk.

Late in May, at Zürich, Switzerland, 16 countries, including Japan, were represented at the organization meeting of the International Silk association, and plans were made for
holding the second International Ski congress in New York in Oct. 1950. Representatives attended from Austria, Belgium, Egypt, France, Germany, Great Britain, Hungary, Italy, Japan, the Netherlands, Persia, Spain, Switzerland, Syria, Turkey and the United States.

The hopes of increased silk consumption in the U.S. in 1949, based on the great increase, did not materialize. Prices of raw silk were stabilized and there was apparently little incentive for purchasing, as shown by the small demand for silk fabrics. However, in June, the U.S. occupation authorities in Japan announced that raw silk transactions would be restored to private trading on and after Jan. 1, 1950. In the expectation that silk prices would advance after that date, exports of raw silk from Japan gained momentum in the last four months of 1949. The total for the year was 36,551 bales, compared with 59,397 bales in 1948. However, much of this came from stocks already in New York. Actual imports from Japan fell sharply to 29,690 bales, compared with 71,239 bales in 1948.

In the domestic production of silk fabrics, U.S. mills decreased their yardage in about the same proportion as they did with respect to rayons, most of which were made in the same or similar mills. The total production was estimated to be 17 million linear yd., compared with 19 million yd. in 1948 and 69 million yd. in 1939. Meanwhile, the smaller mills manufacturing silk fabrics in the U.S. were protesting bitterly over competition with Japanese fabrics, and it was announced by the Tariff commission, at the close of the year, that a preliminary investigation would be undertaken to determine whether there was justification for an increased rate of duty on silk fabrics to protect the domestic industry.

Of a total of 31-3 million yd. of all-silk fabrics imported by the U.S. in 1949 from January to November, 29 4 million yd. came from Japan. The average price per yd. was 54 cents from all countries, and 52 cents from Japan. These were all finished fabrics, ready for manufacture into garments or accessories. (See also Rayon and Other Synthetic Fibres; Textile Industry.) (I. L. Bs.)

**SILVER.** World silver production was gradually working back toward the prewar level. Outputs of the more important producing countries, and the estimated world totals during the past several years are shown in Table I.

**Total** | 181 | 157 | 132 | 166 | 171 |

The countries listed account for about 85% of the total although there are a number of minor producers, the U.S.S.R. being the most important of these.

**United States.** The salient features of the silver industry in the United States are shown in Table II, as reported by the U.S. Bureau of Mines.

The improvement in output that was manifested in 1948 was not sustained in 1949, as the total mine output for the first three quarters of 1949 was only 26,829,754 oz.

**Canada.** Mine output of silver rose from 12,504,018 oz. in 1947 to 14,569,280 oz. in 1948, and to 11,166,642 oz. in Aug. 1949, as against 10,780,518 oz. in the same period of 1948.

**SINGAPORE:** *see Malaya (Federation of) and Singapore.*

**SIRRY PASHA, HUSSEIN,** Egyptian statesman (b. Cairo, Dec. 21, 1892). Educated in Cairo and Paris, from 1916-24 he was associated with the Egyptian Irrigation service. In 1924 he was appointed secretary general of the ministry of public works; from 1925-27 he was assistant under secretary of state and from 1929-37 under secretary of state at the same ministry. In 1937 he became minister of public works, in 1939 minister of national defence and later in the same year minister of finance. From Nov. 15, 1940, to Feb. 2, 1942, he was prime minister, maintaining a policy of non-belligerency. From 1938 he was an Independent member of the Egyptian Senate. On July 26, 1949, he formed an all-party "caretaker" coalition cabinet the main mission of which was to carry out the forthcoming elections in a spirit of peace, justice and equity." He resigned on Nov. 3 and on the same day formed another government composed of non-party men, keeping for himself the portfolio of foreign affairs (see Egypt)

**SISAL:** *see Hemp.*

**SKATING:** *see Ice Skating.*

**SKING.** In spite of lack of snow which restricted skiing in 1949, international fixtures attracted large entries, the most important event being the Arlberg-Kandahar, held on March 12-13 at St. Anton-am-Arlberg for the first time since the race was cancelled in 1938. It was a great reunion of racers, and both founders, Arnold Lunn and Hannes Schneider, saw the Italian Zeno Colo beat 108 first-class international competitors, and the Frenchwoman Jacqueline Martel win the ladies' event.

The Lowland championship was organized by the Dutch at Arosa, the Belgian team winning the men's events and the British the ladies'. Sheena Mackintosh set up a record by beating all competitors, men and women, in the slalom.

The Tour ski clubs (Kandahar, Swiss university, Ladies' and Swiss Ladies') who developed downhill ski-racing, held their Silver Jubilee meeting at Murren on Jan. 29-30.

In Scandinavia, the special jumping at Holmenkollen was won by the Norwegian Trygvevoll Falkanger, the special Langlauf by the Swede Nils Ostedtsson and the 18 km. combined by the Norwegian Ottar Gjermundshaug.

**United States.** Members of a French national team took nearly all the North American championships held in 1949 at Aspen, Colorado. After Jean Pazzi had won the downhill race, Georges Panisset won the slalom to defeat Pazzi for the combined title.

Mrs. Rhoda Wurtele Eaves of Montreal won the women's downhill race; Mrs. L. C. Schmitt, the only feminine member of the French team, won the slalom.

At the national jumping at Salt Lake City, Utah, Petter Hugsted, 1948 Olympic champion from Norway, won the class A title with leaps of 262 and 263 ft.

At the national downhill-slalom contests at Big Mountain, Montana, George Macomber of West Newton, Massachusetts, won the slalom and second place in the downhill...
contest. The U.S. open downhill championship went to Yves Latreille, a Canadian representing the Sun Valley (Idaho) Ski club. (T. V. H.)

SKIN DISEASES: see DERMATOLOGY.

SMUTS, JAN CHRISTIAAN, South African statesman (b. near Riebeck West, Malmsbury district, Cape Colony, May 24, 1870), was defeated in the 1948 general elections. (For his career see Encyclopædia Britannica and Britannica Book of the Year 1949).

In 1949 the United party continued to oppose the nationalist government of D. F. Malan (q.v.) and on Jan. 25 General Smuts moved a motion of no confidence in the government on the ground of its intention to abrogate non-European franchise rights. He was in Britain in June when he undertook duties as chancellor of Cambridge university. Recipients of honorary degrees which he presented included two women—Professor Lilian Penson and Dame Myra Hess. He also unveiled a memorial panel to old scholars of Perse school, Cambridge, who fell in World War II. He later visited Rome and also Athens where he was the guest of King Paul and Queen Frederika. In October the Nationalist government removed General Smuts from the post of commander in chief of the Union's defence forces which he had held from 1940. On Nov. 22 he spoke at a dinner in London to launch a scheme for planting a forest in Israel to commemorate the 75th birthday of Chaim Weizmann (q.v.).

SNOOKER: see BILLIARDS AND SNOOKER.

SOAP, PERFUMERY AND COSMETICS. The year 1949 witnessed a remarkable increase in the world output of synthetic detergents of the soap substitute types which, unlike soap, were not made from vegetable and animal fats but were mainly derived from petroleum and other non-edible sources. They had the advantage that they could be adapted to meet specific cleansing requirements and, although they were originally expensive to produce, it was estimated that production costs in 1949 were lowered sufficiently to enable some of them to compete on equal terms with soaps.

In Great Britain official control of the industries covered by this heading continued to be relaxed. The Toilet Preparations (Revocation) order of July 1948 removing control from the manufacture and supply of perfumery and toilet preparations was followed in Nov. 1949 by the removal of control from soap substitutes packed for retail sale, thus revoking the Soap Substitutes Labelling and Prices order of 1943. The domestic soap ration in Great Britain was also increased by one-seventh in Nov. 1949 because of improved supplies of edible oils and fats from the colonies and sterling area.

Responsible elements in the British cosmetic industry were well aware at the outset of 1949 that the industry's future would largely depend upon its ability to win dollars in overseas markets. The fact that India, Australia and other countries were increasingly able to look after their own requirements and that South Africa had banned imports added to the trade's export difficulties. Several British firms sent export emissaries abroad to make first-hand investigations and others were greatly assisted in their day-to-day problems by their trade associations, the British Export Trade Research organization and similar bodies. The absorption of smaller firms by larger and more highly organized concerns was a noticeable feature of these industries in Great Britain during 1949.

Technically, the most notable advances comprised the development of more efficient soap processes of the continuous and link-batched types, the opening of new synthetic detergent plants and the continued modernization of cosmetic research. The first scientific meeting of the Society of Cosmetic Chemists of Great Britain was held in London in Nov. 1949. (F. V. W.)

United States. Throughout 1949 sales of perfumery and cosmetics in the U.S. were about equal to those of 1948. Some items—notably hair preparations—sold more briskly than in 1948, while others, such as perfumes, did not.

The industry continued to wait for its trade practice rules from the Federal Trade commission, and it was expected that these might be issued in time to become effective by the middle of 1950.

As a result of a meeting of some of the principal perfumers in 1948, Fragrance Foundation, Inc., an organization formed to publicize the products of its members and to conduct a publicity campaign among retail sales personnel, came into being in 1949.

There was a marked lack of new products and new presentations of existing products in 1949. The industry appeared to suffer from a deficiency of inventiveness, creative imagination and initiative, rather than to be governed by considerations of financial caution.

At the close of 1949 information on sales volume in the soap industry was available for the first three quarters of the year only. The industry's trade association reported increases in sales of solid soap, liquid soap and synthetic detergents. But these increases were largely the result of a considerable growth in the number of manufacturers and a comparison of the total dollar volume for companies which reported in both years showed a decrease of about 22% in sales of solid and liquid soaps during the first nine months of 1949. (H. T.)

SOCIALIST MOVEMENT. In 1949 the pendulum swung against most of the world's Socialist parties. But the parties in power in Europe maintained and even strengthened their position. The British Labour party maintained its unprecedented record of by-election successes. The Norwegian party for the first time won a safe absolute majority in the general election of Oct. 10 while the Danish party unsuccessfully sought the dissolution of parliament in expectation of similar gains. The Finnish party, although forming a minority government, showed such strength in countering Communist industrial sabotage that the right-wing opposition showed no disposition to endanger its survival.

In countries where the Socialists formed coalitions with Christian Democrats or right-wing parties their mass support tended to dwindle and their willingness to continue in office was strained. Following losses in the general election of June 26, the Belgian Socialists decided to go into opposition, using the Social Christians' support for the restoration of King Leopold as an excuse. The French Socialist party brought down the Henri Queille government on Oct. 6, but reluctantly returned to office under Georges Bidault several weeks later. In Italy Giuseppe Saragat split his party, the P.S.L.I. (Partito Socialista dei Lavoratori Italiani), by a stubborn determination to support the De Gasperi government at all costs, though for tactical reasons he twice offered his ministerial resignation to the prime minister. In the Austrian general election of Oct. 9 the Socialists failed to strengthen their position relative to the Volkspartei, their senior partners in office, although a new fourth party drew off from the Volkspartei a considerable number of ex-nazis. The federal elections in Western Germany gave the Christian
Democrats a short lead over the Social Democrats, who obtained a little over a quarter of the total vote.

In the Commonwealth the Canadian Co-operative Commonwealth federation lost almost two-thirds of its seats, while in both Australia and New Zealand, Labour party governments were decisively defeated.

In the first Israeli general election in January the moderate Socialists, Mapai (Mi'leget Poalei Eretz Israel or Workers' party of Israel), came out way ahead with nearly 36% of the total vote, while its left-wing rival, Mapam (Mi'leget Poalei Menoukhedet or United Workers' party), obtained 18%.

In Japan the Social Democrats were heavily defeated in the January elections, losing almost two-thirds of their seats.

In India the Socialist party emerged as the main constitutional opposition to the congress government. In Burma and Indonesia politicians of Socialist principles held office through dangerous periods of transition.

Though a few parties, notably the French, still hankered after a formal Socialist International, there was overwhelming agreement that the parties should pursue their co-operation as before through periodic meetings of the International and its constituent (Comunista) conferences. The conference does not claim mandatory powers, and avoids voting on political issues where opinion is known to be divided. It acts rather as a forum for the exchange of ideas and claims the right of direct intervention only as the arbiter in disputes between Socialist groups or as the judge of claims to representation in its meetings.

During 1949 the conference made several interventions of this type. In January a mission consisting of the Belgian, Victor Larock, and the British, Denis Healey, visited Athens to investigate the situation of the Socialist groups in Greece. It found that only one of these—the E.L.D. (Enosis Dimokratias or Union of Popular Democrats)—could by its principles and organization justify a claim to membership of the conference. The so-called Social Democratic party led by Gheorghios Papandreou belonged to the right-centre, while the other groups such as the Archeo-Marxist party and the A.S.O. (Anexartiti Sosialisti Organosis or Independent Socialist union) lacked any considerable organization outside Athens. After the conference's mission left, E.L.D. publicly denounced the Greek Communist party for its part in the civil war, while two moderate leaders, G. Stratis and N. Askoutsis joined the left-wing Alexandros Voulos and Elias Tsirimokos at the executive committee of the party.

The International Socialist conference continued its attempts to promote unity among the Italian Socialists. In 1948 it had suspended from membership the P.S.I. (Partito Socialista Italiano), led by Pietro Nenni, and admitted jointly the P.S.L.I. led by Saragat, and the Socialists' union, led by Ignazio Silone, on the understanding that the last two were to unite in a single party. The P.S.I. was finally expelled from the conference in May 1949 when Nenni regained complete control at its Florence congress. Meanwhile in the democratic Socialist groups were drawing further apart, dividing on such questions as participation in the A. De Gasperi government, Italy's adherence to the North Atlantic treaty and secession from the Communist-dominated trade union centre, C.G.I.L. Saragat supported all three of these policies, whereas they were opposed not only by the Socialists' union but also by the centre and left of his own party. Thus he just failed to obtain a majority for his position at the January congress of the P.S.L.I. in Milan. When however, in defiance of this congress decision, he later committed his party to all three policies by a series of faits accomplis, many of his opponents left the P.S.L.I., leaving him with an easy majority at the further P.S.I. congress at Rome in June. Meanwhile a further group of Socialists led by Giuseppe Romita left the P.S.I. after Nenni's victory in Florence. Under arbitration by the International Socialist conference this group, the so-called "Autonomists," joined the Socialists' union and the P.S.L.I. in setting up a Unification committee to organize a congress in Florence from Dec. 4-8, at which all three groups were to form a single party, the P.S.U. On Oct. 31, fearing that his opponents would have a majority in the Unification congress, Saragat withdrew the P.S.L.I. both from the unification negotiations and from the government and announced that he would hold an extraordinary congress of the P.S.L.I. at Naples in Jan. 1950. This unilateral rupture caused a revolt of the centre and left groups inside the P.S.L.I., which attended the Florence congress in December and formed a new party, the P.S.U. (Partito Socialista Unitario), together with the Socialists' union and the "Autonomists." Comisco admitted the P.S.U. to membership of the International Socialist conference on Dec. 11 and warned the P.S.L.I. that it might be expelled if it did not choose to form a single party with the P.S.U. These interventions of Comisco were strongly criticized by the right-wing press in Italy. In particular, the British Labour party was accused of abusing its position in the International Socialist conference to forward the interests of the P.S.U. At the same time Comisco was fiercely attacked by the Cominform as attempting to split the unity of the working class.

The third intervention of the International Socialist conference was directed at uniting the various Socialist exiles from eastern Europe. These were divided into two main groups—the Bureau International Socialiste with its headquarters in Paris, consisting of Polish, Yugoslav, Rumanian, Bulgarian and Hungarian Socialists that had made no attempt to compromise with the Communists in their countries after 1945 and a group mainly located in London consisting of Czech and Hungarian Socialists that had left eastern Europe only after their attempts to work with the Communists had ended in the liquidation of their parties. Under arbitration by the International Socialist conference these two groups held a joint congress in London in July at which they agreed to establish a single union, through adherence to which they would become associate members of the International Socialist conference. This union contained not only the Socialist parties of Poland, Czechoslovakia, Hungary, Bulgaria and Yugoslavia, but also the Socialist parties of the Baltic states and the Ukraine. But only the first five parties were admitted to the conference. In addition to general mediation, the International Socialist conference attempted unsuccessfully to reconcile opposing Socialist groups from Hungary led by A. Ban and K. Peyer, and Rumania led by E. Gherman, S. Voinca and Iancu Zissu.

Besides E.L.D. the P.S.U., and the exiles, two new parties were admitted to the conference during the year—the Social Democratic party of the Saar and the Social Democratic party of Japan. The former was admitted as an observer only, on the understanding that its admission should not be held to prejudice in any way the future political status of the Saar (q.v.), as might be defined in the peace treaty with Germany. The Japanese Social Democratic party was the first Socialist party from southeast Asia to join the conference as a full member, though observers from the Indian Socialist party had attended previous meetings. Contact between European Socialist parties and the parties of southeast Asia and Latin America remained fragmentary except for the exchange of publications. An attempt by the Indian Socialists to establish a regional Socialist group in southeast Asia was similarly defeated by the obstacles of distance.

The main field of current policy discussed by the International Socialist conference was the movement for European unity. The full meeting of the conference at Baarn, Holland, from May 14 to 16 held a fruitful discussion in which the functional approach was supported by the British, Belgian
and Scandinavian delegates and the institutional approach by the French and Dutch delegates. The desirability of reconciling these approaches was generally agreed but attempts to do so at the Council of Europe in Strasbourg were not conspicuously successful. A public division appeared between the pragmatic Socialist parties enjoying power in Great Britain and Scandinavia and the more juridically minded Socialists of France, Italy and Belgium, all seeking in European union some escape from their impotent imprisonment in right wing coalitions.

This and previous failures to arrive at a common policy on current problems helped to bring about a shift in the function of the International Socialist conference. All parties agreed that, rather than attempt artificial reconciliation of fundamentally different national views, they should concentrate on exchanging their experiences in the technical problems of Socialist administration, and on free discussion between individual Socialist experts unhampered by a party directive. The aim of such exchanges should not be the promulgation of a mandatory doctrine but rather a general broadening of perspectives in all parties. In fact, in this phase of its work, the International Socialist conference should aim at much the same function as the Fabian society had fulfilled inside the British Labour movement.

The first of such meetings had been held in Dec. 1948 in Great Britain on the administration of nationalized industries. Further meetings were held at Bennekom, Holland, from March 14-18, 1949, on the international control of basic industry, and at Örenas, Sweden, from Sept. 11-16, on the problems of industrial democracy.

On Dec. 21 the sub-committee of Cominform published a lengthy reply to the resolution passed by the November meeting of the Cominform somewhere in Hungary (See COMMUNIST MOVEMENT). This reply quoted Communist spokesmen to prove that the Cominform was an agency of the Soviet state, and rejected the Cominform claim to represent peace, freedom and Socialism. The statement was the first public response of the International Socialist conference as such to Communist attacks on it, and might mark the emergence of the International Socialist conference as an active participant in the "cold war." (See also ELECTIONS; POLITICAL PARTIES, BRITISH.) (D. W. H.)

SOCIAL SECURITY, U.S. The year 1949 was marked by a record outlay on social insurance benefits and for public assistance. Some of the increase was due to the growth in population and number of persons working and to a rise in unemployment. Part reflected larger expenditure of federal funds for assistance programmes and part represented the normal growth in insurance programmes, especially federal old-age and survivors insurance. The year also registered progress in health and welfare programmes providing services rather than individual payments. Services for mothers and children were extended to new areas, and new programmes for children with special needs were initiated.

Amendments to the Social Security act that became effective in the latter part of 1948 partly accounted for increases that occurred during 1949 in assistance payments, as well as in the number of persons aided under the programmes for the needy, aged and for dependent children. Most states increased payments, although frequently the additional amount was not sufficient to close the gap between payments and living costs. For the country as a whole, the average monthly payment towards old-age assistance and aid to the blind was $5 higher in June 1949 than in the previous June and the average for each child receiving aid to dependent children was about $3 higher.

Two of the programmes under the Social Security act were designed to compensate for some of the loss of income which resulted when a wage earner reached retirement age or died (old age and survivors insurance) or became unemployed through no fault of his own (unemployment insurance).

Federal old age and survivors insurance covered, in general, workers in industry and commerce. It was financed through contributions of the wage earner and his employer, based on the worker’s wages from covered employment. The benefits were also gauged in accordance with his average taxable earnings. In Nov. 1949, monthly benefits totalling $55,319,000 were paid to more than 2,710,000 persons.

Similar payments were made during the month under other insurance or related programmes. Monthly retirement, disability and survivor benefits went to beneficiaries under the railroad retirement programme (367,100), veterans programmes (3,305,800), and the federal civil service system (161,600). Retirement and disability pensions went to some 230,000 state and local government employees and to the survivors of about 38,000 such employees who had died.

The disability payments mentioned above were the only public provisions for compensating wage loss due to a permanent disability that was not caused during employment. For a temporary disability of non-work-connected origin, public provisions were limited to the temporary disability insurance systems in effect in a few states and in the railroad industry. For work-connected disabilities—accounting for only about 5% of all disabling illnesses and injuries—federal and state workmen's compensation provisions were in effect.

Unemployment insurance under the Social Security act was a state-federal programme covering the same type of employment as federal old-age and survivors insurance. The benefits were financed by employer contributions but the federal government bore the cost incurred by each state in administering its programme. Benefits were paid to an unemployed worker who qualified on the basis of his previous employment and for whom suitable job openings could not be found. The amount of the weekly payment and the length of time the worker could draw benefits were determined by the provisions of the state law.

Protection against wage loss from unemployment was also available to railroad employees under the Railroad Unemployment Insurance act. In November, about $16,840,000 was paid to an average of 219,100 workers (average number in a 14-day period).

Assistance and Welfare. In Nov. 1949, almost 2,716,000 persons aged 65 or over were receiving old age assistance, at an average payment of $44.50 during the month. More than 1,486,000 children in 585,400 families were receiving aid to dependent children; the average payment was $29.12 per child and $73.93 per family. About 92,200 blind persons received assistance, at an average payment of $46.00.

Other needy persons who could not qualify under one of these special assistance programmes were cared for by general assistance, financed without federal participation. In November, general assistance payments went to 543,000 cases, at an average payment of $50.57 per case. The aggregate amount expended in the month for assistance in all four programmes from all sources—federal, state, and local—was $195,806,000.

The Social Security act also provided federal grants to states to help them extend and improve state and community services for mothers and children. Of the annual total of $22 million authorized for federal grants, certain portions of which must be matched by states, $11 million was for maternal and child health services, $7.5 million for services for crippled children and $3.5 million for child welfare services. (See also NATIONAL INSURANCE.) (A. J. A.)

SOCIETIES, LEARNED AND PROFESSIONAL. The learned and professional societies in the United Kingdom continued in 1949 to consolidate their position in
the life of the community after interruptions caused by World War II. It might be said of the majority of them that the period of reconstruction was completed and that they had returned as nearly as possible to normal working. It was not unnatural, however, that the general economic situation affected their programmes; the value of money restricting the scope of those which depended on subscriptions for their income and the choice of subjects for study and discussion being determined in part by the urgent need to consider topical questions affecting the present and future welfare of the world, the nation and the individual.

Among the many subjects which were considered during the year the most outstanding were those concerned with food and people. These topics were offered by the United Nations Educational Scientific and Cultural organization as the title of a theme for world-wide discussion of one of the most pressing of international problems, namely the feeding of a world population increasing at the rate of two million a year with a corresponding increase in the production of food. Additional interest was given to such questions in Great Britain by the publication of the report of the Royal Commission on Population.

A large proportion of the programme of the annual meeting of the British Association for the Advancement of Science at Newcastle-upon-Tyne during the first week in September, which was attended by 3,400 people, dealt with subjects which had a bearing on this theme. Thus an opportunity was provided not only for experts such as chemists, biologists, agricultural scientists, economists and so on to discuss what was being done and what more could be done to improve the position but also to focus public attention on matters which affected all. At the 14th International Veterinary congress, attended by 1,000 delegates from 53 countries, which was held in London (Aug. 8-13), the whole programme was based on this theme as it was thought by the organizers that the world food situation was the most important scientific and practical question of the day. Some aspects of this question were considered at the annual summer scientific meeting of the British Medical association at Harrogate, Yorkshire, and at the first International Congress of Biochemistry held at Oxford. One of the summer schools of the British Social Health council dealt with the family and the nation; the National Institute of Adult Education encouraged discussion groups on food and population problems; the Association of Applied Biologists held a conference on growth-promoting substances in agriculture and horticulture; and many others of the learned societies contributed directly or indirectly to consideration of this theme. Other significant problems in contemporary thought which received prominent attention among the activities of the learned and professional societies were those concerned with productivity in industry. Such problems included bridging the gap between scientific discoveries and their application, incentives to workers in industry, technical and other adult education, vocational guidance and so on. All these subjects were discussed by various groups of experts, including engineers, economists and psychologists at the meeting of the British Association. Individually they received attention also from such bodies as the National Institute of Industrial Psychology and the British Institute of Management which arranged conferences on single topics. At the close of the year, on Dec. 29, the many national bodies constituting the Conference of Educational Associations held a joint meeting on continued education for vocation.

In the two main fields so far mentioned the societies performed the important functions of assembling information and opinions from experts and, through publication and report, of helping to mould public opinion on questions of the day; but by far the greater proportion of their work during the year was unrelated to immediate practical problems, except in the case of those dealing with the applied sciences.

The principal topics which were dealt with by the learned societies included: modern advances in astronomy; atomic physics; the use of radioactive elements in chemistry and biology; oceanography (particularly deep sea exploration); control of insect populations; results from the development of new research techniques such as chromatography; developments in the design of internal combustion engines; recent fossil evidence with a bearing on the ancestry of man; techniques in education; ecology; and the preservation of nature.

During the year the British Council began work on a revised edition of the Year Book of the Learned Societies, an invaluable directory which had been out of print for ten years. The Scientific Film association announced in November that they were making a national survey of makers, owners and users of scientific films, with a view to compiling a comprehensive record of sources of supply and demand and of catalogues, lists and data sheets. In these and many other ways new beginnings were made in documentation. With further eaves of paper supply restrictions, which made possible larger issues of journals, delays in publication of new material were reduced. In May the Royal Aeronautical society produced the first issue of a new publication called the Aeronautical Quarterly.

At an Empire conference on scientific information held in 1948, one suggestion put forward for overcoming some of the difficulties of scientists, particularly those in distant parts of the world, in gaining access to published records of original work was to extend the practice of making photocopies. In the spring of 1949, the Royal Society made a declaration that it would regard certain copying from its own publications as "fair dealing" and invited all learned and professional societies to subscribe. By the end of the year about 100 societies had done so. It was thought that this expedient would assist the free flow of information without damage to the societies on such matters as copyright.

The 33rd annual exhibition of scientific instruments and apparatus arranged by the Physical society was held in London in April. It consisted of 150 exhibits and was visited by 13,000 people. A feature of the 1949 exhibition was the renewal of a competition in craftsmanship and draughtsmanship among apprentices and learners which had lapsed for several years. The 94th annual exhibition of photography arranged by the Royal Photographic society was held in the society's house in London in September and October. Pictorial and stereoscopic prints and transparencies were on view from Sept. 9 to Oct. 2; scientific and technical exhibits from Oct. 8-26. For this exhibition 5,300 entries were received of which 863 were accepted. From June 11 to 26 the first exhibition arranged solely for the Blind was staged by the Science museum in London in cooperation with the National Institute for the Blind. The exhibition covered a wide range of popular science and each of the exhibits had a special descriptive label in braille.

On March 7 the Royal Institution celebrated the 150th anniversary of its foundation by Benjamin Thomson (Count Rumford). A special evening discourse was delivered by Professor E. K. Rideal who retired at the end of the year from the post of resident director of the institution and was succeeded by Professor E. N. da C. Andrade. The 200th anniversary of the birth of Edward Jenner, the discoverer of vaccination, was celebrated on May 17 by the Wellcome Historical Medical museum, London. The Genetical society (in its 30th year) held its 100th meeting from June 30 to July 1, at Cambridge. To mark the occasion, guest speakers reviewed the early days of genetics and there were comprehensive
demonstrations of genetical work in progress in Great Britain. In celebration of the 100th anniversary of the birth of Ivan Pavlov, a series of lectures on appropriate subjects was delivered during October in the London Institute of Education under the auspices of the Society for Cultural Relations with the U.S.S.R.

An agreement designed to bring about a merger between the British Institute of Management and the Institute of Industrial Administration by two stages was signed in 1949. During the first stage, which came into effect immediately, the Institute of Industrial Administration, which had been in existence for 30 years and had a membership of 6,000 would retain its separate identity and its professional activities would continue unchanged; but its executive management, subject to the policy control of its own council, would be undertaken by the staff of the British Institute of Management. It was expected that the merger would be completed in the second stage by 1951 or 1952. During the year 1949, also, the National Institute of Adult Education was formed by the amalgamation of the National Foundation for Adult Education and the British Institute of Adult Education. At a meeting of the British Dental association at the end of November it was resolved to unite the dental profession by forming a single representative association by amalgamation of separate organizations of which the other main one was the Incorporated Dental society. On April 14, the Royal Institute of Chemistry was granted a new charter which made it clear that the institute was concerned with the whole profession of chemistry and not merely that of “analytical and consulting chemistry” as stated in the original charter of 1885.

The principal awards of the main learned societies included the following:

Royal Society: Royal medals to Sir George Thomson for distinguished contributions to many branches of atomic physics and to Professor R. A. Peters for biochemical researches; Copley medal to Professor G. C. de Hevesy for work on the chemistry of radio-active elements, Davy medal to Professor A. R. Todd for studies and achievements in organic chemistry; Sylvester medal to Professor L. J. Mordell for researches in pure mathematics; Hughes medal to Professor C. F. Powell for work on nuclear particles.

Linnean society: Linnean medal to Professor D. M. S. Watson.

Institution of Civil Engineers: James Alfred Ewing medal to Sir I'dward Appleton.

Royal Aeronautical society: Gold medal (the premier award) to S. Cannon, for design and development of fighter aircraft.

Royal Astronomical society: Gold medal to Professor S Chapman for contributions to geophysics and solar physics.

Institution of Mechanical Engineers: James Watt medal to Dr. Frederik Lungstrom of Sweden for work on the development of the steam turbine.

Zoological society: Gold medal to Henry G. Maurice for general service to the society. This medal had been awarded only three times previously since the foundation of the society in 1877.

Physical society: Duddell medal to Dr. E. H. Land, inventor of poloroid.

(D. N. L.)

SOIL CONSERVATION. Public statements on soil erosion during 1949 tended to avoid extravagant stories of the amount of damage being done and to concentrate upon the more constructive view of what had been and was being achieved to counterbalance the known losses from sheet erosion and gullying due to water action and from erosion by wind. The direct connection between the loss of cultivable land through gullying, decrease in productivity of cultivated land through sheet erosion and formation of shifting sand dunes and the world's food supply was, however, stressed. Out of a total land area of 35,700 million ac. less than 4,000 million, or about 10% of the whole, was actually cultivated and this again was allocated partly to industrial crops so that the food producing area averaged 1\(^2\) ac. per head of world population. Given yields similar to those of Great Britain this would be enough, but the average in most countries was very much less. Thus, with spectacular increases in their population, Asia and Africa faced increasingly heavy deficits of wheat and rice. Every country would have to try to stop erosion losses, make existing fields more productive and bring into some form of production land now lying idle.

In most countries of Asia and Africa marginal land was being ruined, not by ploughing, but by over-grazing by useless village herds. India possessed 300 million head of cattle out of which at least 80 million were surplus and formed a heavy drain upon available fodder. An even worse burden was the huge herds of goats which were largely responsible for the desiccation and spread of desert conditions in India, Pakistan, Baluchistan, Iraq, Persia and many parts of Africa. As this type of land was more used for grazing or ranching than for field crops, the study of grassland improvement was being taken up in many countries. In South Africa over 100 types of veldt were recognized. Crested wheat grass originating in the U.S. S.R. was now widely used in Canada and the United States. Australia took grasses from many other countries to build up suitable strains by selection and cross-breeding, but lack of seed in many arid grasses was a handicap. The need for a Commonwealth research station to deal with arid and semi-arid grass types was emphasized by Sir John Russell (g.v.) in his presidential address to the British Association at Newcastle in Sept. 1949. A great need was for leguminous plants which could serve as pasture improvers in semi-arid conditions in the same way as clover and lucerne had already done for monster regions.

In Australia large tracts of previously infertile land were improved by the application of only a trace of rare soil constituents such as zinc, copper, iodine and boron, to whose absence the infertility was due. Soil barrenness was investigated in the Cawthron institute, New Zealand, and by the Swedes at Svalof, their plant breeding station in southern Sweden.

The reclamation of badly gullied land by means of bulldozers and similar mechanical equipment was demonstrated in the Rawalpindi uplands of the West Punjab where waste land was reclaimed partly for fields and partly for the afforestation of land too steep to terrace economically. For average slopes terracing cost Rs 100 an ac. but where the land was very badly gullied or the slope was up to \(8\%\), the cost rose to Rs. 150 or 200 an ac., the Pakistan rupee being worth 9.2 to the £ sterling at the end of 1949. The making of water ponds formed an integral part of this catchment planning but due to local conditions and a lack of adequate proportionate means management was apt to be neglected if the plough bullocks had to go far for water in the hot season. Ploughing of fallow between storms was essential if field surfaces were to be kept absorbive.

The provision of water ponds similarly formed a prominent part in the mechanized land reclamation done by the Overseas Food corporation in northern Queensland and by the Sudan Plantation syndicate. The ambitious groundnuts scheme for developing 3,250,000 ac. of savannah land in Kenya and Nyasaland got off to a bad start owing to causes such as lack of machine spares and to cultivation attachments for ploughing and sowing being unsuitable for the jungle clearance which had to be done before crops could be sown. There was also a danger that complete clearance of jungle vegetation, although an advantage through ensuring freedom from tsetse fly, would eventually lead to serious erosion and
desiccation through lack of windbreaks or shelterbelts. The social side of the problem was to provide enough supervision with an expensive and thinly scattered European staff during the interval until enough capable Africans could be found and trained up to hold supervisory posts.

An example of wind erosion was seen in the Mianwali Thal, a desert district of the West Punjab now being opened up with irrigation from the newly finished Daud Khel barrage across the river Indus. The rainfall was about 8 in. and very erratic and unreliable, and for the previous 30 years the old desert scrub jungle which held the sandy surface had been destroyed by opportunistic ploughing of the sloping ground to produce an unirrigated crop of gram (Phaseolus mungo). As a result the irrigation farmers who included many groups of ex-service men were faced with land which was now largely shifting sand dunes of from 3 to 15 ft. high and moved around by every storm. Storms in May 1949 not only blew plants out of the ground but also blew away many of the water channels. The cure for this lie in planting hedges as windbreaks round every holding and thicker belts of trees along the banks of all distribution channels.

The U.S.S.R. had announced in Oct. 1949 a new project in which shelterbelts were to be planted along the lower reaches of the Don, Donets, Volga and Ural rivers as an essential step towards preventing droughts such as had hit the Volga basin 20 times in the previous 63 years. Sandy areas were to be afforested, and crop rotations made compulsory in ploughland. A prominent item was again farm ponds of which 44,000 were planned.

Figures of the erosion incidence in New Zealand were published in the Geographical Magazine (London, Sept. 1949) in which C. R. Stanton showed that a quarter (15,244,000 ac.) of the total country was already suffering in the following proportions: minor land-slips, 3,200,000 ac.; major slips and torrents, 6,163,000 ac.; wind eroded, 4,557,000 ac.; sheet eroded, 1,324,000 ac. The Soil Conservation and Rivers Control act passed in 1941 worked through local catchment boards which were small groups of officials and non-officials authorized to enforce this law.

Technical knowledge about the way to control erosion was summarized by the United Nations which held a conference on the conservation of natural resources at Lake Success, New York, in Aug. 1949. Papers prepared by British and other workers in the tropical and more backward countries tended to prove that the social and administrative difficulties were much worse than the purely technical problem of stopping erosion. The smallness of individual holdings prevented effective contouring but consolidation of holdings was a lengthy legal process. Collective farming was a difficult matter to introduce amongst primitive or individualistic people who had no previous experience of working on a co-operative principle. Again the local land revenue or taxation authority in charge of village records had no enthusiasm for work which would wreck his own book-keeping system and deprive him of his customary payments. A further difficulty was that common land was nobody’s business; the commons in most countries were in poorer condition than they ought to have been, but it was difficult to alter legally admitted grazing rights.

From a technical point of view, it was advisable to tackle each single river from top to bottom of its catchment, starting with the forest protection of the mountain ranges concerned and working downhill to the plains, applying every conceivable remedy no matter to what use the land was being put. In practice national boundaries often defeated this. A notable example of co-ordinated work of this sort was seen in the Rhine Control commission, under whose direction counter-erosion work had gone ahead in Switzerland and Austria through both World War I and II. The creation of new national boundaries might raise fresh difficulties: for instance the occupation of Kashmir by India might prevent the co-ordination of control in the great Punjab rivers all of which have their catchments in the high Himalayas in and around Kashmir; the Indus, Jhelum, Chenab and Ravi were all affected, and even some of the smaller torrents of Jammu province of Kashmir are two miles width of sand at the point they enter the West Punjab. Expensive and vital irrigation works are therefore very vulnerable and the drawing of a new political boundary may greatly complicate the administration of water resources.

United States. During 1949, about 115,000 new soil conservation farm plans, covering more than 32 million ac. were prepared by Soil Conservation service technicians working with farmers and ranchers in soil conservation districts. More than 22 million ac. were given complete conservation treatment, and 26 million additional acres were covered by detailed conservation surveys. By July 1, a total of 740,000 farms covering 202 million ac. had been planned for conservation treatment and use. Complete conservation plans were in use on 668,322 farms totalling 185 million ac.

Throughout the country, in co-operation with the experimental stations of all states, and also in Puerto Rico, the Soil Conservation service carried out many research investigations in specific areas. Outstanding results were reported in the use of legumes in combination with stubble mulching on arable land in Washington and Idaho. Grass and legume cover crops were used in southern Californian vineyards to control wind erosion and sand drifting, and there was an increase in the use of organic matter on the tobacco lands of Maryland and North Carolina. The extension of disc-pitting principles as a method of seed-bed preparation, formerly developed in Wyoming, to the range lands of Arizona, resulted in the highly successful establishment of grasses in arid regions.

Fourteen more states began schemes for the improvement of wild life habitation, in co-operation with soil conservation authorities. Thirty-five states were engaged on similar schemes in 1949. The state wild life agencies supplied planting stock, seeds and fencing materials to carry out those provisions of farm conservation plans prepared by farmers and the Soil Conservation service which affected wild life preservation.

An important aspect of the soil conservation programme was the distinct trend towards grassland farming in many districts. Completed conservation farm plans called for nearly 13 million ac. of range and pasture seeding, more than 87 million ac. of range and pasture improvement and large quantities of grass seed for use in crop rotations. Seed of scientifically tested conservation grasses continued to be in short supply, and for this reason the resources of the Soil Conservation service and hundreds of soil conservation districts were utilized to obtain larger amounts. The greatest success achieved was in the harvesting of native grass seed from farm plots in northeastern Oklahoma and Texas. More than 5 million lb. of the seed of native tall grasses and mid-season grasses were harvested on these farms. The bulk of the harvest consisted of the bluestem, Indian grass and switch grass. These were the best known varieties for planting in areas subject to wind erosion. Tall grasses with a greater yield were also in demand for conservation plantings in northern and southeastern states, where efforts were made to increase seed supplies of orchard grass, brome grass, timothy and the newly developed Kentucky-31 fescue or Suter’s grass. The Great Plains Agricultural council reported that by July 15, 1949, more than 10.2 million ac. of formerly cultivated land in the Great Plains had been returned to grass.

Active flood control projects were carried out in 11 major watershed areas by the Soil Conservation service in co-operation with farmers and ranchers during 1949. The areas
concerned were: the Little Siouxs in Iowa; the Yazoo and Little Tallahatchie in Mississippi; the Coosa in Georgia; Buffalo creek in New York; the Trinity and Middle Colorado in Texas; the Los Angeles and Santa Ynez in California; the Washita in Oklahoma and Texas; and the Potomac in Virginia, Maryland, Pennsylvania and West Virginia. Flood control surveys also were under way or completed in 59 other watershed areas, and plans had been prepared by Soil Conservation service technicians for 450 sub-watersheds. Heavy winter snows provided an outstanding test of the value of windbreak plantings in the Great Plains, and this combined with a wider use of mechanical tree planters stimulated widespread planting in the autumn of the year. In the heart of the blizzard area, belts which had been properly planted and cared for not only kept snow from drifting over roads and around farmsteads, but served in trapping snow for moisture storage in the soil. About 1,300 mi. of field windbreaks were planted in soil conservation districts in the fiscal year 1948-49. This brought the total length of windbreaks planted in accordance with soil conservation planning since 1942 to approximately 7,000 mi. Eighty million trees were used in planting them.

*Philippines.* The Division of Soil Survey and Conservation, Department of Agriculture and Natural Resources, completed a reconnaissance survey of the erosion problem. The survey showed that of the 29,094,000 ac. of open and cultivated land in the Philippines, about 10 million ac. were subject to severe erosion; about 12-4 million ac. were subject to all stages of erosion; and nearly 7 million ac., largely rice paddies, were either not eroded or only slightly eroded. A total of 2,277,000 ac., mostly land farmed by shifting cultivation and abandoned, should be reafrested to save it from destruction by flooding and other damaging processes. During the year, the Division of Soil Survey and Conservation established the first soil conservation demonstration farm at San Ildefonso, Bulacan. (See also Floods and Flood Control; Meteorology.) SONGGRAM, LUANG PIBUL, Thai army officer and statesman (b. Bangkan, Thailand, July 14, 1897), prime minister of Thailand from April 1947. (For his early career see Britannica Book of the Year 1949.) On the reshuffle of his cabinet in June 1949, Marshal Pibul continued in office as prime minister, taking also the Ministry of Foreign Affairs from Prince Prdi Debyabongs Devakula. On the resignation of the minister of finance, Prince Virat Jayanta, in October, Marshal Pibul took charge of the finance portfolio, transferring foreign affairs to Nai Pote Sarasin who had been deputy minister of foreign affairs.

SOULBURY, HERWALD RAMSBOTHAM, 1st Baron, of Soulbury, Buckinghamshire, British politician (b. March 6, 1887), was educated at Uppingham school and at University college, Oxford, and in 1911 was called to the bar. From May 1929 he sat in the House of Commons as Conservative member for Lancaster until 1941 when he was raised to the peerage. He was parliamentary secretary to the Board of Education, 1931-35; parliamentary secretary to the Ministry of Agriculture and Fisheries, 1935-36; minister of pensions, 1936-39, and first commissioner of works, 1939-40. In April 1940 he was appointed president of the Board of Education and from July 1941 until July 1948 he was chairman of the Assistance Board. In 1944 he was appointed chairman of the Ceylon commission which made proposals that led to the granting of dominion status to the colony. On Feb. 4, 1948, Ceylon became a dominion and in July 1949 Lord Soulbury succeeded Sir Henry Moreton-Mason Moore as governor general. He arrived in Ceylon on July 6 and was sworn in by Sir Arthur Wigneyewardene, the chief justice and acting governor general. On July 12 he delivered the speech from the throne at the opening of the third session of the Ceylon parliament. Members of the House of Representatives and the Senate paid tribute to him for the part he had played as chief architect of the constitution which had brought dominion status to Ceylon. Replying to an address by the mayor of Kandy on Aug. 9 he made his first speech in Sinhalese. He was appointed to the privy council in 1939 and was created a G.C.M.G. in 1949.

SOUTH AFRICA, THE UNION OF. A self-governing dominion of the Commonwealth of Nations. The four provinces of which it consists extend from the southernmost point of the African continent to the Limpopo river in the north. The total area of the Union is 472,550 sq. mi. and the total population was estimated in 1940 at 10,341,200, divided between the provinces as follows:

Official languages (European pop., 1946): Afrikaans (55-9%), English (39-9%). Religions: (European pop., 1946) Christian 95-5%, (Dutch Reformed Church 55%, Anglican 19-1%, Methodist 6-1%, Presbyterian 5-1%, Roman Catholic 5-1%, etc.), Jewish 4-1%; (non-European pop., 1946) Christian 51-1%, no religion 44-1%, remainder Hindu, Moslem and Buddhist. Chief towns (pop., 1946 census): Capetown (q.v.) (seat of legislature, 454,052, including 220,398 Europeans); Pretoria (seat of government, 236,367, including 130,180 Europeans); Johannesburg (q.v.) (727,743, including 332,026 Europeans); Durban (357,904, including 130,143 Europeans); Port Elizabeth (168,231, including 65,271 Europeans). Governor general, Major Gideon Brand van Zyl; prime minister and minister of external affairs, Dr. Daniel François Malan (q.v.).

History. The year 1949 was notable for political controversy, racial feeling, economic difficulties and financial stringency in governmental, commercial and industrial circles. Large parts of the country also suffered from severe drought conditions, especially eastern Cape districts. The Union parliament met on Jan. 26 and remained in session until early July. When introducing his budget in March, N. C. Havenga, the minister of finance, emphasized that the Union must live within its means. Expenditure for the
financial year 1949-50 was estimated at £140 million. A 20% surcharge on both income and supertaxes was imposed. The estimated deficit for the year was £2.4 million, as against a surplus for the previous year of £7.5 million. In April the prime minister attended the Commonwealth conference in London, dealing with the proposed change of status of India in the Commonwealth of Nations. Before his departure Dr. Malan emphasized that South Africa had no desire to become isolationist and, after his return, stated: "In the life of the present parliament, elected at the last general election, we shall take no steps to establish a republic." It was clear, however, from the debate which followed his speech, that a number of his adherents did not share his views.

In June two controversial measures were passed, the Citizenship act and the Mixed Marriages act. The former, ostensibly introduced in order to regularize the position of South African citizens consequent upon the new Commonwealth status, in effect disfranchised about 45,000 recent settlers, who had emigrated to the Union in the belief that they would enjoy full rights of citizenship after two years of residence. The bill, which was forced through both houses in only 12 days, partly by compelling the Senate to accept it as an urgent measure, became effective, despite countrywide opposition, on Sept. 2. In future, British and other Commonwealth immigrants to South Africa, would have to wait five years for citizenship and settlers from other countries six years. Even then their admission to citizenship would be entirely dependent upon the approval of their registration by the minister of the interior, who might refuse citizenship without assigning any reason.

The Mixed Marriages bill was introduced to make illegal all marriages between Europeans and people of other races. Public opinion, it was pointed out by the opposition, had already reduced these unions to no more than 77 out of 28,385 marriages in 1946. The application caused embarrassment and criticism.

In August the cabinet was reconstructed and the portfolios re-apportioned; though bilingual, none of the cabinet members regarded English as their mother tongue (see Cabinet Members).

Amid much rejoicing, on the part of the Afrikaans-speaking section, the Voortrekker memorial outside Pretoria was unveiled on Dec. 16, Dingaan's Day.

Native Affairs. Relations between Europeans and the other races of the Union deteriorated during the year. In January the Natives Representative council was dissolved. This body had not, in any event, met for two years. The secretary for Native affairs made it clear that the government was not prepared to abolish discriminatory legislation, nor to give the council any executive authority over the development of the Native reserves or the finances of Native councils. It was, however, prepared to consider any reasonable suggestions for co-operation between the white and black races. Its intention was to encourage and develop the local council and Bunga system throughout the Union, with due regard to the ethical and tribal situation of the several Native peoples.

Considerable time was occupied in parliament and elsewhere in discussion about the three European who represented the Natives in the Cape province in the House of Assembly; the coloured voters on the electoral rolls of Cape constituencies and the question of “apartheid” or segregation. The opposition maintained that Native representation was enshrined in the so-called “entrenched” clauses of the South Africa act, virtually the constitution of the country. It was
argued by government supporters that the statute of Westminster and other inter-Commonwealth developments had rendered the requirement of a two-thirds majority of both houses of parliament to change the constitution, as laid down in the act, no longer necessary. A simple majority decision in both houses separately was all that was needed. It was suggested the Senate was the best place for Native representatives to sit. The opposition contended that nothing had occurred in inter-Commonwealth relations which entitled the Union to alter its constitution in a matter so vital to peaceful racial co-operation, without carrying out the safeguards laid down in the act. The government gave notice of introducing legislation, along their own lines, early in 1950. The outcome would depend, to a considerable extent, upon the attitude of N. C. Havenga and his Afrikaans party, which held nine seats in the House of Assembly: Havenga had shown himself, during the 1949 session, more inclined to abide by the constitution than his other colleagues in the cabinet.

To ascertain the effect of taking the coloured voters off the mixed rolls in the Cape, enquiries were instigated during the latter part of the year in a few constituencies. So embarrassing were the questions as to racial descent, even among government supporters, that the investigation had to be self-pedalled. So far as "apartheid" was concerned, the issue upon which the Nationalist government was really returned to office, its precise definition remained elusive. Certain minor measures were adopted, in addition to the insistence that separate carriages should be reserved for Europeans only on Cape suburban trains; segregation was intensified in both railway stations and post offices; and, in the Government's economy drive, many minor Native servants of the state were dismissed only to be replaced by Europeans. Dr. W. W. M. Eiselen, an exponent of "apartheid," was appointed secretary for Native affairs in October, against the recommendation of the Public Service commission, which had advised that the next senior civil servant should succeed to the position.

While parliament was still in session Dr. A. J. Stals, then minister of education, said that grants to enable Native children to obtain meals at school would be withdrawn. The opposition to this measure was so intense that it was subsequently modified. Although two conferences were held on the question of Native housing, for which there was an estimated demand for close on 300,000 dwellings, little was settled. The municipalities, with some justice, claimed that they were in no position to finance the vast schemes required. Industry, on the other hand, showed extreme reluctance to pay any subsidy toward housing their Native employees, without whom their factories could not function. Meanwhile there were at Cato Manor, near Durban, at Alexandra township, outside Johannesburg, and at many other places within the Union, bordering the main industrial centres, shanty dwellings with little sanitation, overcrowding and all the other evils of bad housing, far below decent 20th century standards. Coupled with bad housing conditions wages for Native workmen were below proper subsistence level to such an extent that malnutrition, tuberculosis and venereal disease were rampant in many districts.

So serious were the results of this situation that, on facts given by C. R. Swart, the minister of justice, Communism was said to be increasing its adherents among the Native population at an alarming rate. Bad feeling on the whole position of the Natives resulted in serious riots with loss of life at Durban during January and minor disturbances took place at Johannesburg, Krugersdorp and Randfontein later in the year.

Economic Position. The most important events during 1949, in the economic sphere, were the ban on imports, owing to the shortage of both sterling and dollars, and devaluation. Strict import control was imposed and certain goods were completely banned because South Africa had spent more than it could afford abroad. At the same time, after the Nationalist government took office, much capital left the country; nor had it proved easy for the Union later to raise any large loans either internally or from Great Britain or the United States. Devaluation immediately made the situation with regard to South African goods, whose output was appreciated some £40 million overnight, and many of the mines, regarded as marginal producers, began to show increased profits. Another consequence was the payment of 15% higher wages to mine workers in the gold and coal industries. These increases had long been due but the position of the mines hitherto had made any rise impossible. On the debit side was the increased price for petrol and white bread.

The ban on imports, besides hitting commerce adversely, also struck at Union industries importing raw materials. Shortage of ready money affected the building industry, many workers becoming unemployed. Although carrying record quantities of goods the South African railways showed steadily mounting losses at the rate of £4 million a year, not the least of these accidents, the worst in the history of the Union, was the one at African railways, at Orlando and Waterval Boven, caused much loss of life.

W. R. G.

Economy.

State schools (1947): Primary schools 1,190 (European 1,110), pupils 115,368 (European 92,291), teachers 3,927; high schools 241, pupils 75,339 (European 65,232), teachers 3,122; Mission schools 3,036, pupils 386,054, teachers 9,421; other schools 99, pupils 3,031, training institutions 12 (European 9); pupils 3,790 (European 874), teachers 218; Private schools (1947): Kindergarten schools 92; primary schools 773; secondary schools 114; commercial and business schools 19; other schools 10. Pupils at all private schools 73,787 (European 36,500). Technological colleges (1946) 11, students 1,000; technical institutes 2,063, students 1,175; universities (1948): 5, with professors 19,994, and lecturers 1,743.

Agriculture and Fisheries. maize 1,800; wheat 477; oats 87; barley 43; rice (milled equivalent) 17; potatoes 303; groundnuts 74; sugar (raw value) 333; tobacco 18-6; raisins 5; currants 1-0; oranges and tangerines 180; grapefruit 16; lemons 4. Livestock (in '000 head): cattle (Aug. 1946) 12,593; sheep (Aug. 1946) 30,182; pigs 1,194; horses (1946) 687; chickens (Aug. 1947) 9,194. Wool production (in '000 metric tons, on greasy basis, 1947-48; 1948-49 in brackets): 93 (99).

Industry. Industrial establishments 11,886; persons employed 51,796. Major industries: Value of manufactures (1948): iron and steel 1,361 (1,163); coal 23,558 (11,908); electricity (in million kwh.) 9,259 (4,778); raw materials (in '000 tons): iron and steel 194,858, 194,938; copper and nickel 194,856, 194,935; copper, zinc, lead and silver 194,858, 194,935; coal 5,585 (5,742). Diamond output (in '000 metric carats, 1948), 1,382, cement (in '000 metric tons, 1948), 1948, 25,000, in brackets 1,308 (643). Employment in manufacturing, including building (index on base 1937-100, 1948; 1949, six months, in brackets 1,156 (162).

**SOUTH AFRICAN LITERATURE.** English.

Though the output of books during 1949 was considerable there was a notable dearth of first rate imaginative literature. Of greatest merit was *Face to Face* by Nadine Gordimer (Johannesburg), short stories in the modern mode, subtly conceived out of a sensitive perception of the South African scene. Herman Charles Bosman presented with realism the intimate lives of long-term convicts in a South African gaol, in *Cold Stone Jug* (Johannesburg). *African Dawn by Langwill Hunter (Lovedale)* told a sympathetic tale of modern Bantu life. Bantu history provided a subset for Oliver Walker's *Proud Zulu* (London), a spirited tale of the fall of the Zulu people under Cetewayo and his white chief, John Dunn.

Historical literature included two important books by Sidney R. Welch: *South Africa under John III, 1521-1557*, and *South Africa under King Sebastian and the Cardinal (Capetown)*, the fruits of original research in Portuguese and other sources. There were also biographical works of historical and political interest: Sir James Ross Innes' *Autobiography* (Capetown), *Memoirs and Reminiscences vol. 2* (Capetown) by Sir John Gilbert Kotze, and *The Life and Times of Daniel Lindley* (London) by Edwin W. Smith. Eric Rosenthal's *African Switzerland* (Capetown) was a lively book of travel, history and comment about Basutoland.

The authoritative and comprehensive *The Sotho-English Dictionary* by J. B. I. Smith (Capetown) and *Farming Practical and Scientific* by John Fisher (Durban) were the most outstanding books of scientific interest. (L. H.MN.)

**Afrikaans.** Since 1932 lyric poetry had dominated Afrikaans literature, and 1949 was no exception. D. J. Opperman's *Joernaal van Jorik* was a long narrative poem which confirmed the impression made previously by this winner of the Academy award for poetry. A volume of poems by Uys Krige, *Hart Sonder Have*, broke new ground with the publication of poems in both official languages of the Union of South Africa. A long narrative ballad by I. D. du Plessis Ballade *van die Eensame Seenan*, was favourably received.

The growing demand for translations of the classics was met by a number of works including Edgar Allen Poe's *Tales of Mystery and Imagination* and Stevenson's *Dr. Jekyll and Mr. Hyde*, published by the *Afrikaanse Kulturele Leserskring*.

Critical essays were well represented by a work on modern poetry, *Die Duister Digter* (Grové). Prose output of quality was scanty and best represented by *Die Eindelone Waagstuk* by M. E. Rothmann, whose clarity, maturity and sincerity of purpose were a major contribution to this section of Afrikaans literature in the 1939-49 decade. (I. D. Du P.)

**SOUTHERN RHODESIA.** A self-governing African colony in the Commonwealth of Nations, with imperial government supervision over Native rights. Area: 150,333 sq. mi. Pop. (Aug. 31, 1949, est.): 82,021,900 (European 115,500; African 1,898,000; Asiatic 3,400; mixed 5,000). Chief towns (1949 est., Euro: 3,750 (and 32,000); Bulawayo (28,000); Umtali (4,200); Gwelo (4,000). Languages: English, Afrikaans and Native tribal languages. Governor, General Sir John Noble Kennedy; prime minister, Sir Godfrey Huggins.

**History.** Politically it was an uneventful year. The United party lost the only by-election held in 1949, being defeated by the Rhodesia Labour party candidate in Bulawayo district. A Liberal party candidate was second. The prime minister headed a delegation to a meeting with non-official representatives of Northern Rhodesia and Nyasaland at the Victoria Falls under the chairmanship of Sir Miles Thomas to discuss federation of the three territories. A resolution in favour of "a constitution which will create a federated parliament with such powers as are surrendered to it and which will not affect the other powers of the governments of member states" was passed on Feb. 17. The constitution would be modelled on that of Australia. Commenting on the proposal, the secretary of state for the colonies said in London that His Majesty's government had a special responsibility for Africans and pointed out that no African took part in the conference. During the visit of the secretary of state to Northern Rhodesia, Sir Godfrey Huggins flew to Lusaka to discuss federation and financial matters. Philip J. Noel-Baker, secretary for Commonwealth relations, after consultations in December with T. H. W. Beadle, Rhodesian minister of internal affairs, recommended further investigations of the problem between the parties concerned.

The minister of finance, E. C. F. Whitehead, headed a delegation to London to present to the British government the colony's four-year plan for loan expenditure and to ascertain whether British industry could supply capital goods for the production targets. He also attended the conference of Commonwealth finance ministers in London. The prime minister relinquished the portfolio for Native affairs.

A Royal commission on town-planning and a special research department for conservation works were established. Price control was removed from a wide range of commodities during the latter part of the year and permit control of building ceased except in Salisbury and Bulawayo.

British charges included a tax on undistributed profits, an increased duty on imported spirits, a higher surcharge on cigarettes, reintroduction of the 2d. rate for postage within the colony, doubling the rate of transfer duty on property valued at more than £20,000, an increase of 3d. per gallon on petrol, a tax on non-industrial Native labourers and an increase from 20% to 30%, in entertainment tax. A 20% export tax was imposed on Virginia flue-cured tobacco. This caused considerable controversy and was reduced to 15%. Later it was withdrawn in favour of a five-year loan of 15% of the proceeds of tobacco sales. Control over all financial transactions outside the sterling area was strengthened. The 34% development loan (1968-78) closed in March with total subscription of £6.5 million, and an issue of £1.8 million 3% Treasury bonds (1958) was offered.

A new peacetime establishment for the territorial force was approved comprising armoured cars, artillery, engineers, signals, two battalions of infantry and a medical corps. The annual defence force camp was attended by units from Northern Rhodesia, Nyasaland and Kenya.

Government assumed control of all base mineral exports. The old subsidy was modified to the advantage of low grade workings and was withdrawn when the pound was devalued. A bill was introduced to terminate within six years the mineral concessions granted to the British South Africa company without compensation; but this was amended to include compensation after six years. An agreement was completed with the Wanke Colliery company for the company to retain an area containing 350 million tons of extractable coal of anthracite quality. The estimated production in 1949 was over 2 million tons and plans were in hand to raise it to 3.5 million tons a year.

Sir William Halcrow visited the country to advise on the development of hydro-electric power in the Kariba gorge. The Industrial Development commission ceased in March. Central African Airways corporation had an accumulated loss of £280,000 in March 1949. The board of the corporation resigned and a new one was appointed. Immigration in 1948 amounted to 14,439, and for the first nine months of 1949 during which restrictions were in force, to 10,793. The cost of living index (1939 = 100) reached 153.

**Education.** (European 1949): schools, government primary 69, pupils 12,377, teachers 447; high 11, pupils 4,531, teachers 265; aided private 21, pupils 3,638; aided farm 13, pupils 195. *Assata and Mixed* (1949): schools government primary 12, pupils 1,774, teachers 60, aided 4, pupils 886 *Native* (1948) schools, primary 1,994, pupils
**SOUTH PACIFIC COMMISSION—SOVEREIGNS**

204,172, teachers 5,327 African and 204 European Teacher training schools 18

In the Pacific, fuel and power coal (in long tons) (1948) 1,869,000, (Jan-Aug 1949) 1,380,000, electricity (1948-49) 173 million units sold. Raw minerals gold (1948) 514,440 oz., (Jan-Aug 1949) 359,000 oz., asbestos (1948) 69,000 long tons, (Jan-Aug 1949) 53,000 long tons, chrome (1948) 254,000 long tons, (Jan-Aug 1949) 167,000 long tons.

**Agriculture.** Tobacco (Virginia, 1948-49) 81,714,317 lbs. Livestock (1948) cattle 2,821,000, sheep 301,000, goats 555,000, pigs 103,000, poultry (Europeans only) 510,000.

**Foreign Trade.** (Jan-July 1949) Imports 28,992,000, exports 15,578,000, re-exports £2,548,000.

**Transport and Communications.** (1948) Main roads 15,500 mi., including 2,500 mi. with tar-macadam strips. Railways 1,521 mi., passing through 2,936 sta., goods traffic 2,960,000, passenger traffic 15,578,000.

**Finance and Banking.** Budget (1948-49) estimated revenue £13,575,000, expenditure £13,546,000; (1949-50 est.) revenue £15,059,000, expenditure £16,400,962. National debt (March 1949) £75,380,359. Currency circulation (March 1949) £8,402,000 (including Northern Rhodesia and Nyasaland).

**SOUTH PACIFIC COMMISSION.** This is an advisory body, similar to the Caribbean commission (q.v.), which was set up by the agreement of 1947. It is designed to promote and develop international co-operation by improving the economic and social welfare of the inhabitants of the territories administered by its members: Australia, France, the Netherlands, New Zealand, United Kingdom and the United States. The geographical jurisdiction of the commission embraces all the non-selfgoverning territories in the Pacific which are administered by member governments and are wholly or partly situated south of the equator and east of Dutch New Guinea, including the latter. The agreement provides that the commission shall be assisted by two auxiliary bodies, the Research council and the South Pacific conference.

At its first meetings, held in 1948, the commission appointed its senior officers and the members of its Research council. It also decided to establish its permanent headquarters at Nouméa, New Caledonia. Early in 1949 the members of the Research council made a rapid tour by air of a number of the territories within the jurisdiction of the commission.

At the conclusion of the tour the council held its first meeting at Nouméa from April 30-May 9. At this meeting it drew up a broad research programme including the collection of information on or the study of the following subjects in the fields of health, economics and social welfare: epidemiological information; infant and maternal welfare; tuberculous; nutrition and diet; introduction of economic plants; copra, rice and cacao; pasture improvement; land use survey; fruit and vegetable grading; coral island and atoll crops; by-products of atolls; fisheries; diet and working tools of indigenous peoples; insect pests and weeds; credit facilities; world agricultural census; information on technical and professional training; wireless broadcasting and visual aids in education; literary training; conference of educators; review of work in social anthropology; survey of linguistic research; native co-operative societies; survey of building types; pilot project for developing a selected community; the preservation of archaeological sites.

The meeting of the Research council was followed by the third meeting, also held at Nouméa, of the commission itself from May 7-17. The senior commissioner for the Netherlands took the chair for the session. It approved the report of the Research council, embodying the above projects and calling for an estimated expenditure of £7,440 in 1949 and £35,275 in 1950. It accepted a report of its library committee that, within the existing resources of the commission, it should assemble and distribute bibliographical material on the region. It decided that the first South Pacific conference should open on or about April 24, 1950, at Suva, Fiji, and that the proceedings should be conducted in English.

The fourth meeting of the commission was held at Noulm4a in Oct. 1949.

SPAAK—SPAIN

SOVIET UNION: see Union of Soviet Socialist Republics.

SPAAK, PAUL-HENRI, Belgian statesman (b. Brussels, Jan. 25, 1899). (For his early career see Britannica Book of the Year 1949.)

Prime minister of a government formed from a Christian Social and Socialist coalition from March 19, 1947, he resigned after the election of June 26, 1949 (see Belgium).

After the formation of a Christian Social and Liberal coalition government by Gaston Eyskens (q.v.) on Aug. 10, the following day Spaaq was appointed minister of state by the regent.

Also on Aug. 11, at Strasbourg, he was elected president of the first consultative assembly of the Council of Europe. On Aug. 16, in Paris, he was succeeded as chairman of the O.E.E.C. by Paul van Zeeland (q.v.).

SPAIN. A country of southwestern Europe, bounded on the N. by the Bay of Biscay and France, on the W. by the Atlantic and Portugal, and on the S. and E. by the Mediterranean. Area: 194,915 sq. m., including Balearic (1,936 sq. m.) and Canary (2,802 sq. mi.) Islands (1949 census) 25,877,971 (Dec. 31, 1948 est.) 28,154,332 including Balearic (1940 census, 407,497) and Canary (680,294) Islands.

Languages: mainly Spanish (Castilian) but Catalan, Galician and Basque are also spoken. Religion: mainly Roman Catholic. Chief towns (pop., 1947 est. if not otherwise stated): Madrid (q.v.) (cap., 1949 est., 1,440,041); Barcelona (1949 est. 1,500,000); Valencia (562,967); Seville (382,013); Zaragoza or Saragossa (292,965); Malaga (277,582); Murcia (226,702); Bilbao (220,333). Leader (Caudillo), chief of state and prime minister, General Francisco Franco y Bahamonde (q.v.); history of foreign affairs, Don Alberto Martín Artajo.

In a press interview at the end of Jan. 1949, General Franco spoke of the United Nations as having been born in an atmosphere of passion and as having "employed Spain as a means of paying out appeasement money to the aggressors of the future." Until the international climate became more propitious, Spain was not interested in whether or not it was admitted to membership. Although a share in the European Recovery programme would naturally be welcome, it had made no approaches whatever in this sense, either direct or indirect, to the United States. Gibraltar, though now of little military value, would always, while it remained British, constitute a shadow in Anglo-Spanish relations. General Franco would make no statement about the prospect for a restoration of the monarchy and held out scant hope of an early return to parliamentary democracy.

The U.N. Security council approved on April 28 an Australian resolution for the appointment of a sub-committee to inquire into the complaint that the Franco regime had led to international friction and was a threat to international peace and security and to suggest practical measures for ending it: Australia, Brazil, China, France and Poland were chosen.

In May a motion to restore to member states (chiefly Latin American and Arab) to 16, with 16 abstentions but failed by four votes to get the necessary two-thirds majority in the full assembly, where the voting was 26 to 15, again with 16 abstentions, among them Great Britain, France and the U.S. The consulates general in Barcelona of Brazil, Peru and Bolivia, the three states which, with Colombia, had tabled the resolution, were simultaneously damaged by bombs on May 15. A Polish resolution proposing sanctions was lost by 6 votes to 40, 7 abstaining. Diplomatic relations between Spain and Venezuela had been renewed in April, when notes to the same effect were exchanged with Liberia.
General Franco (centre in light uniform) at a session of the Institute of Hispanic Culture in Madrid on Oct. 12, 1949, on the anniversary of the landing of Christopher Columbus at San Salvador in 1492. Oct 12 is celebrated as the Feast of the Hispanic Race.

On May 18, in a long opening address to the third legislative session of the Cortes in Madrid, General Franco accused Great Britain of having failed to keep promises made to Spain in 1941 that after the war she would further Spanish territorial claims in North Africa at the expense of France, and also alleged an Anglo-American intention in 1944 to open the second front in the Iberian peninsula, which was only defeated by "Soviet realism." General Franco stated that he was not greatly interested in the countries of Europe, which were driving Spaniards "in the direction where our heart impels us—to Hispano-America." But, "If our hearts lead us towards Spanish America, the force of reality impels us towards North America."

Authorized by the State Department in May to negotiate directly with the Export-Import bank for a government loan, Spain, represented by Andrés Moreno, director of the Banco Hispano-Americano, was reported to have asked in Washington for $1,250 million, or $400 million more than the bank's entire Treasury assets. The application was refused. President Truman said on June 2 that he did not favour a loan and, on July 14, with reference to a congress proposal to lend Spain $50 million of European Recovery programme funds, that "the U.S. was not on friendly terms with Spain." Dean Acheson, secretary of state, gave his opinion that Spain was "a poor credit risk." Earlier, in February, the Chase National bank of New York had granted a short term loan of $25 million, the first substantial credit advanced to Spain by a U.S. commercial bank for many years. Four-fifths of the loan was to go to buying the U.S. out of the Spanish telephone system.

A resolution calling on all affiliated organizations of the new International Confederation of Free Trade Unions to support the efforts of democratic and anti-totalitarian forces in Spain to end the Franco regime was approved unanimously at the confederation's first congress in London in December. The congress was opposed to the granting in the meantime of any assistance to Spain.

General Franco made his first state journey abroad when he visited Portugal for five days in October. (Marshal Carmona's visit to Spain in 1929 was to have been returned by King Alfonso in 1931: the fall of the monarchy in April of that year made this impossible.) The programme included military manoeuvres at Mafra and the conferring of an honorary degree at Coimbra. A meeting arranged with Don Juan, pretender to the Spanish throne, who was living in Portugal, did not take place, and reports spoke of a rupture. The Spanish government had been consulted by Portugal in March concerning the invitation to the latter to adhere to the North Atlantic treaty, such consultation being called for by the treaty of friendship and non-agression of 1939 and the protocol to this of 1940, and had intimated that it raised no objection. King Abdullah of Jordan paid a fortnight's visit to Spain in September. An official statement issued jointly by the foreign ministers of the two countries at the conclusion of the visit recorded complete agreement on the seriousness of the menace of Communism to world peace.

The statutes of the Council of the Kingdom created by the law of succession of July 26, 1947, were published by decree on Jan. 1. This supreme consultative body of 14 members—seven ex-officio (the president of the Cortes, the senior prelate in the Cortes, the senior captain general, the senior general in the Alto Estado Mayor of the forces, the president of the Council of State, the president of the Supreme Tribunal of Justice and the president of the Institute of Spain), four elected by the Cortes and three nominated by the chief of state, with the president of the Cortes as chairman—was to advise the chief of state in major matters of his exclusive competence such as the declaration of war or making of peace, the choice of a successor as head of the state, abdication of any kind, royal marriages and the depriving of royal personages of any rights of succession on grounds of lack of capacity or "notorious deviation from the fundamental principles of the state." On Feb. 28, anniversary of the death of Alfonso XIII in 1941, General Franco and his cabinet attended the official mass for Spanish royalty at the Escorial, whose monastery houses the royal pantheon.

In June, against a worsening economic background, he made a two weeks' tour of Catalonia; reports stated that he was seeking the co-operation of Catalan industrialists. A bomb explosion in Barcelona cathedral during the service attended by his wife and daughter caused no casualties. Elections for the provincial diputaciones were held on March 20, candidates being chosen partly from representatives of the town councils, partly from economic, cultural and professional corporations. New facilities for crossing the frontier with Gibraltar were announced in May.

Spain's internal economy suffered greatly from a drought even more severe than those of the two previous years, householders and public services being among those affected by the repeated and prolonged water and electricity cuts.
Catalan industry was particularly handicapped by the hydro-electric shortages, as too by reduced imports of raw cotton and other materials. Lack of fertilizers and tractors combined with the drought to weigh heavily on agriculture, the grain harvest falling short of consumption needs by 1-5 million tons. In the Canary Islands the summer was marked by a series of severe volcanic eruptions on La Palma: Streams of lava, which formed a substantial promontory in the sea, cut off an area in the south of the island and caused several villages to be evacuated. The shocks continued for six weeks, as many as 80 tremors being registered in one day.

National expenditure for 1950 was estimated in November at P.17,941 million and revenue at P.17,848 million. The raising of a loan was authorized to cover the deficit of P. 93 million. In a press interview General Franco stated that Spain’s internal economic needs were not great but that assistance was necessary for defence purposes. The first entirely Spanish-built transport aircraft made its trial flight in March in the presence of the air minister, General E. G. Gallarza. A new type of “articulated train,” the invention of a Basque military engineer, Alejandro Goicoechea, was on test during the summer after undergoing preliminary trials in the U.S. Normal speeds of 62 mi. per hr. and over were claimed for it.

The United Kingdom was again Spain’s best customer. During the first quarter of the year visible trade between the U.K. and Spain and its possessions totalled over £15-5 million, with a balance of nearly £9 million in favour of Spain. A new one-year trade programme between the two countries concluded in June envisaged some increase in value and an easing of conditions. Acceleration in the import of U.K. manufactured goods and in financial debt transfers was announced in December after further discussions of outstanding trading difficulties. An agreement was signed with Benelux countries in April for a trade exchange totalling some B.Fr. 1,500 million, Spain to receive electrical plant, rolling stock and heavy industrial equipment against Spanish manufactured goods and other products. A trade treaty was also concluded with Denmark in May; and in June the trade and payments agreement with France was renewed for a further year, French exports to include coal, phosphates, rolling stock and electrical plant. Following on the devaluation of sterling, Spain decided in October to maintain its parity with the $ at P.10-95, this giving a new rate of P.30-65 to the £ instead of 44-13.

Health department statistics published in March showed an increase in the population of Spain by almost 10 million since 1800 and of 2·2 million since 1940. Continuance of the latter rate of increase, which was due both to a rising birth-rate and to a notable improvement in the expectation of life, would show by 1957 a population more than double the 15·5 million recorded in the first full census of 1857.

The Republican “government in exile” was reconstituted in February, the “prime minister” being Alvaro de Albornoz; the president of the republic” was Martinez Barroso.

Among eminent Spaniards who died during 1949 were Santiago Alba, Liberal statesman under the monarchy and sometime president of the Cortes under the republic; Niceto Alcalá Zamora (see OBITUARIES), president of the republic from 1931 to 1936; Alejandro Lerroux (see OBITUARIES), radical leader and four times premier of the republic; Joaquin Turina (see OBITUARIES), the composer; and the painter Federico Beltrán Masé.

Agriculture and Fisheries. Main crops (in ’000 metric tons, 1948): wheat 3,266; barley 1,742; oats 550; rye 508; maize 560; potatoes 3,000; rice 272, cottonseed 12; sugar, raw value, 265; cotton, ginned, 6; wool on greasy basis, 35; tobacco (leaf) 13.9. Olives (in ’000 metric tons 1947) 4,750; oranges and lemons (in ’000 metric tons, 1947) 2,257; rice (in ’000 metric tons, 1947) 6,110 (2,453) Raw materials (in ’000 metric tons 1948; 1949, six months, in brackets): iron ore, metal content, 1,632 (893); pig-iron 517 (287); steel ingots and castings 548, black and blister copper 8-9; lead 9-1. Other products (in ’000 metric tons): rock salt (1947) 265, potash ore (1947) 622; cork (1946) 70; paper (1946) 165. Cement production (in ’000 metric tons 1949, four months, in brackets) 1,646 (438).

SPANISH-AMERICAN LITERATURE. Three factors continued in 1949 to impede the fullest development of creative literature in Spanish America: (1) the high price of publishing books, greatly increased by postwar inflation; (2) political instability which had made the position of the writer insecure and in many cases had driven him into exile; (3) the increasingly evident preference of the reading public for translations of European and North American authors rather than for original works by Spanish-American writers. In spite of these discouraging facts good books continued to appear in Spanish-speaking America.

While a few of the older and established generations of novelists continued to write, 1949 saw the publication of a number of works of fiction by newer writers of diverse tendencies. Among the former, two Mexican novelists of recognized reputation produced praiseworthy works: Sendas perdidas by the veteran Mariano Azuela, and Cabello de elote by Mauricio Magdaleno, whose Sunburst was already known to the English-speaking world in translation. Other distinguished novels of the year included En medio del camino de la vida, an autobiographical tale by the Colombian essayist Germán Arciniegas; El reino de este mundo, a beautifully conceived novel of Haitian folklore by the Cuban author Alejo Carpentier; and Marta Brunet’s poetic work, Raíz del suelo, which continued the Chilean novelist’s tradition of fine style.

Less striking but of considerable value in tracing the complex development of the novel in Spanish-speaking countries were the following: Fogarada, by Enrique González Rincones, a story of the Venezuelan oil fields; Una noche en Acapulco, by the Mexican Rodolfo González Hurtado, in which adventure and fantasy combine in agreeable proportions; El Holandés volador, a whimsical treatment of an
old theme by the Chilean, Ernesto Silva Román; La fuga de la quimera, an imaginative tale by the prolific Mexican litterateur, Carlos González Peña; Aventuras de un bracero, an interesting account of the life of a Mexican itinerant labourer in the United States by Jesús Topete; Evocación, a novel of the older Latin colour tradition by a Venezuealan, Pedro César Domíñici.

As usual, it was impossible to keep account of the hundreds of books of poetry which appeared in 1949. Two among them were of unquestioned importance: Sambitos, by the brilliant Mexican poet and statesman Jaime Torres Bodet, and Poésías completas, the collected works of the much-lauded Peruvian, César Vallejo. Colombia, long the home of famous poets, produced among many other volumes of verse an Antología de la nueva poesía colombiana.

Not since colonial days had the drama been a thriving genre in Spanish America, and 1949 provided no exception to the rule. Two dramas might be mentioned as indicative of tendencies: ... de campanario o de Macotlatlán, a three-act poetic play by a Mexican author, J. Jesús Castorena, and a volume of two plays by an older Venezuelan writer Pedro César Domíñici: El hombre que vivió and La casa, both of which showed somewhat romantic and old-fashioned characteristics.

Among biographies written by Spanish American authors the following were noteworthy: Sarmiento y su americanismo, by the Cuban scholar Emeterio Santovenia, and El misterioso almirante y su enigmático descubrimiento, a new interpretation of the personality of Christopher Columbus by Carlos Brand (Venezuelan).

The year was notable for the appearance of a number of outstanding works of literary criticism, the majority of which were published in Mexico. Of superior quality was Las corrientes literarias en la América Hispánica, by the recently deceased Pedro Henríquez Ureña. Leopoldo Zea's Romanticismo y positivismo was a stimulating study of philosophical and literary trends in the 19th century.

A number of the more important literary landmarks of 1949 would be classified as essays or general works, and in them one often found Spanish-American writers at their best. Félix Lizaso's Panorama de la cultura cubana provided an excellent survey of a relatively unknown field. El problema del Indio en América, by Aída Cometta Manzoni, whose previous studies of the Indian in literature had given her authority, was an illuminating series of five essays. Vicente Sánchez's Hispanoamérica contra el colonialismo exemplified in a polemic vein the intense nationalism of contemporary Latin America and El futuro de América by an Ecuadorian, Juan Yépez de Pozo, dealt with similar themes.

SPANISH COLONIAL EMPIRE. Under this heading are grouped the Spanish possessions in Africa. Their total area is approximately 134,715 sq. mi. and the total population (1947 est.) 1,406,800. Certain essential information on the territories composing the empire is given in the table.

* Excluding the nomads.
abroad (e.g., Pedro Salinas’ study of Rubén Dario, Enrique Moreno’s of Guzmán de Alfarache and Joaquín Casalduero’s of Don Quijote), there was also much activity in Spain. A valuable linguistic study was M. Cravi’s Dictionario del verbo español moderno. The middle ages were represented by the first volume of Martín de Riquer’s La Lirica de los trovadores, F. Alarco’s Investigaciones sobre el libro de Alexandre and José Romeu Figueres’ El Mitó de “El Comte Arnau”. Outstanding works on the 16th century were E. Segura Covarsi’s La Canción petrarquista en la lirica español del Siglo de Oro, Rafael Lapesa’s La Trayectoria poética de Garcilaso and Ramón Carande’s Carlos V y sus banqueros: La Hacienda real de Castilla. Figures in the Romantic era who received full-length studies were La Avellaneda (M. Ballesteros), Nicomedes Pastor Díaz (E. Chao Espina), Gregorio Romero Larrañaga (J. L. Varela) and Vital Aza (N. Alonso Cortés). Of the moderns, Federico García Lorca was the subject of a monograph by G. Díaz-Plaja, and R. Gullón and J. M. Blecua wrote on La Poesía de Jorge Guillén. Two notable events in Madrid were the compilation of a series of “Homenaje” volumes celebrating the 80th birthday of Ramón Menéndez Pidal, and the foundation of the Instituto de Humanidades by José Ortega Gasset and Julián Marías: a course given there by the latter was published as El Método histórico de las generaciones. The Revista de Occidente published a comprehensive Diccionario de literatura española. Criticism suffered a double loss in the deaths of Antonio Ballesteros Beretta and Ángel González Palencia.

Foremost among the year’s novels were S. J. Aibó’s Sobre las piedras grises, awarded the Premio Nadal, J. A. de Zunzunegui’s La Ulcerá (Premio Nacional de Literatura), the late Benjamin Jarnés’ Eufrosina, Enrique Azcoaga’s El Empleado and the Doña Juana la Loca y otras seis novelas superhistóricas of Ramón Gómez de la Serna, who had recently returned to Spain. Collections of verse included Leopoldo Panero’s Escrito a cada instante, Luis Rosales’ La Casa encendida, Leopoldo de Luis’ Las Imposibles Pájaros and José María Valverde’s La Espera. The 1949 Premio Lope de Vega for drama was awarded to Antonio Buero for his Historia de una escalera. Notable new literary reviews were Alcántara (Extremadura), Alma (Madrid) and Proel (Santander). Literary men recently elected to the Spanish Academy of the Lenguaje were Vicente Aleixandre and Salvador González Anaya. (E. A. P.)

SPEEDWAY RACING. The attendance of over 12 million people made the 1949 season the most successful in the 21 years of the third most popular sport in Great Britain. Betting was not permitted at speedway meetings and it was considered to be the greatest family sport in the world.

The world individual championship was won for the first time by an Englishman when Tommy Price (Wembley) finished ahead of Jack Parker and Louis Lawson (both of Belle Vue, Manchester). Australia, whose team did not appear sufficiently strong at the beginning of the season to provide formidable opposition for England, created a surprise by winning the test series by four matches to one.

The national league, the major team competition, divided into three sections, was won by Wembley (division I), Bristol (division II) and Hanley, Stoke-on-Trent (division III). The national trophy competition was won by Belle Vue, who defeated West Ham in the final. The London cup was retained by the Wembley Lions. Jack Parker, captain of the England team, successfully defeated all opponents to keep his title of match race champion. (G. J. Wk.)

SPICES. Pepper spices during 1949 reflected the scarcity of this commodity in the world markets. Prices at Rotterdam, London and New York city ranged up to $1-42 per pound for black pepper and $2-40 per pound for white pepper. Supplies from Indonesia, normally the largest source, continued to be shut off, but India, with a larger crop than usual, maintained a well-exploited monopoly and in November raised the export tax to about 12 cents per pound. Imitation pepper made by grinding grain with cayenne and excellent oils reappeared on the market to ease the situation.

The United States and Canada reported good harvests of mustard seed, while European production was reduced to make more land available for the planting of root crops and cereals. China did not report its crop, which at times had exceeded 11 million lb. from provinces which had fallen under Communist control.

Dry weather and labour problems shortened production of ginger and caused prices to rise 350% above normal; plans were laid for larger plantings in Jamaica, Sierra Leone, India and Nigeria, the principal sources of supply.

Batavia (Java), Kortrijk and Saigon varieties of cassia (cinnamon) were obtained from Indonesia and Indo-China despite continued warfare during 1949. In China the harvesting of the different varieties of cassia continued, distribution being effected through Hong Kong.

Madagascar and India nutmegs were available during the year but shipments were smaller because of unfavourable conditions. Prices exceeded those of 1948. Shipments of nutmegs and mace from East Indian islands were interrupted. A fine crop in Grenada (British West Indies) balanced supply with demand.

Production of red peppers (chillies) was less than normal and prices were high. The scarlet Hontaka and Takanotsume pods reappeared from Japan, at prices up fourfold. Cayenne from Africa sold at high prices as did Mexican “Anchos” for “chile con carne.” Yugoslavia and Chile exported fine-quality paprika, supplementing Spanish and Portuguese supplies, and prices were moderate.

The world supply of herbs was affected by political disturbances in Europe, principally in Yugoslavia, the source of the preferred sage (Salvia officinalis). Bay leaves proved scarce, satisfactory quality (laurus nobilis) being obtainable only from Greece, where the crop was neglected.

Supplies of caraway, poppy, dill, coriander and cummin seeds were available from Europe and North Africa. Sesame had become a successful crop in Nicaragua.

Saffron, the world’s most costly spice, dropped from the usual range of from $45 to $75 per pound to $17 per pound on the Spanish market. The stigmas of the saffron flower, hand removed from about 75,000 blossoms, constitute a pound. This spice is very popular in the cooking of certain Spanish dishes. (C. A. T.)

SPIRITS. The figures for production and export of French Cognac brandy in 1948-49 were the highest since World War II. Production season was equivalent to 115,000 hectoliters of pure alcohol compared with 95,000 hectolitres in the previous season. Exports of Cognac were 34,816 hectolitres during the first six months of 1949 compared with 23,203 hectolitres in the same period in 1948. In Great Britain the production of potable spirits again increased and was slightly above the 1938 figure.

Increased releases of grain resulted in increased distilling of whisky but the industry suffered from a shortage of sherry.

**SPEEDWAY RACING—SPIRITS**
casks for maturing. Whisky stocks which had become depleted during World War II approached their prewar level. Devaluation of the pound sterling had little effect on export of whisky as most of the available mature stocks were already being exported. Exports of spirits to most countries increased slightly during the year, exceptions being the U.S., India, and Argentina.

Imports of brandy and rum by Great Britain were both 10% greater than in 1948. In the case of brandy 90% of the imports were from France as against 70% in the previous year, there being a drop in imports from the Commonwealth. The Ministry of Food issued a Code of Practice for brandy during the year. Imports commenced again of aquavit, the national spirit of Norway, matured by storage on board ship during a round trip to the Antipodes.

In France the importance of sugar beet as a source of alcohol continued to rise, as the production of industrial alcohol was reflected in the publication of Vol. I of Traité de la Distillerie de Betterave (Paris 1948). In Great Britain the production of industrial alcohol was lower than in 1948.

* Years ending Aug 31

There was a drop in the quantity of molasses imported in spite of a big fall in price at the end of 1948. During the year controls on industrial alcohol and related materials were removed after having operated for nearly ten years.

Although Great Britain did not produce alcohol from petroleum, contrasting with the United States which obtained 40% of its alcohol from this source, four major industrial enterprises developed plans for the manufacture of chemicals from petroleum and it would be a short step to produce synthetic alcohol if it became an economic proposition.

In India the government went ahead with its plans to produce power alcohol from accumulated supplies of molasses. Arrangements were made for the Naini distillery in Bombay to make one million gallons of power alcohol annually after a prohibition of alcoholic liquor proposed for the state in April 1950. Pakistan started to build what was to be the largest alcohol production plant in Asia. Syria began the manufacture of alcohol from sugar refinery residues. In Australia a company was formed to manufacture chemicals, including cellulose acetate based on alcohol as a raw material.

**United States.** The production of all types of distilled spirits in the United States reached 266,542,499 proof gallons in the fiscal year which ended June 30, 1949, an increase of more than 20 million gal. from the previous year's total of 244,127,343 million proof gal. Whisky production, accounting for the bulk of all distilled spirits produced in the U.S., jumped considerably above the total of the 1948 fiscal year—149.6 million proof gal., as contrasted with 129.6 million gal. in 1948. The remainder of distilled spirits manufacture, gin, rum, brandy and other spirits, together represented 40% of the total.

Withdrawals of distilled spirits from distilleries and warehouses dropped from 161.7 million proof gal. in the 1948 fiscal year, to 153.5 million proof gal. for the year ended June 30, 1949—a decrease of about 5%.

In June 1949, U.S. whisky inventories stood at about 511 million proof gal., or well over the 425 million proof gal. average for "normal" years. However, the supply was far from adequate, for only 23 million gal., or less than 5% of the total, were composed of sufficiently matured whisky (four years or older).

During 1948-49 there was an increase in moonshining (illicit distilling). In the calendar year 1948, 7,552 illegal stills were seized by agents of the Alcohol Tax unit—an increase of more than 25% from the previous year's total. The total for the fiscal year ending June 30, 1949 indicated a similarly rising total—8,008 stills seized having a daily producing capacity of 224,988 proof gal., as against 6,757 (with a daily capacity of 173,087 proof gal.) during the fiscal year 1948.

The demand for distilled spirits underwent a gradual process of change in 1949 and there was an increasing preference for straight and bonded whisky rather than blends. Blended whisky totals declined. From January-June, 1948, the total number of blended gallons available for consumption was 53.8 million—the same period in 1949 saw a decrease in output to 51.5 million gal.

The years 1947 and 1948 marked the change from a seller's to a buyer's market, with stocks readily available. For the first eight months of 1949, total distilled spirits imports equalled 8,788,823 wine gal., with whisky accounting for more than 7 million gal.

**SQUASH RACKETS.** M. E. Karm, Egypt, who retained the open championship, and N. F. Borrett, who won the amateur championship for the third time, were the outstanding players of the 1949-49 season. The runner-up in both open and amateur championships was B. C. Phillips. Miss P. J. Curry won the women's championship for the third time. The professional championship was won by A. E. Biddle.

In men's international matches England beat Ireland, Scotland and Denmark; Scotland beat Wales, and Ireland beat Scotland. In women's internationals England beat Scotland and Wales; Wales beat Scotland. Surrey won both the men's and women's county championships. Oxford beat Cambridge in the university match, and the Army won the inter-services championship. Lancing Old Boys beat Old Tonbridgeians in the London Derby cup. The junior championship (Drysdale cup) was won by M. G. Case.

**United States.** Hunter Lott, Jr., of the Merion Cricket club, Pennsylvania, won the national singles squash rackets championship by defeating Donald Strachan of the Princeton club of New York. Lott combined with G. Diehl Mateer, Jr., another Merion representative, to win the doubles. George Waring, Boston, Massachusetts, retained the veterans' singles title, and the intercollegiate crown was retained by Mateer, who represented Haverford college, Philadelphia.

U.S. representatives won the Grant trophy, but the Lapham trophy was returned to Canada when the dominion team won 7-3. A strong British women's team visited the U.S. Janet Morgan, Surrey, won the national singles championship, and the doubles with Mrs. R. J. Tague, Devonshire. Miss Morgan also won the New England States title. The U.S. women's team however, regained the Wolfe-Noel Cup. Betty Howe, New Haven, Connecticut, won the Atlantic Coast, Pennsylvania, New York state and Connecticut state women's championships.

**STALIN (DJUGASHVILI), JOSEPH VISSARIONOVICH,** Soviet statesman (b. Gori, Georgia, Dec. 21, 1879), secretary general of the V.K.P. (Vsesoyuznaya Komunisticheskaya Partiya, or All-Union Communist party) from April 3, 1922, and prime minister of the U.S.S.R. from May 6, 1941. (For his early career see Encyclopaedia Britannica and Britannica Book of the Year 1949).

On Jan. 30, 1949, Marshal Stalin published his answer to four questions put to him by a U.S. news agency. He said that the Soviet government was prepared to reconsider the publication of a joint Soviet-U.S. declaration that the two governments had no intention of resorting to war against...
each other; that the U.S.S.R. was prepared to take measures towards gradual disarmament; that the U.S.S.R. saw no obstacles to the lifting of transport restrictions between Berlin and the western zones of Germany provided the U.S., Great Britain and France simultaneously removed transport and trade restrictions between the western and the Soviet zones, pending a meeting of the Council of Foreign Ministers to consider the German problem; and that he was ready to meet President Harry S. Truman to discuss these matters. On July 18 he received Sir David Kelly, the new British ambassador to the U.S.S.R., and on Aug. 15, Vice Admiral Alan G. Kirk, the new U.S. ambassador. On Oct. 13 he sent a message to Wilhelm Pieck, president, and Otto Grotewohl, prime minister of the German Democratic republic, in which he expressed the opinion that the German and Soviet peoples possessed "the greatest potential in Europe for accomplishing great actions of world importance." On Dec. 21, his 70th birthday was celebrated throughout the U.S.S.R. and the Soviet-dominated states with extraordinary pomp and circumstance. He was awarded the Order of Lenin for the second time. (He received it for the first time in 1939, on his 60th birthday).

STEEL: see IRON AND STEEL.

STIKKER, DIRK UIPKO, Dutch businessman and statesman (b. Winschoten, Groningen province, Feb. 5, 1897), educated at the University of Groningen, he started his business career as manager of a bank at Leyden and later at Haarlem. From 1935-48 he was the managing director of a brewery company and member of the board of the Société Internationale de Brasserie, Brussels. In 1946 he founded and was elected chairman of the People's (Liberal) Party for Freedom which gained six seats in the Second (Lower) Chamber at the elections of May 17, 1946, and—having merged in Jan. 1948 with the Democratic People's party—eight at the elections of July 7, 1948. He was elected a member of the First (Upper) chamber on July 8. He joined as minister of foreign affairs the Willem Drees cabinet formed on Aug. 6. On April 4, 1949, he signed the North Atlantic treaty for the Netherlands and said that the signing marked "the end of an illusion—that the United Nations would by themselves ensure international peace." Although a former critic of the government's policy of negotiating with the Indonesians, during 1949 he worked hard for a lasting agreement with them.

STOCKS AND SHARES. By far the most important event of the stock market world in 1949 was the devaluation of the pound. Although this did not take place until Sept. 18, the circumstances leading to devaluation could be clearly seen at work for the greater part of the year and frequently gave rise to rumours that devaluation was about to take place. It was not over-stating the matter therefore to say that stock markets, almost throughout 1949, were under the influence of the possibilities of devaluation.

Nowhere could the shadow, and the final substance, of devaluation be seen more clearly than in the gold-mining share section of the stock exchange. Since the official U.S. price of gold remained at $35 an ounce, the effect of lowering the value of the £ from $4.03 to $2.80 was to raise the price of gold in terms of sterling; the actual increase arising out of this devaluation was from a price of £8 12s. 3d. to £12 8s., a fine ounce. Sterling producers of gold, such as South African, west African and Australian mines therefore stood to gain enormous advantages from devaluation, provided that the higher cost of machinery and stores imported from dollar areas and increased labour costs did not offset the addition to the revenue of the mines. It may be recalled that at the end of 1948 the Financial Times gold mines index had fallen to 94 67, its lowest since July 1932, mainly for the reason that the price of gold had remained virtually stationary, while because of the world-wide inflation costs had mounted enormously. This downward trend was not reversed until March 1949. After that month (as can be seen from the accompanying table of the monthly high and low points of the Financial Times indices) the index advanced more or less without a break until following the Sept. 18 devaluation it achieved a new and substantially higher level, closing 1949 approximately 40% higher than in Jan. 1949.

On the other hand, devaluation and the factors leading up to it had a depressing effect on the other principal classes of securities quoted on the stock exchange. At every mention of the word devaluation, the prices of British government and kindred securities wilted. To the investor's mind the subjects of the gold and foreign exchange holdings and confidence in the government (and, therefore, in its securities) were closely inter-related. Adverse trade figures, implying a drain upon gold and dollar resources, were likely to produce an adverse trend in government securities. It was therefore hardly surprising that in a year of dollar crisis, with devaluation and the threat of a break away from the country, there should have been a substantial recession in British government securities, which touched the lowest levels since 1939. The fall amounted to 7%: until the government broker dramatically reversed the downward trend on Nov. 11, it was more than 10%. Such percentages represented immense falls in total money values, probably to the extent of £1,000 million in British government securities alone. As the year closed, the effects of devaluation were tending to improve the external balance of trade and the gold and foreign exchange reserves of the country. This was reflected in firmer markets for British government securities.

At one time during the "fall" it was possible to secure from a British government security (4% consols) a flat yield of 4%. This landmark itself brought many investors into the market; but there was no doubt that the government intervention—"to squeeze the bears," in the words of Sir Stafford Cripps, the chancellor of the exchequer—was the main influence in restoring some semblance of order and confidence into the market. This made it possible for the government to undertake with fair success the conversion of the £787 million of 31/2% exchequer bonds—which were to mature on Feb. 15, 1950—into 21/2% exchequer bonds, due for repayment in 1955. The return of the government to the market naturally raised the question as to whether the policy of allowing prices and yields to find their own levels had been abandoned in favour of a return to the cheap money policy through government control of the market. But as yet there appeared to be no evidence of anything but a desire to restore the market to an even keel, partly because of the psychological importance of the market in the nation's affairs and partly to warn those who might have been taking liberties with the price structure by selling short.

The steady rise throughout the year in yields of British government securities would, in normal circumstances, have tended to raise yields and depress prices of industrial shares quite irrespective of other influences. The yield on 21/2% consols advanced from 3-13% to about 3-5% but the parallel movement in the yield of industrial ordinary shares was of greater proportions, from 4 38% to 5-20%. Financially, United Kingdom industrial companies continued to prosper, although, so far as public companies were concerned, results had been less uniformly favourable. Such cuts as had been made in expenditure following devaluation had so far had little effect and full employment continued. Nevertheless, spending power had varied at different times of the year—especially in highly taxed luxury industries, such as entertainment and brewing—and the growth of savings withdrawals
STOCKS AND SHARES

had been a disquieting feature. Despite this not entirely unfavourable background, the "bear market," which began in industrial ordinary share prices at the beginning of 1947, persisted in 1949 and was in fact accelerated. While the falls in 1947 and 1948 were only of the order of 5%, or so, in 1949 prices fell by 12%. Apart from such investment influences as the problems to be faced in balancing United Kingdom external trade at a high level and the extent of the expected cut in and under the European Recovery programme, markets had to reckon with an important technical factor. The only nationalization operation undertaken during the year was in respect of the gas industry; and the amount of re-investing in industrial equities by investors who did not wish to retain the nationalization stock (3% British gas, 1990-95) was relatively small compared with previous operations of this nature.

There was, indeed, little encouragement for investors to take an optimistic view of the future of share prices. The continued austerity policy of the government and the more or less fixed nature of dividends, owing to dividend limitation, provided no incentive. Taxation was once more at a high level; indeed, it was increased by the raising of the distributed profits tax from 25% to 30%, following devaluation. As the year ended, a brighter atmosphere developed, which is not unusual at that season. This was partly a reflection of the reluctance of investors to sell and the consequent market shortage of stock.

The U.S. stock market of 1949 was inactive in volume of trading, unusually steady throughout the year as to the average price level and extraordinarily unresponsive to either good or bad news. Alternate bear and bull movements—only two in number, involving a bear market during the first half of the year and a moderate recovery during the second half—were unusually small in extent. For 90 stocks combined, representing the railroad, industrial and public utility groups, the December average price level stood at 131.6, as compared with 121.9 for January, and with 120.6 and 117.7 for December and January of 1948. Briefly summarized, the 1949 price level seemed to indicate a slight bear market in certain groups of stocks, and a slight bull

These indices of prices on the London stock exchange are reproduced by courtesy of the Financial Times, London. Constituents of the indices are: industrial ordinary, 30 of the leading British industrial equities; government securities, 11 British government securities (including short-dated, medium-dated, long-dated, and some redeemable only at the option of the government); gold mines, 30 South and West African and West Australian gold mining shares. The industrial ordinary share yield is based on dividends on the shares in the industrial ordinary share index. Stock exchange markings are for ordinary, July 1, 1935, government securities and gold mines, Oct. 15, 1926.
market in others, but without any definite momentum for future forecasting.

Corporate dividends, with the exception of certain limited groups like the amusement, food products and mining stocks, showed an increase of 8.2% in total dividend distribution during 1949 as compared with 1948. As was the case in 1948, most groups of corporations except the rails managed to adjust themselves fairly well, through price increases and improved productive efficiency, to the large successive wage increases won by labour in 1947-49.

The stock market seemed to withstand the shock of adverse news throughout 1949; the market might "back and fill," but the averages were well maintained. A longer perspective might conclude that the drastic decline of the last half of 1946 could be regarded as a discounting of the nation's economic problems during 1947-49, and thus explain the periodic backing and filling of the market during the three previous years.

On Nov. 1, 1949, the market value of all listed shares on the New York Stock exchange stood at $72,631 million with an average flat price per share of $43.75. On Nov. 1, 1948, this market value stood at $72,186 million, with an average flat price per share of $45.26. A depreciation in the value per share of approximately 3-3% was shown for the period.

According to the New York Stock exchange's compilation, the total stocks listed on that exchange on Nov. 1, 1949, stood at 2,145 million shares, with a total market value of $72,631 million. This value compared with $72,185 million on Nov. 1, 1948, $68,884 million on Nov. 1, 1947, $66,115 million on Nov. 1, 1946, and $69,560 million on Nov. 1, 1945. Of the 1949 total (as of Nov. 1) U.S. stocks aggregated 2,079 million shares valued at $71,451 million, and stocks of other countries 65,834,000 shares, valued at $6,180 million. The total of shares was distributed over 1,432 separate U.S. issues and 20 issues of other countries, representing a total of 1,452 issuing corporations.

Total shares traded on the New York Stock exchange during 1949 amounted to 272,203,402 shares, as compared with 302, 218,965 shares during 1948. The New York curb market had sales during 1949 of 66,130,000 shares, as compared with 75,090,000 during 1948. The U.S. bond market was remarkably stable during 1949 at a high price level. The rise in bonds after June was accompanied by a similar trend in the stock market.

According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the beginning of Nov. 1949 stood at $129,870 million, with a market value of $132,221 million—compared with $131,226 million and $136,711 million for the corresponding years of 1948 and 1947. Of the 1949 total, U.S. corporation bonds (at the beginning of November) amounted to $17,328 million (par value), with a market value of $16,478 million; company bonds of other countries, a par value of $551,153,000 and a market value of $475,925,000; U.S. government bonds (inclusive of corporations and subdivisions), a par value of $110,279 million and a market value of $114,029 million; and other governments (inclusive of subdivisions), a par value of $1,460 million and a market value of $982,410,000.

The total listed bonds of U.S. corporations were distributed over 616 issues with 312 issuers; of U.S. government bonds, 71 issues and 3 issuers; and other governments, 182 issues and 48 issuers. The total bonds traded on the New York Stock exchange during 1949 amounted to $817,949,070, as compared with $1,013,829,000 during 1948.

According to the condensed statement, income and expenses of the exchange for the nine months ended Sept. 30, 1949, showed a net loss of $325,995. This compared with a loss of $367,108 for the same period of 1948 (See also BUSINESS REVIEW.)

### STRANG, SIR WILLIAM, British diplomat

(b. Jan. 2, 1893), was educated at Palmer's school, Grays, at University college, London, and at the Sorbonne, Paris. He served in World War I, and entered the diplomatic service in Sept. 1919. From 1919 to 1922 he was in Belgrade and was in Moscow from 1930 to 1933. He was promoted to be an acting assistant under secretary of state in Sept. 1939 and in Nov. 1943 was appointed United Kingdom representative on the European advisory commission with the personal rank of ambassador. He became political adviser to the commander in chief of the British forces in Germany in June 1945, and in Oct. 1947 he returned to the Foreign Office as joint permanent under secretary of state (German section). He succeeded Sir Orme Sargent as permanent under secretary on Feb. 1, 1949. He visited Austria and attended meetings of the Allied council in March 1948. In May and June 1949 he undertook a tour of north Africa and the middle east and visited Tripoli, Benghasi, Amman and Tehran. His
STRIKES AND LOCK-OUTS

STRIKES AND LOCK-OUTS. Up to October, the total number of days lost in Great Britain in 1949 by strikes and lock-outs was only 1,665,000 working days, as compared with 1,824,000 in the corresponding period of 1948. These were both remarkably low figures, in relation to a labour force of 22 million. Most of the days lost were accounted for by coal-mining (735,000) and transport (528,000); but even in coal-mining the loss was only a day for each man employed, and was much less serious than the loss of output from either sickness or voluntary absence from work. The only considerable stoppages during 1949 were the following. In January there was a one-day strike of 28,000 London road transport workers for special payment on Saturday afternoons (referred to arbitration). In April there was a three-days' strike of 16,700 London dockers and stevedores in protest against discharges of workers regarded as redundant or ineffective: work was resumed without concessions. In May dockers at Bristol, Liverpool and a few other ports struck in sympathy with the left-wing Canadian Seamen's union, refusing to handle cargoes for vessels involved in the dispute between this union and the Canadian shipowners. The strike petered out in mid-June, after involving about 11,500 men at one time or another. There also occurred in May a 12-day stoppage of the Lancashire coal-miners in connection with a claim to "concessionary" coal (that is, coal at less than market price for the miners' own use). This dispute, involving 44,000 men, ended inconclusively, the matter being referred for negotiation nationally between the Coal board and the National Union of Mineworkers. In June the Canadian shipping dispute led to a further stoppage, this time in London. At first only a few hundred men were involved; but later in the month the trouble spread, and in the third week of July the number rose to nearly 16,000. On July 23, the strike, which had been throughout unofficial and opposed by the Transport and General Workers' union, was called off by the unofficial leaders, a month after its beginning. In August 91,000 workers in the Yorkshire and Lancashire coalfields were idle for four days owing to a strike of 550 winding enginemen, who claimed higher wages on the ground that their time-rates were out of relation to the earnings of other mineworkers, and that the N.U.M. was refusing to deal adequately with their demands in its negotiations with the National Coal board. This dispute was referred to arbitration after the Colliery Winders' federation had ordered a resumption of work. The National Arbitration tribunal later rejected most of the claims; but some concessions were secured. In August there was also a small but important dispute affecting locomotive drivers and firemen on east coast routes. The matter at issue concerned the conditions of "lodging turns," where men had to be away from home overnight. Objection was taken to new regulations, which the men resented as involving too frequent absences. The stoppage of work occurred on successive Sundays between Aug. 14-28, and was ended by a promise to withdraw the disputed turns at the end of the summer, and not to re-introduce them. In September a series of stoppages, none lasting for more than a few days, took place at various collieries in Scotland, where the "oncost" workers paid at daily rates demanded higher wages. The matter was referred for further negotiation between the Coal board and the N.U.M. There were no disputes of importance in either October or Nov. 1949. But on Dec. 12 an unofficial strike at three London power stations, which spread to a fourth, over a wages decision, constituted a serious threat to London's electricity supply, despite the drafting of servicemen to man the stations. After discussions between the strike leaders, trade union officials and the British Electricity authority, work was fully resumed on Dec. 16.

In considering the absence of serious industrial strife it is necessary to bear in mind that the wartime provisions for the reference of disputes to arbitration by the National Arbitration tribunal or some other acceptable body remained in being, and also that the policy of the Trades Union congress in advising unions to refrain from pressing wage-claims meant that nation-wide stoppages could not occur. Most stoppages were therefore unofficial, or at any rate sponsored...
only by smaller unions which rejected the official policy; and most of them arose out of grievances in a particular establishment or at most a particular district. Of the major disputes mentioned, only the sympathetic stoppages in support of the Canadian Seamen’s union showed any considerable sign of Communist influence, which was weak in most unions—even in those in which Communists held a number of official positions. Even among the London dockers, the large response to the unofficial strike-call came mainly from men who did not support Communism but were discontented with what they regarded as the bureaucratic leadership of the Transport and General Workers’ union. Moreover a call not to blackleg on fellow-workers usually exercises a strong emotional appeal, and in the London and Bristol dock stoppages the extension of the trouble was due largely to unwise handling of the issue by the port employers. In general, a growing sense of national emergency strengthened the hands of the official leaders of the trade unions in checking all stoppages except those due to purely local troubles and in bringing such spontaneous movements to a rapid end.

The period of industrial tranquillity in Great Britain, as measured by the absence of really serious stoppages of work, had lasted for 23 years—even since the general strike of 1926. To a considerable extent this was due to the great extension of collective bargaining procedure and, after 1939, to the adoption of arbitration as the normal method of settling differences when agreement could not be reached by direct negotiation.

In the British colonies, serious troubles developed in November out of a strike of coal miners in Nigeria. Police attempting to remove explosives from the affected mines were attacked and opened fire, killing a number of strikers; and trouble spread to the ports. A state of emergency was declared in the areas affected.

Europe. In France there were in 1949 no stoppages comparable in importance with those of the previous year, which included the extensive and bitterly fought coal strike of Oct.-Nov. 1948. The most important strike in 1949 was a one-day stoppage of civil servants (including teachers) in June, initiated by the Socialist trade union Force Ouvrière, but supported both by the Communist-led Confédération Generale du Transit and by the Christian trade unions. The purpose of the strike was to protest against the government’s refusal to grant higher salary scales to compensate for increased living costs. A further protest strike, extending over a much wider field but also limited to a single day, took place in November. In Italy extensive farm workers’ strikes in June secured considerable concessions from the government (see Trade Unions), and renewed troubles broke out in southern Italy and Sicily in November in protest against the delay in enforcing land distribution for the benefit of landless peasants. In Western Germany there were small and short stoppages in protest against the continuance of dismantling but no considerable stoppages. (G. D. H. C.)

United States. During 1948 (Table I), the U.S. experienced 3,419 labour disputes, a decline of 274 from the 1947 level and of 1,566 from the 1946 level. A total of 34,100,000 man-days were lost in 1948 which was only slightly less than in 1947. This was opposed to the record level of 116 million man-days lost in 1946. The first eight months of 1949 indicated a further decline in such activity since the strikes in progress caused a loss of less than 19 million working days. However, several very large strikes of several weeks’ duration occurred in the coal-mining and steel industries in later months.

In Table I, figures on man-days idle and workers involved cover all workers made idle in establishments directly involved in a stoppage. Figures for 1949 are preliminary and subject to revision.

These figures relate only to the actual number of strikes and lock-outs in existence and the workers involved during the year, not being a summation in each case of the monthly figures.

Source: S. T. A. (Compiled from the Labour Gazette (Ottawa)) All 1949 and last three months of 1948 figures are preliminary.

1949, time lost and employees involved declined below the corresponding months of 1948. All other months of 1949 experienced an increase in time loss (except July) and in number of workers involved. (P. T. A.)

SUDAN: see ANGLO-EGYPTIAN SUDAN; FRENCH UNION.

SUEZ CANAL. The substantial increase in tanker traffic between the middle east and Europe passing through the Suez canal led to a decision at the close of 1948 to embark on a major programme of improvements, in particular the cutting of a by-pass canal about 30 mi. south of Port Saïd. The by-pass would be 7½ mi. long, and would enable petroleum ships proceeding in convoy, as do other vessels today, to make the transit with increased speed and under even greater conditions of safety, as they would no longer have to pass alongside other ships. The work was entrusted...
to a French group of companies and was started in the second half of 1949. It was estimated that it would take about 15 months at an approximate cost of £1.6 million.

The Suez Canal company also decided to deepen the canal by 20 ft. over its whole length, involving the removal of 8 million cu. yd. of under water soil and 800,000 cu. yd. of rock. This would require from four to five years. Additionally, the tanker mooring-station in Lake Timsah would be deepened, and one of the basins in Port Said enlarged to permit the berthing of 18 ships of 660 ft. instead of 9 ships of 330 ft.

On March 7 an important new agreement was signed between the Egyptian government and the company. The provisions were as follows:

I. The number of Egyptian directors will gradually be increased from 2 to 7. Two will occupy the vacancies in the quota of French directors. One will be given the first vacancy in the quota of non-government British directors, and two additional Egyptian directors will be appointed, one in 1959 and the other in 1964.

II. On July 1 annually the company will pay the Egyptian government an allowance of 7% of the gross profits of the preceding financial year, with a guaranteed minimum of £350,000. This allowance, however, shall not exceed the total gross profit that shall be shown on the figure.

III. 1 exemption from canal dues will be granted to all transiting vessels of less than 300 gross Suez Canal tonnage.

As from 1949 the company will engage its staff working in Egypt of the services of 4 Egyptians for every 5 vacancies on the technical side, and 9 for every 10 vacancies on the administrative side. The company will also recruit a certain number of Egyptian officers on an intermediate post.

Providing they have the requisite professional qualifications 20 Egyptian pilots will be granted priority of engagement to fill forthcoming vacancies. Subsequently one in every two vacancies will be reserved for an Egyptian pilot.

VI. The company renounces its right to the remainder of the sums due by the town of Port Said in reimbursement of development carried out in the past.

VII. The Egyptian government will establish a municipality at Ismailia, which in future will be responsible for the town's development and maintenance expenses.

VIII. The company will hand over to the Egyptian government the Ismailia-Port Said fresh water canal, the government assuming responsibility for its upkeep and for providing the company's water works in Port Said with the water necessary for the requirements of the town and shipping generally.

IX. The company will create a basin for the fishing fleet at Port Said.

X. For the purpose of constructing the by-pass canal the required tract of land will be conceded to the company in exchange for double the value of the surface of land elsewhere not indispensable for the running of the canal.

XI. The concession for the exploitation of Attaka quarries, providing stone for the company's needs, will be renewed and extended up to the company's canal concession.

This agreement came into force in August after ratification by both parties.

During the year Norway offered a serious challenge to the United States for second place among the nations using the canal and the year was also marked by the appearance in the canal for the first time of vessels flying the Librarian flag.

Although there was no peace settlement between Egypt and Israel the position affecting the search of vessels in Egyptian ports and the detaining of some cargoes which might be destined for Israel had eased. Satisfactory conversations took place in Paris in June between the British foreign secretary and the Egyptian foreign minister. Following upon the evacuation from Egypt of United Nations observers by Egyptian customs administration in November informed shipping agents of an order which permitted free transit through Egyptian ports of normal commercial cargoes to and from Israel.

The Growth of Traffic. In 1880, 2,026 ships totalling 3 million tons used the canal. In 1913 the figures rose to 5,085 ships and 20 million tons, in 1919 to 6,171 ships and 34 million tons; in 1948 to 8,868 ships and 55 million tons.

SUGAR. Climatic conditions in Europe in 1948 were more favourable for the growing of sugar beet than in 1947 when the crops in most countries suffered from drought. The estimated total beet sugar output of Europe, exclusive of the U.S.S.R., in the 1948-49 season, on a raw value basis, was over 61 million tons compared with less than 43 million tons in 1947-48, some 5 million tons in 1946-47 and an average of about 7 million tons for the years just before World War II. There was a fairly general and profound increase in production and in some countries, notably Germany, France, Czechoslovakia and Italy, the increase was considerable. Germany, with an output of 1,300,000 tons, and France with 950,000 tons, were the leading producing countries; they were followed, in order of importance, by Poland, the United Kingdom and Czechoslovakia, each of which had a crop above the prewar average. Although the increase for the United Kingdom was less marked than that of some of the other countries, its output, at 630,000 tons, was about 150,000 tons more than in 1947-48 and the heaviest ever recorded. Official estimates for the U.S.S.R. were not available, but trade reports indicated a yield of approximately 1,800,000 tons, an increase of some 300,000 tons over the figure for 1947-48. Preliminary estimates for 1949-50 indicated little change in the production of beet sugar in Europe but a further recovery in the U.S.S.R., though its figures were not expected to be up to the prewar level.

In spite of a fairly big reduction in the output of Cuba compared with the very high figure of 1947, and some decline in the production of India, there was a further increase in the world output of cane sugar in 1948-49, the estimated total yield, in terms of raw sugar including the raw value of Indian gur, being nearly 203 million tons as against 20 million tons in 1947-48. The expansion was due largely to heavier crops in other parts of the Commonwealth and a substantial recovery in the production of the Philippines and other territories occupied by the Japanese during World War II. The combined production of India and Pakistan was estimated at about 3,600,000 tons. The bulk of this quantity, however, consisted of gur, an inferior type of sugar; the output of white sugar accounted for only about 1,300,000 tons. Of the other Commonwealth countries, Australia was by far the most important with an estimated output of over 900,000 tons; South Africa produced about 550,000 tons. There was a very heavy crop in Jamaica; the British West Indies and British Guiana together produced some 800,000 tons. Production in Mauritius was estimated at nearly 400,000 tons. The combined output of the countries mentioned exceeded that of 1947-48 by more than 400,000 tons and, in each case, production was appreciably heavier than in prewar years. On the basis of preliminary crop estimates, output of cane sugar in Commonwealth countries in 1949-50 should be approximately the same as in 1948-49. It was expected that crops would be good in India, Pakistan and Australia and that production in South Africa and the British West Indies would be maintained at about the 1948-49 high level.

The international trade in sugar was confined mainly to cane sugar. Among Commonwealth countries increased domestic consumption in Australia and South Africa in the 1940s reduced the supplies available for export and, in most years, shipments from India were comparatively unimportant. In 1948-49, however, the exports from Australia rose sharply from the 1947-48 total of 100,000 tons to over 400,000 tons. Exports from the British West Indies and British Guiana were also heavy in 1948 at nearly 500,000 tons, and those from Mauritius totalled over 350,000 tons.

Imports of raw sugar into the United Kingdom in 1948-49 (September to August) totalled slightly over 2 million tons, an increase of some 200,000 tons compared with 1947-48. Cuba was again the main source but its supplies accounted for only about 25% of the total as against over 50% in the previous year. There was a considerable increase in the
supplies from Australia and Mauritius. Imports from the British West Indies were about the same as in 1947-48. In 1948 the United Kingdom government guaranteed Commonwealth producers an outlet for their exportable sugar up to the end of 1952 either in the United Kingdom itself or in other Commonwealth countries and, more recently, stated its intention to make long term purchase arrangements. With this object in view a conference of representatives of Commonwealth producers was held in London in Nov. 1949.

United States. Total sugar production in the U.S. was estimated at about 2.1 million tons in 1949 as compared with 1,846,000 tons in 1948. The preliminary estimate of the 1949 crop included 1,550,000 tons of refined beet sugar and 550,000 tons of cane sugar. The 1949 U.S. crop included a sugar beet crop of 10,110,000 tons, 9% larger than the 9,422,000 ton crop of 1948 and about the same as for the 1938-47 average. Acreage harvested dropped to 690,000, compared with 694,000 in 1948 and 796,000 average of 1938-47. Yields under generally favourable weather conditions increased to 14.7 tons per acre, compared with 13.6 tons in 1948 and 12.7 tons average 1938-47.

The 1949 sugar-cane crop, mostly in Louisiana, was used for sugar making, was well above average, estimated at 6,842,000 tons, compared with 6,279,000 tons in 1948 and an average for the previous decade of 5,503,000 tons. Yields in tons per acre, were high at 21.5 and acreage at 318,600 was slightly above 1948. Sugar cane for syrup in several southern states was a smaller crop in 1949, principally because acreage was cut to 69,000 ac. from 79,000 ac. the previous year. Production was 11,770,000 gal. as against 13,390,000 gal. in 1948.

Other minor U.S. sources of sugar such as honey and maple sugar products, were produced in 1949 in significantly larger amounts than in 1948, whereas sorgo syrup was the smallest crop on record, 6,012,000 gal. as against 7,665,000 gal. in 1948. Maple products of the northeast amounted to 1,614,000 gal. of syrup and 292,000 lb. of sugar against 1,445,000 gal. of syrup and 229,000 lb. of sugar in 1948. Prices were generally lower. The 1949 honey crop was estimated at 229,751,000 lb., 11% more than in 1948.

Civilian consumption of refined sugar in 1949 was estimated at 93.3 lb. per person, compared with 95.6 lb. in 1948 and an average of 97 lb. during the years 1935-39. (J. K. R.)

SUICIDE STATISTICS: see Vital Statistics.

SUKARNO, AHMED, Indonesian statesman (b. Tulunggung, Java, June 6, 1901). (For his early career see Britannica Book of the Year 1949).

After the Japanese surrender, on Aug. 17, 1945, he proclaimed at Batavia an Indonesian republic which was to include all the islands of the East Indian archipelago. In fact, however, by consenting to the signature with the Netherlands government of the Linggadjati agreement (Nov. 15, 1946), he reluctantly reduced his ambitions to parts of Java. On Dec. 19, 1948, it was announced by the Dutch army that he had been captured at Djokjakarta (Jogjakarta) together with many other members of the republican government, and interned at Kaliurang. On Jan. 7, 1949, it was officially stated that he and his colleagues had been released but that they were confined to the island of Banka. On July 6 Sukarno returned to Djokjakarta with his ministers, and on Aug. 17, broadcasting on the fourth anniversary of the republic, said that the transfer of complete and real independence was the condition for peace and security in Indonesia. On Dec. 15 he was elected president of the republic of the United States of Indonesia. On Dec. 28, the day after A. H. J. Lovink, the Netherlands crown representative, had signed the protocol transferring the sovereignty to an Indonesian delegation, Sukarno arrived in Batavia (renamed Jakarta) to take up residence in the palace.

Ahmed Sukarno conducting a class at an Indonesian school in a nationwide drive against illiteracy. (The writing on the school board reads 'Yesterday, it was very busy at Sarangan, the visitor took a walk in the woods.')

SURGERY. Two general tendencies in the field of operative surgery may be noted during 1949. Improvement in anaesthesia, advances in the treatment of traumatic shock and in the maintenance of circulatory balance during a long and severe operation, accompanied by an increasing knowledge of the balance of fluids, proteins and salts in the circulation and the greater reservoir lying outside it, enabled undertakings whose risks were previously almost prohibitive to be conducted with reasonable safety; and a study of the results of some of the methods of treatment introduced during World War II permitted a better assessment of their value.

Operations in the thorax, and on the upper abdominal organs through the thoraco-abdominal approach, were no longer rare nor particularly dangerous. The intra-thoracic reconstruction of the oesophagus after resection for cancer by anastomosis between the mobilized stomach and the upper cut end of the oesophagus became the standard operation for the middle third of the oesophagus but was not considered practicable for growths of the upper third, until W. H. Sweet of Boston recorded a success by a new technique. He mobilized the stomach by an incision in the eighth intercostal space until it could be lifted to the thoracic inlet and then brought it up into the neck, after enlarging the inlet by resecting the inner end of the left clavicle and left first rib, and sutured it to the cervical oesophagus through a new incision. The upper end of the oesophagus was reconstructed after resection by H. W. Wookey of Toronto using a skin tube. Cancer of the lower end of the oesophagus, which tended to spread to the lymphatic glands of the stomach, was treated by a radical resection of the lower end of the oesophagus, the
spleen, the whole stomach and the pancreas as far as the inferior mesenteric vein in one block through a thoracoabdominal approach. The cut oesophagus was then joined to the jejunum. T. R. Allison of Leeds reported 24 total gastrectomies by this route, with seven deaths. He also advocated side-to-side anastomosis between a loop of jejunum and the oesophagus in the many inoperable cases that are encountered as a better palliative operation than gastrectomy.

Excision was undertaken in early cases of cancer of the pancreas with more confidence and greater safety. Richard Cattell recorded 56 pancreatico-duodenal resections with a mortality of 17%. The limit of feasible radical surgery was probably reached by Alexander Brunschwig who, after describing a total clearance of the female pelvic viscera for cancer, reported a case in which the male pelvis was cleared for a carcinoma of the colon attached to the bladder.

Formerly traumatic structure of the common bile duct could be cured with certainty only by mobilization of the ends and suture of mucosa to mucosa. When this result could not be realized, suture over a vitallium or rubber tube, or the use of a loop of bowel, defunctioned on the Roux-en-Y principle, were popular methods. For the tragic case, previously inoperable, in which no trace of duct could be found in the porta hepatis, W. P. Longmire introduced a new operation. The left lobe of the liver was sectioned until a large duct was identified and this was then anastomosed to a loop of jejunum.

In cancer of the rectum the radical abdomino-perineal operation of G. P. Mills was now performed with greater speed and safety by two surgeons working simultaneously, one from the abdomen and one from the perineum. Conservative resection, preserving the sphincters and pelvic floor, had few advocates for cancer, but it was re-introduced for certain benign conditions. M. Ravitich used this method after total colectomy for congenital polyposis of the colon and for intractable ulcerative colitis. The terminal ileum was, in these cases, pulled through the anal sphincter. O. Swenson used the same technique in treating cases of Hirschsprung's disease. He believed that the great dilatation of the colon which occurred was due to obstruction by a spastic segment in the terminal sigmoid colon. This segment of bowel was resected by an intra-peritoneal operation and the proximal colon was pulled through the anal sphincter and sutured to the stump of anal canal.

There was no fresh advance in cardiac surgery during 1949 although further reports of the success of the Blalock operation were made. R. C. Brock quoted a mortality rate of 15% but two thirds of his patients had almost perfect results. Brock reported further on the subject of pulmonary valvulotomy but although successful cases appeared to have satisfactory results the mortality of the operation was 50%. Resection and anastomosis of the aorta for coarctation, introduced by G. Crafoord in 1944, remained the operation of choice. In the rarer, infantile type of coarctation, the left subclavian artery was divided as far out as possible and swung down to be anastomosed to the aorta below the stenosis. R. L. Gross investigated the preservation of cadaver arteries in a viable state. They could be stored in a solution of serum ultrafiltrate at a temperature just above zero, and might be used as grafts to bridge the gap in the aorta after resection of an infantile coarctation or to give added length to the subclavian artery in a difficult subclavio-pulmonary anastomosis for Fallot's tetralogy.

With regard to the surgery of hypertension, it was becoming increasingly clear that operations on the sympathetic system would relieve these symptoms even when they had no appreciable effect on the blood pressure. The scope of the operation varies greatly but there was a trend away from the transthoracic operation which, in addition to being subject to occasional pleural complications, had the disadvantage of not giving access below the twelfth dorsal ganglion.

It remains to discuss the influence of streptomycin on surgery. The Gram negative infections of the urinary tract which were resistant to penicillin and the sulfa drugs yielded to streptomycin. But it was in relation to surgical tuberculosis that the place of streptomycin was most seriously on trial. In tuberculosis of the kidney, streptomycin appeared to be curative in stage I, that is, in bacilliura without X-ray change, but it was without effect in the ulcerocavernous type of disease. Considerable symptomatic relief was reported with tuberculous cystitis but reinfection from the kidneys prevented cure. No improvement in general tuberculosis took place. In the surgery of pulmonary tuberculosis the incidence of complications following resection was reduced. The contralateral spread of tuberculosis infection following thoracoplasty occurred with equal frequency, but streptomycin was effective in controlling such spread and thus rendered thoracoplasty safer. (See also ANESTHESIOLOGY.) (W. H. O.)

SWAZILAND: see BRITISH SOUTH AFRICAN PRO- TECTORATES.

SWEDEN. A constitutional monarchy of northern Europe, lying on the eastern side of the Scandinavian peninsula, bounded on the N.E. by Finland, on the E. and S. by the Baltic sea, on the S.W. by the straits of Øresund and the Kattegat and on the W. and N.W. by Norway. Area: 173,390 sq. mi. Pop.: (1945 census) 6,673,749; (Dec. 31, 1948 est.) 6,924,888 Chief towns (pop., 1948 est.): Stockholm (cap., 710,591); Gothenburg or Göteborg (343,978); Malmo (185,947); Norrköping (73,279); Helsingborg (70,729). Language: Swedish, with some Finnish (1930: 33,929) and Lappish (1945: 1,410) in the north. Religion: predominantly Lutheran; there were, however (1930 census), 119,361 Protestant dissenters of various denominations, 4,818 Roman Catholics and 6,653 Jews. Ruler, King Gustaf V (q.v.); prime minister, Tage Erlander; minister of foreign affairs, Osten Undén (q.v.).

History. To the western world, preoccupied with forming and strengthening the North Atlantic treaty, Swedish events of 1949 were seen in the shadow of a conspicuous negative, summarized as "Sweden abstains"; to the native citizen it was a year of progress in the economic field and of steadily expanding inter-Scandinavian and international co-operation, carried forward with a spirit of confidence in the fruits of continued "neutrality" which explicit warnings from the military scarcely disturbed.

The Scandinavian defence committee reported, soon after Jan. 1, that a common military policy would increase possibilities for resistance because of the larger territory involved, unified planning and the standardization of equipment, although supplies would still be needed from other countries in peacetime, and armed support in war. The opportunity to secure the advantages thus defined was immediately studied at three conferences by the Swedish, Danish and Norwegian prime ministers and foreign and defence ministers, parliamentary representatives attending the second and third. An intimation that Norway and Denmark would soon be invited to discuss the North Atlantic treaty in Washington lent urgency to these deliberations. At Karlstad (Jan. 5-6) the Norwegian spokesmen were encouraged by a Swedish draft for a binding ten-year Scandinavian defence union (excluding Greenland, the Faeroes, Spitsbergen and Jan Mayen Land), which would make an attack on one an attack upon all; but adequate armament was still contingent on supplies from the U.S., whose ambassadors in the three capitals made it clear that deliveries must go first to full allies of the Atlantic
group and prior commitments, and that "outsiders" would have to pay for them. At Copenhagen (Jan. 22-23) Halvard Lange (q.v.) suggested offering at least staff talks on strategy to the western powers, but such consultations were rejected by Sweden as unneutral and after the Oslo meeting (Jan. 29-30), which the Scandinavian ambassadors to the U.S.S.R., the U.S. and Great Britain had attended, communiqués admitted failure, although stressing the desire for collaboration in other spheres.

In a report to parliament (Feb. 9) Tage Erlander, the prime minister, admitted that a Scandinavian pact would have involved a departure from neutrality, and Østen Undén, minister of foreign affairs, explained that the manifest tendency in Norway to change her former foreign policy had led the government to propose a defensive association which would be independent of any outside power. Sweden would, however, now again adhere to a neutrality qualified only by U.N. membership. Uneasiness was perhaps revealed in Erlander's oft-quoted statement, on the same occasion, that "Sweden will build a defence which will delay an aggressor long enough for Swedish territory to become a base for the other side," the ambiguity leading friends of the west such as Herbert Tingsten of the liberal Dagens Nyheter to fear that potential friends, as well as enemies, might be confused about the nation's attitude. The detachment of the "middle way" was indeed emphasized when Per Edvin Sköld, minister for economic co-ordination, told an open-air meeting of the Northern society in Denmark (Sept. 11) that even Norway was under long-term pressure, even if less obviously than Finland, and attributed the breakdown in Scandinavian negotiations to the influence which the "Anglo-Saxon great powers brought to bear to hinder the creation of an independent Nordic defence bloc," in accordance with their predetermined policy.

Meanwhile Sweden, already far better armed than its neighbours (the forces having received some £70 million worth of new materials, including 1,000 aircraft, since 1945), gave evidence of taking the risks of enhanced isolation seriously. General Bengt Nordensköld (q.v.) visited R.C.A.F. stations in Canada and eight Meteor jet fighters from Britain paid Stockholm an official visit in August. The new budget (Jan. 11) allotted about Kr.800 million to defence, and parliament increased the appropriation for military equipment to Kr.125 million and gave the government a free hand in furthering preparedness and extending refresher courses. Radar had in some extent been installed, on the basis of Swedish research, from 1942 but by 1949 most units of the navy had received British radar equipment. Vice admiral Helge Strömberg announced (Sept. 14) that the fleet would be strengthened the "serious risk of submarines and mines in the Baltic."

Nevertheless military leaders did not disguise their disquiet at the triumph of isolationism. General Nils Swedlund, chief of the defence staff, stated (March 9) that a military alliance would both ensure foreign aid in war and give Sweden the advantage of the great powers' military and scientific research; he dismissed moreover the usual argument basing the need for neutrality on the position of Finland, for that country could, he considered, be occupied more quickly than Sweden could make up deficiencies in defence. General Helge Jung, commander in chief of all forces, followed up many earlier warnings by underlining to Lund university students (Nov. 25) the danger of a third world war and saying grimly that in case of invasion

"evacuated areas must not be regarded as pacified. Isolated army units and the home guard, supported by a freedom-loving and self-sacrificing population, must wage war in the enemy's rear to the bitter end . . . . Yet the survivors in western Europe would finally see the return of freedom, because of the superior war potential of the west."

Swedish men gymnasts performing on the last day of the Lingiad which was held in Stockholm, July 1949.

Opening an exhibition of local products at Lycksel, northern Sweden (July 16), Jung also called attention to a "small, but not harmless group of Swedes who had sworn allegiance to a foreign power" and "could constitute a grave danger in the event of war," urging that effective measures be taken in time against this fifth column, instead of letting Swedish good nature give it passive assistance. He was severely taken to task by the organ of the Social Democratic party in the north for the "pessimism" of his comments on such an occasion, which should rather be associated with faith in the future, and a leading article asked whether the commander in chief differed from the government and parliament as to what constituted suitable measures against a possible danger. The prime minister had, indeed, referred (May 15) to the fact that Communists held confidential positions; e.g., in the police and in civil and home defence, but considered that "undemocratic" elements should be combated chiefly by weakening the voters' support: the Communist party was, he thought, likely to suffer a marked defeat in the 1950 municipal elections. The Communists were in fact already losing some ground in trade union elections. The dangers at key points in Sweden's vulnerable, productive north were however detailed in a series of articles on the sabotage problem in Dagens Nyheter (Sept. 12-18), which later echoed the fears of the weekly Aret Runt about Communists who were legally armed as members of the home guard (Nov. 11).

Among many instances of Scandinavian co-operation in 1949 was the common decision to join the Council of Europe; at Strasbourg Bertil Ohlin, economist and Liberal party leader, was elected to the general committee and made an outspoken plea for devaluation as the lesser evil in Europe's trade plight. Sweden, Norway, Denmark and Iceland
decided together to withdraw from the W.F.T.U. (see Trade Unions), and Denmark was diplomatically supported by the other three with respect to South Schleswig. An important step towards the co-ordination of social security regulations was an agreement (Aug. 27) making old-age pensions available to Scandinavians in any of these four states, regardless of shifts in place of employment from one to another. Sweden, Norway and Denmark decided to support the admission of Israel to the U.N., but Sweden had accorded Israel only de facto recognition (Feb. 16), since the Israeli authorities had "regrettably failed" in taking adequate precautions for Count Bernadotte's protection and because of the "entire unsatisfactory" nature of the investigation into his assassination.

Swedish economic conditions gave the prime minister grounds for claiming that the prevsar standard of living was almost regained. Wages were 90% higher than prewar, with the cost of living only 53% higher, although by 1949 social services absorbed 10% of the national income. The danger of inflation was said to have been averted, with the price level steady for two years and unemployment down to 2-7% a record. Meat, butter, fat, sugar and soap rationing ended by August, motor car tyres and the coal trade (except coke and anthracite) were released and only coffee and petrol remained rationed. Some social trends caused anxiety: for example a continuing flight from the land, a high divorce rate still rising and increased crime in Stockholm.

Ernst Wigforss, a brilliant economist who had been minister of finance in every Social Democratic government since 1925 and in the wartime coalition, resigned in June, admired on the one hand as a sincere Socialist of the old guard, he had on the other been the main target for critics of high taxes and control. David Hall took his place, but resigned within four months because of publicity given to correspondence on a matter of party discipline. The first woman cabinet minister, Karin Kock, left the government (Dec. 29) to head the Central Bureau of Statistics. Gunnar Hedlund succeeded the veteran Axel Pehrsson Bramstorp as leader of the Farmers' party. The Conservative party sought for the basis of a renaissance, after its long period of recession, and the leaders of the Young Conservatives and Young Liberals urged the government to respond at least to Norway's offer of discussions on defence, Gallup polls indicating a considerable body of opinion favourable not merely to Scandinavian unity but to joining the North Atlantic treaty.

The O.E.E.C. recommended that Sweden should receive $40 million in 1949-50 as compensation for the "drawing rights" which it was extending to other E.R.P countries ($34 3 million to Norway and $9 3 to Greece). Sweden released more dollars for import permits in the third quarter of 1949, to be used for the re-equipment of industry. The krona was devalued in step with the pound (Sept. 19). The O.E.E.C. proposal for lifting many import restrictions among Marshall plan countries was accepted and British initiative resulted in Anglo-Scandinavian talks in Stockholm (Dec. 15-17), which concluded in a New Year.

The Soviet Union sent two notes (Feb. 28 and March 14), the second received by the press before it reached the foreign ministry, accusing the Swedish authorities of terrorizing "Soviet refugees from the Baltic states" and preventing their return home, charges which were described by the government as "sheer imagination." The minister of the interior nevertheless expressed concern (Nov 9) at the recent increase of refugees, mainly from Poland and Germany, about 2,000 arriving illegally in the course of 12 months. Sweden had certainly been hospitable, especially to neighbours, including those in the Soviet sphere, the figures for immigration (and emigration) for 1946-48 being eloquent: from Finland 19,482 (1,394), from Estonia and Latvia 16,611 (27), from Poland and Lithuania 6,196 (162).

Education. Schools. Elementary (1947-48) pupils 555,000, teachers 27,500, higher elementary (1948-49) pupils 4,359, continuation pupils 40,000 (principal city about 71,000). "National" pupils mixed 4,470, girls' 16,254, pract.46,710, state secondary (1948-49) 203, pupils 75,032, higher private (1948-49) pupils 4,872; folk high schools (1948) 70, students 7,887, two universities and three institutions of higher education (1948-9) abolished. The Lapp's folk high school (Jokkmokk) was inaugurated by Bishop Bengt Johnsson in 1949, but had received students (including Norwegian Lapps) since 1947.

Agriculture and Fisheries. Harvest estimates for 1949 cereals 908,400 metric tons (1948 1,024,300 tons), grain for fodder 20% below and potatoes 11% below the 1930-39 average. In 1949-50 Sweden would have to import 75,000 tons of refined sugar. Olive oil prices, reduced by the January 1949 agreement ensured the nation's supply of edible fats. In 1947, 7,517,707 ha. of state forest were cleared of 111 cu. m of timber. Livestock (June 1, 1948) horses 497,260; cattle 2,624,708 (1,705,479 cows); pigs 1,195,018, sheep 349,446, goats 17,177. Poultry 9,007,121. Annual (1947) 16,840 Fisheries (1947) total catch 155,942 metric tons worth Kr 89,9 million.

Industry. Industrial establishments (1946) 17,781, with machines, 4,528,367 h.p. and 652,415 workers, producing goods worth Kr 16,030 million. It was expected that iron ore exports would reach 12 million metric tons in 1949 (1948 11 million). In 1948, 14,269 million kWh of electricity were produced (11,663 million hydro-electric, of which 1,760 million from upper Norland). Oil was found, in small quantities, in Hollviken, Skåne. In 1945, industry and crafts occupied 39.7% of the population. The Industrial board production index (1935 = 100) reached 120 in July 1948.

Foreign Trade. (Million kronor, 1947) 1948 in brackets) Imports 5,220 (4,877), exports 3,240 (3,964). The largest supply countries (1948, million kronor) Great Britain (839), U.S. (688); Belgium (290), Poland (265); France (245). The best customer countries (1947) Great Britain (673), Norway (366), U.S. (295), Netherlands (244), Belgium (240). Sweden's principal imports (1948; million kronor); textiles (828); oil and mineral products (1,003); metals and metal products (652); machines, apparatus and electrical material (519). Principal exports pulp, paper etc. (1,571), the volume of pulp exports being maintained in 1949 despite loss of sales to U.S.; metals and metal products (455), machines, apparatus and electrical material (454). Foodstuffs and wood products (430). Commodities (1948) 220,000 tons, worth Kr 7,250 million.

Transport and Communications. Railways (1948) 16,869 km. Roads (1949) 90,004 km, including 4,748 km paved Motor vehicles in use (Dec. 1948); private cars 179,587, lorries 76,638, buses 6,471. Shipping (Dec. 1948) 2,294 sea-going vessels (1,457 steam and motor) amounting to 2,057,304 gross tons. In 1948 Swedish shipbuilding, with 246,000 tons constructed, ranked second in the world. Telephones (Dec. 1948) 1,450,478, or 212 per 1,000 inhabitants. Radio licences (1949) 2,055,094, or one for every Swedish family.

Frank Swift playing for England against Scotland at Wembley, April 1949. This was the last time he played at Wembley.

English football he captained the English team which, in May 1948, played Italy at Turin, Switzerland "B" team at Bellinzona and Schaffhausen.

He retired at the end of the 1948-49 season but was recalled by his club in Aug. 1949 to play in the first matches of the 1949 season owing to illness of his successor. At a dinner before the England v. Ireland match at Manchester in November the Football association presented him with an illuminated address giving details of his international career. Standing more than six feet tall with a big reach (he has a hand span of 11 3/4 in.) he was one of the greatest goal-keepers in modern football. His book Football from the Goalmouth was published in 1948.

SWIMMING. Great Britain took no part in international contests in 1949. England won the Inter-Country Speed contest.

The centralized national championships drew 119 more entries than on any previous occasion, juniors totalling 173, 99 more than in 1947. Seniors' best performances were: Ronald Stedman (Beckenham), 100 m. in 59.8 sec and 100 yd. in 53.7 sec.; W. J. Brockway (Newport, Mon.), 100 yd. backstroke in 60 sec. and, two 17-year-olds, Elizabeth Turner (Galashiels), 62.4 sec. for 100 yd. and Grace Wood (Bristol), 5 min. 34.7 sec. for 440 yd. Peter Heaty (Portobello) and Edna Child (Plaistow) were the only two British divers in world class, each being highboard and springboard national champions.

England's youngest-ever water polo team won eight out of nine matches played in Norway, Sweden and Denmark. Motherwell won the A.S.A. water-polo championship. For the 1950 Empire games England selected 11 swimmers, Scotland 5, Wales 1. An Amateur Swimming Association's advanced training course for 14 coaches and 31 selected juniors was held at Loughborough college under the tutorship of Max Madders.

A survey directed by the Council for the Promotion of Education in Swimming revealed that more than half of the population could not swim. The Royal Life Saving society, the National Association of Bath Superintendents, and the Swimming Teachers' association did useful work. A National Schools Swimming association and a Channel Swimming association were inaugurated.

United States. The rise of Japan to international leadership was the outstanding development in swimming in 1949. Six Japanese youths won the men's outdoor championships of the U.S., winning four of the five free-style events and breaking five world records.

Twenty-one-year-old Hiroshin Furushashi reduced the time for the 400 m. from 4 min. 35.2 sec. to 4 min. 33.3 sec., 800 m. from 9 min. 50.9 sec. to 9 min. 35.5 sec., 1,000 m. from 12 min. 33.8 sec. to 12 min. 14.8 sec. and 1,500 m. from 18 min. 58.8 sec. to 18 min. 19.0 sec. He also helped Yoshihiro Hamaguchi, Shigeyuki Maruyama and Shuichi Murayama to reduce the time for the 800 m. relay from 8 min. 46.0 sec. to 8 min. 45.6 sec.

Swimmers from the United States won the other events at the title meeting, retaining supremacy in the back and breast strokes and in springboard and platform diving, and they also broke five world records during the year. Allen Stack lowered the back stroke figures for 100 m. from 1 min. 40.0 sec. to 1 min. 39.6 sec.; 150 yd. from 1 min. 30.4 sec. to 1 min. 29.9 sec. and 200 m. from 2 min. 19.3 sec. to 2 min. 18.5 sec.; Keith Carter reduced the time for the 100 yd. breast stroke from 59.4 sec. to 58.5 sec. and Paul Girdes, John Blum, Raymond Reid and John Moore that for the 880 yd. relay from 8 min. 24.3 sec. to 7 min. 55.1 sec.

Only one world record for women was officially broken, Greta Andersen, of Denmark, reducing the time for 100 yd. free style from 59.4 sec. to 58.2 sec. (L. DE B. H.)

Channel Swimming. On Aug. 23-24, Philip Mickman, an 18 year-old Yorkshire schoolboy, swam the English Channel in 23 hr. 48 min. and was the youngest swimmer ever to do so. Others followed his example: F. Du Moulin (Belgium) in 22 hr.; Hassan Abd-el-Rehim (Egypt) in 15 hr. 46 min., Marie Hassan Hamad (Egypt) in 15 hr. 22 min., Z. Zirganos (Greece) in 18 hr. 30 min. Also, in September, a relay team of six Egyptians swam the Channel from England to France in 11 hr. 11 min.

SWITZERLAND. A republican confederation of 22 cantons in west-central Europe, bounded by France to the west, Germany to the north, Austria and Liechtenstein to the east and Italy to the south. Area: 15,944 sq. mi. Pop. (1941 census): 4,265,703; (mid-1948 est.) 4,609,000. Languages: German 72.6%; French 20.8%; Italian 5.2%; Romansch 1.1%; Religions: Protestant 57.6%; Roman Catholic 41.1%; Jewish 0.5%. Chief towns (pop., est. 1946): Berne (cap., 136,700); Zurich (360,500); Basel (170,300); Geneva (137,600); Lausanne (99,300). President of the confederation for 1949, Ernst Nobs (q.v.); Vice president of the federal council (government), Dr. Max Petitpierre (q.v.).

History. While the foreign relations of Switzerland in 1949 continued their course without any noteworthy change, attention was focused upon the foreign trade situation and an internal crisis which was both financial and constitutional. There was a noticeable trade recession in the first half of the year. This included a tendency unwelcome to the Swiss, who expect to import more than they export (paying the deficit out of their foreign assets), for imports to sink faster than exports; from July onwards indeed the monthly figure for imports more than once sank below exports. In July and September this was in fact partly explained by the general expectation that sterling was about to be devalued and that it was therefore worth while delaying one's orders. With its trade necessarily dependent to a large extent upon bilateral
agreements Switzerland found its clients quick to get short of Swiss francs while it itself tended to accumulate an uncomfortably large proportion of the world’s gold.

Switzerland is an industrial country which is obliged to import nearly all its raw materials and its national life is therefore conditioned by its foreign trade relations. The commercial decline was reflected on the labour market, for almost all foreign labour was sent home while the number of those registered as wholly unemployed, which had been negligible in 1948, rose to a modest monthly average of several thousands.

Prices remained extremely high and, as the boom period had passed, were felt to be oppressive. At one time there was a housewives’ strike in the chief towns against the high cost of meat which was so expensive that the average citizen could only afford to eat it twice in the week. In the course of the year there was a diminution only in the cost of clothing. The high cost of living was largely due to a policy of protection of the peasants—scarcely 20% of the total population—for whose benefit heavy duties were imposed upon imported food, whereas food exports were subsidized. In the summer, for instance, 5,000 fatted pigs were exported to Germany because the peasants could not get the prices they wished at home; this cost the government Fr.55,000 to subsidize and therefore caused considerable indignation, both on account of the taxation involved and the lack of meat at a reasonable price on the market at home. The prices of butter, sugar and various fruits were kept very high for similar reasons; it was additionally felt that the official price-control office at Montreux was unnecessarily bureaucratic in its ways.

was a wave of anti-governmental irritation which was probably unprecedented and which first forcibly expressed itself on May 22. On that day two referenda were held, the people being asked to approve (1) the continued use of paper money as legal tender which dated from the devaluation of 1936, and (2) compulsory medical examination for tuberculosis as recommended by the government and both chambers. Both these things were rejected after a bitter campaign against the latter as a piece of army interference with private life.

The main issue continued to be that of the budget which was only balanced through taxes based upon emergency legislation which was due to expire at the end of the year. On behalf of the federal government it should be made clear that modern circumstances had enormously increased federal administrative costs and that the constitution did not forbid the direct federal taxes that had been introduced by emergency decrees which, moreover, both chambers and the chief political parties had accepted. Further, public opinion, although it rebelled against the high cost of living, approved of preserving the peasantry as a privileged group; it also attributed aggressive tendencies to the U.S.S.R. and believed that large sums should be spent on an up-to-date army and air force in order that Switzerland should be able in all circumstances to sell its neutrality dearly. Finally it was natural that the federal government should wish to have a new financial order worked out within the constitution before it abandoned the special powers which it had used since the unemployment crisis of 1933.

In a country with the democratic traditions of Switzerland, however, emergency decrees four years after the end of the war were bound to be resented, especially as the opposition claimed that the government was using them in order to reduce the autonomy of the cantons. The claim was a shaky one; nevertheless it seemed certain that the government had allowed itself to get out of touch with public opinion. Already in 1946 two “initiatives” had been tabled which demanded a popular vote on the constitutional issue; the actual voting was, however, constantly delayed by the minister of justice and police who publicly belittled the “initiatives.” At last it was settled that the first of them which demanded the confirmation of emergency decrees by a popular vote should be held on Sept. 11, 1949. In fact the federal government made plain that it did not take the “initiative” seriously by recommending to the country on July 22 an extension of its special powers for another five years from the end of 1949. This completed popular exasperation.

On Sept. 11, although only 40% of the electorate voted, the first “initiative” was accepted by 281,961 against 272,359 individual votes, and by 12½ cantons against 9½. The actual majority was a narrow one but it created a constitutional crisis, since the sovereign people had protested against the methods adopted by their elected rulers and approved by their elected representatives. The chambers met later in September and in October, and approved a two-year provisional financial programme without which it would be impossible to levy, after the end of 1949, what had by now become basic taxes. The new programme, which abolished the sales tax on essential foods and made other small concessions, was to be submitted to popular approval before the end of 12 months.

On Sept. 11 two other significant events took place. On the one hand an owner of a chain stores and Switzerland’s most active demagogue in whipping up resentment against the government was elected as one of the canton of Zürich’s two representatives in the Swiss Upper House. On the other the Social Democrats lost control of the municipality of Zürich which had for many years been regarded as a Socialist

Philip Mickman (left) of Ossett, Yorkshire, who, in Aug. 1949, swam the English channel in 23 hr. 48 min. being congratulated by Ishak Helmy of Egypt who himself swam the channel in 1928.
stronghold; a week later the devaluation of sterling heralded an employers’ attack upon industrial workers’ wages on the grounds that some of Switzerland’s imports would now be cheaper.

But the Social Democrats were still one of the three parties which dominated the political scene; and the situation was felt to have deteriorated further when at their congress on Nov. 4 they voted by a large majority against the provisional financial programme. It was feared that the one Socialist member of the federal council might be asked to resign; this would mean returning to the rigid division of the country between non-Socialists and Socialists which had prevailed until World War II.

On Dec. 15, Dr. Max Petitpierre was elected president of the conference for 1950 and Eduard von Steiger, minister of justice and police, vice president of the federal council.

(E. W. L.)

Education. (1946-47) Elementary schools, pupils 431,332, teachers 13,692; secondary schools, pupils 75,546, teachers 3,043; universities (1947-48) 7, students 13,182, professors and lecturers 1,334; institutions of higher education 2, students 4,547, teachers 427.

SYDNEY, capital of New South Wales, the largest city of Australia and third city of the southern hemisphere. Pop. (June 30, 1947, census) 1,484,434. Lord Mayor, E. C. O’Dea.

At the city council elections in Dec 1948 the Australian Labor party gained 18 seats, Civic Reform party 9 and Lang Labour party 2. Alderman O’Dea (A.L.P.) was installed as lord mayor on Jan. 1; in December he was re-elected for 1950. In May, the minister for local government announced his approval of the principles of the county of Cumberland’s master plan to control development of the metropolitan and county area; in August a royal commissioner was appointed to investigate objections to the plan by metropolitan municipal councils.

In February experts arrived from Great Britain to report on the city’s public transport system, following an announcement of heavy losses and a sharp increase in fares; recommendations included the replacement of trams by buses. A new commissioner for road transport, R. Windsor, was appointed in September. A strike of coal miners (June to August) caused drastic lighting and power restrictions and severe curtailment of transport services and industry.

The composition of the council of the newly established N.S.W. University of Technology was announced in May and the first professors appointed. The minister for education appointed a committee to report on the financial difficulties of the University of Sydney.

The Royal Sydney show (April 9 to 19) was attended by more than one million people. The main theatrical event was the visit of the Stratford Memorial Theatre company, Nov.-Dec. A number of overseas musicians, including Elizabeth Schwartzkopf and Otto Klemperer, appeared during the year.

SYRIA. An independent Arab republic, formerly under French mandate, bounded by the eastern Mediterranean, Turkey, Iraq, Jordan, Israel and Lebanon. Area: 73,587 sq. mi. Pop.: (1943 est.) 2,860,400, (1947 census) 3,430,310. Religions (1943 est.): Moslem 2,424,700 or 85% (Sunni Arabs 1,721,000, Shia Arabs 12,700, Sunni Kurds 200,000, Sunni Turks 30,000, Sunni Circassians 20,000, Druze 87,200, Ar. 49,782,000, Chaldean, 403, 497; Roman Catholic 103,800; [Greco-Melchite 46,700, Armenian 16,800, Syrian 16,200, Maronite 13,400, Latin 6,000, and Chaldean 4,700]; Eastern Churches 288,000; [Greek Orthodox 137,000, Gregorian Armenians 101,700, Syrian Jacobites 40,100, and Nestorians 9,200]; Protestant 11,200; other 1% (Jewish, Yezidi, etc.). Languages: Arabic is the mother tongue of some 86% of the population, but Kurdish, Armenian, Turkish and Circassian are also spoken. Chief towns (pop., 1948 est.): Damascus (cap., 342,000); Aleppo (369,000); Homs (111,000); Hama (82,000); Latakia (the only port, 42,000). Presidents in 1949: Shukri Bey el-Quwatli (until March 30), Marshal Husni ez-Zaim (see OBITUARIES) (June 25-Aug. 14) and Hashem Bey Atassi (from Dec. 14); prime ministers in 1949, Khalid el-Azam (until March 30), Dr. Muhun Barazi (June 26-Aug. 14), Hashem Bey Atassi (Aug. 15-Dec. 13), Nazem el-Kodsi (Dec. 24-25), and Khalid el-Azam (from Dec. 28).

History. On March 30 a section of the army led by Colonel Husni el-Zaim, the chief of staff, overthrew the government, arresting President Shukri Bey el-Quwatli, the prime minister Khalid el-Azam and other ministers, two of whom were later released. The frontiers were closed and a curfew was ordered. In the first of many broadcasts Colonel Zaim said that he had acted to save Syria from a despotic regime. On the following day he said that elections would be held as soon as possible; and the frontier with Lebanon was re-opened. There was no bloodshed or disturbance, and the new regime received a widespread public welcome.

Zaim appeared before the Chamber of Deputies on April 1 and received a vote of confidence by a slight majority. Next day he announced its dissolution. A consultative commission was summoned to draft a new constitution. Zaim also proclaimed a policy of internal reform and cordial relations with other countries.

On April 7 it was announced that the president and prime minister, still under detention, had resigned; and Zaim shortly after formed a cabinet in which he assumed the titles of prime minister, minister of defence and minister of the interior. Among the far reaching changes proposed were the transfer of power to the middle classes, the division of large estates, the limited enfranchisement of women and the reform of the civil service. Zaim gave absolute priority of expenditure to the army, with the declared intention of making it one of the strongest in the middle east.

All political parties were dissolved by decree on May 29. On June 25 a referendum was held, all troops being confined to barracks; Zaim’s regime and all its decrees were endorsed and he himself elected president by 621,000 out of
SYRIA

762,000 votes. A government was then formed on June 26 with Dr. Muhsin Barazi as prime minister and minister of foreign affairs. The new president also took the rank of marshal.

Syrian finances were in a disastrous condition and heavy taxes were resorted to, including a 15% tax, retrospective to 1940, on the profits of all industrial concerns, businesses and sales of land or houses. Marshal Zaim began consciously to model himself on Kemal Atatürk and openly flouted older Moslem notions of propriety. His popularity began to decline. A number of senior officers, the president's former colleagues and supporters, were dismissed and imprisoned. Arrests of leading men were numerous.

Early on the morning of Aug. 14 a group of army officers led by Colonel Sami Hinnawi, with three armoured vehicles, forced their way into the president's and prime minister's residences, whence both were taken out and summarily shot. It was proclaimed that they had been condemned to death by a supreme war council presided over by Colonel Hinnawi and that the army had acted to save the country from the tyrant who had abused his authority, wasted public money and restricted personal freedom, acting contrary to the spirit of the March 30 coup d'état.

At a meeting in the defence ministry Hashem Bey Atassi, 85 years old, who had once been president under the French mandate, agreed to form a provisional government; and to this Colonel Hinnawi handed over on Aug. 15, returning with his officers to barracks. The main duty of the new government was to pave the way for the early election of a Constituent Assembly to prepare a new constitution.

These events had wide repercussions in the middle east. On April 16 Nuri Pasha, the Iraqi prime minister, and the minister of defence had visited Zaim in Damascus. The Lebanese minister of foreign affairs was also present at the talks. The Iraqis returned to Baghdad next day, not waiting for the arrival of the secretariat general of the Arab league (q.v.), who came up from Cairo that evening. On April 21 Zaim flew to Cairo where he was received by King Farouk and Egypt's recognition of his regime followed on April 23. Statements by the King of Jordan (q.v.) were not well received in Damascus, and on April 27 Zaim declared himself resolutely opposed both to the Greater Syria project of King Abdullah and the "fertile crescent" scheme of Nuri Pasha. At the same time he closed the Jordan frontier, concentrated Syrian forces there, and called up 20,000 men. The frontier was reopened on April 27, but Zaim in a further statement spoke of Jordan as the tenth province of Syria. On May 7 he said that Syria would shift from defensive to offensive opposition to the two schemes, and in a press interview in June was quoted as saying, "when King Abdullah dies I shall take over his kingdom."

Relations with Lebanon (q.v.) deteriorated but improved slight after the termination of the Saudeh episode. By the end of April the Zaim regime had been recognized by Great Britain, the United States, France, Italy, Belgium and Persia. Zaim sought French support and was later to be accused by Colonel Hinnawi of having re-installed in posts of command supporters of the mandate. On April 15 he announced that he wanted strong ties of friendship with Turkey; and at Syria's request the Turkish government, on July 25, sent General Kazim Orbay to advise on the reform of the Syrian army. The general was received with great ceremony in Damascus, where he remained until Aug. 25. Turkey was also asked to admit Syrians to Turkish military schools.

After Zaim's death, the new government was quickly recognized by Jordan and Iraq but not by Egypt and Saudi Arabia. It was assumed to be in sympathy with Nuri Pasha's plan to unite Syria with Iraq under King Faysal II, particularly after a ceremonial welcome had been given to the Iraqi regent at Damascus airport, on his way back from London on Oct. 6, in which the prime minister and his cabinet, Colonel Hinnawi and other leaders took part. After mutual consultation, the British, United States and French governments gave recognition on Sept. 20. The Syrian prime minister said on Aug. 18 that the policy of the new government remained without change toward Turkey. But an agreement for the sale to Turkey of 100,000 metric tons of Syrian grain, concluded on July 24, was denounced on Aug. 27, owing to the government's inability to find the quantity required.

The government of Zaim on May 16 had ratified the agreement initialled on Feb. 2 between the previous government and the Arabian American Oil company granting wayleave for the Trans-Arabian pipeline. On June 7 it signed agreements with the Anglo-Iranian Oil company granting wayleave for a pipeline from Abadan to the Mediterranean and providing for the construction of a refinery at Tartous on the Syrian coast. Hashem Bey Atassi stated on Aug. 16 that his government would neither endorse nor repudiate these agreements, which must come before the new assembly for its decision.

Armistice talks with Israel began in April and an armistice was signed on July 20.

Parliamentary elections took place on Nov. 15: only 39% of the electorate voted, women voting for the first time. In the result no party gained an absolute majority but the Constituent Assembly of 113 deputies was dominated by the Popular party (led by Rushdi Kekhya, minister of the interior) which gained 44 seats; the elections were boycotted by the National party, of which Shukri Bey was the founder; the Ba'th (left-wing) party secured 7 seats. On Dec. 12 the Assembly elected Rushdi Kekhya its president, the cabinet resigned and on Dec. 14 Hashem Bey Atassi was elected provisional chief of state pending the drafting of a new constitution.

Early in the morning of Dec. 19 a third coup d'état was staged by the Syrian army. Former Colonel, now General Hinnawi, commander in chief of the Syrian army, and his brother in law, Assad Talass, under secretary of state for foreign affairs, were arrested. The leader of the coup, Colonel Adib Shishakli, 41-year-old commander of the 1st motorized brigade, declared that the arrested men were plotting against the republican regime in conjunction with foreign elements. Following the failure of Khalid el-Azam to form a cabinet the premiership was entrusted on Dec. 24 to Nazim el-Kodzi, but he resigned the next day. Hashem Atassi, the provisional chief of state, submitted his resignation on Dec. 26, but the next day the Constituent Assembly refused to accept it.
A new government was formed on Dec. 28 by Khalid el-Azam with Colonel Akram Hawrani, leader of a newly founded Republican party, as minister of defence, and Sami Kabbara, an Independent, as minister of the interior. General Hinnawi was pensioned and Colonel Anwar Mahmoud was appointed commissioner in chief of the army on (X.)

Education. (1946-47) Schools: state 870, pupils 127,502, private 344, pupils 48,133; foreign 55, pupils 5,725, universities 1, students 1,722; institutions of higher education 3

Agriculture. Main crops ('000 metric tons, 1948): wheat 550; barley 262; rice 30, rye (1947) 22, potatoes (1947) 15, cotton 7; tobacco 4; olives (1946) 42, lentils (1947) 39; broad beans (1947) 29

Trade. (1948, with Lebanon) Imports £5468 million, exports £77 million.

**TABLE TENNIS.** The world championships were held at the Eriksdalshall in Stockholm, in Feb. 1949. The men's singles event was won by Johnny Leach of London; Fred Perry last won the event for England in 1929. The men's team event (Swaythling cup) was won by Hungary who beat Czechoslovakia five matches to four. In the Marcel Corbillion cup for women's teams U.S.A. beat England, the holders, three games to one. G. Farkas (Hungary) won the women's singles, F. Tohar and I. Andreidis (Czechoslovakia) the men's doubles, H. Fiott (Scotland) and G. Farkas (Hungary) the women's doubles and F. Sido (Hungary) the mixed doubles.

The other great event in the table tennis world, the English championship, was played at Wembley, Middlesex, in Feb. 1949. M. Reisman (U.S.A.) won the men's singles title, beating V. Barna (England) by three games to two. P. McLean (U.S.A.) won the women's singles, beating H. Elliott (Scotland) in three straight games. R. Bergmann and V. Barna (England) won the men's doubles, P. McLean and T. Thall (U.S.A.) the women's doubles and R. Miles and T. Thall (U.S.A.) the mixed doubles.

**TAIWAN: see FORMOSA.**

**TANGANYIKA: see British East Africa; TRUST TERRITORIES.**

**TANGER.** From 1912 an international and demilitarized zone of Morocco on the southern shore of the Straits of Gibraltar. Area: 232 sq. mi. Pop.: (Dec. 1933 est.) 60,000; (1940 census) 102,306 including 16,266 European; (mid-1949 est.) 150,000 including 30,000 Europeans. Languages: Arabic, French and Spanish. Religion: mainly Moslem. When the one-sided incorporation of Tanger into the Spanish zone of Morocco (Nov. 3, 1940) had been terminated on Oct. 11, 1945, the international administration was re-established with a committee of control composed of the resident consuls general of France, Great Britain, the United States, the U.S.S.R., Belgium, the Netherlands, Portugal and Spain. The Soviet representative refused to take his seat on the committee as long as Franco Spain was represented. Italy was re-admitted to the committee on March 8, 1948. The committee of control appointed a legislative assembly of 26 members (4 French, 4 Spaniards, 3 British, 3 Americans, 1 Belgian, 1 Dutchman, 1 Portuguese, 3 Jews and 6 Moslems). Tanger remained under the nominal sovereignty of the sultan of Morocco and his representative (the mendub) was Haj Mohammed el Tazi. Administrator (from Aug. 1948), Jonkheer H. L. F. C. van Vredenburch.

In 1949 Tanger could be described as the only genuine international administration and the only absolutely free money market in the eastern hemisphere. The international regime functioned smoothly, the financial position was prosperous, with a large budget surplus, and the local debt was reduced to less than 0-5% of the yearly revenue. There was no income tax and revenue was raised largely by the flat-rate 12.5% duty on goods imported or in transit. The Moroccan franc, equal to the French franc, was the legal currency but any of the world currencies could be legally bought and sold. By Sept. 1949 the number of banks had increased from 10 before World War II to 81. Private enterprise was the key to Tanger's prosperity, but speculation rather than public-spirited investment seemed to be the rule.

**TARIFFS.** Anticipations of fundamental changes in the tariff systems of western Europe and the Commonwealth failed to materialize in 1949. Although preparatory work for such changes continued, the extent to which efforts towards the economic integration of Europe showed appreciable results in the sphere of tariffs was so far modest. Notwithstanding pressure from the United States, there was no indication of any growing willingness to remove customs barriers. Although the idea of a Western European Customs union appeared less Utopian in 1949 than two years before, it was still far beyond the possibilities of realization in the near future. For the present, progress in that direction was made in three senses:

1. Regional customs unions were being established or planned. In this respect the "Benelux" countries (Belgium, the Netherlands and Luxembourg) achieved concrete results in 1948-49. Although France and Italy signed an agreement for a customs union in March 1948, the scheme was still in its preliminary stage during 1949 and so was the Scandinavian scheme.

2. Efforts were made in 1949 within the framework of the existing system, to lower customs barriers and reduce preferential rates between European and Commonwealth countries. In this respect the results of the tariff negotiations at Annecy, France, during the summer of 1949 were particularly worth noting.

3. The Organization for European Economic Co-operation intensified its efforts during 1949 to achieve progress towards the economic integration of countries sharing in the European Recovery programme. Although these efforts aimed mostly at the removal of obstacles to intra-European trade other than tariffs, attention was also paid to prohibitive tariffs in the plan to abolish quotas on half the imports of member countries from each other.

The results of the regional customs union between the Benelux countries during 1949 were found to be disappointing. This experience made it evident that, although before World War I and to a less extent before World War II, tariffs might have been the main obstacle to the free flow of international trade, during the postwar period they were over-shadowed, at any rate in intra-European trade, by quantitative restrictions and exchange controls. In spite of the abolition of customs barriers between Belgium, the Netherlands and Luxembourg, trade continued to be hampered by the continued existence of quotas and currency restrictions. Negotiations were pursued to remove or mitigate these obstacles in order that trade should be able to benefit by the removal of tariffs.

Towards the end of 1949 efforts were made to extend the Benelux arrangement to include France and Italy. It was suggested that the new organization might be called "Fritalux" or "Finebel." At the same time an attempt was made...
to establish some degree of economic union between the United Kingdom and the three Scandinavian countries under the name of “Ukiscan.” There was a possibility of including the western zones of Germany in one or the other combinations. Up to the end of the year little actual progress had been made with any of these schemes.

The Organization for European Economic Co-operation was fully aware that quotas and exchange restrictions constituted in existing circumstances a more insurmountable barrier than tariffs. The main effort towards economic integrations was focused, therefore, not on the removal of tariff barriers, but on the mitigation of difficulties to intra-European trade arising from exchange regulations and quotas. In the summer of 1949 an understanding was reached for the establishment of a new intra-European payments system which was expected to go a long way towards facilitating trade between the E.R.P. countries. During the autumn, progress was made on the lines of a proposal put forward by the British government under which the quotas on at least half the member countries’ total imports from other O.E.E.C. countries were to be abolished at an early date. The only important provision which aimed at the reduction of tariff barriers was the proposal that the O.E.E.C. country considered that the reduction of the quotas by another country was frustrated by the continued existence of a prohibitive tariff, it might ask the O.E.E.C. to decide whether the goods affected should be counted towards the 50% reduction. If the O.E.E.C. ruled that the exemption of the goods concerned from the quota was, in practice, ineffective then the government concerned, in order to complete the 50%, would have the choice between lowering the tariff on the goods in question or removing the quota on other goods.

Although the Annecy negotiations were not confined specifically to trade between European and Commonwealth countries, these countries constituted a large proportion of the participants which, between them, represented something like 70 to 75% of the world’s trade. The original participants included Australia, Belgium, Canada, Ceylon, France, India, Luxembourg, the Netherlands, New Zealand, Norway, Pakistan, Southern Rhodesia, South Africa and the United Kingdom. The countries which adhered to the group during 1949 included Finland, Greece, Italy and Sweden.

The 23 original participating countries negotiated a series of tariff agreements at Geneva, Switzerland, in 1947. The object of the Annecy negotiations was to negotiate further tariff agreements between these countries and the 11 acceding countries. The proceedings involved 147 separate negotiations between pairs of countries. The new members revised their tariffs as a condition of their admission to the general agreement on tariffs and trade and the 23 original members made reciprocal concessions for their benefit. The significance of these mutual concessions was enhanced by the operation of the most-favoured-nation rule under which concessions made by any participant to another would be equally available to other members, whether old or new.

In general these agreements succeeded in binding tariffs and margins of preference at their existing level rather than reducing them. In view of the temptation to safeguard home markets and develop regional trade to the exclusion of other countries, even this fixing of the rates at the existing levels was considered an achievement. The United Kingdom undertook to bind duties or to bind the duty-free entry of goods, the total imports of which amounted to £73,900,000 in 1938. Of this amount £22,400,000 related to imports on which the United Kingdom had undertaken to bind duty-free entry; most of the goods concerned were raw materials such as wood pulp. The United Kingdom also agreed to extend to European softwood the tariff reduction granted in favour of American softwood in 1947. In two instances affecting certain iron and steel items the United Kingdom agreed not to increase duties beyond certain maximum rates.

The United Kingdom consented to reduce the margin of preference in the case of cod liver oil and certain types of cheese below the minimum level agreed with Commonwealth countries. This was done in agreement with the Commonwealth countries concerned and the latter were able to obtain counter-balancing concessions in their negotiations with countries which benefited by the reductions. The most important preference items affected by the Annecy agreements was unwrought aluminium on which the United Kingdom undertook to eliminate the duty. The value of imports from Commonwealth countries (principally Canada) was £2,900,000 in 1938. Canada obtained compensation for loss of the preference margin on this item by direct negotiation with Norway, in whose interest the concession was made.

The British government also agreed, at the request of other Commonwealth countries, to the reduction by them of certain margins of preference granted to the United Kingdom at Ottawa in subsequent agreements. The value of the trade affected by these concessions was very small.

The value of trade from which the United Kingdom was expected to benefit directly from these agreements was not to increase duties and from reductions of duties was £22 million in 1938, including about £174 million in respect of the Scandinavian countries alone. The value of corresponding trade items after World War II was substantially larger.

In addition to benefits arising from concessions made by the acceding countries, the United Kingdom also anticipated gains from concessions made by other contracting parties to acceding countries. For instance, concessions made by the United States on items in which the United Kingdom had an interest tended to benefit British trade which had amounted to about £50,000,000 in 1938.

In respect of the Annecy tariff concessions, as well as regional customs unions schemes and O.E.E.C. schemes, it was well to bear in mind that trade between most participating countries was hampered more by quotas and exchange restrictions than by customs duties. All European countries were using quotas extensively and Canada was the only Commonwealth country which did not use them to any considerable extent. Nevertheless, it would be a mistake to underrate the importance of the trend towards tariff reductions.

In a sellers’ market, such as existed during the early postwar years, the price factor was of secondary importance, so that even high tariffs would not have prevented the free movement of goods across the barriers if it had been possible to remove the quotas and exchange restrictions. Since, however, a buyers’ market developed in the meantime, or was about to develop, in almost every line of goods, tariff rates were coming into their own as factors determining the international flow of goods. As and when quotas and currency restrictions are removed or mitigated, the importance of tariffs in international trade tends to increase. Hence the provision in the O.E.E.C. proposal of quota cuts, aimed at preventing these cuts from becoming nullified by high tariff rates which, in a buyers’ market, could easily prove prohibitive.

It was agreed at Annecy that the participating governments would endeavour to follow up the Geneva and Annecy agreements by an attempt at further reciprocal tariff concessions on a larger scale. To that end it was arranged that there should be another international conference on tariffs in 1950, in which 61 nations were expected to join. Meanwhile the O.E.E.C. negotiations for the elimination or mitigation of quotas were also expected to make progress, and intra-European payments further to be facilitated. Pressure from the United States in favour of the removal of tariffs
TAXATION

and other obstacles to free trading in western Europe was on the increase, and apprehension that congress might be reluctant to pass further E.R.P. instalments unless adequate progress was shown in that direction provided a powerful stimulus to the negotiations conducted to that end.

Progress achieved or anticipated in respect of the removal of trade barriers in Europe was confined almost entirely to Western Europe. Czechoslovakia was the only country behind the "iron curtain" which participated in the Annecy negotiations. (See also EXCHANGE CONTROL AND EXCHANGE RATES: INTERNATIONAL TRADE.) (P. EG.)

TASMANIA: see AUSTRALIA, COMMONWEALTH OF.

TAXATION. There were no very striking new departures in 1949 in the taxation systems of the European and Commonwealth countries. During earlier postwar years some of the former countries embarked on new experiments, such as a tax on wealth acquired during the German occupation, a capital levy or a tax on capital gains. By 1949 these experiments—which involved once-for-all levies rather than recurring taxation—were considered of the countries of western Europe was running, for the most part, on traditional lines. The main differences between the 1949 taxation systems of Europe and the Commonwealth and those of 1939 may be summed up as follows: (1) rates of taxation were everywhere well above prewar levels; (2) the wartime reversal of trend in favour of indirect taxation was maintained, though in many instances the rates of indirect taxes were reduced after World War II; (3) taxation was guided, to a larger extent than before World War II, by political and social rather than economic considerations; (4) even to the extent to which taxation was guided by economic considerations, fiscal considerations proper played a subordinate part compared with considerations of general economic policy; (5) even though the wartime increase in the number of direct tax-payers was not fully maintained, it remained well above prewar level, partly through a lowering of the exemption limits and partly through an increase of the nominal wages of lower-paid workers; (6) income tax and death duties remained at their wartime high level on large incomes and fortunes.

In the United Kingdom taxation receipts continued their uninterrupted postwar rise. Actual receipts during 1948-49 amounted to £3,667 million, an increase of £155 million compared with budgetary estimates. As in previous years this increase was mainly the result of the satisfactory yield of the income tax which was £1,367 million, compared with £1,189 million for the previous fiscal year, and exceeded budgetary estimates by £58 million. Practically all other main taxation items showed increases. This was partly caused by the rise of prices and partly by the increase in production. Progress by the Inland Revenue department in its effort to catch up with wartime arrears also helped. On the basis of existing taxation the total receipts from taxes during 1949–50 were estimated at £3,655 million, a decline, on balance, of some £124 million, due to the anticipated fall of the yield of the special contribution, death duties, stamp duties, profits tax and excise. On the other hand, a further increase of the proceeds of income tax, surtax and customs revenue was anticipated. Changes in taxation in the budget for 1949–50 disappointed those who expected substantial concessions in order to compensate workmen for abstaining from pressing wage claims. The only concession of this nature was a slight reduction of the beer duty. The proposed simplification of death duties was expected to produce an additional yield of £11 million; but the repeal of some obsolete stamp duties was expected to cost £1½ million. After allowing for these and other changes the taxation receipts for 1949–50 were estimated at £3,632 million.

During the three quarters ended Dec. 31, 1949, the yield of income tax at £562.1 million showed an increase of £38 million compared with the corresponding period of 1948. Surtax increased by £12.3 million to £48.3 million, death duties by £11.5 million to £143.4 million, profits tax by £60.3 million to £230.2 million. On the other hand, stamp duties yielded £3.4 million less at £38.9 million, excess profits tax declined by £37.7 million to £31.8 million, special contribution by £15.3 million to £171.1 million, customs by £13 million to £611.9 million and excise duties by £25.1 million to £526.7 million. Generally speaking direct taxes showed better results than indirect taxes.

Commonwealth. In Australia total revenue for the year ended June 30, 1949, was £6535 million, which was £443 million above budgetary estimates. It reflected the rapid rise in commercial turnover and incomes but was partly caused by the overtaking of taxation arrears. Revenue from the sales tax was particularly buoyant.

In Canada the wartime increase in the number of direct taxpayers was decidedly reversed in 1949. Under concessions granted in the budget for 1949 some three-quarter million taxpayers ceased to pay income tax and were even refunded what they had paid after Jan. 1, 1949. Various indirect taxes were also cut. The 8% sales tax on fuel oils was removed. The 15% tax on travel tickets, telegrams and cables and long distance telephone calls was repealed; and the duty on cider was lowered from 50 cents to 25 cents a gallon. The tax on soft drinks, sweets and chewing gum was dropped. Cuts of between 10% and 25% were made in the tax on jewels, suitcases, fountain pens, lighters, etc.

In Ceylon, on July 14, 1949, the finance minister announced the government's decision to reduce customs duties and income tax on lower incomes. This was decided in spite of the reduction of the revenue surplus from Rs. 32 million in 1948-49 to Rs. 2 million in the estimates for 1949-50.

India's budgetary deficit for 1949-50 was estimated at £20 million. To deal with it, the government introduced new excise duties on tea, cigarettes, coffee and tyres. The clothes export duty was converted into an ad valorem duty of 25%; handloom clothes were exempted. Export duties on oilseed and vegetable oil and import duties on motor cars were raised; the latter from 45 to 50%.

In New Zealand taxation yields in 1948-49 £NZ130.4 million and estimates for 1949-50 were £NZ132.7 million. For some years in succession the yields of taxation had exceeded budgetary estimates, because the finance minister had not budgeted for the continued rise of prices and of business activity. In the budget for 1949-50 some moderate concessions were made in respect of the amusement tax.

Europe. In the Czechoslovak budget for 1949 the outstanding change in taxation was the unification of the various types of purchase tax, such as turnover tax, luxury tax, railway transport tax, etc. New unified tax was expected to yield Kc. 50,713 million, compared with the yield of the old turnover tax of Kc. 12,426 million in 1948. Considering that the total revenue in 1949 was estimated at Kc. 89,320 million, against Kc. 56,895 million in 1948, it became evident that the country's fiscal system was now based overwhelmingly on this new turnover tax. Accordingly, the yield of direct taxes was expected to decline from Kc. 16,621 million to Kc. 14,791 million and that of stamps from Kc. 4,679 million to Kc. 2,094 million.

In France total revenue for the fiscal year 1948-49 was estimated at Fr. 1,250,000 million, compared with Fr. 924,000 million for 1947-48. Taxation receipts alone increased from Fr. 769,000 million to Fr. 1,069,000 million. The devaluation of the franc in 1948 and the continuous rise in prices was chiefly responsible for this rise. At the end of 1949 the government
introduced new taxes to eliminate the budgetary deficit. They included a tax on transactions of government corporations—an unusual instance of a government taxing itself—a tax on undistributed profits and a tax on road transport.

In Italy the government was experimenting with a change in the system of assessment of income tax. Hitherto the presumption had been that everybody declared only a fraction of their incomes. In July 1949 the finance minister, Enzio Vanoni, proposed a "new deal" to taxpayers for a more equitable assessment of taxable incomes. Under the existing system those who were honest enough to declare their full earnings, or those who were not in a position to conceal part of their earnings, bore an unduly heavy burden. In the future the taxpayers were to be pressed for more accurate information but in return the rates would be lowered. Thus for an income of L 1 million the rate would be reduced from 18 to 13%. Notwithstanding such a substantial reduction the government hoped to increase the yield of income tax through less evasion. The new system was to operate retrospectively; but if the evasion was not in excess of a certain amount there would be no supplementary assessment on past incomes.

The Netherlands, having succeeded in balancing their budget, adopted the course of shifting the burden slightly from direct to indirect taxation. There was a moderate cut in the tax on income from commerce and wages and an increase of the turnover tax by 1/4. Petrol excise duty was also raised. The formula adopted was that taxation must be shifted from earning to spending, to strike a fairer balance between producers and consumers.

Portugal introduced a new purchase tax for the first time in its fiscal history. The object was to use the proceeds to create an export subsidy fund. There was to be a tax on motor vehicles, ranging between 15 and 50%, of their retail prices.

Spain increased direct taxation by 5%, from the beginning of 1949, in order to provide means to extend social insurance. In the budget for 1949 direct taxation was estimated at P 6,185 million and indirect taxation at P 6,553 million.

Switzerland's budget estimate for 1950 showed revenue of Fr. 1,151 million and expenditure of Fr 1,466 million. New federal taxes were adopted to yield Fr. 470 million.

During the brief period between the devaluation of many Commonwealth and European currencies and the end of the calendar year there was no evidence of any change in the yield of taxation. Nor did measures adopted by most governments following devaluation include new taxation. For the most part the budgetary effort to ensure the success of devaluation aimed at cuts in expenditure rather than the introduction of new taxes, the assumption being that the rise in prices as a consequence of devaluation would in any case ensure an increased yield of both direct and indirect taxes. An alternative to raising taxes was the raising of prices of controlled goods, for example, bread in Great Britain and petrol in France, to absorb consumers' purchasing power and to avoid increasing the burden of subsidies. (P. Fr.)

United States. A transition from a postwar period of surplus revenues and debt reduction to the recurrence of deficits marked the federal government's fiscal year 1949. The Revenue act of 1948, enacted over a presidential veto, was estimated to have reduced federal revenues from individual income taxes by $5,000 million per year. Faced, in Jan. 1949, with the possibility of a deficit, but chiefly as a measure of inflation control, President Truman recommended to congress measures to increase revenue from taxation by $4,000 million, chiefly by increased taxes on corporate income, supplemented by increased estate and gift taxes. The president also recommended careful study of the increase of rates for the individual income tax in the middle and upper income brackets.

A congress which showed little inclination to increase taxes and which had failed to act upon the January recommendations received further Presidential tax advice in July. By this time, the fiscal year 1949 had closed with a deficit of about $1,800 million, and a drop in business activity and in employment had become clearly defined. Taxes as a measure for inflation control were no longer desired, and in his midyear economic report the president advised that "no major increase in taxes should be undertaken at this time." Estate and gift taxes were an exception, however, and the president again advised increases in their rates, to recover the revenue lost under the Revenue act of 1948. No response was forthcoming from congress.

By the end of 1949, the business decline of the early part of the year had moderated, and the Department of Commerce estimated that the year would show a national income of $222,000 million a decline of only 2% from 1948. Nevertheless, governmental expenditures had continued to run in excess of receipts and a deficit estimated at $5,500 million was in prospect for 1950 fiscal year unless authorized expenditures should be sharply curtailed or taxes increased. At the beginning of an election year, neither alternative seemed to appeal to congressional opinion: instead there was greater support for a programme for reducing federal excise taxes.

Carrying forward a policy designed to facilitate international trade and to encourage international investment and enterprise, the State Department and the Bureau of Internal Revenue continued to negotiate with other nations treaties designed to eliminate or minimize the barrier of international double taxation, particularly in the fields of income and estate taxation, and at the same time to prevent evasion. At the beginning of 1949 income tax treaties were in force with Denmark, France, the Netherlands and Sweden, and income and estate tax treaties with Canada and the United Kingdom. Awaiting ratification were income tax treaties with Belgium and New Zealand, an income and estate tax treaty with the Union of South Africa and a treaty, plus an amending protocol, with France covering estate taxes and modifying the earlier income tax treaty. Negotiations with other nations were in progress.

In 1949, ratifications of the pending treaty with France were exchanged, and it became effective. The income tax treaty with Belgium, signed in 1948, was submitted to the Senate, and an income and estate tax treaty with Norway was signed and submitted for ratification. Preliminary conversations, or negotiations, looking toward income and estate tax treaties with three American nations, Brazil, Columbia and Cuba, were announced by the State Department in June and July, and with Argentina in Dec. 1949. Increasing costs of government and increasing demands upon government had caused the steady increase in state and local taxes to continue. The frequency with which state and local governments, seeking new or increased revenues, turned to consumer taxes which tended to bear most heavily upon lower and middle income groups distressed many economists.

Indicative of the trend of state and local taxation and the increasingly important part such taxes were playing in the general fiscal problem were figures released in 1949 showing that, though federal tax revenues (excluding payroll taxes for social security) reached their peak of $42,477 million in 1945, and thereafter dropped to less than $40,000 million annually, total federal, state and local tax revenues (excluding payroll taxes) reached a peak of $53,246 million in postwar 1948, as compared with $51,670 million in 1945. Estimates of 1949 total revenues put them on levels comparable with those of 1948.

In per capita terms, the burden of state taxes (excluding payroll taxes) for 1949 ranged from $91 19 per person in
Louisiana, to $35.92 in Nebraska, with an average of $57.43. State legislative activity in 1949 was frequently directed toward increasing rates on the more prevalent forms of taxation. Petrol taxes existed in every state, ranging from 2 cents per gallon in Missouri (subject to referendum action in 1950 which might raise it to 4 cents) to 9 cents in Louisiana. In 1949, 13 states increased their rates, the most common increase being 1 cent per gallon. Cigarette taxes existed in 39 states prior to 1949, ranging from 1 cent per standard packet in West Virginia to 8 cents in Louisiana. In 1949, such taxes were imposed for the first time by Delaware (2 cents) and the District of Columbia (1 cent); ten states increased their rates, and Arkansas decreased its rate from 6 cents to 4 cents. Florida and the District of Columbia introduced general sales taxes in 1949; rates were increased in four states in 1949. Taxes on personal income of varying scope were imposed by 32 states and the District of Columbia; 1949 witnessed rate increases in nine of these states. In addition to such state taxes, a growing number of cities and counties imposed additional local taxes on sales generally, or on the sale of such products as cigarettes and petrol. (See also BUDGET, NATIONAL.)

TEA. Tea production in India and Pakistan in 1948 totalled slightly more than 600 million lb., and production in 1949 was estimated at about the same level. Production in Ceylon in 1948 totalled slightly less than 300 million lb. and reports for 1949 indicated little change. Production in Indonesia, which averaged 165 million lb. in 1934-38, was estimated at only 28 million lb. in 1948 but in 1949 reached approximately 45 million lb. There were no official figures for China. Estimated production in 1949 was higher than in 1948, but still well below the prewar level. Japan's output in 1948 totalled about two-thirds of the average prewar production of 100 million lb. and in 1949 was probably heavier as a result of the increase in the planted area. British East Africa produced 15 million lb. in 1948 and Nyasaland 14 million lb. Production in 1949 was estimated at a slightly higher level.

Since output in most of the chief producing countries declined as a result of World War II, exports on a large scale were again confined mainly to India, Pakistan and Ceylon. India and Pakistan exported 435 million lb. in 1947-48, but exports in 1948-49 declined to 379 million lb. Over two-thirds of the total in both seasons went to the United Kingdom. Exports from Ceylon were larger than in the immediate prewar years, rising from 287 million lb. in 1947 to 296 million lb. in 1948. Exports in 1949 were about the same as in 1948. The United Kingdom was again the chief market. Indonesian exports in 1948 totalled only 20 million lb. compared with an average output of 160 million lb. in 1934-38; but reports indicated that exports in 1949 were heavier.

When the international allocation of tea supplies ended in 1947, the Ministry of Food in the United Kingdom was concerned solely with procuring supplies for the home market. Nevertheless, imports of tea into the United Kingdom exceeded the total imports of all other countries and in 1948 and 1949 amounted to 415 million lb. and 474 million lb. respectively. Average annual imports before World War II totalled about 450 million lb. The United States was the second largest importer of tea, taking 91 million lb. in 1948 and about the same quantity in 1949. Australia received 49 million lb. in 1948 and imports in 1949 were at a slightly lower level. Canada took 36 million lb. in 1948 and imports during 1949 showed a slight increase. No other countries imported tea on a large scale. (J. E. C.)

TEACHERS, TRAINING OF. No striking developments were announced in 1949; the year was one of steady but not rapid advance. A possible exception to this generalization was the launching by New Zealand of an emergency training scheme similar to that now concluding in England. The first course began in September, with 200 students. The minister of education had in January set up a committee to examine methods of teacher training. In February Canada reported a gratifying increase in the numbers of students in teacher training colleges—10,761 as against 7,833 in 1948. In February the British Council announced a programme of teachers' courses for overseas visitors double that of 1948.

In June the minister of education (for England and Wales) announced the establishment of a National Advisory Council on the Training and Supply of Teachers, representative of the local education authorities, the teachers, the universities and the area training organizations for which the university Institutes of Education were responsible. The duty of the council was to keep under review national policy on (a) the training and conditions of qualifications of teachers; and (b) the recruitment and distribution of teachers in ways best calculated to meet the needs of the schools or other educational establishments. The council was not to concern itself with teachers' salaries, superannuation or other matters affecting their condition of employment.

In August the Scottish Education department announced that after 1949-50 pupils intending to be teachers would no longer be able to take the first year of training at school. All not proceeding to a university would have to do at least three years in a training college. To qualify for entry students must have passed the leaving certificate in at least five subjects, including English and history or geography, and in at least two of these, including English, at the higher grade.

An interesting experiment designed to broaden the outlook of teachers in training was held in April at the International Folk high school, Elsinore, Denmark, when 130 students from English training colleges met in conference with 30 Scandinavian teachers and students and others from Africa, Australia and New Zealand. Lectures introduced and elaborated visits which included urban and rural schools, folk high schools, dairy and other farms.

In Germany U.S. Military government held in March an important conference to discuss the future of teacher training in Bavaria, which presented special difficulties owing to the system set up by the nazis of training students between the ages of 14 and 20 in secondary schools. In July and August an international conference of training college staff and students was held at Dortmund. Novel features were that two of the three weeks were spent largely in visits to colleges, schools, factories and so on, and that the members were accommodated with private families. (H. C. D.)

TECHNICAL EDUCATION. International exchange of people for technical training continued to increase during 1949. At the second conference of the International Association for the Exchange of Students for Technical Experience, held in January at Copenhagen, it was announced that arrangements were made for 1,262 exchanges in 1949 as against 920 in 1948. This association developed out of the vacation work scheme begun by the Imperial College of Science and Technology, London, in 1946 when 46 British and foreign students were exchanged. The number of exchanges rose rapidly so in Jan. 1948 a conference of organizers was held in London, the international association formed and central organizations set up in the ten member countries. In 1949 the scheme was broadened to include students from all universities and university colleges in Great Britain. Offers of financial assistance were received from several large industrial concerns.

In August the University Grants committee of Great Britain
announced that about 50 post-graduate scholarships, financed by funds provided by the Economic Co-operation administration, were to be awarded to British students to study technology at universities and technical institutions in the United States. Awards would be tenable for one year with possible extension for a second, and would cover travel expenses in the United States, fees, books and a maintenance grant of $1,800 a year. Passage to and from the United States was to be met by British public funds. The first awards were to be taken up in Feb. 1950.

The relationship between the technical college and the university continued to be a subject of acute controversy in Great Britain. At the summer meeting of the Association of Technical Institutions held at Edinburgh in June, Dr. D. S. Anderson, principal, Glasgow Royal Technical college, declared that only at Belfast, Glasgow and Manchester was there co-operation on a broad basis implying equality in partnership, and that co-operation on a basis satisfactory to the technical institutions seemed to have reached its limit.

Four solutions were being canvassed in technical college quarters: (i) affiliation with the local university, and award by it of degrees in higher technology; (ii) awards (degree or diploma) made by the technical college and sponsored by the local university; (iii) an award made by the college and sponsored by a national body (e.g., a National Board for Higher Technological Studies); and (iv) preparation by the technical college of students for London external degrees, as was already done by some colleges. Opinion was much divided but on the whole in favour of a degree rather than a diploma. This view found support at the annual meeting of the Association of Education Commissioners (England and Wales) which in June unanimously recommended the establishment of a national body empowered to grant qualifications in technology of graduate status.

In September was celebrated at Helsinki the centenary of Finland’s Institute of Technology. Opened as a technical school on Jan. 15, 1849, in consequence of a statute issued in 1847 prescribing the foundation of schools to provide “youths who wish to have a career in industry with an opportunity for all the necessary training,” it became in 1872 a polytechnic school and in 1879 a polytechnic institute admitting only matriculated students. In 1908 it received its present name and was put under the control of the Ministry of Trade and Industry. By the end of 1949 it had 2,200 students in five departments: architecture, chemistry, wood technology, civil engineering and mechanical engineering.

Belgium reversed its traditional policy of controlling technical education by the advice of an educational council and set up a new co-ordinating council on which were represented the Ministries of Education, Economic Affairs, Agriculture and Economic Co-ordination and Re-equipment, public and private technical teaching bodies and employers’ and workers’ organizations. The change was intended to relate technical training to national economic needs. (H. C. D.)

**TELEGRAPHY.** The final legislative step in the co-ordination of the nationalized overseas services in the United Kingdom, Canada, Australia, New Zealand, India and Southern Rhodesia was taken on May 31, 1949, when the Commonwealth Telegraphs bill became law. This act provided for the integration on April 1, 1950, of the operations of Cable and Wireless, Ltd., in the United Kingdom with those of the post office and for the establishment of the Commonwealth Telecommunications board to co-ordinate the operations of the services in various countries. After April 1, 1950, Cable and Wireless, Ltd., would remain in being as a government-owned commercial company operating the cable network and the wireless services in the British colonies and certain foreign countries. It would continue to operate the United Kingdom cable station. In order to secure the advantage of full integration of the telegraph and telephone services with all parts of the world, an External Telecommunications board was set up, composed of representatives of the post office, the company, the Treasury and the Colonial Office.

Continental Telex service was extended during the year to Copenhagen, Oslo and Stockholm. Communication with subscribers to the Danish network was established by direct dialling over telegraph circuits from the London switchboard, as in the case of calls to subscribers on the Swiss and Czechoslovakian network. Traffic to Oslo and Stockholm was switched manually at Copenhagen, the Copenhagen operator completing Stockholm calls by dialling. Connections to subscribers in other countries were effected via manual teleprinter switchboards situated in the European capitals.

The Cable and Wireless central telegraph station, Electra house, London, was largely re-planned. A new automatic teleprinter concentrator system was installed to which most of the teleprinter circuits terminating at Electra house were connected. Electra house was also connected with the post office inland teleprinter switching system.

The Cable and Wireless training school, situated in London for many years, returned to its original home, the Porthcurno cable station, Cornwall. The new school was partially opened by the end of 1949; after completion of the school, the cable station would be moved to new buildings.

Considerable progress was made in the development, production and distribution of new equipment, including cable channelling units, cable code converters, transmitters, and double current cable code sending and receiving units. Further progress was made towards maintaining and developing the company’s 155,000 nautical mi. cable system.

Direct cable service was restored between London and Hongkong, avoiding the need for re-transmitting messages at Singapore. Building of the new cable station at Jesselton, North Borneo, to replace the war-destroyed station at Labuan, continued. The new cable factory being built at Singapore should be in production by the middle of 1950. Considerable work was done towards restoring the Mediterranean, South American and West Indian systems. Regenerator equipment was installed on many cable links, including the Porthcurno-Vigo cable, several West Indian links and in connection with certain South American coastal cables.

In July the new 2,247-ton cable ship “Edward Wilshaw,” the largest ship afloat built for cable repair work only, left England for her first station, Mombasa, Kenya, to maintain the Indian ocean and Persian gulf cable systems. Her three tanks were capable of carrying 400 nautical mi. of deep-sea cable and her operating range was 9,000 mi. The company’s fleet consisted of eight cable repair ships; additionally, ships were chartered from the post office and other organizations when necessary. Cable and Wireless continued to collaborate with the post office in the development of submerged repeaters—valve amplifiers for insertion in cables at close enough intervals to enable a band of frequencies to be carried to provide for multi-channel communication.

On the wireless side, progress was made towards expanding the Barbados and Colombo relay stations and towards building a relay station at Nairobi to provide an alternative circuit for the London-Singapore direct service.

The whole of the external telecommunications services at Hongkong were co-ordinated. Several new wireless circuits were opened to meet requirements arising from the developments in China. Additional radiotelephone circuits were opened to San Francisco and via Colombo to London. The company assisted the government of Pakistan to establish overseas radiotelegraph and radiotelephonic circuits.
New transmitting and receiving stations were erected in Cyprus. In addition to radiotelegraph and radiotelephone circuits, Cable and Wireless (which operated the inland telephone as well as the overseas services) took over responsibility for civil aviation communications in the colony.

Following the opening in late 1948 of radiotelephone service between Accra and Lagos, both stations were linked with Sierra Leone early in 1949; a circuit was opened between Bathurst and the other three stations; and, through Accra, connection was provided with London. Many extensions were opened to the West Indian radiotelephone services.

In 1949 single sideband working was introduced over many of the Cable and Wireless radiotelephone networks, with the anticipated improvement in circuit quality. On Sept. 1, Cable and Wireless opened a direct photo-telegraph circuit between Athens and London. New equipment was distributed for opening further services with centres in the company's system.

The post office installed new picture telegraph equipment in the central telegraph office, London, and was able to re-open the European wire services in time for the Olympic Games. Service was now available by wire to 8 European countries, in addition to 18 European and extra-European services from London by radio (Cable and Wireless).

During 1949 the work of the Cable and Wireless Ionospheric Prediction centre expanded. Working from basic data provided by the National Physical laboratory's radio research department at Slough, the centre plotted every month the range of radio frequencies within which the most effective transmission might be operated during the ensuing month over a very large number of radio circuits throughout the world. At the beginning of 1949 prediction charts were being sent to 120 stations overseas; by the end of 1949 this number had been doubled. The 240 co-operating stations returned the prediction charts with their actual experience during the period plotted, for comparison, and these reports were studied in the centre for guidance towards improving future predictions. Considerable work was also done by the company in providing data to the Cavendish laboratory for the study of radio propagation and with the Radio Research board on the measurement of atmospheric noise. The company continued to collaborate with the Royal Observatory in the study of the effect of sunspots on radio transmission and in investigating the sudden "fades" ("Dellingers") associated with hydrogen flares on the sun's surface.

The United Kingdom was a party to the International Telegraph conference which met in Paris from May-July, 1949. The principal decisions (to come into force on July 1, 1950) were the unification of rates for ordinary telegrams (plain, code and cipher), the abolition of deferred telegrams and the amalgamation of the existing two classes of letter telegrams in the extra-European regime in a single class. Subsequently a British Commonwealth-United States government Telecommunication meeting was held in London to revise the Bermuda agreement of 1945.

A.S.A.)

United States. A programme of mechanization and other plant improvements costing $80 million and increasing the capacity and vastly improving the speed and efficiency of the U.S. telegraph service was nearing completion in 1949.

Three big selective high speed switching centres were placed in operation in 1949 at Detroit, Los Angeles and New Orleans, completing 14 of a national network of 15 centres, each to handle telegrams to and from one or more states. The fifteenth was to be at Portland, Oregon. The centre at Oakland, serving California, was expanded and improved by new installations in 1949. In the switching system, telegrams were typed only at the point of origin and then flashed through the switching centres to their destinations without manual retransmission.
Through the use of carrier systems, it became possible to send as many as 288 telegrams simultaneously over a single pair of wires, or more than 2,000 over a microwave radio beam system such as Western Union had in operation, with towers about 30 mi. apart, between New York, Philadelphia, Washington and Pittsburgh. To interconnect the new switching centres many additional carrier systems were installed in 1949. About 1,650,000 channel mi. of carrier systems were in operation, and 200,000 more were planned for 1950.

(W. P. MA.)

TELEPHONE. In conformity with the national policy to reduce capital expenditure, the Post Office in Great Britain continued to restrict its programme of telephone expansion. During 1949 available resources were concentrated mainly on supplying telephone service for waiting applicants, in relieving congestion wherever possible, in making provision for the gradual but sustained increase in local, toll and trunk traffic and in laying the foundation for long term schemes of trunk mechanization. An increase in the allocation of steel and lead somewhat relieved the shortage of essential stores; but the general scarcity of materials still necessitated careful planning.

Experiments in the use of protective plastics for underground cables were continued which, if successful, would dispense with overhead pole routes in rural areas. Provision of telephone service on a sharing basis made it possible to accept thousands of residential applicants who would otherwise have been deprived of service until local exchange equipment or local line plant could be made available. The success of this scheme was due to the introduction both of new distribution methods into the local cable networks that greatly increased their flexibility and of apparatus that enabled sharing subscribers with dial telephones to be charged individually for their dialled calls. In spite of the shortage of building materials some progress was made in the programme of complete conversion to automatic working of all manual exchanges; by March 31, 1949, 3,969 out of 5,848 local exchanges were automatic. Wartime arrears of maintenance of the equipment efficiency of exchanges were also made up and they were restored to almost normal standards.

A new development in the long distance telephone service would enable the operator who accepted the booking from the caller to take control of the call, and plans were made for complete mechanization on the main trunks of the toll and trunk systems. Voice-frequency carrier systems were extended and other routes converted to this method of working; the capacity of the submarine cable routes to Ireland and the Channel Islands was greatly increased by this means. Progress was made on a new London-Birmingham co-axial cable which should be available during 1950 for the transmission of television programmes. In December when the Midlands television service was opened the programmes were transmitted by a Post Office radio link. Local exchange service development was mainly concerned with the extension of direct dialling by subscribers of all calls within a 15 mi. chargeable radius. Experiments in linking mobile radio stations with the public telephone network resulted in the establishment of a short-range radio link for communication between small craft operating in the Thames estuary and subscribers in the London toll area.

So far as the continental (European) and international radiotelephone (extra-European) services were concerned the year was one of steady development. The service with Germany was extended to include the French zone of occupation and the services with Spain and Portugal were provided by landline enabling 24 hr. service to be given to both places. It was planned to open telephone service with Turkey shortly, leaving Albania as the only European country with which telephone service was not available. New direct services were opened with Pakistan, the Persian gulf (Bahrein) and the British West African colonies, whilst indirect services were either opened or re-opened with Costa Rica, Guatemala, Honduras, Japan, Korea, Nicaragua and Panama via New York; with British New Guinea, Nauru and New Britain via Sydney; with Algeria, French Morocco, Tangier and Tunis via Paris, and with Hong Kong via Colombo.

A new Anglo-Belgian polythene dielectric submarine cable was laid: it had a diameter of 1.7 in., a length of 47-15 nautical mi. and was capable of carrying 216 simultaneous conversations without the use of submerged repeaters.

United States. The U.S. telephone service at the end of 1949 was generally the best and most complete in history; there were more than 40 million telephones, 160 million conversations a day and no distance limit. Long distance calls were being completed at an average speed of about one and one-half minutes, close to the prewar rate, a contributing factor being the further extension of operator toll dialling.

Approximately 2.3 million telephones were added to the U.S. telephone network in 1949, bringing the number added since World War II to more than 13.3 million. The latest available world statistics, compiled as from Jan. 1, 1949, estimated the world total at nearly 66 million telephones, of which nearly 60% were in the United States.

The large volume of construction required to meet the public's telephone needs was indicated by the fact that in the Bell system (serving 33.3 million of the 40-5 million U.S. telephones) over 800 building construction projects, ranging in size from small community dial offices to large central office buildings, were completed in 1949. Some of the projects involved additions and alterations to existing buildings.

Nearly 9,000 toll offices were added during 1949 by the Bell companies, bringing the Bell system total of such circuits to about 100,000. With the addition of some 375,000 telephones in rural areas in 1949, about half the farms in the U.S. now had telephone service—twice as many as in 1940.

The year also saw progress in the development of new techniques and devices aimed at improving service and making it as economical as possible to the user. Bell Telephone laboratories developed a new and better telephone instrument, Field tests of a limited number of these telephones were scheduled to be carried out during 1950. An important transmission feature was an equalizer which automatically adjusts the sound level to compensate in part for the distance between the telephone and the central office. The laboratories also developed a more comfortable, better lighted and ventilated telephone booth. A sealed-in ceiling light fixture equipped with a directive lens concentrated light on the writing shelf and telephone instrument.

A new vacuum tube, capable of relaying a wider band of radio microwave signals over and over again to span longer distances than before, was also developed by the laboratories. Known as the close-spaced-triode (grid and cathode separated by only one-fifth the diameter of a hair), the new tube formed the heart of the improved relay equipment being installed in the New York-Chicago-Omaha radio relay system. The new equipment permitted the simultaneous relaying of six television programmes or thousands of telephone conversations through a single relay antenna.

Another transmission development was a new voice frequency repeater. Used extensively in telephone plant, repeaters were located at regular intervals on long distance circuits to amplify the voice signals progressing along the route.

In Nov. 1949, Boston, Massachusetts, became the sixth
major toll dialling centre in the Bell system's plan for nationwide dialling of long distance calls by operators.

Construction of the coaxial cable and radio relay network for telephone and television transmission continued to move forward in 1949. By the end of the year, the Bell system television network mileage had grown to about 8,400 channel miles, as compared with about 3,500 mi. at the end of 1948.

(L. A. Wi.)

TELEVISION. During 1949 progress outside the U.S. and Great Britain was still primarily a matter of blueprints and optimistic statements intended to allay local impatience. Even in France the number of sets in operation at the end of the year was about one-tenth of the licences issued in Great Britain—20,000 to 200,000. No statistics of this kind were available for the U.S.S.R., the only other country in the world to operate a genuine public service; but it was learned that of the two standard models of receiving sets, one made in Moscow, the other in Leningrad, neither was sold except by special licence. The Moscow Television centre in the middle of the year was transmitting four programmes a week, made up of newsreels, children's hour, plays and opera relayed from the state theatres, films and light concerts. Audiences were encouraged to listen in groups, in clubs and rest centres. Moscow operated on a standard of 625 lines and this showed signs of becoming a world standard, on paper at least, because at a conference of European radio organizations in Switzerland in the autumn, Belgium, Czechoslovakia, Denmark, Germany, Italy, the Netherlands and Switzerland all agreed that it was likely to serve their needs best. Australia and Argentina also settled on 625 lines. Adoption, however, was so far entirely theoretical; only four countries in the European group even embarked on closed circuit experiments and these for the most part consisted of geometrical patterns, not genuine programmes. The European practitioners, Great Britain and France on the other hand, agreed on a common temporary standard of 405 lines (which for France meant a slight reduction), and agreed to consider future co-operation at a higher level of scanning. The way was thus paved for a full exchange of programmes when a cable or radio link was established between the two countries. This was only realistic after it became increasingly obvious that television was a highly expensive entertainment. By the end of 1949, for instance, Great Britain was spending over a million pounds a year on less than a quarter-of-a-million viewers. This inescapable financial fact made it unlikely that any other European country would start a public service for at least two years. To many observers it seemed unfortunate that the smaller countries were not prepared to align themselves with Great Britain and France, since by so doing they would not only have made television a practical proposition for themselves, but would have advanced the cause of European unity.

At the end of the year the B.B.C. opened at Sutton Coldfield, Warwickshire, the most powerful transmitting station in the world, with an aerial 750 ft. high, designed to serve the Midlands, but from its first tests it seemed likely to serve also much of the north. Before this, however, the B.B.C. had announced a national plan for bringing television to 80% of the population within five years. This involved the building of three more high-powered stations, in the north of England, in Scotland, and in the Bristol Channel area, and five low-powered stations, working on the same frequency, for the northeast of England, the highlands of Scotland, Northern Ireland and the west of England (2). Completion

Looking down from high up on the mast of the television station at Sutton Coldfield, which was brought into service on Dec. 17, 1949.
of the plan depended on the government's giving permission for the necessary capital expenditure, estimated at £10 million. The acquisition by the B.B.C. of the film studios at Shepherds Bush, London, from the J. Arthur Rank organization gave the hard-pressed programme and technical staff at Alexandra palace hope of better and roomier conditions in 1950. New cameras were installed and a new system of recording direct from the screen was developed by B.B.C. engineers. (X.)

United States. At the end of 1949, 98 television stations were operating in the United States on a regular programme basis, which was double the number in operation on Dec. 31, 1948. Over 8,000 miles of network facilities were in use interconnecting more than fifty television stations. In January the east coast and mid-western television networks were inter-connected by an east-west link through Pittsburgh. Additional network extensions were provided to Columbus, Cincinnati and Dayton in the Ohio valley; to Erie and Lancaster in Pennsylvania; to Schenectady, Utica, Syracuse and Rochester in New York state; and to Providence and Wilmington on the east coast.

To provide a programme service to stations not yet served by interconnecting network facilities, programme-originating stations used films made by photographing programmes as they were reproduced on the face of special kinescopes or picture tubes. These kinescope recordings were processed rapidly and sent to affiliated stations.

Late in 1948, the Federal Communications commission instituted a "freeze" on applications for television stations in order to investigate the co-channel and adjacent channel interference problems and, if necessary, revise geographical allocations before further stations were actually placed in operation. It had been expected that the engineering studies involved could be made and the hearings completed so that the "freeze" could be lifted early in 1949; but the engineering work was not finished until the middle of the year and, in the meantime, other delaying factors arose. The inadequacy of the very-high-frequency channels to provide a nationwide competitive television system became very apparent and consideration was given to the allocation of ultra-high-frequency channels to provide for additional stations.

Certain proponents of colour television insisted that it had now been developed to the point where a satisfactory commercial television broadcasting service could be provided.

Three specific colour television systems were proposed during a general television hearing of the commission begun in Sept. 1949: a "field sequential" system in which the picture is scanned from top to bottom before a change from one primary colour to another occurs; a "line sequential" system which requires a change in colour for each scanning line; and a "dot sequential" system in which the colour is changed for each picture element or dot.

The Columbia Broadcasting system sponsored its "field sequential" system with standards modified to permit operation in a 6 mc band; the basic system employing a colour filter disc, the same as the one the commission had declined to adopt in 1947. A new "dot sequential" system was proposed by the Radio Corporation of America. Complete compatibility was claimed for this system in that it would permit black and white receivers to obtain black and white pictures from colour transmissions without receiver modification, and with high definition, permitting detail equivalent to monochrome to be transmitted in colour. The "line sequential" system was advocated by Color Television, Inc., of San Francisco, California. This system was also completely compatible in that black and white receivers would not have to be modified and transmission of picture detail would be comparable to that provided by the black and white standards. (See also Radio, Scientific Developments in.) (G. L. B.)

TENNIS. A visit of a strong American team and of P. Etchebaster (France), the world champion, added greatly to the interest of the 1949 season. Etchebaster played only exhibition matches, but the American team, in addition to winning the Bathurst cup against Great Britain and France in Paris, took part in the British amateur championship.

Ogden Phipps (U.S.A.) was the outstanding amateur player of the year. Besides winning the U.S.A. amateur championship for the seventh time, he became the first American to win the British championship since the victories of Jay Gould in 1907 and 1908. In the final of the championship at Queen's club he beat W. D. Macpherson 3—0. In December Phipps challenged Etchebaster for the world championship in New York, Etchebaster winning by 7 sets to 1.

Macpherson in the summer retained the M.C.C. Gold prize at Lords, and R. Aird again won the Silver prize. Oxford won the university match 2—1, and the Old Rugbeians the Henry Leaf cup. (See also Lawn Tennis.) (A.E.)

TEXTILE INDUSTRY. In comparison with any other year after World War II, 1949 was a year of consistent progress—technically and commercially—in the textile industry of the United Kingdom. Statistics revealed increased productions in cotton, wool, and worsted, rayon ( spun and filament) yarns and in practically all classes of woven fabrics. Export returns proved it to be a year of remarkable achievement in view of increased continental competition. Although many control restrictions were relaxed, there still remained the acute problems of labour shortage, insufficient automatic machinery and the high prices of raw materials.

Board of Trade returns showed that in the first nine months of 1949, imports of raw wool into the United Kingdom totalled 623,000,000 lb. compared with 529,000,000 lb. for the same period in 1948. Re-exports for the first nine months amounted to 103,000,000 lb. which was slightly lower than in 1948. In the same period of 1949 (Jan. to Sept.), exports of wool tops were 44,807,000 lb. compared with 44,095,000 lb. in 1948. Export of woollen and worsted yarns at 18,969,000 lb. was a considerable improvement over the 11,818,000 lb. in 1948. For the same period, exports of woollen and worsted tissues totalled almost 81,000,000 sq. yd. compared with nearly 77,000,000 sq. yd. in the same period of 1948. Shipments of blankets were higher than the 1948 figures, and exports of wool waste were 16,019,000 lb. compared with the 1948 figure of 8,260,000 lb. Carpet and rug exports declined slightly from the peak exporting level of 1948.

In the British wool textile industry the most outstanding technical development of 1949 was the Ambler "Superdraft" system. Designed to fit easily on to existing worsted "open" type cap, ring and flyer frames, it was essentially a new method for controlling the fibre movement of a twisted roving in the drafting zone. With this new device drafts ranging from 20 to 25 could be employed on wool fibres, but the upper limit of draft could be increased for synthetic fibres. In woollen processing, few significant changes occurred but it was noticeable that certain woollen spinning firms who ordered new carding machinery seemed to prefer semi-continental and continental types.

In the cotton industry, machinery developments, improved technique, modernization of equipment and re-deployment of operatives continued on a satisfactory scale. The industry continued to exert itself to provide amenities and welfare facilities equal to those in modern industrial establishments. Few Lancashire spinning mills, however, availed themselves of the government's offer of grants towards cost of machinery re-equipment. The main reason appeared to be a desire to retain their individuality. Nevertheless, in many instances the typical conservative Lancashire attitude did not reject
common-sense progressive policies. More cotton mills adopted shortened processing wherever advantages were obvious; and modern systems of lighting and mechanical handling were increasingly applied.

Production figures were encouraging. In the week ended Nov. 19 the total output of yarns was a postwar record of 20,750,000 lb. compared with 19,640,000 lb. for the same period in 1948. Total output for the 46 weeks ended Nov. 19 was 873,520,000 lb. According to the Cotton board, the weaving sections reached their highest postwar level of output in the four weeks ended Oct. 29. The weekly average was 54,320,000 linear yd. for the month and production was 8% higher than in Oct. 1948. Production for the 43 weeks ended Oct. 29 was 2,121,050,000 linear yd. The total labour force in October was 300,330, compared with 332,000 in 1939.

No revolutionary developments occurred in the technical field but fibre drafting was the subject of intensive research. Some progress was also noticeable in efforts to combat the dust problem in cotton cardrooms, and more mills pre-oiled raw cotton before subjecting it to opening processes. The most notable invention of 1949 was the "Autodoffer," designed by the British Cotton Industry Research association. This efficient and compact machine was constructed for automatically doffing full bobbins on cotton ringframes. It operated on rails attached to the front of the frame and doffing commenced by pressing a push-button switch. The announcement of this machine was timely in view of the labour shortage, for without any human aid it doffed 12 spindles at a time and returned automatically to the end of the frame when doffing was completed; the whole operation took 3-4 min. depending on the length of the frame.

The international textile machinery exhibition at Belle-Vue, Manchester, in October, was an important event. It was the first since 1938 and there was evidence to show that the industry was on the threshold of several radical and important individual developments. For the first time, in many cases, textile managers and executives were able to study and examine the latest postwar machines built in Great Britain, the U.S., France, Switzerland, Czechoslovakia, Belgium, Denmark and Italy.

Despite the difficult conditions of world markets, Northern Ireland continued to export 75% of her linen production; and there was an extension of units spinning woollen yarns, manufacturing carpets and spinning and weaving rayon, etc.

Commonwealth. Wool shipments from Australia were higher than in 1948 and no sooner was the devaluation of sterling announced in mid-September than the market began to climb. Average-to-good fleece showed an average appreciation of 10-12%. The Australian textile industry steadily expanded and negotiations to establish the first units of a rayon-spinning industry were well advanced. It was intended to form a company with a nominal capital of £A10 million to build factories for production of viscose and acetate rayon and Courtaulds, Ltd., were expected to take a substantial interest in the new company.

In India, the exports of cotton piece-goods to Pakistan were much reduced but there was an increase in other markets. British East and West Africa absorbed increased quantities and there were smaller increases in Ceylon, Australia and Aden. Towards the end of the year the Argentine placed very large contracts for hessian cloths.

The Canadian textile industry was busily engaged throughout the year and, in addition, imported increased quantities of British piece-goods, chiefly woollens and worsteds.

Europe. Textile production increased in most European countries, one of the most important features being the steady increase in Western Germany. Belgium also showed signs of revival but production in general was actually below the 1948 figures. Activity in the French cotton industry recovered and yarn production was at the 1948 level; cloth production was substantially greater. A new French circular loom (Fayolle-Anet) aroused considerable interest in textile circles. Yarn and cloth production in Italy increased slightly and at least two new looms were announced. Textile production in Holland was now about the prewar level but substantial quantities of textiles continued to be imported from the United Kingdom.

Some astonishing developments occurred in Czechoslovakia. The textile industry increased the output of yarn and cloth to a high level. In addition, the nationalized textile machinery-building industry developed several noteworthy machines, including the Hrdina range of automatic looms and pirn-changing attachments, also the Zbrojovka cone and pirn winders. A new magazine, warping creel and beaming headstock were also announced.

United States. In 1949 consumption in the U.S. of the three major fibres—cotton, wool and synthetics—dropped by approximately 20% from the 1948 level. The over-all decline in demand for textile products in 1949 was partly explained by the appearance on the market, in larger quantities, of other types of consumer goods which had been practically unavailable during World War II and scarce during the immediate postwar years. It was also realized that the war demand brought into action practically all available textile machinery, and doubt was expressed that there would be a permanent domestic market for its full output. In addition, other countries were stepping up their textile production. Synthetics continued to encroach upon the markets of the older fibres, and became available in new and more versatile forms. Wholesale prices of textiles in the U.S. in 1949 were approximately 6% lower than those of 1948, and some textile manufacturers anticipated further declines.

(D. G. WO.)

THAIK, SAO SHWE, Burmese statesman (b. 1896), a member of the ruling family of the state of Yawngwhe, in the Southern Shan states of Burma, was educated at the Chiefs' school at Taunggyi, and later accepted a vicecy's commission in the Indian army, serving during World War I in Mesopotamia. On his return, he served in the civil administration of the Yawngwhe state as Myosa, or sub-chief, of the Heho district. When the late Sawbwa (chief) of Yawngwhe died in 1926, Sao Shwe Thaik was selected by the government of Burma to succeed him, the late Sir Sao Mawng having no direct descendants. As ruler of the fourth in order of importance of the Shan states, Sao Shwe Thaik was a personage of influence. He ruled his state with efficiency, and when war with Japan was threatening in 1941 he took a commission as major in the Shan states territorial battalion of the Burma Rifles. On the withdrawal of the British administration in 1942, he remained in his state, looking after the interests of his people so far as the difficult conditions of the times allowed. When the new constitution for independent Burma had been evolved after World War II, the Burmese political leaders proposed and carried the election of Sao Shwe Thaik as the first president of the country, a gesture of goodwill towards the minority races of Burma. Sao Shwe Thaik assumed office as president on Jan. 4, 1948, and continued to discharge the duties of his office with dignity.

(B. R. P.)

THAILAND (SIAM). A kingdom of southeastern Asia bounded by Burma to the west and northwest, by French Indo-China to the northeast and east and by Malaya to the south. Area: 198,247 sq. mi. Pop.: (1937 census) 14,464,489; (1949 est.) 17,666,000. Languages: Thai or Siamese c. 75%.
Chinese c. 20%, Indian and Malayan languages also spoken. Religion: Buddhist 95%, Moslem 4%. Chief towns: Bangkok (cap., pop., 1947 est., 827,290); Chiangmai (pop., 1937 census, 544,001); Khonkaen (473,475); Chiangrai (443,476). Ruler, King Phumiphon Adunet (who during 1949 was continuing his studies at Lausanne, Switzerland); prime minister, Marshal Luang Pibul Songgram (q.v.); minister of foreign affairs, Nai Pote Sarasin.

History. The new constitution, prepared by a Constituent Assembly during 1948 and submitted to the legislature in Jan. 1949, was finally approved by the council of regency in March. In its general form the new constitution preserved the system of government by king, cabinet and bicameral parliament, the Lower House being elected on a wide franchise and the Upper House nominated by the crown. It also defined in detail the rights of the subject, prohibited members of the armed forces from joining political parties, affirmed the independence of the judiciary, and defined the purposes of the state which included co-operation with other nations in maintaining international justice and world peace, preservation of the national traditions and maintenance of the principle of private enterprise. Following the promulgation of the constitution, the government announced on May 11 that the official name of the country in English would again be Thailand, instead of Siam, so reverting to the practice of the years 1939 to 1945.

General elections were held; and on the meeting of the legislature in June the cabinet was reshuffled, Marshal Pibul Songram remaining prime minister. The cabinet secured a vote of confidence in the Lower House in July.

No change of importance occurred in the composition of the cabinet till October, when the decision was taken not to maintain the official sterling rate at 40 bahts to the pound but to alter it to 35 to the pound; this decision caused the resignation of the minister of finance, Prince Vivat Jayanta, and Marshal Pibul then took charge himself of the finance portfolio.

On a number of occasions during the year rumours were in circulation of an attempted coup by the Free Thai party, the followers of the exiled statesman, Nai Pridi Panomyong. Suitable precautions were taken by the authorities and only one serious outbreak occurred. According to the official statement, on the night of Feb. 26 members of the Free Thai party attempted a revolution; they seized the royal palace and other important centres in Bangkok, including the broadcasting station from which they announced that Nai Direck Jayanana, a member of the Free Thai and a former ambassador in London (1947-48), had assumed office as prime minister. In the resultant disturbances, misunderstanding between naval and military personnel caused a clash between the two services which was not terminated for two days. The disorders were ultimately repressed and a number of Free Thai leaders were arrested, four of whom were shot in an ambush while under police escort. Nai Direck later denied that he had had any connection with the attempted coup.

In the field of external relations, the prime minister made an important statement to the press in June, when he stated that Thailand would favour a security pact for southeast Asia on the lines of the North Atlantic treaty. In regard to the possibility of Communist agitation, Marshal Pibul stated that some 200 Chinese Communist agitators had lately been arrested by the police, and that the possibility of Communist disturbances among the three million Chinese in the country could not be ruled out, though he was confident of the ability of the security forces to deal with them. Marshal Pibul said that he welcomed the close co-operation that had been arranged with the British security forces of Malaya. He expressed similar views in a further statement to the press in September, saying that the country was determined to stop any Communist aggression but was short of equipment; in event of war, therefore, Thailand would welcome aid from the western powers. He again expressed approval of the idea of a regional security pact which should include not only the independent states of southeast Asia but also those near-Asianic states which had interests in the region.

The trial of three men accused of complicity in the death of King Ananda Mahidol on June 9, 1946, continued throughout the year and had not reached its conclusion at the end of the year. His successor, King Phumiphon Adunet, remained in Switzerland throughout the year. It was announced in September that the king and Princess Sirikit Kitiyakara, daughter of the Thai ambassador in London, were engaged to be married.

(Edward L. H.\n
Education. (1939) Government schools 429, pupils 61,297, teachers 3,625; local public schools 10,768, pupils 1,325,891, teachers 32,208; municipal schools 304, pupils 59,592, teachers 1,644; private schools 1,308, pupils 121,965, teachers 5,596; universities 2. Illiteracy: 53%.

Agriculture and Fisheries. Main crops (in '000 metric tons): rice (1948) 5,250; maize (1948) 10; cotton (1948) 6; tobacco (1947) 8.

Livestock (in '000 head): cattle (Dec. 1947) 3,355; buffaloes (July 1945) 3,981; pigs (July 1945) 2,014; horses (Dec. 1946) 171.

Fisheries: estimated total catch (1948) 195,800 tons.

Foreign Trade. (1948) Imports 1,708 million baht; exports 2,022 million baht.

Theatre. An interesting tendency, almost to be dignified by the title of a trend, manifested itself during 1949 in the taste of the British playgoing public. This was a
readiness to accept not merely with resignation but with enthusiasm certain plays in which the authors had set out not to tell a connected story, but to let their minds play, wittily, philosophically or fantastically as the case might be, about a static situation. Two such plays, James Bridie's, Daphne Laureola and Christopher Fry's The Lady's Not For Burning, were among the great successes of the London season; and a third, Eric Linklater's Love in Albania, had a succès d'estime, although it did not rank with the other two in popularity.

Hitherto there had been good reason for thinking that the secret of how to write a discussion-play so that the public could be persuaded to listen to it was George Bernard Shaw's private property and must die with him. And even he had seemed in his last period to be losing his facility—a fact which was underlined in 1949 by the failure in London of his latest play Buoyant Billions which, though it was saluted on all sides as a remarkably lively piece of writing for a man over 90, excited no response but that of curiosity from the general public. Now, however, it began to look as though there were not only other dramatists who knew the secret but a newly experienced and responsive playgoing public such as Bernard Shaw in his best period was unable to count on.

In Daphne Laureola, James Bridie made almost no pretence at all of having a story to tell. His own description of his approach to the play was that he had certain things that he wanted to say and tried to keep his audience entertained while he said them. It was a simple formula, but nobody but a skilled dramatist could carry it to success. Bridie's method of doing so was to invent a magnificently eccentric character, a woman of outstanding quality but a dipsomaniac (beautifully played by Dame Edith Evans, q.v.). He takes her to a restaurant in Soho, and there, having removed her inhibitions with a series of double brandies, he sets her talking at large, to the delight of her fellow-diners in the restaurant and of her auditors in the theatre. What she says, and what follows from it, could hardly be coherently set down in a short description; yet the play played to packed audiences which broke the attendance records of Wyndham's theatre.

Christopher Fry's play, The Lady's Not For Burning, was less obscure than Bridie's, but even so was not so instantaneous a success. The action, such as it was, passed in a mediaeval city, Pamela Brown playing a girl falsely accused of witchcraft and John Gielgud a soldier who, in an attempt to divert official attention from her, accused himself, equally falsely, of murder. Eventually a climax was reached in which the lady escaped her burning and the man his hanging; but the importance of the play lay not in these happenings but in the things Christopher Fry had to say and in the nicely balanced mixture of poetry and wit with which he said them.

A similar mixture of poetry and wit was found in an even more distinguished play, which nevertheless had not been seen in London when the year ended, though arrangements had been made for its production in New York. This was T. S. Eliot's The Cocktail Party, staged at Edinburgh in the first week of the third annual festival there. As a technical achievement this play aroused particular interest, for in it Eliot was held to have brought to a successful culmination the experiments towards a new dramatic verse form which he had been carrying on in his previous plays, Murder in the Cathedral and Family Reunion. In the new play there was remarked an increased facility in the use of verse which, without losing its essential character, could lower itself to the level of ordinary colloquial chatter or rise to the requirements of high poetic emotion. The surprise of the occasion was not that T. S. Eliot could sustain his more lofty passages or his more impassioned scenes; nor had shown that in the earlier plays; it was that he could write in his lighter moments with a brittle wit and a sense of theatrical effect oddly reminiscent of Noel Coward's manner.

The central figure of The Cocktail Party is a mysterious stranger who, appearing uninvited in a London drawing-room, proves to have an uncanny knowledge concerning the private affairs of his host and hostess and their guests; and leaves an impression both on their minds and on the minds of the audience that he is some being of a supernatural order. Nor is this impression entirely removed by a second act in which the stranger turns out to be a psychiatrist with a Harley street practice, for he continues to show a knowledge of his patients and a power to shape their ends which makes him still seem a symbolical being rather than a man.

Two importations from America were of special interest, for each had been awarded the Pulitzer prize for the best play of its own year and both had been hailed by critics in America as plays of outstanding merit. They were received in England with a certain degree of reserve. In New York, Arthur Miller's Death of a Salesman was held to rank as a genuine tragedy, the tragedy of a good man brought to nought by mistaken ideals. In London, some judges refused to allow the play any such grandeur, holding it to be not much more than a piece of sentimentality about an ineffectual nonentity. This difference of opinion might well be explained by the fact that in America the travelling salesman is a ubiquitous character, easily acceptable as a symbol of the average citizen; whereas in Great Britain the word "salesman" is not used so often and conveys no very definite idea. In the case of the other American prize play, A Streetcar Named Desire, by Tennessee Williams, critical opinion generally fell short of enthusiasm and it seemed probable that the great public interest which the production caused was due rather to Vivien Leigh's enormous personal popularity than to the author's merits. Objection was taken in some quarters to the sordid setting of the play and the fact that its heroine was a girl whose obsession with sex drove her to promiscuity and finally to madness. In the end the play became the battle-ground of so many partisans that its objective qualities were obscured; but it could safely be said that the strong appeal which Tennessee Williams's work made to critics and public alike in America found a comparatively wavering and uncertain echo in the British theatre as yet.

Two less controversial American plays which were produced early in the year and were still running when it ended
were The Heiress and Harvey. The former, adapted by Ruth and Augustus Goetz from Henry James's novel Washington Square, told a good story and told it well, and in addition owed much to Peggy Ashcroft's relentless yet pathetic acting as the unattractive girl who was sought in marriage only for her money and to Sir Ralph Richardson's (q.v.) unobtrusive excellence as her father. The latter, Mary Chase's odd fantasy about a happy dipsomaniac whose best friend is an alcoholically-induced rabbit six feet high, might well have failed out of hand with English audiences; instead, with Sid Field playing his first "straight" part in the lead, it drew a delighted public. Another and more delicate American fantasy, Dark of the Moon, by Howard Richardson and William Berney, of a "witch-boy" and his love for a mortal girl, also found a warm welcome though on a smaller scale.

Several established British dramatists added to their reputations during the year, though neither J. B. Priestley with Summer Day's Dream nor Peter Ustinov with The Man in the Raincoat (produced at the Edinburgh festival) was quite at his best. Lesley Storm in Black Cliffon provided an excellent vehicle for Flora Robson; and Margery Sharp in The Foolish Gentlewoman for Dame Sybil Thorndike. Terence Rattigan's Adventure Story had merit, but failed in its attempt to represent Alexander the Great as something more than a man of action. Of a rather meagre crop of plays by dramatists hitherto unknown, perhaps The Late Edwina Black, by William Dinner and William Morum, showed most promise.

The Stratford Memorial theatre continued on its increasingly distinguished career and the Old Vic company, reinforced in the spring by the return of Sir Laurence Olivier, regained some of the ground it had lost and made a promising start under its new direction in the autumn with productions of Shakespeare's Love's Labour's Lost, Oliver Goldsmith's She Stoops to Conquer and Ivan Turgenev's A Month in the Country. Outside these two established homes of the classics there was a notable revival of George Farquhar's The Beaux' Stratagem, with John Clements and Kay Hammond in the leading parts.

France. In the opinion of most observers, the French theatrical season of 1948-49 was without distinction, and this despite the fact that some 40 new names were presented to the public. Few of these, however, left any real trace other than that of promise. In this connection, Julien Gracq's Le Roi Pêcheur should receive especial mention.

Among the established playwrights, although Armand Salacrou was represented by two earlier plays, Une Femme Libre and L'Inconnue d'Arras, other playwrights, for example, Claude-andré Péguy, Jean Cocteau, Jean-Paul Sartre, G. Neuveux, Marcel Aymé, André Obey remained silent. It was generally felt that Henry de Montherlant's Domain il fera Jour and Stève Passeur's 107 Minutes added little to either author's reputation. On the other hand, Jean Anouilh's cynical marital comedy, Ardèle ou la Marguerite, had a long run.

The real laurels of the year, however, went to two of the oldest playwrights in France, both in years and in experience, Paul Claudel (aged 80) and Henri Bernstein (aged 75), for their plays Partage de Midi (written some 30 years earlier) and La Soif, which Bernstein wrote after the Liberation. Claudel's play—which he disavowed after his conversion to Catholicism, and therefore rarely played before—depicted a desperate struggle between the desires of the flesh and the commands of religious faith; while Bernstein sought, with almost pagan frankness, to show the imperative tie that exists between artistic creation and the satisfactions of the flesh. Both plays conveyed an atmosphere of extraordinary sensuality. The former cinema artist, Jean Gabin, who played the leading role in La Soif, quickly assumed front-rank position among contemporary French actors for his remarkable portrayal. Claudel's play was presented by the Jean-Louis Barrault—Madeleine Renaud company with their usual excellence.

---

The Epsom race course scene from Sir Charles Cochran's "Tough at the Top," a musical show by Vivian Ellis and Sir Alan Herbert at the Adelphi theatre, London.
THEOLOGY

Despite an original, painstaking production by this same company, an attempt to present Albert Camus' widely read novel La Peste (the theatre version was entitled L'Etat de Siège), was unsuccessful, and it was generally conceded that the combined efforts of so many admirable talents had only resulted in a sort of mutual neutralization of each of them. Perhaps, too, the play suffered from being presented too late, a turning away from the war and the occupation having already become noticeable.

To relieve this somewhat negative situation, there were to be noted two encouraging factors: the existence and vitality of at least a dozen jeunes compagnies, and the fact that the activities of these groups were scattered throughout the country. A number of promising young producers, actors and playwrights were beginning to emerge whose influence was expected to make itself felt in the future.

Under the direction of Pierre-Aimé Touchard, the official Théâtre Français maintained a high standard of performance. However, the attempt to divide their programmes between a Salle Richelieu on the right bank of the Seine, and a Salle Luxembourg, the former Odéon theatre, proved unsatisfactory to both actors and public. (M. Jol.)

United States. During the season of 1949 clouds gathered over the theatre in U.S. The League of New York Theatres, embracing the principal figures in the operation of the metropolitan playhouses and their subsequent road attractions, instituted an investigation by non-prejudiced analysts, the purpose of which was to determine how the theatre might be lifted out of the decline into which it had fallen, to give it back the prestige which it had once enjoyed and to increase its attendance and box-office receipts.

It was pointed out as an indication of the theatre's decline that, whereas in the 1928-29 Broadway season 224 plays and shows were produced, only 70 were put on in the 1948-49 season. The number of New York theatres, similarly, was 75 in 1929 and only 32 in 1949, not a single new theatre having been built for 22 years.

A supplementary investigation conducted among 2,500 group leaders and 2,500 representative people in the upper and middle income classes in 27 different cities established that 62% of the people interviewed in cities outside New York city spent less on the theatre during 1949 than on the cinema, that the high price of theatre tickets helped to divert patronage and that the physical discomforts of the average theatre added to the discouragement of theatre attendance. Public opinion was thus operating against the theatre and immediate steps were urged to rectify the situation.

The paucity of first-rate plays and shows unquestionably figured largely in the public neglect of the theatre. It was noticeable that, when first rate or even fair second rate attractions were offered, the public interest was as great as it had ever been; at times, indeed, even greater. An outstanding example was South Pacific; the musical comedy by Richard Rodgers and Oscar Hammerstein II, which scored a success unmatched in the latter records of the theatre.

Other plays and shows that proved nothing was amiss with the theatre when attractions were really good were Arthur Miller's Death of a Salesman, the best dramatic play of the season; Sidney Kingsley's Detective Story; Touch and Go, a topical revue by Jean and Walter Kerr; and various others. Even when plays had obvious weaknesses but had elements of popular appeal they were still successful, such as Mae West's revival of Diamond Lil; James Allardice's farce, At War With the Army; the Irving Berlin-Robert E. Sherwood musical, Miss Liberty; I Know My Love, in which Lynn and Alfred Lunt acted; and the Maxwell Anderson-Kurt Weil musical drama, Lost in the Stars. Still further proof was to be had in the box-office receipts of such held-over attractions, produced at the end of the previous season, as Light up the Sky, The Silver Whistle, Anne of the Thousand Days, Lend an Ear, The Madwoman of Chaillot and Kiss Me, Kate, not to mention the continued popularity of long runs such as Mister Roberts, A Streetcar Named Desire, Goodbye, My Fancy, Born Yesterday and Where's Charley?

Among the better-known native playwrights who appeared during the year were Clifford Odets with The Big Knife, a play which was so bad that it drew ridicule not only from the critics but from lay theatregoers: Garson Kanin with both The Rat Race and The Smile of the World, Philip Barry with a poor adaptation of Jean Pierre Aumont's play called My Name is Aquilon, Samuel Spewack with a negligible comedy, Two Blind Mice; and Lilian Hellman with a static and monotonous play, Montserrat.

Ezio Pinza's abandonment of the operatic for the musical comedy stage in South Pacific and his great success in that medium were among the year's notable features. Among the more impressive acting performances were those of A. E. Matthews in the English comedy Yes, M'Lord, known in England as The Chiltern Hundreds, Mildred Smitth in Forward the Heart, Lilli Palmer in the revival of Bernard Shaw's Caesar and Cleopatra and in My Name is Aquilon; Mildred Dandridge in Death of a Salesman. Ralph Bellamy in Detective Story. Pinza and Mary Martin in South Pacific. Lynn Fontanne in I Know My Love. Sir Cedric Hardwicke in Caesar and Cleopatra; and Katharine Cornell in a verbose and tiresome romantic historical drama by Kate O'Brien called That Lady.

(G. J. N.)

THEOLOGY. Progress in theological scholarship and writing depends so greatly on the exchange of findings and ideas between theologians the world over that it is difficult to speak of new trends or fresh emphases in any period shorter than a decade. But 1949 was an important year since it was the first in which it was possible to do some postwar stocktaking.

For almost a century German theological scholarship, especially in the text and meaning of the Old and New Testaments, was the chief foundation on which theologians in Europe and America built. In many respects this analytical work on the Bible was drawing to a close. Its assured results were there for all scholars to draw upon, though the work of making them readily available would still go on. For example, conditions in 1949 permitted the reprinting in Germany of the first three volumes of Gerhard Kittel's monumental work, Theologisches Wörterbuch Zum Neuen Testament; work on vol. 5 was in progress and facsimiles were issued. Fresh work on the text of the Bible is called for with every new discovery of ancient documents - work which is long and costly. The main work to be done on the latest find of Hebrew documents near Jericho fell not to Europeans but to Americans, and it was already felt in American universities and theological seminaries that in the future American scholarship would have to play a more important role than in the past when the pre-eminence of Europeans, more especially of Germans, in the groundwork of theology was largely taken for granted.

The most important trend to be found in the theological work of the year was a convergence of interest on Biblical studies, but with less emphasis on analysis and more on hermeneutics. It was particularly noticeable that a preoccupation with the study of the Bible was not a Protestant monopoly. The Papal Encyclical, Divino Afflante Spiritu (1943), on the promotion of Biblical study was bearing fruit; the learned theological journals of the Roman Catholic Church contained scholarly reviews of Protestant works on Biblical study and the volume of work on the Bible from Roman Catholic theologians grew steadily. In Germany, the Roman Catholic Romano Guardini commented on the
theological scene from the vantage point of his chair in Munich that, although there was nothing in Germany corresponding to the new theology in France, German theologians were "going back to the sources and this time are using them properly as sources, drinking deeply and not merely sipping." The same was true elsewhere.

Three main tasks occupied the forefront of attention in relation to the Bible: first, the translation of the Bible into modern speech; second, the exposition of the meaning of different parts of, or subjects in, the Bible; third, the reassertion of the authority of the Bible for men's lives in the modern world.

In the first a new stage was reached. The American standard version of the New Testament published in Great Britain in 1949 met with general acceptance as the best attempt to remove from the authorized version inaccuracies of translation and archaisms of speech without impairing the beauty and brevity of its prose. But this work of a competent committee of American scholars was for all its virtues not a genuinely new and modern translation. A translation of the Old Testament from the Vulgate by Father Ronald Knox was also published in London in 1949. Although it was going on behind the scenes and would not be completed for many years, mention should be made of the wholly new attempt to translate the Bible into modern English proposed by the general assembly of the Church of Scotland and taken up by all the major churches in Great Britain who appointed a body of theologians to work on a new authoritative translation. A translation of the Bible into basic English also appeared during the year.

The exposition of Biblical teaching was marked by a combination of scholarship with imagination and literary skill. Among notable monographs were A. M. Ramsey's The Glory of God and the Transfiguration of Christ and A. M. Farrer's A Rebirth of Images. P. J. Tillich's Shaking of the Foundations, published in Great Britain in 1949 opened new possibilities in preaching by discussing the meaning of the key words of the Bible such as salvation, grace and redemption.

On the third subject, the authority of the Bible, much was written under the influence of, or in reaction against, Karl Barth who speaks of the Bible as something greater than a collection of documents—a single self-authenticating, self-interpreting Word of God. His Dogmatics in Outline was the first summary of his main works to appear in English. At the end of the 19th century much of what Karl Barth was now saying had been said by P. T. Forsyth: the republication of his works which was going on in Great Britain after World War II was a theological event of importance. A distinguished international gathering of theologians meeting in Oxford in June and July, 1949, prepared a statement on "Guiding Principles for the Interpretation of the Bible," which was later published in the Ecumenical Review. This conference, drawn together by the World Council of Churches, was the outcome of previous international work: 20 theologians from 8 countries and 10 churches took part. The statement was an important agreement in a highly controversial field and further work would be expected.

Movements towards unity among the churches led to a re-examination of the theological factors in disunion, and to restatement by individual churches on their own positions. There were new theological statements on baptism, church membership, and other matters. Discussions to unite the Congregational Church with the Evangelical and Reformed Church in the United States reached a final stage. A week's conference between theologians of the Anglican and the Free Churches of England on intercommunion and the mutual recognition of ministries covered useful ground but did not bring the matter to a conclusion.

A further field of theological activity lay on the borderland between theology and philosophy. Secular existentialism had its strongest exponents in France and the main encounter between secular existentialism and its Christian forms took place there. The Roman Catholic Gabriel Marcel, the main protagonist of a Christian existentialism, well known outside France, delivered the important Gifford lectures at Glasgow university for the year 1949-50. The controversy with existentialists was taken up also by Roger Trontfontaines in his Existentialisme et pense: chrétien; and by F. Munier, editor of Esprit, in a book translated under the title Existentialist Philosophies. French Protestants also entered the lists. Not wholly unrelated to the issue of existentialism in France was the furious debate among Roman Catholic theologians following the publication of Henri de Lubac's book Surnaturel. De Lubac argued that the rigid distinction between natural and supernatural and natural and revealed theology need not and should not have been derived, as it was, from the teaching of Thomas Aquinas and that it was one of the chief stumbling blocks to the acceptance of Christianity by men trained in science. De Lubac was accused of heresy by some of his opponents. The controversy was well summarized by Father Victor White in the Jan 1949 issue of the Dominican.

In other countries the theological encounter with secular existentialism was less direct. Works on Kierkegaard continued to appear (e.g. T. H. Croxall's Kierkegaard Studies in Great Britain and R. Thomte's Kierkegaard's Philosophy of Religion in America) and the Christian origins of existentialism were thereby underlined. J. V. L. Casserley of Great Britain took up wider issues between theology and current schools of philosophy in The Christian in Philosophy. Romano Guardini fulfilled in Germany something of the role of Marcel in France. Among Protestant theologians in Germany one major debate excited a wide circle of the foremost theologians. In a recently published volume, Kerygma and Mythos a number of theologians took up a highly controversial thesis propounded by Professor Bultmann of Marburg (in an essay entitled The New Testament and Mythology published in Germany in 1941) that the New Testament writers had pictured a three-storied world and that the setting of the Gospel story was fundamentally mythological and meant nothing to modern man; it could only mean something if mythology was interpreted existentially, that is, as illuminating not the cosmos but man and his needs. This was in the true line of German theological debate. Bishop Dibelius of Berlin published a notable small book The Limits of the State in the United States Reinhold Niebuhr held his position as the theologian whose works were best known to a great public. His book Faith and History followed the broad line of his other writings. (See also Anglican Communion.)

TIBET. A country of central Asia, lying north and northeast of the Himalayas, mainly a high tableland. Normally a
Chinese dependency, it is in practice independent; it is the only country in the world which is entirely under ecclesiastical control. Area: c. 469,294 sq. mi. Pop. (1948 est.): 3 million; one-fifth of the male population are monks. Capital: Lhasa. Language: Tibetan Religion: Buddhist. Ruler, formerly Lhamo Dhondup, the 14th dalai lama, born June 6, 1935 and enthroned in the Potala, or chief palace, on Feb. 13, 1940; regent, Yung Tseng Dala.

History. The threat to Tibetan independence from Chinese Communism led the regent to make approaches to the U.S. in 1949. The good offices of an American traveller were utilized for the purpose. Later the regent cabled for help. Communist leaders claimed the country as part of China and announced their intention to protect the Tibetans from what they described as the aggressive intentions of the U.S. and Great Britain and to free the people from reactionary feudalism. The threat to India was obvious, but it was hardly in a position to interfere. The British trade mission was withdrawn after the partition of India. It was interesting to note that a British firm was to establish a 600 kw. hydro-electric plant to supply current to Lhasa.

Under R. (W. Bx.) Aden imports: cotton goods, woollen goods, grain, hardware, glass, sugar, biscuits, dried fruit and tobacco. Principal exports: wool, borax, salt, musk, horn and herbs. Main destinations of export China and India.

Finance. Monetary unit: song with an exchange rate (1948) of about 3 sangs to 1 Indian rupee, but there are considerable fluctuations.

TIMBER. Prior to Sept. 18 it was assumed in timber circles that the year 1949 would show a definite downward trend in wood prices generally. The devaluation of the pound sterling on that date by 30% as against the U.S.A. dollar, together with the simultaneous devaluation of their currencies pari passu with the pound by the majority of the timber producing countries in Europe, introduced a new factor in the price situation, the repercussions of which could not as yet be estimated. The results of these financial operations on timber prices would probably not be fully seen until the signing of the 1950 contracts.

In the early part of the year the British Board of Trade published the long awaited report of a committee set up under the chairmanship of Sir Keith W. Price to estimate British timber requirements and possible supplies up till 1955. This report estimated the softwood requirements on a strictly austerity basis at approximately 1,500,000 standards a year, hardwood requirements at approximately 75 million cu. ft. and plywood at approximately 575 million sq. ft a year. There was every prospect of the hardwood and plywood supplies being found from various sources, but Great Britain could not be certain of obtaining more than about 1,200,000 standards of softwood owing to currency difficulties. The exports of both Sweden and Finland were slightly higher in quantity than those of 1948, but somewhat lower prices were accepted by shippers. There was also a distinct easing in Baltic freight rates. In the autumn of 1949 a trading agreement was signed between the U.S.S.R. and Great Britain covering the shipment of some 75,000 standards of White sea and Kara sea redwood, together with 26,000 standards from the U.S.S.R. Baltic ports. This agreement was negotiated by the Board of Trade with Exporters, the Russian timber organization. Speculation was aroused as to the quantity which would be offered for export by the Russians in 1950, some trade circles optimistically putting the figure as high as 250,000 standards. Two other eastern European countries showed their intention to resume wood exports on a considerable scale by entering into trade agreement with Great Britain. In the early part of the year Poland signed a five-year agreement under which, inter alia, a quantity of timber and timber products was to be furnished to Great Britain including 70,000 standards of softwoods, 10,000 cu. m. hardwoods and 50,000 sleepers. Yugoslavia also signed a similar agreement covering trade generally under which she undertook to supply Great Britain with both softwoods and hardwoods: already from this source about 100,000 standards of softwoods had been received together with a considerable quantity of oak and beech, both logs and lumber.

During 1949 the first steps were taken to bring the selling programme of British woodlands into some relation with the annual anticipated increments. A Board of Trade order enforced a cut of 25% over that of 1948.

Canadian lumber production during the year remained at levels comparable with 1948. The restriction of imports by Great Britain owing to currency problems and a somewhat lower price level increased the difficulties of a number of small marginal producers. No new general contract was negotiated between the two countries, but in the autumn under the European Recovery programme a special contract for 70,000 standards of Douglas fir was negotiated for shipment to Great Britain. This was allocated approximately as to 30,000 to U.S.A. exporters and 40,000 standards to Canada. It was believed that somewhat lower prices were taken than in earlier contracts. The Canadian Royal commission which was appointed to investigate lumber prices, particularly in the home market, returned a clean "bill of health" to the Canadian lumber trade. The report pointed out that under control domestic prices for lumber were considerably lower than those obtained for export.

The Food and Agriculture organization of U.N. issued during the summer in conjunction with the Timber committee of the Organization for European Economic Co-operation their final statistics of production for 1948. The review showed a distinct easing of the softwood shortage in Europe. European timber producing countries actually exported in 1948 1,882,000 standards, or 33.5% more than it was estimated could be achieved. At the same time the European Recovery programme office issued a commodity study on lumber and lumber products. The report estimated that in western Europe, excluding Germany, about 3,330,000 dwelling units were destroyed during World War II and to replace these alone would require 14,700 million board ft. of lumber. Another 850,000 dwellings a year would also be needed to take care of the growth of the population.

A significant factor in the European plywood market was the proposed resumption by the U.S.S.R. of her former great plywood export trade. It was known that a small contract had already been signed between Great Britain and the U.S.S.R. The imports of both U.S.A. and Canadian plywood into Great Britain were much reduced owing to currency difficulties. In Canada one large organization announced a 15% reduction in the domestic prices for Douglas fir plywood in order to encourage increased home consumption and to replace trade lost in the export market. A feature of 1949 was the marketing of considerable shipments of plywood from factories established since World War II in tropical Africa, including Nigeria and the Ivory Coast. (B. L.)

United States. Lumber production in 1949 was not as large as the 36,000 million board ft. produced in 1948 but was estimated at about 31,000 million bd. ft. divided into 25,500 million bd. ft. of softwoods (largely southern pine, Douglas fir and ponderosa pine) and 5,500 million ft. of hardwoods (principally oak, red gum, yellow poplar and maple). The usual active spring building boom did not occur as expected. Although the serious housing shortage continued, many buyers refused to pay the prices at which houses were offered. Lumber production therefore slowed down, and this situation continued until about Aug. 1 when the demand picked up strongly, with the result that prices advanced and a large number of mills were re-opened. Production fell off about 10% to 15% in the south during
An air view of 20 million cubic feet of floating timber threatening the town of Kemi in northern Finland, Aug. 1949. This timber block was caused by a strike of workers at a power station near Kemi.

1949: of the 23,000 mills in the 12 southern states, about 98% cut less than 5 million bd. ft. each. The small mills accounted for about three-fourths of the entire 1949 southern pine production.

There was also a drop in the production of west coast woods although prices in that section did not fall as low relatively as they did in other parts of the U.S. The leading lumber-producing states, in order of production, continued to be Oregon, Washington and California, followed by Alabama, Georgia, Mississippi, North Carolina and Arkansas.

Substantial wage increases and other manufacturing costs led to the increased use of mechanical power saws for felling and bucking saw logs, as well as loading devices, mechanical log barkers, mechanical tree planters, track-type log trailers and improved skidding devices. At the mills, lift trucks and straddle buggies, mechanical lumber sorters, improved feed works and automatic lumber pilers and unpilers were installed to counteract the steadily rising operating costs.

The industries' Tree Farm movement continued to expand under the leadership of the American Forest Products institute and operated in 24 states embracing about 2,000 certified tree farms with a total of more than 18 million ac. In 10 of the southern states nearly 12 million ac. of forest lands had been dedicated to forest management policies to maintain continuous crops of timber for the future.

About 70% to 80% of the entire lumber production was from re-growth forests. The acquisition of large timber properties by many of the lumber and pulp and paper companies continued in order to protect the heavy capital investments in plant installations and assure raw material for the future. Stumpage prices for standing timber remained very high and did not recede as much as lumber and log prices during the year. This was notably true for veneer logs, tight cooperage stock and material for poles, piling and crossties, especially in the south. (See also Forestry.) (N. C. B.)

TIMOR: see Netherlands Overseas Territories; Portuguese Colonial Empire.

TITO: see Broz (Tito), Josip.

TOBACCO. The world tobacco harvest for 1949 proved to be 3% larger than had been estimated and 5% larger than 1948. Although production fell in several of the minor tobacco growing countries, this drop was more than compensated by increases in others. The total crop from all countries apart from the U.S.S.R. whose figures were not available amounted to 7,453 million lb. In the United States growers produced about 2,019 million lb. or 2% more than in 1948. Canada's production for which final figures were not yet available was estimated to show an increase of about 7% over that of 1948 which amounted to 126,629,000 lb.

The most important development was in the production of Southern Rhodesian tobacco for which Great Britain was the principal market. The growing season of 1949 was a record one, the final crop total being 81,600,000 Ib., valued at £10,880,000. The 1947-48 crop of flue-cured tobacco amounted to 75,385,241 lb., valued at £7,327,000. The table gives an indication of the rapid growth of the Rhodesian industry since 1940:

Devaluation was expected to assist Rhodesian tobacco development in 1950 by giving a further preference over American tobacco unless rising costs should overtake the ratio of devaluation.

Among Asiatic countries, Turkey's crop amounted to 176,400,000 lb. against 220,000,000 lb. in 1947. In Persia, Iraq and Palestine which produce Turkish-type leaf, 1949 production was also slightly below 1948 output. The harvests in most far eastern countries were above those of 1948, larger crops being reported for China, Japan, Korea, Formosa, Indonesia and the Philippines. For all Asia, harvests totalled 3,315,000,000 lb. from about 3,720,000 ac. against 3,175,000,000 lb. from 3,750,000 ac. in 1947-48 and the 1935-39 average of 3,250,000,000 lb. from 3,750,000 ac.

Total 1949 production in European countries excluding the U.S.S.R. was about 924,000,000 lb. from about 1,100,000
ac., compared with 810,000,000 lb. in 1948. The 1947 European harvest had amounted to 745,000,000 lb. and the prewar annual average 675,000,000 lb. from 680,000 ac. Among countries which increased their production were Bulgaria, Czechoslovakia, Hungary and Poland, with smaller increases in Rumania and Spain. France, Belgium and Italy showed a slight decrease in production. France’s production of cigars was now only about half that of the prewar years.

The year was marked by a world-wide increase in cigarette smoking. An example of the ratio of increase in the greatest of the tobacco growing countries, the United States, was provided by the Department of Agriculture at Washington. Cigarette production during the fiscal year ending June 30, 1949, approximated 390,000 million, or about 3% more than in 1947-48, and a new record. Cigaret production during 1949 totalled nearly 5,700 million, about the same as in 1948. The output of smoking tobacco was estimated at about 107 million lb., compared with 109 million lb. in 1947-48.

United States exports of tobacco to Great Britain were 151 million lb. (export weight) or 18% more than the low level of 1947-48 but 28% less than the prewar average. The allocation was reduced by the British government in June 1949 by 25% from 110 million to 90 million dollars. Next to Great Britain the largest foreign outlet for United States tobacco was Germany. Most other western European countries took substantially more than the prewar average, although some got less in 1947-48. Exports of tobacco to China dropped sharply and were not expected to return to earlier levels in the near future.

India and Pakistan also considerably increased tobacco production and export of leaf, and the two governments aimed at expanding the 1948 export total of 22,776,373 lb. of leaf to Great Britain. The most important tobacco producing province in India was Madras where Virginian cigarette tobacco of various qualities was produced, Guntur in the Madras Presidency being the chief market for Virginian tobacco. The total area under Virginian tobacco was somewhat over 144,000 ac. out of which nearly 140,000 ac. were cultivated in the Madras Presidency. In Bihar and Mysore, areas under Virginia were about 250,000 and 150,000 ac. respectively. Small areas of Virginia were also under cultivation in the United Provinces, Orissa, Baroda and Hyderabad. The area under Virginian tobacco was being steadily increased every year in the Indian union and cultivation and curing methods had rapidly improved. Experts claimed that the country could now produce Virginia of good colour and combustibility; it was usually flue-cured though some was sun-cured.

The 1948-49 tobacco crop in New Zealand amounted to about 5,000,000 lb. from 4,400 ac. During 1948 a total of 3,251,000 lb. of domestic and 5,056,000 lb. of imported leaf were released to manufacturers from bonded warehouses. Imports of unmanufactured tobacco totalled 4,346,000 lb. of which 4,342,000 lb. were from the United States. Imports of leaf in 1947 had been 4,651,000 lb. It was estimated that New Zealand now produced approximately 50% of home tobacco requirements. The government required all manufacturers to use a minimum of 30% domestic leaf. In general, most manufacturers adhered to the 30% requirement but some used a great deal more domestic leaf to reduce costs.

The new state of Israel reported an increase in home production of cigarettes, the monthly total having reached 80,000,000 by 5 factories employing 650 workers. (G. Wt.)

TOBAGO: see Trinidad and Tobago.

TOGLIATTI, PALMIRO, Italian politician (b. Genoa, March 25, 1893). After graduating in law at the University of Turin, he joined the Italian Socialist party. In 1921 he was one of the founders of the P.C.I. (Partito Comunista Italiano) and editor of its organ. After the coming of the Fascist party into power he tried to work underground but in 1926 fled to Moscow where he lived for 18 years, acquiring Soviet citizenship and using the name of Ercole Ercoli. From 1924 he was a member of the executive committee of the Comintern and from 1935 one of its secretaries. He directed the Garibaldi brigade in the Spanish Civil War and was interned in France in 1939 but escaped to Moscow. In March 1944 he returned to Italy and resumed his role as leader of the P.C.I. On April 21, 1944, he joined the Badoglio cabinet and on June 18, 1944, the first Bonomi cabinet as minister without portfolio. On Dec. 10, 1944, he was appointed deputy prime minister in the second Bonomi cabinet and on June 19, 1945, joined the Parri cabinet as minister of justice. He kept this post in the first cabinet of De Gasperi formed on Dec. 4, 1945, but did not join the second De Gasperi cabinet formed on July 12, 1946. He decided to devote himself to party organization. He was elected a member of the Constituent Assembly on June 2, 1946, and a member of the Chamber of Deputies on April 18-19, 1948. On July 14, 1948, in Rome, he was the object of an attempted assassination by Antonio Pallanl, a medical student. On Feb. 26, 1949, he declared that if the Soviet army should pursue an aggressor on to Italian territory, the Italian people would have the duty of aiding it.

TOGOLAND: see British West Africa; French Union; Trust Territories.

Even with the lifting in Dec. 1948 of the ban on immigration into the city there was no near prospect of its re-housing its prewar total. Reconstruction by the authorities and private enterprise continued, gradually covering the remaining desolate spaces in its 360 sq. mi., restoring the sense of habitation, and even exaggerating the former complexity of lines and forms. Against the mixed background of surviving elegance, of ramshackle improvisation and of clean but
diminutive new houses the inhabitants appeared subdued in dowdy clothes, with only an occasional kimono seen in street or crowded tram. The frequency of the emperor's excursions—his simple cortège preceded by the sirens of his U.S. military police outriders—had dulled for the capital the tremendous interest and enthusiasm which greeted the sovereign in the provinces. The supreme commander likewise aroused less awe than formerly. American aid ensured adequate food supplies. The drastic measures enforced by Joseph M. Dodge, during his stay from Feb. 2 to May 2, intended to set Japan on the road to a balanced economy, pressed increasing austerity and unemployment (see JAPAN). On July 6 Mr. Shimoyama, chief of the national railways, was assassinated in a Tokyo suburb. But despite extensive dismissals of redundant workers the city remained peaceful and Communist influence, after an increase, declined. (X )

TONGKING: see FRENCH UNION

TORRES BODET, JAIME, Mexican statesman and author, and United Nations official (b. Mexico city, April 17, 1902), was educated at the University of Mexico, and from 1922 to 1924 he was head of the department of libraries in the secretariat of public education. He was professor of French literature in the University of Mexico, 1924-28, and then joined the Mexican foreign service, serving in Spain, Netherlands, France, Argentina and Belgium. He was under secretary for foreign affairs, 1940-43, minister of education, 1943-46, when he became minister for foreign affairs. He led the Mexican delegation to the United Nations general assembly, 1947, and in Nov. 1948 the third general conference of the United Nations Educational and Scientific organization (U.N.E.S.C.O.) elected him, by 30 votes to 3, to succeed Julian Huxley as director general. In March 1949 he arrived in London from the United States for the first meeting of the United Kingdom national commission for giving effect to the decisions of U.N.E.S.C.O. He later addressed the annual meeting of the National Union of Teachers at Margate.

In his first year of office he made special efforts to get U.N.E.S.C.O. down to many practical tasks. At the general conference held in Paris in September he defended the organization's budget against criticisms from many delegates including those from Great Britain. His many novels and poems included Fervor (1918), Margarite de Niebla (1927) and Estrella de dia (1933).

TOURIST INDUSTRY. The volume of tourist traffic between European countries had by 1949 barely reached the prewar level. Currency restrictions enforced by all European countries with the exception of Switzerland and Belgium were the major cause of continued restricted travel. There was a remarkable degree of recovery in making good destruction caused during World War II which so greatly affected the equipment of the tourist trade, such as hotels, railways and ships. New building, rehabilitation and modernization were undertaken throughout Europe on a considerable scale.

During 1948 and 1949 great hopes were placed by all western European governments on the expansion of Europe's dollar income by the increased tourist traffic from the United States, and in both years the industry proved to be, in value, the largest dollar earner in many countries, including Great Britain. In 1948 some 200,000 Americans visited Europe, but this amounted to less than 6% of the total tourist traffic. In 1949, mainly as a result of improved shipping conditions and introduction of improved air transport across the north Atlantic providing approximately 200,000 berths each way, this number had grown to 300,000. Further considerable expansion of travel from the United States to Europe would be dependent mainly on the provision of low cost transport facilities both by sea and by air enabling those in the middle and lower middle income groups to travel.

Efforts of the European tourist organizations were directed to the lengthening of the traditional tourist season normally limited to the months of June, July and August, and the countries participating in the European Recovery programme arranged a publicity scheme in the United States to promote travel to Europe in the spring and autumn.

The pattern of Europe's tourist traffic in 1949 was little different from 1948, but had changed a great deal compared with that of prewar years. Germany as a tourist country and German travellers were still absent from the scene. The British government, however, re-opened western Germany to British tourists as from June 21, 1949. The British were still the greatest purchasers of Europe's tourist services. In 1949 some 800,000 Britons went abroad; more than half went to France, over 150,000 each to Italy and Switzerland and smaller numbers to the other western European countries. A small volume of luxury-type tourist traffic from Britain was enjoyed by sterling area resorts outside Europe. Residents of most western European countries travelled more than they did before World War II—particularly the Scandinavians, Swiss and Belgians. Great progress was made in lifting paper barriers, very few visas being required in western Europe.

Most American tourists visiting Europe included a number of countries in their tour. Britain and France took the larger share of the traffic, with Switzerland and Italy next in order of popularity. Tourists from Latin America were relatively few; most went to Portugal, Spain, France and Italy, although in 1949 many more travelled to Britain than before the war. With the restoration of long distance passenger liners on the ocean routes, traffic from the Commonwealth countries was greater than before the war, and these visitors almost invariably made Britain the centre of their European stay.

![Graph: OVERSEAS VISITORS TO THE U.K.](chart.png)
The amount spent by tourists in western European countries in 1949 could only be roughly estimated. British earnings from the tourist trade in 1949, excluding fare payments to British transport carriers, were provisionally estimated at £15 million from the United States and Canada, £8·5 million from western European countries and £8·5 from Australia, South Africa and Latin America; these, together with receipts from other countries, totalled £40 million. British shipping and airline operators earned an additional £18 million from fares paid by overseas visitors. Europe's tourist earnings from all countries were in the neighbourhood of 1,000 million dollars. Of these total tourist receipts the money actually paid in U.S. dollars amounted to 300 millions, constituting by far the largest European export to the United States.

(E. W. We.)

TOWN AND COUNTRY PLANNING. In Great Britain the new planning machinery in force from July 1948 was still to a certain extent in a running-in phase. The local planning authorities, now the counties and county boroughs, got to work on their surveys and development plans due to be completed by July 1951. They also put into effect in varying ways the delegation of part of their functions to town and district authorities within their areas. As their master plans were still incomplete much consultation was necessary between the two tiers of authority on current applications for consent to develop. Though building was still restricted for economic reasons, applications were numerous and, trained staff being in short supply, administration was hard pressed. Life was not made easier for planning staffs by the issue by the Ministry of Town and Country Planning and the Scottish Office of many regulations and circulars made necessary by the complex provisions of the acts. These dealt among other things with general development, preservation of trees and woodlands, compensation, planning appeals, land owned by local authorities, colour of telephone kiosks, methods of survey, preparation of development plans, control of advertisements, mining and minerals and airfields. Good progress was, however, made by many planned authorities with their surveys and development plans, some of which were expected to be ready for submission to the ministries by the end of 1949 and more in 1950.

Further important regional advisory plans were published: notably for south Wales, north Staffordshire, the Hartlepoools, northeast England, the Clyde valley, central and southeast Scotland and the Tay valley. Among local advisory and outline plans were those for Chichester, Salisbury, Sudbury and the county of Kent. The literature of planning was also amplified by many stout law books with comments on the acts and regulations.

Declaratory orders or Compulsory Purchase orders were made for the acquisition of land for the reconstruction of blitzed areas in many cities, including Bristol, Coventry, Hull, Plymouth, London (Stepney-Poplar and an area east of St. Paul's cathedral) and Clydebank. In some places redevelopment work was begun.

The regional plans of 1949, as of the preceding years, disclosed the necessity of much de-congestion of the central parts of built-up areas and recommended the preservation of green belts around cities, involving some provision for overspills of people and industry by the building or expansion of towns beyond the green belts. Sites for 11 new towns in England and Scotland had been chosen up to the end of 1948. Further sites were chosen in 1949 at Basildon, Essex, Bracknell, Berkshire, Corby, Northampshire, and Cwmbran, south Wales. Manchester corporation proposed to seek parliamentary powers to build a new town at Mobberley, Cheshire, and the minister of town and country planning asked Lancashire county council to suggest sites for two in that county. Several other sites were under discussion in Wales and Scotland. Progress with the actual building of the new towns was still slow but showed signs of accelerating in the second half of 1949. Master or outline plans had been prepared and in some cases submitted to the appropriate ministry for the new towns of Stevenage, Hemel Hempstead, Harlow, Crawley, Welwyn Garden City, Hatfield, Newton Aycliffe and Peterlee and in Scotland for East Kilbride and Glenrothes. A proposal to take over the first garden city, Letchworth, under the New Towns act was dropped, an agreement being made with the estate company that it be continued as a private enterprise with an undertaking to hand the town over to a public authority when complete.

Lively public discussion arose during 1949 as to the competing claims on land for food growing and for development. Farming interests and amenity societies opposed projects for open-cast coal and iron ore mining, quarries and cement works, army training grounds, power stations, hydro-electric plants, housing estates and new towns. This growing consciousness of the need of careful adjudication on conflicting demands emphasized the necessity of a strong national planning machinery: but, as each decision in favour of any claim offended one or more other claims, planning itself was often attacked.

A more intractable difficulty arose over the working of the development value provisions of the Planning acts of 1947. The Central Land board extended to June 30, 1949, the final date for claims on the £300 million hardship fund for extinguished development rights in land. In the end 935,000 claims were received, 500,000 of them in the last four days. There was no indication as to whether the £300 million fund would prove too little or too much. Concessions were made to owners of single plots for dwelling houses and to registered builders owning near-ripe land for development whereby within certain limits they would have a 100% claim on the fund. Other owners were very critical of the fact that they would not know for another four years what percentage of the valuation of their claims they would receive. In the meantime they had no financial incentive to sell their land for development; the expectation that land would be freely available for development at existing use value was, as the Central board had said in 1948, "just not being achieved." With the approval of the minister, therefore, the board in 1949 experimented with its power of compulsory purchase on behalf of would-be developers. Though orders were confirmed in a number of cases much land continued to be held out of the market. The amount collected in development charges up to March 1949 was £1,328,552; and on the 6,812 dwelling house plots included in the total the average charge was £145 (House of Commons Paper No. 223, H.M.S.O., London).

Broadly the new planning system seemed adequate to check publicly undesirable uses of land such as increases of residential density or the transfer of green belts on good farm land to building; in this field criticism was confined to decisions on individual cases. It was not so clear that the system facilitated positive development where it was desired in private and public interests. The development rights sections of the acts, an integral part of the negative control, seemed to need some revision if they were not also to check desirable developments.

The Licensing act, 1949, extended to all the new towns state management of the liquor trade with an advisory committee for each such town. The Lands Tribunal act, 1949, set up a new tribunal to settle disputes on the valuation of land for compulsory acquisition and for claims on the £300 million land fund. The National Parks and Access to the Countryside bill, introduced in March 1949, provided for
the creation in England and Wales of national parks in areas of special beauty and for special protection of smaller similar areas. A National Parks commission would select the areas and the management of each park would be entrusted to special committees of local planning authorities under the supervision of the central commission. Powers would include making development plans for the improvement of the parks, tree planting, removal of unsightly buildings and the provision of certain holiday facilities. There was to be a separate bill for Scotland. (See National Parks.)

Europe. In war-damaged countries, notably Italy, the Netherlands, Poland and Yugoslavia, reconstruction was accompanied by local planning. In France and Belgium efforts were made to induce owners voluntarily to pool and divide land in re-development areas. But even in the countries most advanced in planning law the desperate need to overcome the housing shortage outpaced planning control. The numerous excellent surveys and plans made were not to any great extent put into operation. In countries where land was nationalized planning machinery took a different form from those in which it was mostly private property; but the problems of urban congestion and spread, of journeys to work, of housing density and of the protection of food-growing land and green belts were universal. There was, therefore, much interchange of experience between planners and government administrators in many countries. None could claim to have found complete solutions of town and country planning problems but most showed growing awareness of their importance. (F. J. Os.)

North America. In Canada, a committee was formed to promote the planned development of Ottawa (q.v.) and a national planning conference was held in October at Winnipeg.

In the United States two national planning conferences were held: the National Citizens Conference on Community Planning, sponsored by the American Planning and Civic association, at Oklahoma City, Oklahoma, March 27-30, 1949; and the National Planning conference, sponsored by the American Society of Planning Officials, at Cleveland, Ohio, Oct. 10-12, 1949.

Private building of houses and apartments continued to dominate construction. Postwar plans contained many projects for public buildings and works, but actual construction awaited easing of the acute housing shortage. A number of cities listed public works projects to be realized in five- and six-year improvement programmes.

In Tennessee and Connecticut, state planning agencies stimulated planning for cities and towns. In Connecticut all communities were urged to prepare comprehensive plans, including land-use maps, before adopting zoning plans. In Tennessee, the state planning board fostered public school courses in planning.

On July 8, 1949, congress passed the National Housing act authorizing an $10,000 housing unit programme to be completed within six years. The act also provided for local planning for housing projects to conform to the comprehensive plan and set up a programme of slum clearance under which urban redevelopment plans were being submitted to the Housing and Home Finance agency.

The congestion of main streets in U.S. cities continued to be a major problem. Parking meters at the curb helped to some extent, and proceeds in some cities were devoted to...
purchase of land for off-street parking. In spite of increased car parking facilities, many drivers abandoned their cars for short journeys in main urban areas and this added to the public transport load. A number of cities abandoned some or all of their tram services and substituted buses.

Most cities in the United States improved or enlarged their airports during the year; new and larger airports were planned to care for planes needing longer runways. Some cities made planning studies to locate airports on sites in conformity with the comprehensive plan for the region.

A score of universities offering degrees in planning were listed in the July Planning and Civic Comment. There was a tendency for universities to include courses in regional and national as well as city and town planning.

The citizen movement to support planning continued to grow. In addition to many existing local organizations, the American Planning and Civic association published work sheets for about 50 local and regional planning associations. (See also Housing; Local Government.)

(H. J.)

TRADE UNIONS. The British Trades Union congress held at Bridlington, Yorkshire, in Sept. 1949 represented 7,936,600 members organized in 187 trade unions, as compared with 7,791,470 in 188 unions the previous year. Most groups increased their membership to a small extent; but there were small reductions in the case of the general workers, the railwaymen and one or two others. The total membership included 1,237,000 women, as compared with 1,220,000 in 1948. The Trades Union congress includes nearly all the big trade unions except the National Union of Teachers (181,000) and the National Association of Local Government Officers (190,000). The most recent figures of total trade union membership relate to the end of 1947, when there were in all 9,114,000 trade union members, of whom 1,662,000 were females. The Scottish Trades Union congress, which is separate from the British T.U.C., had 809,000 affiliated members in Scottish trade unions or in Scottish branches of British unions in 1948; but most of these were also included in the British T.U.C. figures. The General Federation of Trade Unions, which acts mainly as a mutual insurance society for a number of the smaller unions, had 319,000 members in 1949, including a number of small unions not belonging to the T.U.C.

A few big trade unions included a high proportion of the total membership. The biggest were the Transport and General Workers (1,271,000), the General and Municipal Workers (816,000), the Amalgamated Engineering union (743,000), the National Union of Mineworkers (611,000), the National Union of Railwaymen (455,000), and the Shop, Distributive and Allied Workers (342,000). Nine others, besides the two unaffiliated bodies already mentioned, had over 100,000, and 14 more between 50,000 and 100,000. The largest groups in the Trades Union congress were the Transport Workers (other than railways), with 1,383,000 in 10 unions, and the Engineering and Vehicle Workers, with 1,250,000 in 27 separate unions.

The Trades Union congress of 1949 met under the shadow of economic crisis, but before the devaluation of sterling was announced. The principal issues before it were the policy to be followed in respect of wage claims, the representation of trade unions on the boards administering nationalized industries and services and the secession of the British delegation from the World Federation of Trade Unions.

On the first and last of these issues it was a foregone conclusion that the policy of the general council would be approved, in face of strong opposition from the pro-Communist minority. Actually, the voting on the wages issue was much the same as the year before, the general council's resolution re-affirming the policy of restraint in pressing wage claims being carried by 6,485,000 to 1,038,000. The resolution approving the general council's secession from the W.F.T.U. and its subsequent steps towards the formation of a new International was carried by 6,258,000 to 1,017,000. On the other main issue, a resolution requiring that trade union representation on the boards of nationalized industries should be drawn from the unions representing the workers in the industries concerned was defeated by the rather narrow margin of 800,000.

Bryn Roberts, of the National Union of Public Employees, endeavoured without success to persuade the delegates of the need for a more positive co-ordination of trade union action in dealing with major economic problems arising out of the crisis. The policy of the general council in refraining from pressing for the immediate adoption of the Congress's declared policy of "equal pay" for men and women was strongly challenged but was endorsed after a heated debate. The prime minister visited the congress and delivered a speech in which he insisted on the urgent need for higher productivity as a means of overcoming the crisis in the balance of payments. The report of the general council's economic committee and Sir W. Lawther's presidential address followed the same lines. Sir W. Lawther (Mineworkers) also delivered a vehement attack on Communist activities in the trade unions and called for more energetic action to counter their disruptive tactics directed against the European Recovery programme and the establishment of a new International free from Communist influence.

A number of unions, headed by the National Union of Railwaymen, pressed for the discontinuance of compulsory arbitration in trade disputes, which is still continuing under emergency powers taken during the war. There was much difference of opinion on this matter, other unions taking the view that before long arbitration might be useful as a means of preventing wage cuts and that in any event the country could not at present afford the risk of serious trade disputes. Finally, the question was referred to the general council for report to next year's congress.

The prime minister, in his speech, criticized the policy of insisting that wage advances to the lower paid grades in an industry should be accompanied by advances to the more highly paid grades, in order to maintain wage differentials for skill and responsibility; and after the devaluation of the pound Sir Stafford Cripps insisted that advances to the lowest wage groups, should they become necessary in face of rising costs of living, could not be allowed to spread to the better paid workers. This led to a retort by Arthur Deakin (Transport and General Workers) that the trade unions could not allow wage differentials to be further
narrowed or the established methods of collective bargaining to be undermined by the institution of any general legal minimum wage.

In general, except in the field of international relations, the year was uneventful from the trade union standpoint. There were various consultations with the government and also with the central employers’ organizations concerning the best methods of improving output and further developing systems of joint consultation; but nothing very much thus far came of them. Delegations representing particular industrial groups began to visit the United States in order to study American production methods and worker-management relations; and the group representing the steel foundries came back with important recommendations on both matters. In the coal industry there were numerous meetings held to consider means of raising production in face of a renewed decline in the labour force and an increase in the percentage of absentee; but it was not yet possible to assess the results. In the cotton industry there was some approach to agreement on the long disputed matter of “re-deployment” of labour. This industry, as well as coal-mining, was seriously short of workers; and in connection with the drive to increase exports, especially to “hard currency’” areas, there was some discussion concerning the expediency of a greater use of the powers of “direction of labour” which the government possessed but refrained from using in more than a very few isolated cases.

There was a good deal of dissatisfaction with the working of the national board system in the industries that had been nationalized. This was centred largely on the absence of trade union representation on the boards, which all included former trade unionists, but not as representatives of the unions. The methods of appointing salaried officers were also criticized, and some unions (notably the National Union of Railwaymen) complained that the system of joint consultation under national ownership was no advance on what had been in practice before nationalization. The complaints, however, were mostly rather vague; and it was evident that the trade unions were not at all certain what they really wanted. They were torn between the desire for some measure of workers’ control or participation in management, as distinct from mere consultation, and the desire to maintain independence in order to protect their members’ interests without becoming involved in responsibility for the efficient conduct of the industries concerned.

The Trades Union congress general council and the unions chiefly concerned continued to take an active part in the system of National Joint Advisory councils set up to consult with the government planning authorities and with the separate departments responsible for economic and social affairs. During the year it was arranged that representatives of the managements of the socialized industries would take part in these consultations together with those of private employers. The National Joint Advisory council recommended in Oct. 1948 that the coming into force of the Restoration of Prewar Practices act, which provided for the resumption of trade union regulations suspended during World War II, should be postponed, in view of the economic situation, till the end of 1949. Further postponement seemed probable on account of the agreed necessity of doing everything possible to ensure increased production.

France. In France there were no strikes in 1949 comparable with the large coal strike of Oct. 1948. The most important single strike movement was a 24 hr. strike of the civil service, called originally by Force Ouvrière, but backed by the other trade union federations, to demand salary increases. The question of wage advances came to the front again in Oct. 1949, when the disintegration of the Henri Queuille government was directly caused by the resignation of the Socialist minister of labour, Daniel Mayer, on account of the government’s refusal to make concessions to the demands of the unions (see FRANCE). The new government, under Georges Bidault, was compelled to grant a once-for-all bonus to meet the rising cost of living, pending measures for restoring free collective bargaining which it promised to introduce in the near future.

The French trade union movement continued throughout the year to be divided into rival factions. The C.G.T.-F.O. (Confédération Générale du Travail-Force Ouvrière), the anti-Communist trade union federation led by Léon Jouhaux and closely connected with the Socialist party, failed, despite some financial support from the British trade unions, to make much headway except among the non-manual workers. The C.F.T.C. (Confédération Française des Travailleurs Chrétiens) continued its independent existence, and in Oct. 1949, a new independent federation, Confédération Syndicale du Travail, was founded by a number of unions that had held apart from the existing bodies and also included a number who had been expelled or who had seceded from the Communist-dominated C.G.T. (Its secretary general was Benoît Frachon, a Communist member of the National Assembly.) Sulpice Dewez, secretary general of the C.S.T., declared its willingness to collaborate with all other non-Communist groups. Earlier in the year the C.G.T., as a sequel to the failure of the coal strike, had carried out a large-scale purge of trade union officials, especially in the northern départements, designed to ensure fully effective party control over the Communist section of the trade union movement, which remained by far the largest among the manual workers.

Italy. In Italy, the most important strike in 1949 broke
out in May among the farm workers in the Po valley, Latium and Apulia. It was supported by both Communist and non-Communist trade union groups and resulted after five weeks' struggle in the grant of a cost-of-living bonus, in the extension of unemployment benefit to agricultural workers and in a number of other concessions. The Italian trade union movement, like the French, continued to be divided into rival factions, the largest section being organized in the C.G.I.L. (Confederazione Generale Italiana del Lavoro or General Confederation of Italian Labour), which was under the control of the Communsists in conjunction with the Pietro Nenni P.S.I. (Partito Socialista Italiano). The Christian trade union organization (Corrente Sindacale Cristiana), formed in Aug. 1948, decided later in that year to transform itself into an anti-Communist L.C.G.I.L. (Libera Confederazione Generale Italiana dei Lavoratori), but failed to carry with it the bulk of the anti-Communist workers that were not organized on a definitely Christian basis. In May 1949 the dissident P.S.I.L. (Partito Socialista dei Lavoratori Italiani), led by Giuseppe Saragat, joined with the Republican party, led by Randolfi Pacciardi, in forming a new body, the F.I.L. (Federazione Italiana del Lavoro), and there were thus three rival bodies attempting to represent the Italian workers. Trade union power was sapped by heavy unemployment in the industrial areas and over and above this the continuing dissensions among the Italian Socialist groups made it impossible to achieve a common front of the non-Communist sections in the trade unions (see also ITALY: SOCIALIST MOVEMENT).

International Movement. The strong disaffection which had been evident for some time past inside the World Federation of Trade Unions came to a head in Jan. 1949, when the British Trades Union congress and the American Congress of Industrial Organizations joined in a demand that the W.F.T.U. should suspend its activities for the time being and, when this proposal was rejected, withdrew from further participation in its proceedings.

The cause of this split was the carrying on by the executive bureau and officials of the W.F.T.U. of a Communist-inspired campaign against the European Recovery programme and against the support given to it by the British, American and other trade union groups. These groups had formed a loosely organized joint advisory committee representing the E.R.P. countries; and the W.F.T.U. office had issued, without a meeting of the full executive, various manifestos to which strong objection was taken by the non-Communist members.

At the same time, the W.F.T.U. had been negotiating with the separate Internationals of trade unions representing particular occupational groups (transport workers, miners, textile workers, etc.) with a view to their absorption as departments; but these negotiations broke down. The "Trade" internationals thereupon formed a joint committee of their own but disclaimed any intention of founding a rival International, regarding this as a matter to be dealt with by the national trade union centres.

In June 1949 the British Trades Union congress, in close consultation with the Americans and with other bodies which had left the W.F.T.U., called at Geneva a preparatory conference for the establishment of a new International Confederation of Trade Unions. The A.F.L. (American Federation of Labour) which had refused throughout to join the W.F.T.U., took part in this gathering together with the C.I.O. (Congress of Industrial Organizations). The Geneva conference appointed a committee to draw up a constitution for a new International and to convene a further congress for its formal institution. This committee included representatives from the U.S., Great Britain, France, Belgium, Italy, Australasia, Scandinavia, Latin America, Asia, Africa and the middle east. Germany was also invited to appoint a representative and so was the joint committee of the "Trade" internationals.

In July 1949 the World Federation of Trade Unions held a rival conference at Milan, and passed resolutions denouncing the secessionists and the European Recovery programme. The seceding bodies were accused of following a policy of subservience to American imperialism and of treason to the working class cause. The Milan conference further decided to take steps to set up a rival system of trade secretariats representing the workers in particular industries as departments within the W.F.T.U.; and later in the year a number of sectional conferences were called for this purpose.

On Nov. 28 about 245 delegates of over 47 million members of non-Communist trade unions throughout the world met in London to adopt the constitution of the new I.C.T.U. Among them were: from the U.S., William Green, president of the A.F.L., and Walter Reuther, vice-president of the C.I.O.; from Great Britain, Arthur Deerin, secretary general of the Transport and General Workers' union, and Vincent Tewson, secretary general of the T.U.C.: from France, Leon Jouhaux, secretary general of the C.G.T.—F.O., and Gaston Tevier, president of the C.F.T.C.; from Italy, Giulio Pastore, secretary general of the L.C.G.I.L. Paul Pauel, secretary general of the Belgian T.U.C., was elected chairman of the London congress and J. H. Oldenbroek (Holland), secretary general of International Transport Workers' federation, secretary general of the congress. An executive board of 19 was elected on Dec. 7 with J. H. Oldenbroek as secretary general. Two days later, at its final session, the congress adopted a manifesto appealing to all workers to unite within the confederation's ranks, opened with three following slogans: Bread Economic and social justice for all Freedom Through economic and political democracy Peace With liberty, justice and dignity for all.

The world trade union movement was thus again split into rival Communist and anti-Communist sections, as it was between the two World Wars, but with the difference that the majorities of the French and Italian movements were firmly integrated with the Soviet group, and that Soviet influence was exclusively dominant in eastern Europe, except in Yugoslavia. The exiled trade unionists from the countries under Soviet domination founded in Paris a Free Centre for Trade Unions in Exile; and this body was represented by observers at the Geneva conference.

United States. The political issues affecting the demands and position of organized labour in the U.S. were the leading subjects of debate in the long first session of the 81st congress. The large and unexpected victory of the Democrats in the national political campaign of Nov. 1948 persuaded the leaders of the American Federation of Labour and the Congress of Industrial Organizations that the new congress, with the support of President Truman, would repeal the Taft-Hartley act, extend and liberalize the federal social insurance system and raise the statutory minimum wage rate.

In these hopes organized labour was disappointed. Although repeal of the Taft-Hartley act and restoration of the Wagner act was one of the principal campaign promises of the Democratic party, the majority of the new congress, including both Democrats and Republicans, resisted pressure from the President and union leaders. The dominant opinion of congress was that the Taft-Hartley act had corrected abuses associated with the Wagner act. Any revision of the existing law, therefore, would, to win the support of congress, have to be moderate and limited. The unions wanted either the essence of the Wagner act or no change in the law at all. They, therefore, rejected a considerable revision proposed by Senator Robert A. Taft. The result was that congress adjourned without changing the law and
left the Taft-Hartley act as the foremost issue in the congres-
sional elections of 1950.
Organized labour was no more successful in its efforts
to win thorough-going revision of existing social insurance
legislation, since congress failed to adopt a bill to raise old-
age pensions and various forms of assistance and substantially
to extend the coverage of the pension plan. But congress did
satisfy union demands by raising the statutory minimum
wage from 40 to 75 cents an hour and appropriating large
federal subsidies to promote housing construction for the
lower-income population
Although the year proved, in retrospect, to have been
almost as good a year as 1948, there occurred within the 12
months a noticeable slump in production, employment and
profits and an increase in unemployment, which made it
difficult for the unions to pursue their expected demand for
further wage increases.
In the major negotiations for contract renewals in 1949,
union policy took another direction. The C I O. Steel and
Automobile Workers' unions added to their wage demands
proposals for company-financed pension and insurance
benefits, it being generally understood that wage concessions
would be waived in return for a satisfactory settlement of the
union pension and insurance claims. As in past years
a single union, in this case the United Steel Workers,
assumed the leadership in the drive for welfare benefits as a
substitute for higher wages. The negotiations between the
unions and the steel companies ended in disagreement,
mainly because the companies considered the union proposals
excessively costly and because some companies, in particular
the U. S. Steel corporation, insisted on contributions by their
employees to the pension funds. Failing to reach agreement
the union prepared to call a national steel strike
At this point President Truman intervened with the
appointment of a steel fact-finding board, before which the
industry reluctantly and the union eagerly appeared to present
their respective cases. The findings of the board were legally
not binding on either party, but it was clear that what the
board recommended would have a determining influence
on the ultimate settlement. This was, in fact, what happened.
The board ruled against a wage increase because of unfavour-
able business conditions. But it recommended both pensions
and social insurance to be financed by employer contributions
amounting to ten cents an hour. In its argument the board
found the cost of such benefits to be an appropriate charge
on business and threw the weight of its influence toward
non-contributory pensions. The board's report was accepted
by the union and rejected by the employers. On Oct 1 the
steel industry came out on strike.
In the coal industry pensions and welfare benefits were
also the source of strikes and disturbances. In this inustry
pensions and welfare funds, financed by a royalty on each
ton of coal produced, had been in existence since the settle-
ment of the strike of April 1946. The royalty amounted in
1949 to 20 cents a ton. The causes of trouble were in the
main peculiar to this industry and the policies of John L.
Lewis. The funds, for all practical purposes administered
by the union, ran out of sufficient reserves. In 1949, there-
fore, the United Mine Workers wanted the royalty raised
and, in addition, sought a shorter working week and a sub-
stantial increase in wages. Negotiations, which went on
for most of the year, were inconclusive. The coal operators,
already suffering from loss of business to competing fuels,
were unwilling to raise costs. Considering, also, the alleged
wastes in the union administration of the benefit funds, they
objected to making a new contract which failed to deal
with this problem. The miners, therefore, resorted to direct
action. For a large part of the year Lewis ordered his mem-
bers to work only three days a week and late in the year the
entire industry was shut down by a strike. When the year
ended nothing was settled and the industry reverted, by
union order, to a three-day week.
The national steel and coal strikes raised the losses from
labour stoppages to the unusually high level of 53 million
man-days, a total exceeded only in 1946. The steel strike
was settled after a month's idleness, though numerous
strikes against particular companies continued beyond that
time

(L. W.)

TRANSJORDAN: W.JORDAN, HUSBITE KINGDOM
OF

TRIESTE, THE FREE TERRITORY OF.
A small state at the northern end of the Adriatic sea, between
Italy and Yugoslavia, demilitarized and neutral, whose
integrity and independence were assured from Sept. 15,
1947, by the Security council of the United Nations. Total
area: 293 sq. m. Total pop. (June 1949 est.): 345,000.
Military governors under provisional regime: Zone A,
British-U S (area 96 sq. m.; pop. 285,000). Major General
Terence S. Airey. Zone B, Yugoslavia (area 197 sq. m.;
pop. 60,000). Colonel Mirko Lenac. Mayor of the city of
Trieste, Gianni Bartoli.
History. During 1949 the problem of Trieste remained
unsolved; the British, French and U S governments stood
by their declaration of March 20, 1948, suggesting the return

TRIESTE
of the Free Territory to Italian sovereignty, and the Soviet government refused to agree to a revision of the Italian peace treaty which they considered unwarranted. Although in Jan. 1948 the Security council had been unable to agree over the appointment of a governor for the Free Territory, on Feb. 17, 1949, Yakov A. Malik, the Soviet representative, re-opening the controversy, proposed that the council should nominate Hermann Frückiger, a Swiss diplomat, one of the candidates who had been put forward a year before by the British government and rejected by Moscow. The Soviet delegate renewed his proposal in March and again in May, when it was rejected by nine votes to two.

On June 12 the people of Trieste freely elected their municipal council, for the first time for 27 years. The elections were quiet and orderly and the six Italian parties which favoured the restoration of Trieste to Italy received 63.7% of the total of 172,036 votes cast. The strongest Italian party was the Christian Democratic which received 65,944 votes (39.1%). The Cominform Communists secured 35,586 votes (21.1%), fewer than had been expected, and three independent groups running under the slogan "Trieste to the Triestines" polled 11.1%—a larger proportion than forecast. The Slovene vote was exceptionally low, only 4.1%, 2.4% of which went to pro-Tito Communists and 1.7% to the anti-Communist Slovene coalition.

On July 3 the Belgrade government announced their decision to introduce Yugoslav currency in zone B—or Yugoslav-occupied—of the Free Territory. The Yugoslina, an occupation money introduced in May 1945 which exchanged with the Italian lira (legal tender in Trieste) at the rate of one Yugoslina for two lire, was discontinued. The Yugoslin dinar was introduced instead with an exchange rate of one dinar for nine lire. (This Yugoslin reaction to the June elections seemed to be more than a monetary reform. A monetary union is practically an economic one and this could lead to political union). As the Yugoslin decision was technically a violation of the peace treaty (but so had been the creation of the Yugolira in 1947), the Italian government protested to the Security council. Italy had hoped that according to the British-French-U.S. declaration of March 1948 the whole Free Territory would eventually return to its sovereignty. The monetary union between zone B and Yugoslavia seemed, however, to imply that the Belgrade government would not be easily dislodged from their part of the Free Territory. Although Yugoslavia had protested vigorously in 1948 against the three-power declaration, it appeared that it would, perhaps, accept the partition of the Free Territory as the only practical solution of the dispute. The British and U.S. governments on July 14 delivered only mildly-worded protests against the introduction of the dinar to zone B.

Unhappily for the Triestines Italy is not ill-provided with ports and geographically Trieste is not part of the Italian peninsula. The creation of secondary industries might alleviate but was unlikely to solve the problems of a seaport in decline. The Cominform quarrel with Tito, by diverting Czechoslovak and Hungarian traffic from Rijeka to Trieste, helped to improve the economic situation as well the political atmosphere; but, at the close of 1949, Trieste's economic recovery still awaited the end of the "cold war" and an active east-west trade.

Economy and Finance. Budget (1948-49): revenue L12,800 million; ordinary expenditure L13,800 million, extraordinary expenditure L16,300 million; total deficit L17,300 million. During the year 1948-49 the E.C.A. allocation to Trieste was $17.8 million. For the year 1949-50 the Allied Military government asked for $12.6 million. The British-French-U.S. allocation for the year was $15.2 million.

TRINIDAD AND TOBAGO. British colony consisting of two islands off the South American continent north of the Orinoco river delta. Area: 1,980 sq. mi. Pop. (1947 est.): 586,700. Governor, Major General Sir Hubert Rance.

History. Details of a new constitution were announced in February; although not yet promulgated, preparations for its introduction, including the appointment of a speaker, were made. It provided for a governor possessing restricted reserve powers and presiding over an executive council which also includes three ex-officio, one nominated and five elected members, these last to be chosen by the Legislative Council from among their unofficial members and to be actively associated with the work of administration of departments of government. The Legislative Council, presided over by a speaker appointed by the governor from outside the council, was to consist of three ex-officio, five nominated and 18 elected members, the speaker having neither an original nor a casting vote.

TROPICAL DISEASES. During 1949 chloromycetin (chloramphenicol) was prepared synthetically and the formula (D-threo-1-paramidophenyl-2-dichloracetamide-1, 3-propanediol) published by H. Raistrick. Its chief properties were in the treatment of rickettsial diseases (typhus group). B. Ehrlich showed that it was active against R. prowazeki, and J. E. Smadel et al. that it had similar action on all pathogenic rickettsiae. They successfully treated a
group of louse-borne typhus patients in Mexico, and J. E. Smadel et al. had a similar experience with 25 cases of scrub typhus (mite typhus) in Malaya. In Rocky Mountain spotted fever (R. rickettsii) chloromycetin caused complete remission. J. E. Smadel showed, too, that it was active against the virus of psittacosis. In typhoid fever it was also discovered in Malaya that the drug possessed a curative effect in ten cases. It did not, however, exterminate Sal. typhica: neither did it appear to be active in a typhoid carrier. W. H. Bradley recorded that patients became apyrexial by the third day of treatment and signs of resolution were obvious within 48 hr. after eight gm. of the drug.

It was found that aureomycin hydrochloride obtained from the mould Streptomyces aureofaciens was potent against many Gram-positive and Gram-negative organisms and could be used against infections that had become resistant to penicillin, streptomycin or sulphonamides. Aureomycin was as effective in Rocky Mountain spotted fever as was chloromycetin. S. C. Wong and H. R. Cox showed its effectiveness in Q fever and E. H. Lennette et al. reported on 15 cases of this fever with relatively prompt improvement. L. T. Wright et al. treated 25 cases of lymphogranuloma venereum with babses and proctitis with decided improvement. In ulcerating granuloma of the pudenta, R. B. Greenblatt showed good results in streptomycin-resistant cases. In undulant fever (Brucellosis) due to Br. abortus and Br. suis, E. B. Schoenbich, W. N. Spink, S. Ross and M. S. Bryer reported successful results with remissions in three to four days.

The chief victories of streptomycin were in plague and the allied tularaemia. In experimental plague S. F. Quan et al. showed that it was bactericidal in the most virulent strains, and in guinea-pigs and mice injected subcutaneously with plague it was more active than sulphonamides. Even in pneumonic plague in mice, 200-400 mg. of streptomycin hydrochloride every six hours cured 90-95% of infections. D. Herbert showed that in concentration of three units per ml. streptomycin caused rapid sterilization of plague cultures. P. V. Karanchandani and K. S. Rao reported that in an epidemic of 152 cases and 66 deaths, five moribund plague patients were treated with intramuscular streptomycin. Improvement was evident with a total of 1.5 gm. W. Lewin et al. (1948) treated two cases of pneumonic plague with the recovery of one. The treatment was from the third day of the illness with streptomycin 1-8 gm. daily for eight days and a total of 24 gm. of sulphadiazine or sulphathiazole. C. Haddad and A. Valero, in three severe cases of bubonic plague, showed that streptomycin was superior to any drug in doses of 200 or 300 mg. every three hours. Streptomycin also cured tularaemia (Brucella tularensis) in doses of 1 gm. intramuscularly daily for seven days and cases of tularaemic pneumonia were also cured.

Treatment of Schistosomiasis. Miracil D. or Nilodin. (1-Diethylmiconoethyl amino-4-methylthioxanthone hydrochloride) was tried out on an extensive scale in man in Egypt, Rhodesia and elsewhere. In lower dosages the drug appeared to be erratic but the results in much higher and more frequent doses were more consistent. In a series of trials, doses of 400 mg. were given twice or thrice at three-day intervals. In a later series doses up to 300 mg. at 12 hr. intervals were given for as long as two weeks. The final results were better in the case of S. hematobium, less good in S. mansoni infestations and on S. japonicum (according to W. Kikuth and R. Gönert) it was inactive. Miracil D. cured schistosomiasis in about 32% of cases.

Treatment of Filariasis. Experiments with Hetrazan or Banocide (1-diethyl carbamyl-4-methyl piperazine hydrogen di-citrate) showed that it combined a high toxicity for the parasite with low toxicity for the host. Its main lethal action was against the microfilariae, whereas its action against the adult worms was slight. Studies on Wuchereria bancrofti were carried out in Puerto Rico, British Guiana, Costa Rica, Virgin Islands and Tanganikya. The dose was about 20 mg. per kg. of body weight and removed all, or most, microfilariae from the blood. On microfilariae in hydrocele fluid hetrazan had no action. It behaved somewhat like an opsinin, modifying the microfilariae so that they were seized by fixed phagocytes of the endothelial system which then destroyed them.

On Lou loa microfilariae hetrazan was very active and there was some evidence that the adult worms were also affected, as dead individuals were demonstrated under the skin. Prolonged treatment resulted in abolition of symptoms, such as Calabar swelling and pruritus. On Onchocerca volvulus hetrazan produced severe allergic responses after a single dose, according to the intensity of the infestation Pyrexia, facial oedema, pruritus and itching of the eyes were often encountered, according to F. Hawking and W. Laurie, with a dosage of 50-100 mg. twice daily for two days and then 150-600 mg. twice daily. The skin became negative for microfilariae after 2-3 days.

TRUCULENT SHERIDMOS: see ARABIA

TRUMAN, HARRY S., U.S. statesman (b. Lamar, Missouri, May 8, 1884), was elected vice-president of the United States on Nov. 7, 1944. On April 12, 1945, upon the death of Franklin D. Roosevelt, he became the 33rd president. On Nov. 2, 1948, he was elected president by 24,104,836 votes to 21,969,500 for governor Thomas E. Dewey. (For his early career see Encyclopedia Britannica and Britannica Book of the Year 1949.)

President Truman underwent a metamorphosis in 1949 which surprised both friends and enemies. The erstwhile modest Missourian, who regretted publicly that circumstances had catapulted him into the White House and whose defeat in the 1948 election was generally regarded as a certainty, stepped forth as a confident, determined and aggressive leader of his party and the nation. Nor did he shrink from asserting himself as a spokesman and director of world affairs. The new Truman appeared for the first time when he delivered his inaugural address on Jan. 20. He scrapped the famous Roosevelt slogan of the New Deal, substituting for it his own Fair Deal. In this address, in other speeches and in subsequent messages to congress, his Fair Deal demands were: repeal of the Taft-Hartley act and enactment of the Brannan farm plan; compulsory national health insurance; civil rights legislation; extension of social security; federal aid to education and health; stronger anti-trust laws; greater development of public power; rent control and housing for middle and low-income groups.

Congress refused to pass the greater part of his domestic programme because of a hostile combination of Republicans and conservative Democrats, the latter mostly from the south. Nevertheless, the legislative rebuff did not discourage the president. Addressing a Jefferson-Jackson day dinner on Feb. 24, he said that "all we have on our side are the people."

addressing 400,000 people at the Minneapolis state fair in St. Paul in early November, he declared that he expected congress to enact most of his Fair Deal programme at the
1950 session. Referring to the opposition’s derogatory characterization of his theories as foreshadowing a “welfare state,” he said that he appreciated the description and welcomed the challenge. He regarded the results of scattered off-year elections on Nov. 8, which were favourable to the Democrats, as an endorsement of his record.

TRUST TERRITORIES. Under this heading are grouped former German colonies in Africa and Australasia which became League of Nations mandates after World War I and United Nations trusteeships after World War II. Their total area is approximately 1,031,451 sq. mi. and the total population 1,655,300. Certain essential information on the respective territories is given in the table.

Developments which might prove to be of great moment took place in the trusteeship system of the United Nations during 1949. A continual study of the whole system was maintained so that it became possible to obtain clearer indications of the direction in which the experiment was moving.

All the trust territories sent in their annual reports—submissions, for the first time, the Pacific islands (also a strategic area) which were administered by the U.S.A. The Trusteeship council examined them at length, bringing into view the political, social, economic and educational development of the peoples during this period, and adopted resolutions thereon. It noted an increasing tendency to take advantage of the right of petition, which had been stimulated by the Council’s mission to east Africa in 1948.

Broadly speaking, majority of the council approved of the progress made, particularly in the social and economic field, in spite of difficulties of climate, ethnology and finance, by the administrations in the following territories: New Guinea and Nauru (Australia) (territories recovered from Japanese occupation), Western Samoa (New Zealand), where the inhabitants had had a larger share in responsible government, the Pacific islands (U.S.A.), nearly 100 in number covering over 3,000,000 sq. mi. and with a population of nearly 53,000 Micronesians, the two Togolands (British and French) and two Cameroons (British and French) and Tanganyika, the largest and least affluent of these territories.

But there was considerable criticism, some of it constructive and helpful, some marked by little sense of proportion. The latter tendency was met with at the fourth assembly in New York, on a larger scale, resolving itself into an increasing conflict between the powers of the administrations on the spot and the claims of those who, to a large or small degree, were opposed to existing colonial systems. These last therefore lost no opportunity of claiming jurisdiction for U.N. and responsibilities for the trusteeship in matters which were not covered by the charter. Such anti-colonial critics often had a real or confused sympathy for the inhabitants of the territories in trust, but owing to lack of colonial experience were over-anxious to hurry on the steps by which the territories could become independent sovereign states. Great stress was laid on education, particularly of a political kind. The U.S.S.R. and a few other states went further and demanded full-fledged independence and sovereignty on “democratic lines” straightaway and coupled this often enough with violent denigration of all colonial systems and overt political attacks on the administration of the British empire.

The Trusteeship council further undertook two far reaching studies, the course and length of which were to depend on future developments: first, of the effect of administrative unions, such as that between Tanganyika and Kenya and Uganda, on the status and progress of trust territories; secondly, of the implications of expanding facilities for higher education in these areas. If these were really fact-finding studies they might exercise a wise influence on trusteeship policies. The reports of the council’s mission to east Africa—Tanganyika and Ruanda-Urundi in 1948 were closely examined and their conclusions broadly adopted with a stress on the increasing need of speed. A further mission started for west Africa—the two Togolands and Cameroons trust territories—at the close of the year. A third was to visit the Pacific islands (with due regard to their being a strategic area) early in 1950.

When the fourth assembly met, the trusteeship issue was expanded to include colonial government in general and bulked larger in international discussion than any subject except the determined and hardening difficulties between the U.S.S.R. and the western powers.

A number of resolutions were adopted. The special committee on information from non-selfgoverning colonies was given larger powers and prolonged for a further three years. Hence, in accordance with article 73 (e), Great Britain and other administering powers had forwarded to the secretary general of United Nations, for information purposes, statistical and technical information on economic, social and educational conditions in the areas for which they alone were responsible. The act was voluntary and excluded political information. The assembly now asked these colonies to supply information on political and constitutional developments and to appoint a committee with powers of roving enquiry. Great Britain and other administering powers objected on the ground that the new proposals went beyond the charter and tended to assert the principle of international supervision over all colonies.

Enlargement of the powers of the Trusteeship council also came from another quarter, being part of the programme finally adopted by the general assembly for the solution of the postwar problem of the former Italian colonies. Libya, for example, was to be constituted as a sovereign state by Jan. 1952; and to assist the inhabitants in the transition, help them to make their own constitution and administer the territory in the interval, a U.N. high commissioner was to be appointed, with a council of ten, who was to report to the next assembly. Next, Somaliland was to become a sovereign state 10 years after the approval of a Trusteeship agreement by the Trusteeship council and the general assembly, with Italy as administering authority, aided by a council of three. As regards Eritrea, a U.N. commission of five was to try and find out the best means to promote the wishes and the welfare of the inhabitants and to report to the fifth assembly.

Thus there appeared to be two converging movements in the recent development of the trusteeship system, one tending to enlarge the power of U.N. to the point of taking actual part in the process of administration in trust territories and the other to extend methods of internationalization to all non-selfgoverning territories. By the charter the proper role of U.N. was to watch, criticize, admonish if need be and generally supervise territories administered under trust, but not to take any part in the actual process of administration. Finally, at the close of the session, a majority of the nations in the U.N. fourth general assembly gave further evidence of the increasing pressure which might be brought to bear on colonial powers. This was especially clear in their attitude towards the Union of South Africa’s refusal voluntarily to transfer South-West Africa, which they persisted was held under a mandate, to a trust territory under U.N. Three measures were taken. A resolution was adopted calling on South Africa to resume the submission to the assembly of annual reports on South-West Africa. What might become a precedent was created by the hearing given by the assembly to the Rev. Michael Scott (g.v.) on behalf of the Herero tribe, inside a former mandated area. Lastly, the International Court of Justice at The Hague was asked

*Controversial status

for an opinion on three questions. "What are the international obligations of the South African government in this former mandated area?" "Has the South African government the right to modify the international status of South-West Africa (a problem hotly debated under the League of Nations) if not, who has the right?" "Is South-West Africa subject to the provisions of chapter xii of the charter?"

M. Fr.)

TUBERCULOSIS. Although the tuberculin test remained the only practical method of diagnosing tuberculosis early in its development, P. Courmont, Switzerland, stated that he was able to diagnose before tissues became sensitive to tuberculin, by serum agglutination.

F. Friedman, Boston, found that anti-histamine medication had no effect on the tuberculin reaction. W. W. Jones et al., Denver, confirmed the fact that repeated testing with tuberculin did not cause people to become reactors nor did it accentuate or suppress sensitivity already present.

In Great Britain a bill to ensure the greater freedom of children's milk from the dangers of tuberculosis passed its second reading in the House of Commons. Dr. Edith Summerskill said that 1,500 deaths had occurred each year from milk containing tubercle bacilli and many more thousands were crippled. G. S. Wilson stated that, in the rural areas, the percentage of children infected was 10 times greater because more milk was consumed there than in London. The number of attested herds had been doubled since 1944 and about 16% of the cows in Great Britain belonged to such herds.

In Brazil the mortality rate was 246 per 100,000 population. A. A. Dufourst stated that there had been a great reduction in the death rate from tuberculosis in France since 1900, but there were long waiting lists for sanatorium beds. In Greece, the rate was approximately 250 per 100,000, and there were fewer than 5,000 sanatorium beds. G. Hensel stated that 80% of the children leaving school in Germany reacted to tuberculin, against 30 to 40% before World War II.

B. Mann stated that in India 500,000 persons died annually from tuberculosis. G. R. Kokatnur estimated the number of active cases at 2 million, for about 1% of which sanatorium beds were available. In Turkey, the mortality rate was 267 per 100,000. Free government sanatoriums and hospitals had a patient waiting list of about 3,000.

The 1948 mortality rate from tuberculosis in the United States was slightly less than 30 per 100,000 of the population. There was evidence suggesting that it was in the vicinity of 27 in 1949—total 48,000—the lowest of any nation in the world with the possible exception of Australia. Approximately 103,819 beds were available. A. Reifel, Detroit, pointed out that the mortality from tuberculosis among Red Indians was five times that of the general population.

By a surgical procedure known as decortication, J. A. Weinberg, et al., California, expanded lungs which had been collapsed by artificial pneumothorax and were otherwise unexpandable. G. W. Wright, Saranac Lake, New York, and J. G. Gordon, et al., Ray Brook, New York, found that some such lungs do not function normally even though they are well expanded.

J. H. Grindlay, Minnesota, removed one lung from each of 21 dogs and in each case replaced the lung with a single unit prosthesis consisting of a roughly lung-shaped bag of polythene filled with fibre glass. This experimental work gave promise of leading to the development of a suitable prosthesis to replace the large undesirable spaces which result from the removal of diseased lobes or lungs in humans.

S. A. Waksman, New Brunswick, New Jersey, reported that a new antibiotic, neomycin, was more active than other antibiotics against both pathogenic and saprophytic micro-bacteria. It was active against both streptomycin-sensitive and resistant micro-bacteria; moreover, it did not allow a rapid development of resistance among the organisms as did streptomycin.

One of the thiosemicarbazones designated as T.B.1/698 announced by Domagk in 1946 was reported by F. Knuhel, et al., and J. Hartung, Germany, as having a beneficial effect on tuberculosis lesions.

The effects of streptomycin on tuberculosis had been carefully investigated by the United States Veterans administration in co-operation with the army and navy for three years and its usefulness and limitations had been fairly well
delineated. In 1949 these studies were extended by examining the effects of dihydrostreptomycin and para-aminosalicylic acid. This gigantic study included the administration of these new drugs to 7,000 tuberculous veterans. Streptomycin conferences of physicians in the various veterans hospitals were held regularly.

No drug was found which would destroy tubercle bacilli in human and animal tissues. However, para-aminosalicylic acid and the antibiotics—streptomycin and dihydrostreptomycin—have a bacteriostatic effect on these organisms. Thus they suppress the disease temporarily, especially in acquired lesions. The problem of tubercle bacilli becoming resistant to streptomycin was partially solved by alternating this drug with para-aminosalicylic acid. C. W. Tempel, Denver, Colorado, employed an intermittent dosage schedule by which tubercle bacilli acquired resistance to streptomycin much later than when the drug was administered daily.

Although there was no new substantial evidence concerning the value of methods which were used with the hope of providing immunity to tuberculosis, enthusiasm ran high in some parts of the world over the use of BCG (Bacillus Calmette-Guérin) and the vole tubercle bacillus vaccine. Headed largely by Danish workers through the World Health Organization, governments of nations were solicited to sanction prophylactic vaccinations against tuberculosis with BCG of 15 million children and young adults mostly in Europe and Asia.

The World Health organization established an Expert Committee on Tuberculosis and a Tuberculosis section. The second assembly was held in June 1949. All countries were invited to submit their requests for tuberculosis work with special reference to demonstrations in X-ray work, tuberculin testing, BCG, special forms of therapy and fellowships. (J. A. My.)

TUNNELS: see French Union.

TUNNELS. Construction of tunnels for sewer, water supply, drainage, railway and road schemes throughout the world was unusually active in 1949. New techniques used in tunnel driving included machines that excavated the face in soft rock, eliminating drilling and blasting; and mechanical booms that used heavy drifter drills mounted on drill carriages.

In Scotland many tunnels were under construction for the North of Scotland Hydro-Electric board. Those driven through during the year included the Clunie tunnel for the Tummel-Garry scheme, and the Sloy tunnel. The Clunie tunnel was the largest water tunnel in Great Britain, being 23 ft. in diameter. Work continued on other tunnels including those of the Affric scheme, where two tunnels each of 3·3 mi. made good progress, the Fannich scheme, 3·7 mi., and the Cowal scheme.

The boring of the cyclists' tunnel, 12 ft. in diameter, under the river Tyne from Jarrow to Howdon was completed. Work was proceeding on the nearby pedestrians' tunnel.

In England British Railways were driving the new Woodhead double track tunnel between Manchester and Sheffield. The 11-ft. Bowland Forest tunnel, 10 mi. long, was under construction near Manchester as part of the city's new Haweswater water supply line. Contracts were let late in 1949 for two more tunnels, Haslington and Walmersley, totalling 11½ mi., on the same scheme.

In Italy 13 tunnels on 8 hydro-electric schemes were under construction, the longest of these being the Piave di Cavore-Vaiont tunnel, 15 ft. in diameter and 11 7 mi. in length. The Acquedotto Romano del Peschiera water supply scheme, under construction in 1949, included several tunnels, the longest being 49 mi.

In Germany two tunnels totalling 4·3 mi. were completed in Oct. 1949, on the Rissbach hydro-electric scheme in the Bavarian alps.

The only major tunnel under construction in France during 1949 was the four-lane Croix-Rousse highway tunnel at Lyons, 394 ft. in diameter and 1½ mi. long. Hydro-electric tunnels were also under construction in Switzerland, Sweden and Norway. In Italy seven railway tunnels were being driven; the longest being the Lupacino tunnel, 4·7 mi., on the Lucca-Aulla line.

In the United States the 4,200 ft.-long twin-tube Squirrel Hill traffic tunnels were driven through at Pittsburgh. The Union Pacific railway opened up its 6,700 ft. Aspen tunnel in Wyoming, eliminating the last single-track bottleneck on the main line between Omaha, Nebraska, and Ogden, Utah. In West Virginia the Norfolk and Western railway completed two double-track tunnels, 7,000 ft. long, the largest in cross-section ever driven for railroad traffic.

On New York city's Delaware river water supply system, the 6 mi. Neversink tunnel was approximately half finished, and the 25 mi. Downsville tunnel was begun. In Baltimore, Maryland, the 7 mi. Montebello-Liberty Road water tunnel was completed and the 10 mi. Liberty Road-Patapsco water tunnel was under construction. The 5·5 mi. city tunnel at Boston, Massachusetts, was driven through.

The Pacific Gas and Electric company continued to make progress on the two tunnels of its Feather river hydro-electric development in California. Los Angeles, California, started work on three long 10 ft. tunnels for new hydro-electric plants in its Owens Valley water development.

In Latin America the Puerto Rico water resources authority was extending the Caonillas hydro-electric scheme by diverting three rivers, the Upper Arecibo, Pellejas and Vivi into the Caonillas reservoir through four successive 7 ft. tunnels which were all started in 1949. In Chile the quarter-mi. Angostura two-lane road tunnel on the Pan American highway, south of Santiago, was completed in August.

Lerma tunnel, 10 mi. bore and the longest in Mexico, was driven through in 1949 and concrete lining was to be completed in 1950 to alleviate Mexico City's water shortage.

In Brazil two large hydro-electric tunnels—the Santa Cecilia and the Vigaría—were being built by the Brazilian Tracton, Light and Power company for its Barro do Pirau scheme in the state of Rio de Janeiro.

In Japan fifteen road tunnels, from 20 to 33 ft. in diameter, and up to 4 mi. long were under construction. In India two 4·0 mi. tunnels 50 ft. in diameter were being driven as river diversion for Bhakra dam, Bhakra-Nangal hydro-electric scheme, in East Punjab. Two 11 ft. tunnels, each 1½ mi. long, were under construction on the Sengulum hydro-electric scheme in Travancore. (H. W. Rw.; X.)

TURKEY. A republic in the southeastern Balkans and Asia Minor, bounded on the west by the Aegean sea, on the northwest by Greece and Bulgaria, on the north by the Black sea, on the northeast by the U.S.S.R., on the east by Persia and on the south by Iraq, Syria and the Mediterranean. Area: 296,184 sq. mi. (including 9,256 sq. mi. in Europe). Pop.: (1927 census) 13,648,270, (1945 census) 18,790,174, (June 1949 est.) 19,750,000. According to 1945 census, Turkish 86·8 ½ %, Kurdish 9·3 %, Arabic 0·9 %, Greek 0·7 %, Circassian 0·6 %, Armenian 0·4 %, Georgian 0·5 %, other 0·8 %. Turkey being a lay state, no religion has primacy, although 97·7 % of the population is Moslem. Other religions (1935 census): Christian 226,167 (Greek Orthodox 125,046, Gregorian Armenian 44,526, Roman Catholic 32,155, Catholic Armenian 11,229, Protestant...
Of Communism less was heard than in previous years. A few Communist slogans with sickles and hammers were scribbled on walls but, it seemed, by irresponsible persons and no sign of serious movement was reported. There was a certain infiltration of Communist literature from Bulgaria and a few magazines were sent to schools through the post but these were hardly taken seriously. The occasional troubles on the frontiers, in keeping with ancient tradition, were sometimes attributed to Communist inspiration. Such a case was a Kurdish raid from the Persian side during the summer, with the customary robberies, in which several of the raiders were shot.

Foreign Relations. In foreign affairs the policy of Turkey remained unchanged. It was based on the desire to develop a democracy on western lines, with friendship all round. Turkey sought no territory, but would not yield an inch of her own. On this line all its statesmen were firm. With the United States relations were most cordial, in view of the great contributions made by America towards the development of Turkey, the construction of roads—its most vital requirement—the equipment of its agriculture and its fighting services on modern lines. The ancient friendship between Turkey and Great Britain, which began three hundred years ago, remained as strong as ever. A certain disappointment was felt that the North Atlantic treaty was not accompanied by a Mediterranean pact including Turkey. The Turks were resolved to play their full part in international movements in favour of peace and their representatives joined in August the ministerial committee and the consultative assembly of the Council of Europe at Strasbourg.

Turkey’s relations with her neighbours were cordial or at least correct. A trifling, but unpleasant, incident in Athens—where the crowd had applauded Italian football players more cordially than the Turkish—cast a momentary chill upon Turco-Greek friendship.

Resentment against the U.S.S.R. was caused by the mysterious death—reported as suicide—in the train between Moscow and Batum of Fuat Günlaltay, a former captain of the republican party, the Turkish diplomatic courier. The press regarded this as an assassination and matters were not improved when the U.S.S.R. submitted a bill for £40,000 for the cost of the inquiry and return of the body.

Relations with Bulgaria were strained by several frontier incidents, such as the kidnapping of Turkish soldiers and peasants on the frontier and the explosion of a bomb at the Turkish consulate at Plovdiv. These were not mollified by the stories told by Turkish refugees of the ill-treatment of their kinsmen in Bulgaria. Diplomatic relations were established with Israel, India and Pakistan.

Economics. The year was economically a critical one for Turkey. Prolonged drought ended in a failure of the harvest and in places violent floods caused immense damage and loss of life. From being a substantial exporter of grain, Turkey was obliged to import £40 million of wheat from the United States, Canada and elsewhere.

The fish catches were also poor and a contractor who had agreed to provide the British government with preserved fish to the value of £500,000 was unable to fulfil his obligations. Further, it was reported in the press that Turkey, a fish exporting country, had actually imported preserved fish.

The devaluation of the pound sterling, though long rumoured, came as a bombshell in commercial circles. The government at once announced that the Turkish lira would not be devalued and the Central bank quickly stated that the new rate of the Turkish lira to the pound sterling would be £7.87 to 7.91 instead of £11.28. American help continued on a moderate scale; the allocation to Turkey, proposed by the O.E.E.C. on Oct. 13, amounted to $59 million.

President Ismet Inonü of Turkey (right) at the wheel of a tractor at the state agricultural school, Ankara, Nov. 1949.

8,486, other Christian 4,725); Jewish 78,730. According to 1935 census 962,159 Turkish citizens were foreign-born, including 367,801 in Greece, 227,464 in Bulgaria, 158,145 in Yugoslavia, 69,798 in the U.S.S.R. and 61,649 in Rumania. Chief towns (1945 census): Ankara (cap., 226,712); Istanbul (q.v.) (860,558); İzmir (198,396); Adana (100,780); Bursa (85,919); Eskişehir (80,030). President of the republic, İsmet İnönü (q.v.); prime minister, Şemsettin Günlaltay (q.v.); minister of foreign affairs, Necmettin Sadak (q.v.).
In foreign trade there was a great reduction in compensation business, to the satisfaction of those who saw in it the main cause for the fluctuation of prices. A marked feature was the revival of trade with Western Germany. It should be remembered that before World War II Germany supplied 45% of Turkish imports and took 43% of Turkish exports. Turkish civil aviation was successful; it held the record for the lowest rate of accidents. Whereas Turkish airlines carried 73,000 passengers in 1948, the 100,000 mark was passed in 1949. In 1948 the profit made was shown as £3 million; in 1949 it was more than £4 million.

Miscellaneous. Laying the foundation stone of a new tuberculosis hospital at Ankara, the prime minister pointed out that a law had been passed to establish associations to fight consumption and expressed the hope that by 1959 the number of such hospitals would be doubled. It was the intention to set up a network of them over the country.

Turkish women played an increased part in public life. As doctors they were winning the confidence of the public. In literature, and even in the practice of law, women were successful. To the existing feminine organizations was added a Social and Feminist Association for the Protection of Women. This was vast scope for the institution of women of the lower classes in general hygiene, the care of children, maternity and treatment of the sick.

In education steady progress was being maintained and it was stated that in 1949 about a thousand new schools were opened. About 1,900 Turkish students were studying abroad. Interest, not unmixed with irony, was roused by a private American expedition to search for the remains of Noah's ark on Mount Ararat. As this is a frontier district, the military authorities were concerned and it had some political repercussion: the U.S. S.R. would not credit it as a genuine scientific search and regarded it as an attempt at spying on their territory. (M. A. BR.)

Education. Schools (1947-48) primary, 15,317, teachers, 30,708, pupils, 1,487,997; secondary, 265, teachers, 3,845, pupils, 63,135: (former 86, teachers, 1,862, pupils, 23,744, vocational, 231, teachers, 4,408, pupils, 66,649; institutions of higher education 34 (including the universities of Ankara and Istanbul), teaching staff, 1,437, students, 25,684. Illiteracy (1935) men 76.7%; women 91.8% (1945) men 47.2; women 77.7.

Agriculture. Main crops (1,000 metric tons, 1948, average for 1934-38 in brackets): wheat, 4,854 (3,708); barley, 2,163 (2,075); maize 701 (557), rye, 517 (368), oats, 339 (247), potatoes, 462 (181), sugar beet 721 (171). Tobacco, 3.8 million (55.4), cotton, 1,587, wool, 52 (52). Livestock: (1,000 head, Jan. 1948, Jan. 1939 in brackets): sheep, 23,500, (25,221), goats, 13,500, cattle, 9,761, 9,311, mohair goats, 3,975, asses 1,172, mules 1,213, horses, 1,071 (964), buffaloes, 916, merna sheep, 172, camels 98: mules 96 (74); poultry 24,410.

Industry. Industrial state aid establishments (1941) 931, persons employed, 31,110. Fuel and power (1949, in 1938 in brackets): coal, 1,410,000 (2,589,000) metric tons, electricity, 663 (312) million kwh. Metals (1,000 metric tons, 1938 in brackets): iron ore, metal content, 207 (76.8); bluster copper, 10.7 (2.3), chrome ore, 36,000 tons, 50 (106.5). Raw materials (1,000 metric tons, 1949): iron, 110 (119,300), 19.38 (287), cotton yarn, 19.37-38 (19.7), wool yarn, 9 (1937-38 4.5).

Foreign Trade. (Million LTL, in brackets) Export 812 6 (770), (May 1948), 693 9 (551 0). Principal commodities export (1949): tobacco 37.5%, cotton and wool 13%, cotton 11%. Principal items imported, machinery 5.9%, cotton and wool, yarns and manufactures 15.9%, iron, steel and manufactures thereof 10.7%; wheat 5%, motor vehicles 4.7%. Main sources of import (1949): United States 20%, United Kingdom 17.3%, Czechoslovakia 7.7, Belgium 3.7%, United States 1.5%, U.S. 13.4%, U.K. 12.3%.

Finance and Banking. (Million LTL) Budget (1950 est., 1949 revised est in brackets): revenue, 1,133 1 (1,251.8); expenditure, 1,147 2 (1,371 9). Money deposit (May 1949) 819 (May 1948) 718 Currency circulation (Nov. 1949) 951 (Nov. 1948) 1,008. Gold reserves (million U.S. $) (Nov. 1949) 154, (Dec. 1948) 240. Money, the Turkish pound with an exchange rate of £1 ET 785 (ET11 344 before Sept. 19, 1949) and 1 ET 825.

UBANGUI-SHARI: see French Union

UGANDA: see British East Africa.

UNION OF SOVIET SOCIALIST REPUBLICS. After the revolution of 1917 the former Russian empire, a Eurasian state covering parts of eastern Europe and northern and central Asia, became on Dec. 30, 1922, a federation of Soviet socialist republics. Area (Sept. 17, 1939): 8,173,557 sq mi. Pop. (Jan. 17, 1939), census: 170,467,186. In 1939 the union consisted of 11 republics of which the Russian Soviet Federated Socialist republic was by far the largest (78% of the whole territory and 64% of the population). Of the remaining 36% of the population, almost one-half lived in the Ukraine Soviet Socialist Republic (10.2% of the territory) and the other half in the nine other republics of the union. The U.S.S.R. is inhabited by almost 100 different nationalities speaking different languages. In Jan. 1939 Russians constituted 58.4% of the population, Ukrainians 16.6%, and Byelorussians 3.1%. None of the other nationalities, all non-Slav and most of them non-Europeans, reached 3% of the total. The most important were: the Uzbeks 2.9%, the Tatars 2.5%, the Kazakhs 1.8%, Jews 1.8%, the Azerbajians 1.3%, Georgians 1.3%, Armenians 1.3%.

In 1939 the U.S.S.R. consisted of the following republics:

- **Capital**
  - Moscow
  - Kiev
  - Minsk
  - Tbilisi

- **Area (sq. mi.):**
  - Moscow, 1,591,094
  - Kiev, 30,960,221
  - Minsk, 7,002,675
  - Tbilisi, 27,020,3,542,289

- **Population:***
  - Moscow, 3,722,860
  - Kiev, 1,156,790
  - Minsk, 1,900,000
  - Tbilisi, 1,900,000

- **Languages:***
  - Russian
  - Ukrainian
  - Belorussian
  - Georgian

- **Religion:***
  - Russian Orthodox
  - Ukrainian Orthodox
  - Belorussian Orthodox
  - Georgian Orthodox

- **Economy:***
  - Agriculture
  - Industry
  - Trade
  - Communications
  - Banking

- **Culture:***
  - Education
  - Science
  - Art

- **History:***
  - Prehistory
  - Early History
  - Mediaeval History
  - Modern History

- **Government:***
  - Soviet Republics
  - Soviet authorities abroad.
Between 1939 and 1945 the U.S.S.R. considerably expanded its territory. In Europe the following areas were annexed:

* About 400,000 Karelians left in 1944 to resettle in Finland.

In Europe the territorial possessions of the U.S.S.R. had increased by 180,635 sq. mi., an area twice as large as the United Kingdom, and with a population of 21,780,900. From Japan the U.S.S.R. acquired Karafuto (southern Sakhalin), an area of 13,935 sq. mi. with a population of 331,900; and the Chishima or Kurile Islands (3,994 sq. mi.; pop. c. 90,000). In addition the formerly "independent" republic of Tannu Tuva (64,000 sq. mi.; pop. c. 65,000) was annexed to the union.

As the result of this territorial expansion the U.S.S.R. after World War II formed a federation of 16 republics. The five new ones were: the Karelo-Finnish S.S.R. (cap. Petrozavodsk), consisting of the territory ceded by Finland and of the former autonomous Soviet Karelia; the Moldavian S.S.R. (cap. Chișinău or Kishinev), consisting of most of Rumanian Bessarabia and the former autonomous Soviet Moldavia; and Estonia (q.v.), Latvia (q.v.) and Lithuania (q.v.) transformed into Soviet republics. Total de facto area: 28,436,121 sq. mi.

Addition of the figures quoted above would give a total population of 192,735,000. The official estimate for 1940 was 193 million (E. Davydov in Bolshaya Sovetskaia Entsiklopedija: S.S.S.R., suppl. vol., Moscow, 1948). The only postwar estimate, published in Pravda of Jan. 23, 1946, by Gheorgy F. Alexandrov, then propaganda chief of the All-Union Communist party, gave the same figure. If this were correct, it would be necessary to assume that by 1946 Soviet war losses were compensated by the natural increase of population. The only official estimate of the numbers killed in fighting was given by Andrey A. Zhdanov in a speech on Nov. 6, 1946, as 7 million. General A. Guillaume, who during World War II was chief of the French military mission to the Soviet Union, estimated the number of killed at 7.5 million, of severely wounded or sick who died later at 3 million and the number of civilians killed or dying from hunger or exhaustion at 11 million.

Chief towns (1939 census): Moscow (q.v.) (4,137,018); Leningrad (3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,347); Gorki, formerly Nizhny Novgorod (644,116); Odessa (604,223); Tashkent (585,005); Tiflis (519,175); Rostov-on-Don (510,253); Dneprpetrovsk (500,662). Chairman of the presidium of the supreme soviet of the U.S.S.R., Nikolai M. Shvernik; chairman of the council of ministers, Marshal Joseph V. Stalin (q.v.); minister of foreign affairs, Andrei Y. Vyshinsky (q.v.).

History. The year 1949 in the history of the U.S.S.R. was notable for events both in the external field and also in internal affairs such as the announcement concerning an atomic explosion on Soviet territory which seemed to bear directly on the relations between the Soviet Union and other powers. As far as internal history was concerned, external...
United Nations charter and the Potsdam agreement. To this primary object, other issues both political and economic appeared wholly subordinate.

Assimilation of People's Democracies. In as far as the so-called satellite countries were concerned, the process of assimilation into the Soviet system was carried on with little interference from the rest of the world. It took the form of combating what appeared to be the most powerful forces opposing the process—religious organizations, in particular the Roman Catholic Church in Hungary, Poland and Czechoslovakia, and those elements which might seek to give local Communism a nationalist twist in the form of an insufficient subordination of local matters to the total requirements of Soviet planning. It also took the less spectacular form of continuing the transformation of the political and economic institutions of the so-called people's democracies into the single-party socialism of the Soviet Union itself. In each case, since the countries maintained a formal independence, it is proper to treat these issues as belonging to their own internal history; but for the sake of example one might point to Hungary (q.v.) as exemplifying all these tendencies. The trial of Cardinal József Mindszenty in February marked one stage of the struggle, that of László Rajk in September, the other. In between, in August, a new constitution had been adopted, closely modelled on the 1936 Soviet constitution. But for the fact that the collectivization of agriculture was still in the future, it could be argued that the final stage in such assimilation—the incorporation of Hungary within the Soviet Union—was not far off. Still more striking an evidence of the completeness of Soviet control was provided by Poland (q.v.). It was there announced early in November that the Soviet Marshal K. K. Rokosovksy, a Pole by birth, had been released by the Soviet Union to act as commander in chief and minister of defence of Poland and had assumed Polish citizenship for the purpose. In face of such demonstrations of Soviet power, there was little to be hoped for from western protests about the violations of human rights under the peace treaties to the three ex-German satellites or from the protest in November against the convening of a conference to carry out the decisions regarding Danubian navigation contained in the Belgrade convention of Aug. 18, 1948.

It was argued that some at least of the Soviet intransigence where local Communist attitudes were concerned was due to the fear that the successful resistance of Marshal Tito to the economic and propaganda weapons of the Cominform might inspire emulation elsewhere. There was indeed no doubt but that the Tito "heresy" was regarded with more avarice than outright capitalism, since the ideological foundation of the Soviet position was that there could be no half-way house between total acceptance of the Soviet lead and full participation in the alleged aggressive plans of the war-mongering Anglo-Saxon imperialists. The Soviet Union took, therefore, a full share in the increasing pressure brought upon Tito (see YUGOSLAVIA).

Soviet Policy in Germany. The course of events in Germany, where the year began with the Berlin airlift still in progress and with consequent tension between the Soviet Union and the western powers, was more complicated. After some rather oblique approaches from the Soviet side, the foreign ministers eventually met again at the end of May and after a month of discussion sufficient agreement on the local issue was reached to permit the partial lifting of the Soviet "blockade" and the gradual winding up of the airlift in the autumn. Nevertheless, the affairs of Berlin (q.v.) continued to add their quota of trouble to the international situation. On the other hand, in the second half of 1949, attention shifted to more general aspects of the German problem, with the Soviet authorities still torn apparently between their fear of a revived German nationalism and their determination to make what they could out of their claims to be the real protagonists of German unity and of their contention that it was the western allies who were splitting the country. Matters were precipitated by the inauguration of the Bonn government in Western Germany; at the beginning of October the Russians countered this move by setting up a German people's republic in the eastern zone. The form of the new regime was closely modelled on that of the other satellite countries and it had all the appurtenances of sovereignty including a foreign minister. But despite a message (Oct. 13) from Marshal Stalin to Wilhelm Pieck, president of the new republic, in which the Soviet leader referred to these events as a "turning point in the history of Europe," it rapidly became clear that the Russians were not proposing in the immediate future either to withdraw their troops or to hand over the levers of control. The appointment of a Soviet diplomatic representative to the new government did not appear to diminish the importance of the position of General Vasily Ivanovich Chuykov, transformed into the head of a control commission, nor of his political advisers, Ivan
Fedorovich Semichastnov and Vladimir Semenovich Semenov. The Russians appeared unwilling to do anything that might render more difficult contacts between their friends in Eastern and in Western Germany or to make impossible a resumption of four-power talks under the provisions of the Potsdam agreement which they continued to invoke (see Germany).

Soviet Policy in China. Outside Europe the most important area of Soviet interest was China where the collapse of the main Nationalist resistance led to sweeping advances by the Chinese Communist forces. The Soviet government did not appear to wish to precipitate a crisis in this field, for instance by immediate insistence on the replacement of the Chinese delegation at U.N.; but all evidence pointed to a continued close connection between the Chinese Communists and the Russians. In October it was reported that large numbers of Soviet technical staff had arrived in Peking; and in as far as divisions of opinion among the Chinese Communist leaders could be detected, it was held that the pro-Soviet wing headed by Liu Shao-chi, secretary general of the party, had clearly got the upper hand. It was he who made the keynote speech at the conference of Trade Unions of Asiatic and Australasian countries, held in Peking in November, at which a permanent bureau was set up to perform, it seemed, the functions of a Cominform for the far east (see China; Communist Movement).

Atomic Energy. The difference between the Soviet and the western approach to the control of atomic energy continued throughout the year. The matter was given a new complexion by the announcement from Washington on Sept. 23 that the western governments had evidence of a recent atomic explosion in the Soviet Union. Official Soviet comment on Sept. 25 was to the effect that much blasting work for peaceful purposes had recently been going on in Russia and that this might have attracted outside attention. On the other hand it was recalled that Vyacheslav Mikhailovich Molotov had declared as long ago as Nov. 6, 1947, that the atomic bomb was no longer a secret. Supporting the Soviet proposal before the Atomic Energy commission of the United Nations for simultaneous conventions on prohibition and control, Andrey Yanuarevich Vyshinsky declared in a speech on Nov. 10 that the Russians were using atomic energy not to stockpile bombs but for peaceful purposes, for razing mountains and irrigating deserts. This statement was received with some scepticism by foreign experts. The Soviet-licensed German press located the explosion at the Tingai Gates between the Urals and the Kazakh mountains.

Home Politics. The structure of Soviet government remained substantially intact, though a continuation was noticed of the previous tendency to merge into single ministries various specialized economic ministries that had been given independent existence as a part of the wartime production drive. The total number of ministries was thus reduced. More important seemed certain changes in personnel. On March 4, Molotov was replaced as minister of foreign affairs by his deputy Vyshinsky whose own place was taken by Andrey A. Grzymko, the permanent Soviet delegate to the United Nations. On Aug. 15 Arkady Isosipovich Lavrentiev also became a deputy minister of foreign affairs after his withdrawal from the Belgrade embassy. At the same time as Molotov was replaced, the minister of foreign trade, Anastasy Ivanovich Mikoyan was also replaced by his deputy Mikhail N. Menshikov. Since both Molotov and Mikoyan remained deputy prime ministers and members of the Politburo, the political significance of the changes remained uncertain.

On the other hand, the dismissal on March 14 of Nikolay Alexeyevich Voznesensky from his post as chairman of the State Planning commission, from his deputy premiership and from the Politburo was thought to imply his disgrace. He was succeeded in his two administrative capacities by Maxim Zakharovich Saburov. On the same day it was announced that Ivan Goliakov was replaced as president of the Supreme Court by Anatoly Volin. On March 24 Marshal Nikolay Alexandrovich Bulganin was replaced as minister of the armed forces by Marshal Alexandr Mikhailovich Vasilevsky whose place as first deputy minister was filled by Marshal Vasily Danilovich Sokolovsky. On June 14 Ivan Fedorovich Tsvosian, minister of metallurgical industry, was replaced by Anatoly Kuzmin, being himself appointed deputy prime minister.

With this appointment the number of deputy prime ministers was raised to 13. They were: V. M. Molotov (first deputy prime minister), Andrey A. Andreyev, Marshal L. P. Beria (q.v.), Marshal N. A. Bulganin, Lazar M. Kaganovich, A. N. Kosygin, Alexey Krutikov, Vyacheslav A. Malyshew, G. M. Malenkov (q.v.), A. I. Mikoyan, I. F. Tsvosian, Marshal Klimenty E. Voroshilov and M. Z. Saburov.

After the dismissal of Voznesensky the 12 members of the Politburo were: Stalin, Andreyev, Beria, Bulganin,
Kaganovich, Nikolay S Khrushchev, Kosyghin, Malenkov, Molotov, Molotov, N. M. Shvernik and Voroshilov.

In view of the importance attached to outward signs of the order of precedence within the top Soviet hierarchy, some significance was attached to the choice of Gheorghi Maximilianovich Malenkov (q.v.) to make the keynote speech in the Nov. 6 celebrations of the anniversary of the revolution. Slightly before this the possibility of a further shake-up in the government was suggested by an attack in Pravda on the editorial board of the Soviet trade union organ Trud, followed on Nov. 23 by a strongly worded attack on officials of the important Ministry of Labour Reserves for falsifying accounts in an attempt to give a false picture of success. The criticism of Trud was the more remarkable in that in April, the Soviet trade unions had held their 10th congress—the first for 17 years.

In the first quarter of 1949, there were numerous congresses of the Communist parties of the constituent republics of the U.S.S.R. and of local party organizations. These did little more than restate the current themes of Soviet propaganda but there was some suggestion that local nationalism was still regarded as a threat in both the Ukraine and Byelorussia. About this year there were reports of purges in the Communist parties of the Ukraine, Uzbekistan and Kazakhstan. Some internal divergences of opinion might also explain why the expected congress of the All-Union Communist party did not take place during the year although there was no evidence as to the nature of the disagreements in question. In April, the 11th Congress of the Young Communist league (Komsomol) was held and new rules for the organization were adopted, stress being laid on its responsibility for carrying out the decisions of the party and the government in the economic and cultural sphere.

Cultural Life. There was no abatement in 1949 of the Soviet claims that the Russians had been responsible for all the most important scientific achievements of the past and were also culturally the leading nation. Nor was there any slackening of pressure upon all forms of cultural activity to lend themselves wholeheartedly to the service of the regime and its economic social and political ends. Any tendency to look outside the U.S.S.R. for inspiration was branded as decadent "cosmopolitanism." In the spring the Literaturnaya Gazeta published a denunciation of a large number of literary critics for indulging in this heresy. It was noted that almost all of the persons denounced either had Jewish surnames or had their former Jewish names given in brackets. This was unprecedented in the Soviet press; and the anti-Semitic nature of the campaign was subsequently made clear in other ways. Foreign commentators were, however, prone to see in this less a cultural than a political manifestation, a fear lest Soviet Jews might, however mildly, feel inclined to seek some kind of contact with the new state of Israel and thus expose themselves to foreign contamination. The measures against Zionism in the satellite countries and the frictions between the Israeli government and some of the people's democracies were witness to the same thing. Soviet patriotism seemed not merely to demand total allegiance but to emphasize its Russian character, rather than the multinational facets so much in evidence before World War II.

Education. According to an article published in Evvesta (Dec 16, 1949) by Sergey Kafanov, the Soviet minister of higher education, the U.S.S.R. had in 1949 more than 220,000 elementary and secondary schools with a total of about 34 million pupils (in 1938 31,517,000; in 1941, within the 1921 frontiers, there were 5,155,600 pupils in elementary and 765,600 pupils in secondary schools). As stated by Lavrenty P. Beria in Pravda (Dec. 21) 78,000 of these schools were outside the Russian S.F.S.R., that is, teaching was given in other than the Russian language. There were about 3,500 secondary technical schools with 1,094,000 pupils (931,000 in 1938, 35,800 in 1941). There were also 31 universities and 806 other institutions of higher education of V.U.Z. with 770,000 students (in 1938 there were 23 universities and 727

**Industry.** Reporting on the five-year plan to the Supreme Soviet Voznesenskii said on March 15, 1946, that the gross output of the entire industry for the year 1941 was 135,800,000 rubles. The Central Statistical Board pointed out that in the fourth quarter of 1949 the average monthly output of gross industrial production exceeded the 1940 level by 53%. In assessing the index figures on the
fulfilment of Soviet plans must always be borne in mind that they are reckoned on the value of goods produced and not on their quantity. The target for 1950 was fixed at 205,000 million roubles calculated in 1926-27 prices. The postwar five-year plan also fixed the weights to be achieved in many industries and these are compared in Table IV with published production figures.

Housing remained the acutest problem in Soviet economy. Between 1923 and 1939 living-space in towns decreased from 6.4 sq m per head of population. In 1939 there were only 0.8 sq m. By 1948, in his book "Voznesensky" has been published a report totaling a repair of a total of 84.4 million sq m of living-space, including only 31.2 million sq m allocated to war-damaged areas. According to the Central Statistical board, by the end of 1949 a total of 72 million sq m of housing floor-space had been repaired or newly built during 1949.

The postwar five-year plan stipulated that by 1950 about 5,900 state industrial plants, including 1,200 in war-ravaged areas, should be built or reconstructed. According to a speech by Malenkovich on Nov. 4, 1945, 860 million sq m of buildings were put into operation by Oct. 15, 1949. Thus the total of Soviet state-owned industrial plants, not counting co-operative and small private plants, was estimated in 1940 at 8,400, and at the end of 1949 at 9,600. According to the Central Statistical board the total number of workers employed in the five-year plan was increased by 1.8 million during 1949 thus passing the prewar level by 15%.

In 1948, while the number of workers employed was 30 million the 1945 figure was therefore 34 million. In 1949 at about 37 million, were employed in industry, 12 million in transport, 9 million in agriculture, 7 in building, etc.

In the Soviet country an 8-hour day was introduced in the first dozen of the great October socialist revolution. In the years of the first five-year plan this was changed to a 4-hour day by the time the second five-year plan was set for 1950. The output of oil in the Baku basin was decreasing before World War II, the total of 44.3 million tons fixed for 1937 (in the second five-year plan) was never reached and there was no hope of reaching it at the level of 48.5 million tons fixed for 1942 (in the third five-year plan). In 1940 Baku produced 27.3 million tons and the other basins (Mankop, Grozny, Ufa) only 37 million, according to the postwar five-year plan, Baku was given the task of flooding the oil of other basins in 1949 (originally the former Polish Bygorybas) basin 12.7 million tons. An indirect sign of a petrol scarcity was the organization in the spring of 1949, at Korunov-Schevchenkovsky near Kiev, of the first machine and tractor station equipped with electrically driven tractors.

Assuming that the 1949 steel output of the Soviet Union reached the level fixed for 1950, the per capita production between 1938 and 1949 would have increased only from 107 to 130 kg, compared with an increase during the same period from 226 to 314 kg produced per head of the population in the United Kingdom and from 216 to 547 kg in the United States.

*P. Bokshaya Sovetskaya Entsiklopediya (Estimates)*

In 1940 almost a half of all Soviet coal 81 million tons was extracted in the Donets basin (Donbas). In his book "Soviet Economy During the Second World War" (New York, 1949) Voznesensky said that by the end of 1945 the Donbas was producing 96,000 tons daily or about 35 million a year. On Dec. 28, 1949, A. F. Zasuladko, Soviet minister of the coal industry, reported to Stalin that in the fourth quarter of the year the average daily coal output in the U. S. S. R. has passed the 1950 target, while the coal output in the Donbas exceeded the 1940 level. From a pledge given by the miners of the Soviet Union in a letter to Stalin on his 70th birthday it could be estimated that in 1949 the Donbas produced about 35% of the total coal output, the Kazakh (Krunets basin, western USSR), 17%, Urals (including Vorkuta) 14%, Moscow basin 10%, Karaganda open-cast mines 7%, eastern Siberia 8% far east 7% and central Asia 2%.

The Central Statistical board stated that the output of crude oil in the fourth quarter of 1949 was 27% higher than in the five-year plan for 1950. The output of oil in the Sakhalin basin was decreasing before World War II, the total of 44.3 million tons fixed for 1937 (in the second five-year plan) was never reached and there was no hope of reaching it at the level of 48.5 million tons fixed for 1942 (in the third five-year plan). In 1940 Baku produced 27.3 million tons and the other basins (Mankop, Grozny, Ufa) only 37 million, according to the postwar five-year plan, Baku was given the task of flooding the oil of other basins in 1949 (originally the former Polish Bygorybas) basin 12.7 million tons. An indirect sign of a petrol scarcity was the organization in the spring of 1949, at Korunov-Schevchenkovsky near Kiev, of the first machine and tractor station equipped with electrically driven tractors.

Assuming that the 1949 steel output of the Soviet Union reached the level fixed for 1950, the per capita production between 1938 and 1949 would have increased only from 107 to 130 kg, compared with an increase during the same period from 226 to 314 kg produced per head of the population in the United Kingdom and from 216 to 547 kg in the United States.

*Statistical Yearbook of the League of Nations* (Geneva, 1945)

1949 iron production increased 31% above 1948.

With emphasis on heavy industry the Soviet economy looked like a war economy, while the people were deprived of consumer goods to a considerable degree. Table VI gives, for instance, the actual production of cotton and woollen fabrics and leather footwear in 1937 compared with amounts fixed for 1942 and 1950 by the third and the postwar five-year plans.

Cotton fabrics (million m.) 1937 1342 1942 2050 1950 5000

Woollen fabrics (million m.) 1937 1342 1942 2050 1950 5000

Leather footwear (million pairs) 1937 1342 1942 2050 1950 5000

These figures show that there was no prospect of any rapid improvement in conditions. The targets for 1950 meant about 1 sq. yd. of woolen fabric per inhabitant, compared with 4.5 sq. yd. in Great Britain in 1948 and four pairs of leather shoes for five inhabitants (as against over two pairs per head supplied in 1948 in Great Britain for the home civilian market and almost three pairs in the U.S.).
Transport and Communications. During the period 1920-40 the total length of Soviet railways increased from 58,500 km to 105,500 km. During World War II the operations and construction work were reduced by 40% (1945), and the losses of locomotives amounted to 15,800 (15% of the total) and of goods wagons to 428,000 (20%). Among the new railway lines built before World War II the Turksib completed in 1930 linked the Trans-Siberian railway from Novosibirsk with the Trans-Siberian railway system. Construction was begun of a new railway across eastern Siberia which branched off the main line at Taishet, east of Krasnoyarsk, and passed north of Lake Baikal, the sections Tatish-Kirensk and Chekund-Metallurgopolis were completed by 1945. It is believed that by 1950 the Kirensk-Chekund link would be completed. By 1949 the Trans-Siberian railway linked all the major trans-Siberian cities and was a vital link for the trans-Siberian and Peking rail routes. The line was extended farther east from Akмолinsk to Barmaul (where it crossed the Turksib), and continues eastwards to Stalingrad, in the Kuzbas (already linked to the Trans-Siberian via the new industrial town of Kemerovo). From Slavinsk the line was being extended to Abakan, source of supply for iron ore and manganese for the Kuzbas steel works, and was expected to join the Trans-Siberian at Taishet by 1950. Another line, opened in 1942, ran from Kaltas to Yarkutsk, a new coal basin 70 mi N of the Arctic circle.

In 1940 the railways transported 415,000 million tons-km, a figure which was increased to 548,000 million tons-km in 1941 and 710,000 million tons-km in the same year (but an area only 37% of that of the U.S.S.R.). According to the five-year plan, the total transport capacity was to reach 653,500 million tons-km by 1950, including 532,000 million tons-km for freight and 121,500 million tons-km for passenger traffic. The total traffic reached the 51,000 million tons-km level in 1946, 54,000 million tons-km by 1947, and 63,000 million tons-km by 1948. The report of the Central Statistical board stated that in 1949 the freight tonnage on Soviet railways was approximately 120% of the 1940 figure. By 1949 there were only 11,500 km of all-weather highways for motor traffic, that is, slightly more than in Belgium. Here again enormous distances, climate and the general backwardness of the country explained the situation, and a report on roads published in Izvestia on May 31, 1949, S. P. Pechelukov, head of the board of communications of the Russian S.F.S.R., that there were as yet few surface roads. In autumn and spring many of the highways were impassable. These conditions of motor traffic can be partly attributed to a severe brake on the economic and cultural development of the country. In 1948 the number of motor vehicles was estimated at 760,000 (8,800 in 1913; 19,000 in 1929). The actual production figure was 144,000 in 1940 and was expected to reach 500,000 by 1950. Shipping with 1,299,300 gross tons in 1948 occupied the ninth place in the world and represented 1.5% of world tonnage (in 1914 the Russian merchant marine totalled 1,770,000 gross tons). The greatest highways in Soviet Russia are the Trans-Siberian and the Baikal-Amur line, and the necessity for four separate navies (Arctic ocean, Baltic and Black seas and Pacific ocean).

By 1949 the total length of operating lines of the Soviet Union's extended railway system was about 175,000 km, the main line linking Moscow-Novosibirsk-Novosibirsk-Irkutsk-Khabarovsk-Vladi- vostok with branches Sverdlovsk-Magnitogors, Novosibirsk-Novosibirsk-Kemerovo, Irkutsk-Uskutsk and Khabarovsk-Komsomolsk-Sakhalin. Other lines linked with the motor traffic were the Trans-Siberian, Baikal-Amur, Krasnoyarsk-Siberian and other trans-Siberian lines. Air transport was complemented by motor transport to the remote regions of the country by road and rail. On the one hand, the conflict of interests was the inevitable outcome of the great economic projects. On the other, the war effort required the full strength of the national industry, transport and agriculture.

**UNITARIAN CHURCH.**

The year 1949 marked for British Unitarians the beginning of rebuilding of churches destroyed by enemy action. The Brixton congregation erected an excellent temporary building. Ilford restored and refurnished their church, and St. Helens approved plans and obtained a licence for a permanent building in place of the corrugated iron chapel destroyed in World War II. The cause at Marlpe, Cheshire, was revived after an interval of twenty years and was expected to be completed in the year. The Unity churches at Macclesfield and Stockport were admitted to full membership of the assembly. A further sign of progress was the entry into the ministry of the largest number of students from the colleges since 1939.

Dr. Mortimer Rowe retired after 20 years as secretary of the assembly and was made an honorary life member. He was succeeded by the Rev. John Kiely who acted as secretary of the commission on the Work of the Churches and of the £100,000 appeal fund. An annual Youth Sunday was instituted for the first Sunday in March. The Rev. E. W. Kubeler, director of education in the American Unitarian association, made a very successful month's tour of the schools and youth groups. The number of one-day schools for teachers and youth leaders was much larger than in 1948, and statistics showed an increase of scholars and teachers in the Sunday schools.

The 13th world congress of the International Association for Religious Freedom was held in Amsterdam and was attended by religious liberals from America and many European countries. The British party numbered over 40. An excellent congress was followed by a camp conference of the International Religious fellowship, the youth counterpart to the I.A.R.F., at Soesterburg, also in the Netherlands. From both gatherings several broadcasts went out on the liberal broadcasting station at Hilversum.

An excellent congress was followed by a camp conference of the International Religious fellowship, the youth counterpart to the I.A.R.F., at Soesterburg, also in the Netherlands. From both gatherings several broadcasts went out on the liberal broadcasting station at Hilversum.

United States. An important gathering was the conference of the American Unitarian association in Portland, Oregon, in August. The programme centred around "The Challenge of the New Day" and the Unitarian answer derived from the twofold faith in the divinely creative potential in man and in what man can be. Practical programmes for Unitarian efforts resulted, and action was taken looking towards a union with the Universalist Church. Commissions set up by both denominations submitted a joint resolution "concerning the association of self-governing congregations wishing to enlist in the extension of organized religion on the basis of local autonomy in matters of government and religious belief." If by June 1, 1950, 50% of the parish churches had voted affirmatively for union, the commissions would proceed with a specified plan. A still wider fellowship of churches based upon freedom of faith and congregational polity was foreseen as a result of the union of the two denominations.

A report submitted by the Interdenominational committee of the American Unitarian association, the Universalist Church of America and the American Ethical Union proposed a common action project. It recommended that this half times the 1940 figure. This inflation was drastically arrested by a decree of Dec. 14, 1947, when for 10 roubles of the old currency one new was given in exchange for cash in hand. On Dec. 31, 1949, the official Moscow exchange rates were as follows:

- £1 = Rb. 14.84
- US$ 1 = Rb. 5.30
- Taking into account the purchasing power of the rouble, the exchange rate would be about Rb. 105.2 to the pound sterling.

**BIBLIOGRAPHY**

A. K. Mairin, The fifth centenary of America and the American Ethical Union proposed a common action project. It recommended that this
first project should be concerned with the problems of mental health on the three levels of education and survey, remedial action and application of principles of mental health to church life. The project was adopted for the following biennium. (See also CHURCH MEMBERSHIP.)  (J. H. L.)

UNITED CHURCH OF CANADA. The United Church of Canada which in 1925 united with the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches in Canada, reported for 1948 a membership of 791,677 with 1,861,683 persons under pastoral oversight, a Sunday school enrolment of 503,251 and 6,494 preaching places. The church owned property worth about $114,498,936 and raised a total of $20,672,466 for all purposes. The missionary and maintenance givings of the church in 1948 totalled $2,529,370, an increase of $402,848 over 1947.

Among the important features in the life of the United Church during 1949 were the reception of 28,367 persons into membership on profession of faith, 58% of whom were adults, as a result of visitation evangelism undertaken largely by laymen; a vigorous campaign to secure recruits for the ministry; and the sending of more than $74,000 for relief to churches in Europe and in Asia.

The church was saddened by the loss of two former moderators: the Very Rev. Aubrey S. Tuttle, who was moderator from 1940 to 1942 and who gave distinguished leadership in the field of higher education; and the Very Rev. J. R. P. Scalter, who had been taking a prominent lead in seeking ultimately to bring about organic union with the Church of England in Canada. Dr. Scalter was moderator from 1942 to 1944. (G. A. S.)

UNITED KINGDOM: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

UNITED NATIONS. During its fourth year, the United Nations continued to be handicapped by the lack of cooperation between the Soviet Union and the Western Powers. In addition to preventing the conclusion of treaties of peace with Germany, Austria and Japan, this circumstance prevented the Security council from functioning as the organ primarily responsible for the maintenance of international peace and security as the charter had anticipated. In addition, it slowed down and in some respects obstructed the work of other U.N. organs. Secretary general, Trygve Lie (q.v.).

Membership. Membership was increased during the year to 59 by the admission of Israel. At the close of 1949 membership was as follows:

<table>

New applications were received from the Republic of Korea (South Korea), Nepal and the Democratic People’s Republic of Korea (North Korea). Favourable action by the Security council on the first two was prevented by the negative vote of the Soviet Union. The council refused to approve a Soviet proposal to refer the application of the Democratic People’s Republic of Korea to its committee on the admission of new members. The Security council reconsidered the 12 applications which had previously failed to gain approval (Albania, Austria, Bulgaria, Ceylon, Finland, Hungary, Ireland, Italy, Jordan, Mongolia, Portugal and Rumania) but was unable to reach an affirmative decision on any of them. A Soviet proposal to approve all 12 applications plus that of Nepal en bloc was defeated.

During the fourth session, the general assembly decided to request the International Court of Justice to give an advisory opinion on whether a state could become a member of the United Nations by vote of the general assembly without a favourable recommendation by the Security council.

The Principal Organs. The general assembly met twice during 1949. Because of failure to dispose in Paris of the items appearing on the agenda of its third session, a second part of the third session was held at Lake Success, New York, from April 5 to May 18 with Herbert V. Evatt (q.v.), Australia, continuing to serve as president. The fourth regular session of the general assembly met at Lake Success from Sept. 20 to Dec. 10. Carlos P. Romulo (q.v.), Republic of the Philippines, was elected president. The general assembly disposed of an agenda of 68 items, including many of pressing political, economic and social importance. It adopted the recommendations of a special committee for improving its methods of work and rules of procedure. It voted the continuation of the United Nations Special Committee on the Balkans, the United Nations Commission on Korea and the Interim committee as subsidiary organs.

Though the charter requires that the Security council be so organized as to be able to function continuously, and the provisional rules provide that the interval between meetings may not exceed 14 days, the failure of the permanent members to agree on questions brought before the council, and the consequent tendency to appeal to the general assembly when possible, resulted in a decrease in council activity. During 1949 the Security council was composed of China, France, the Soviet Union, the United Kingdom and the United States (permanent members) and Argentina, Canada, Cuba, Egypt, Norway and the Ukraine (non-permanent members). During its fourth session, the general assembly elected Ecuador, India and Yugoslavia for two-year terms beginning Jan. 1, 1950, to succeed Argentina, Canada and the Ukraine. The election of Yugoslavia was bitterly opposed by the Soviet Union, who favoured the election of Czechoslovakia.

The Economic and Social council held two sessions during 1949, its eighth at Lake Success from Feb. 7 to March 18, when James Thorn (New Zealand) was elected president, and its ninth at Geneva from July 5 to August 15. During 1949 the council was composed as follows: with terms ending Dec. 31, 1949—Byelorussia, Lebanon, New Zealand, Turkey, United States and Venezuela; with terms ending Dec. 31, 1950—Australia, Brazil, Denmark, Poland, the Soviet Union and the United States; and with terms expiring Dec. 31, 1951—Belgium, Chile, China, France, India and Peru. During its fourth session the general assembly elected the following to membership for three-year terms beginning Jan. 1, 1950: Canada, Czechoslovakia, Mexico, Iran, Pakistan and the United States.

The Trusteeship council also held two sessions during 1949, its fourth and fifth, both at Lake Success. The fourth session was held from Jan. 24 to March 25 with Liu Chueh (China) serving as president. The fifth session was held from June 15 to July 22 with Roger Garreau (France) as president. The membership of the council during 1949 was as follows: members administrating trust territories—Australia, Belgium, France, New Zealand, United Kingdom and United States; members by virtue of permanent seats on the Security council—China and the Soviet Union; and members elected by the general assembly—Iraq and Mexico for three-year terms ending Dec. 31, 1949, and Costa Rica and the Republic
THE UNITED NATIONS AT WORK IN 1949.

The Kashmir commission (1) at Gobindpur during a tour of Azad Kashmir territory. On Oct. 24 President Harry S. Truman laid the corner stone (2) of the headquarters building in New York, and (3) Moshe Sharett is seen holding the flag of Israel on May 12 after his country had been admitted as the 59th member the previous day. The Food and Agriculture organization, a specialized agency, conducted research into the eradication of rinderpest; an F.A.O. technician (4) is seen producing rinderpest vaccine by growing the virus inside hen's eggs.
of the Philippines for three-year terms ending Dec. 31, 1950. On Oct. 20, the general assembly elected Argentina and Iraq for three-year terms beginning Jan. 1, 1950, and also elected the Dominican Republic to serve the unexpired term of Costa Rica which had resigned.

Maintenance of International Peace and Security. The work of the United Nations in this field was handicapped by the state of relations between the Soviet Union and the Western Powers. Some notable achievements, however, were registered. Though the India-Pakistan question remained deadlocked and tension continued to exist in the Balkans, the U.N. could claim partial credit, at least, for the Indonesian settlement, and its intervention in Palestine had achieved the end of hostilities though the political dispute still remained unsettled.

The India-Pakistan question remained before the Security council for the whole year without any final settlement being reached. The United Nations Commission for India and Pakistan reported to the Security council at the end of the year that it had failed to end the dispute and suggested to the Security council that it be disbanded and that authority be vested in one person in an attempt to end the deadlock. (See India, DOMINION OF; Pakistan, DOMINION OF.)

The U.N. continued to deal with the Communist rebellion in Greece. The U.N. Special Committee on the Balkans (U.N.S.C.O.B.) in a report to the general assembly covering the period from Oct. 1948 to July 1949, stated that Albania, Bulgaria and Yugoslavia had refused to recognize the committee, that Albania and Bulgaria had continued to give moral and material assistance to the Greek guerrilla movement, that aid from Yugoslavia which had been on a large scale early in the year was diminishing, and that the present situation constituted a threat to the political independence and territorial integrity of Greece and to peace in the Balkans. The committee submitted a supplementary report to the assembly on Sept. 16. The committee asked the assembly again to call on Albania and Bulgaria to cease giving aid to the Greek guerrillas and to find Albania primarily responsible for the threat to the peace in the Balkans. The assembly adopted a resolution asking members to impose a complete arms embargo against Albania and Bulgaria as long as the two countries continued to give aid to the Greek guerrillas. (See also Greece.)

The Indonesian situation, at the stage of armed conflict between Netherlands and Indonesian forces at the beginning of 1949, seemed satisfactorily resolved by the end of the year. On Aug. 23 meetings began at The Hague to effect a transfer of sovereignty from the Netherlands to the Indonesian republic. These meetings took the form of negotiations between the two countries and were not held directly under U.N. auspices. The round table discussions proved successful and on Nov. 2 agreements were signed providing for the transfer of sovereignty over Indonesia to the republic of the United States of Indonesia by Dec. 30, 1949. The general assembly adopted a resolution approving the agreement. On Dec. 27, the Netherlands transferred full sovereignty over Indonesia to the republic of the United States of Indonesia. (See also Netherlands Overseas Territories.)

The Korean situation remained substantially unimproved throughout 1949. The U.N. Commission on Korea, established by the general assembly to replace the Temporary Commission on Korea, held its first open meeting in Seoul on Feb. 12, 1949. A commission report adopted on July 28 set forth five main conclusions: (1) that propaganda and hostile activity between the two parts of Korea made unification remote; (2) that opposition of the Soviet Union to the commission and its objectives made a substantial degree of unification impossible; (3) that the differences between the Soviet Union and the United States remained one of the underlying factors in preventing unification; (4) that the Korean government should be allowed a broader political base; and (5) that the situation in Korea had not improved and that the commission had been unable to facilitate reaching the objectives of the general assembly. The general assembly on Oct. 21 voted to continue the U.N. Commission on Korea in being, rejecting a proposal by the Soviet Union to terminate the commission. The assembly widened the competence of the commission, giving it explicit instructions to be on guard against the outbreak of civil war in Korea. (See also Korea.)

The Palestine situation remained one of continuous concern throughout the year. Primarily through the efforts of acting mediator Ralph J. Bunche, armistice agreements between Arabs and Jews were concluded early in the year. On Jan. 6 a cease-fire agreement between Israel and Egypt was signed, followed on Feb. 24 by an armistice agreement such as the Security council had requested in its resolutions of Nov. 4 and 16, 1948. On March 11 a cease-fire agreement between Israel and Jordan was signed. Armistice agreements between Lebanon and Israel and between Jordan and Israel were signed on March 23 and April 3, respectively. Negotiations between Israel and Syria began on April 5 and culminated in agreement on July 20, thus bringing hostilities in Palestine to an end. Bunche's final report was taken up by the Security council on Aug. 4. On Aug. 11 the council adopted a resolution declaring that the one-year truce had been superseded by the armistice agreements, relieving the acting mediator of further responsibility, re-affirming its unconditional cease-fire order and providing a nucleus of observer personnel.

The Palestine Conciliation commission, established by the general assembly on Dec. 11, 1948, met at Geneva on Jan. 17, 1949, and established formal headquarters in Jerusalem on Jan. 24. The commission began discussions with Israel and the Arab countries in February. The commission later invited all the governments and delegations to Lausanne. This invitation was accepted, and the first meeting was held on April 27. It soon became obvious that deep-seated differences existed. The Israeli government was pressing for territorial negotiations, while the Arab governments insisted that negotiations regarding refugees should come first. The commission eventually set up an Economic Survey mission to aid the governments in overcoming economic dislocations. After six months' study of the problem, the conciliation commission transmitted its recommendations to the general assembly on Sept. 1. These recommendations provided for the division of Jerusalem into a Jewish and an Arab zone, with specified functions performed by an international regime consisting of a U.N. commissioner, a general council, an international tribunal and a mixed tribunal. Jerusalem was to be permanently demilitarized and neutralized. The general assembly, however, refused to accept this recommendation, returning to the plan continued in its resolution of Nov. 29, 1947. In a resolution of Dec. 10, the assembly re-affirmed the two principles that the city of Jerusalem should be established as a separate body under an international regime and that the Trusteeship council should be designated as administering authority. The resolution requested the Trusteeship council to complete the preparation of the statute. Both Israel and Jordan, the two states in actual occupation of the city, announced their unalterable opposition to the plan. (See also Israel; Jerusalem; Jordan.)

With respect to the questions of the international control of atomic energy and the limitation and reduction of conventional armaments, the stalemate existing at the close of 1948 continued throughout 1949. The Atomic Energy commission held six meetings between Feb. 18 and May 25 and then decided to refer the general assembly resolution of
Nov. 1948 to its working committee for further consideration. The working committee decided that there was no useful purpose in continuing discussions and that its work should be suspended until the six permanent members had found a basis for agreement. On Aug. 9 the six permanent members of the commission began a series of meetings which failed to produce agreement. The general assembly later asked that these meetings continue, and in its resolution it again endorsed the majority control plan. (See also ATOMIC ENERGY.)

The Soviet Union introduced a proposal in the Security council in February that the Commission for Conventional Armaments elaborate a plan for the reduction by one-third of the armaments and armed forces of the permanent members of the Security council by June 1, 1949. The U.S. representative asked that the general assembly's resolution of 1948 be referred to the commission for action. The soviet resolution was rejected, and the U.S. proposal accepted. The French delegate to the working committee of the commission introduced a working paper on May 26 which contained proposals and recommendations for the census and verification of conventional armaments and armed forces, The commission adopted the proposal on July 18, and on Aug. 1 the commission adopted the plan. A French proposal in the Security council that the commission's plan be accepted was defeated by the negative vote of the Soviet Union. Full information on the action taken was sent to the general assembly. The general assembly approved the commission's recommendations and requested the Security council to continue its study of the problem through the commission.

Development of International law. Under article 23 of the charter, the general assembly is made responsible for the development of international law. The International Law commission, established by resolution of the general assembly of Dec. 1946 to assist in this work, met for the first time in 1949. It was in session at Lake Success from April 12 to June 9. The commission prepared and adopted a Draft Declaration on the Rights and Duties of States; it adopted a procedure for the further study of the principles of international law recognized in the charter; it gave preliminary consideration to the establishment of an international criminal court; and it provisionally selected certain topics for codification, giving priority to the law of treaties, arbitral procedure and the regime of the high seas. The general assembly, after receiving the commission's report, adopted resolutions urging the commission to include the regime of territorial waters in its list of priority subjects for codification and to transmit to members for comment the Draft Declaration on the Rights and Duties of States.

The development of international law was also advanced by the adoption by the general assembly of rules governing the calling of international conferences by the Economic and Social council, by the work of the general assembly, the Economic and Social council and its commissions and the secretariat in preparing draft agreements on various topics for submission to members and by the increased frequency of use of the International Court of Justice, either for advisory opinions or judgments. (For further details, see INTERNATIONAL LAW.)

Economic and Social Co-operation. The most significant achievement of the U.N. during 1949 in the economic field was the adoption of a comprehensive plan for technical assistance to underdeveloped areas along the lines of President Harry S. Truman's Point Four programme. During its eighth session the Economic and Social council adopted a resolution requesting the secretary general to prepare for the ninth session of the council a comprehensive programme of U.N. technical assistance. Accordingly the secretary general, in co-operation with the chief administrative officers of the specialized agencies, submitted a report on measures already devised to promote economic development in underdeveloped areas. There was also submitted a report, the result of co-operative action by the secretariats of the United Nations and eight specialized agencies, on an expanded programme of technical assistance. The report outlined the administrative organization of such a programme and estimated the expense of the first two years at $35.8 million and $50 million respectively. The objectives of the programme were set forth to include the achievement by underdeveloped countries of the material and social benefits of a sound, balanced economic development. During its ninth session the Economic and Social council approved a programme substantially along the lines of the secretary general's report, except that a smaller initial expenditure was envisaged. The council's recommendations were adopted by the general assembly in its fourth session. As finally approved, the plan provided for the calling of a technical assistance conference for the purpose of negotiating contributions to the expanded programme. It authorized the secretary-general to set up a special account for technical assistance to which governments were invited to contribute. It provided for the administration of the programme by a technical assistance board composed of the executive heads of the United Nations and the participating specialized agencies, operating under the general direction of a standing technical assistance committee of the Economic and Social council. The plan provided for the distribution of funds initially available and laid down basic principles to govern the administration of technical aid.

Specialized Agencies. The following specialized agencies were in operation or in progress of formation in 1949: International Labour Organization. (I.L.O.). See separate article. Food and Agriculture Organization (F.A.O.). See FOOD SUPPLY OF THE WORLD. International Monetary Fund. See separate article. International Bank for Reconstruction and Development. See separate article. International Civil Aviation Organization (I.C.A.O.). See AVIATION, CIVIL. International Refugee Organization (I.R.O.). See REFUGEES. International Trade Organization (I.T.O.). See TARIFFS. United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.). The fourth general conference was held in Paris, Sept. 19 to Oct. 5. In preparing the programme for 1950 three criteria were followed: practical value for the betterment of the masses; the possibility of associating prominent intellectual and professional workers with the organization; and the possibility of obtaining rapid results. The work of the organization during 1949 included educational and scientific aid to states that suffered during the war, educational aid to refugees, fundamental education projects, seminars, technical assistance to underdeveloped areas, cultural co-operative programmes and the development of the use of mass media. World Health Organization (W.H.O.). The second World Health assembly met in Rome from June 13 to July 2. It approved a regular budget of $7,873,000 and a supplementary budget of $9,152,250 to be raised on a voluntary basis. The programme adopted by the assembly provided for the expansion and intensification of the activities of the organization, acting both independently and in co-operation with other international bodies. It gave special attention to possibilities of technical assistance to underdeveloped areas. In line with the organization's policy of regionalism, regional meetings were held at New Delhi, Geneva, and Lima, Peru, so that delegates of southeast Asia, of the eastern Mediterranean and of the Americas could discuss health problems
of their particular regions. Among the programmes initiated in 1949 were: the survey of ways and means to deal with tuberculosis in ten eastern Mediterranean countries as well as in South America; long-term malaria control in India, Pakistan and Persia; and the promotion of penicillin output in eastern Europe. Practical services included: the sending of a venereal disease control demonstration team to India; medical services for the Arab refugees; supplies for Afghanistan to control a typhus outbreak; iron lungs for Bombay to relieve a poliomyelitis epidemic; and aid to Ecuador following a disastrous earthquake.

International Telecommunications Union (I.T.U.). Carrying out the decisions of its plenipotentiary conference at Atlantic City, New Jersey, in 1947, the International Telecommunications union during 1949 adapted its permanent organs to the structure decided upon at the conference and undertook through various means to bring some order into the use of radio frequencies.

Universal Postal Union (U.P.U.). The Executive and Liaison committee held its 1949 session at Berne from May 16 to May 25. F. Hess (Switzerland) was elected director to succeed Alois Muri on Jan. 1, 1950.

World Meteorological Organization (W.M.O.). The United States instrument of ratification of the convention establishing W.M.O. was deposited on May 4, 1949. The 30 ratifications required for the convention to enter into force had not been obtained by the end of the year.

Non-Self-Governing Territories and Trusteeship Matters. The fate of the Italian colonies was settled by the general assembly during 1949. During the second part of the third session, the general assembly attempted to find a solution, but without success. In the fourth session the recommendations of the First committee were adopted without change on Nov. 21. These recommendations called for the complete independence of Libya not later than Jan. 1, 1952, placed Italian Somaliland under trusteeship for ten years with Italy as the administering power and set up a commission to determine the wishes of the inhabitants of Eritrea and to report not later than June 1950. The assembly later approved Adrian Pelt, assistant secretary general for conferences and general services, as the U.N. commissioner to administer Libya until it should become independent on Jan. 1, 1952. On Dec. 9 the Trusteeship council established a special committee to draw up a trusteeship agreement for Italian Somaliland. (See also Italian Colonial Empire.)

The question of the status of South-West Africa, formerly administered under League of Nations mandate by the Union of South Africa, was again brought before the general assembly as the result of the announcement by the Union government that it intended to establish a closer association between the Union and the former mandated territory and to discontinue sending reports to the U.N. on its administration. After extended consideration of the matter by its Fourth committee, the general assembly adopted two resolutions inviting the government of the Union of South Africa to resume the submission of reports and to comply with previous decisions of the general assembly, and requesting the International Court of Justice to give an opinion on the
international status of South-West Africa. (See also South America, The Union of.)

During 1949 information concerning over 60 non-self-governing territories was transmitted to the secretary general and, after being summarized and analysed by the Division of Information on Non-self-governing Territories, was studied by a special committee of the assembly. The committee met at Lake Success from Aug. 25 to Sept. 12, 1949. The report submitted by the special committee, including ten draft resolutions, led to vigorous debate in the fourth session of the general assembly. The position was taken by certain of the colonial powers that the permissive limits of the charter were being exceeded. Resolutions which the general assembly adopted recommended that members administering non-self-governing territories be invited to submit political information, that administering members give special attention to the improvement of education in territories under their control, that there be more effective co-operation with specialized international bodies in providing technical training facilities for natives, that the special committee be continued for three years and that the committee devote its attention each year to a special field, such as education. The representatives of Belgium, France and the United Kingdom strongly opposed certain of these resolutions and reserved their rights.

U.N. supervision of the administration of trust territories made substantial progress during the year. Following a new procedure suggested by the president of the council, reports to the council were presented by the special representatives of the administrative authorities, and members of the council submitted both written and oral questions. Following a general discussion of each report a drafting committee on annual reports, consisting of representatives of all council members, was appointed to prepare the council's report to the general assembly on the territory in question.

During its fourth and fifth sessions the Trusteeship council considered reports of the administering authorities on the administration of Western Samoa, the Cameroons (under both British and French administration), Togoland (under both British and French administration), Nauru, New Guinea and Trust Territory of the Pacific Islands. The council also considered the report of its Visiting Mission to Trust Territories in East Africa and organized a Visiting Mission to Trust Territories in West Africa. Pursuant to a resolution adopted by the general assembly in its third session, it undertook the study of the question of administrative unions. A large number of petitions were considered, and some changes in petition procedure were adopted. In considering conditions in trust territories, the council was especially critical of the slow rate of political, economic and educational advancement and of the practice of combining trust territories with colonies in administrative unions.

The general assembly, on the basis of Trusteeship council reports and recommendations, adopted a series of resolutions reflecting a critical but constructive attitude toward the actual achievements of administering authorities. The assembly urged the more rapid advancement of trust territories toward self-government or independence, a greater participation of the indigenous population in various economic activities, greater progress in the elimination of uncivilized practices and in social improvement, improved educational facilities and the elimination of racial discrimination in education. The assembly also authorized further inquiry into the practice of administrative unions and recommended the use of the U.N. flag along with that of the administering authority. France and the United Kingdom reserved their positions on the methods of implementing these proposals. (See also Trust Territories.)

General Administration and Finances. The original 1950 budget estimates of the secretary general called for gross expenditures of $44,314,398, which would have exceeded 1949 appropriations by more than $800,000. The advisory committee on administrative and budgetary questions felt that a reduction of $1,786,750 could be made in the budget and so recommended to the assembly. The general assembly finally approved appropriations amounting to $49,641,773, including $8 million for the international regime of Jerusalem. Miscellaneous income was estimated at $5,091,740.

In 1948, the general assembly had requested the committee on contributions to re-examine the existing scale of assessments. The committee concluded that since the world economic and financial situation could not be considered as having returned to normal, the time had not arrived for fixing a scale for a three-year period as contemplated in the general assembly's rules of procedure. The only adjustments proposed concerned the assessments of the United States and Sweden, which were reduced by 0 % and 0-2 % respectively. The committee fixed the contribution of Israel, the only new member, at 0 12 %.

L. M. G.

UNITED STATES OF AMERICA, THE. A republic in North America composed of 48 separate and (theoretically) sovereign states united by a federal government: the fifth largest country of the world in area (after the U.S.S.R., China, Canada and Brazil), the fourth in population (after China, India and the U.S.S.R.), but the foremost as to industrial production and financial resources; bounded on the north by Canada (the 49th parallel forming the western section of the boundary which follows the general line of the Great Lakes at the eastern end), on the south by Mexico, on the east by the Atlantic ocean (air distance, New York-London, 3,400 mi.), and on the west by the Pacific ocean (air distance, Seattle-Yokohama, 4,800 mi.). Area of the continental U.S. (land only): 2,977,128 sq. mi.

Population: (April 1, 1940 census) 131,669,275; (July 1, 1949 est.) 149,215,366; sometime after the middle of the year the population passed the 150 million mark. In 1940 the population included 118,214,870 whites (89-8 %), 12,865,518 Negroes (9-8 %), 333,969 Indians (0-3 %), 126,947 Japanese, 77,504 Chinese, 45,563 Filipinos and 4,904 other non-whites. The number of foreign-born whites decreased from 13,983,405 (12-7 % of the total) in 1930 to 11,419,138 (9-7 %) in 1940; about 15 million U.S. white citizens were persons with both parents foreign-born; about five million had only the father foreign-born and about three million only the mother foreign-born. Total foreign white stock in 1940 numbered 34,576,718. The German foreign white stock was the largest (5,236,612), followed by the Italian (4,394,780) and the Polish (2,905,859); other countries contributing more than two million were Russia, Ireland and Canada, with England just under this figure (1,975,975). From 1940 to 1949 there was a great westward movement of the population: during this period the states of California, Oregon and Washington showed a net gain of 54 %; Mississippi, Montana, North Dakota and Oklahoma lost slightly; Florida and Virginia gained substantially (see Table I). The non-white population, checked in the past by a relatively high death rate, was increasing more than the whites during 1940-47 (11-6 % increase compared with 7-5 % for whites).

In 1948 there were in the U.S. 53 religious bodies of more than 50,000 members, with a total of 75,371,137 members. Though Protestants as a group outnumbered Roman Catholics by almost two to one, the Roman Catholic Church, with a total of 25,268,173 (35 % of the total, mainly Americans of Irish, Italian, Polish and German extraction) was far ahead of any other single denomination. Nine Baptist bodies numbered 15,239,014 (including more than four million Negroes); four Methodist bodies 10,337,682 (including
about 1,770,000 Negroes); seven Lutheran bodies (mainly Americans of German or Scandinavian extraction) 5,098,515; four Presbyterian bodies 3,127,000; Protestant Episcopal Church 2,160,207. The largest non-Christian congregation was Jewish (4,641,000).

Chief towns (pop., first figure 1940 census; second figure 1949 est.): Washington, D.C. (q.v.) (cap., 663,091; 870,000); New York (q.v.) (7,454,000; 7,897,498); Chicago (q.v.) (3,396,808; 3,632,808); Philadelphia (1,931,338; 2,250,000); Detroit (1,623,452; 1,815,000); Los Angeles (1,504,277; 1,947,785); Cleveland (878,336; 900,000); Baltimore (859,100; 930,000); St Louis 816,048; 840,000; Boston (770,816; 766,386); Pittsburgh (671,659; 700,000); San Francisco (634,536; 814,500).

President of the United States: Harry S. Truman (q.v.); vice-president: Alben W. Barkley (q.v.). The U.S. cabinet on Dec. 31, 1949 was as follows:

| Secretary of State | Dean G. Acheson (q.v) |
| Secretary of the Treasury | John W Snyder |
| Attorney General | J. Howard McGrath |
| Postmaster General | J. Howard McGrath |
| Secretary of the Interior | Oscar L. Chapman |
| Secretary of Agriculture | Charles F Brannan |
| Secretary of Commerce | Charles Sawyer |
| Secretary of Labor | Maurice Tobin |
| Secretary of Defense | Louis A. Johnson |

District of Columbia | 663,091 | 780,000 | —

History. Upon taking office on Jan. 20, President Harry S. Truman called for more taxes to bring in an additional $4,000 million revenue. Truman's programme for labour included repeal of the Labour-Management (Taft-Hartley) act of 1947 and re-enactment of the Wagner act with improvements; reorganization of the Department of Labour; and the enactment of a minimum wage law requiring at least 75 cents an hour. For the farmer Truman asked for an improved national programme to insure abundant agricultural production, parity of income for farmers through farm price supports, and good utilization of land. To expand domestic markets for farm products and increase and stabilize foreign markets was a further aim of this programme. To raise the standard of living of the U.S people as a whole, the president asked for expansion of the social security programmes with increase in the size of benefits and increased coverage against unemployment, old age, sickness and disability. To accomplish this, he proposed a system of prepaid medical insurance and remedies for the shortage of doctors, hospital facilities and nurses; federal financial aid to states to help them operate and maintain their school systems; the enactment of legislation for loan-credit public housing, slum clearance, farm housing and housing research and encouragement of the building industry to produce lower priced housing by allocating materials in short supply and imposing price ceilings on such materials. Finally, the president called for the enactment of the civil rights proposals he had made to the 80th congress.

Problems at Home. Unrest caused by the menace of communism abroad was increased by the evidences of communism at home, shown notably in the trial of 11 Communist party leaders in the U.S. district court in New York city. This trial ended on Oct. 14, with a verdict of guilty of secretly teaching and advocating, on orders from Moscow, the overthrow and destruction of the government of the United States by force and violence. Although the defendants were conceded by the government an arguable point on appeal under the free speech amendment, the nine months long, carefully handled trial had presented overwhelming testimony as to the incompatibility of Communist party activities with U.S. ideals.

The verdict in this case helped to resolve in the public mind the confusion caused by other trials, in particular the trials of Alger Hiss former official of the State Department, accused by a confessed former Communist, Whittaker.
Chambers, of passing to Soviet agents confidential state documents. Because of the confidence in Hiss expressed by a number of men prominent in public life, these trials, more than spanning the year, were sensational and deeply disturbing to the public.

The charge of Senator Bourke Hickenlooper that David Lilienthal, chairman of the Atomic Energy commission, was guilty of "incredible mismanagement" produced long and exhaustive hearings before a joint congressional committee. At the close, the chairman was exonerated by a majority vote, but it was partisan in the continuance of doubt—either on political or practical grounds—on the part of Republican members.

The conflicts between president and congress as to specific measures resulted in a stalemate when congress adjourned in the autumn. This, of course, was not an unusual condition in U.S. politics. It was clear, however, that the president ended the year in a stronger position on domestic issues than at the opening of congress. Both parties, as represented in congress, were seriously divided on every major issue. The Democratic party did not have a dependable majority. The southern Democratic revolt was stronger at the close than at the beginning. The president had made no major overtures at reconciliation and was still pressing his programme of civil rights when congress adjourned.

Discussion continued on the theme of so-called outworn political alignment, that is, Republican versus Democrat. The composition of party membership in the congress emphasized the divisions on party programme; within the Democratic membership were wide divergences of belief, notably on the civil rights issue and on other domestic proposals; within the Republican membership, there was greater agreement on domestic problems, but none whatever on either temporary or fundamental questions in foreign relations. Consequently legislation, when enacted, was by bi-partisan vote, notably on the North Atlantic treaty, military aid to Europe, continuance of the European Recovery programme and extension of reciprocal trade agreements. There was every indication as the year closed that the various divisions in the congress reflected actual divisions in the electorate and that, barring dramatic realignment caused by events beyond the borders of the country, the fundamental differences between the two great parties were to be more marked than at any time since 1932. Third parties were as unimportant in public thinking as at any time since the opening of the century.

A hard working congress in an unusually extended session, due to conflict with a determined president, accomplished five important objectives: (1) reaffirmation, by financial support amounting to more than $5,000 million, for the second year of the economic aid to Europe; (2) ratification of the North Atlantic treaty; (3) passage of the Reciprocal Trade Agreements act, restoring the full powers of the president to negotiate reciprocal trade agreements on the pattern successfully pursued by Cordell Hull; (4) adoption of the National Housing act, a long range measure to obtain low rental public housing and slum clearance; (5) passage of a series of reorganization acts following the recommendations of the Commission on Organization of the Executive Branch of the Government (Hoover commission). President Truman signed 792 measures enacted into law by his signature and vetoed 32 measures.
Failure to act on the president's civil rights programme appeared as the reflection of a southern Democratic-Republican coalition in this entire field of legislation. Failure to enact a new labour bill correcting some of the faults which experience had demonstrated in the existing Taft-Hartley act was attributable to the pressure of the administration for a dramatic repeal of the latter. The fact that congress failed to vote $4,000 million in taxes failed for by the President and yet voted a budget in which prospective expenditures would exceed prospective revenue, possibly by as much as $5,000 million, reaffirmed national deficit financing. The passage of a new farm bill, which fixed farm-price supports at the highest level ever reached, placed upon congress responsibility for greatly increasing the taxpayer's burden, placing the consumer at a disadvantage, and disregarding the pledges given by both political parties in favour of a system of flexible supports. Minimum wage rates in the nation were raised by the 81st congress from 40 to 75 cents an hour. Legislation for federal subsidies to schools, for creation of a department of public welfare, for compulsory national health insurance and for the extension of social security failed of passage. The steel unions continued to press for security and for increased wages. Outstanding was the campaign for the fourth round of wage increases since the end of the war. By the middle of July a stalemate was complete between the steelworkers and the steel companies. The federal fact-finding board on Sept. 10 recommended no increase in wages, but the payment of pensions and social insurance by management. This the unions accepted and management rejected. The steel workers went on strike in October, and by the end of the month won. The contracts which were then signed pointed the way for all industry on this issue. In common with the mood of the rest of the nation, organized labour was engaged throughout the year in expelling known Communists and in reducing the powers of more radical unions.

The rise of the power of organized labour in politics had never been more evident than in the year 1949. Its importance was clearly recognized by the president in his inaugural speech and again in his message to congress. The programmes of both American Federation of Labour and Congress of Industrial Organizations for wage increases and for pension provisions were constantly under public discussion. The role of John L. Lewis, in his conferences on strikes and in his public utterances, was dramatically presented in newspaper and radio comment. The public was aware that no question in domestic legislation and no issue in politics was unaffected by the attitude or anticipated attitude of labour. Election figures indicated that the political power of labour in votes far transcended the membership in organized trade unions. In the congress the issue was drawn upon proposals to repeal the Taft-Hartley act and to amend it to the extent of making it workable. The heart of the discussion was on the injunction clause. The Senate under the leadership of Senator Robert A. Taft by a close vote modified the act, but the bill was buried in the House. The administration maintained its position demanding repeal and re-enactment of the Wagner act. The full intent of the leaders of organized labour was seen at the end of the year in the issuance of the call by the American Federation of Labour on its members to express their sentiments at the polls in punishing 107 "enemies of labour" in congress, almost all of them Republican.

Foreign Policy. The North Atlantic treaty was ratified by the Senate in a vote of 82-13 on July 21. Shortly afterwards Truman submitted his proposal for a military assistance programme which, on Sept. 22, came to its crucial test in the Senate and was passed by a vote of 55-24 pledging $1,314 million. By October, spending under the Marshall plan went over the $7,000 million mark. The menace of Communism as a revolutionary force in the world outside the United States was made more vividly evident to Americans by the announcement of President Truman on Sept. 23, the day after the passage of the Arms Aid bill, that an "atomic explosion" had taken place in the Soviet Union. This was followed by a nation-wide debate as to the possible need for reshaping all plans not only for defence but also for participation in an open alliance having an aggressive programme of attack. The extreme views were less evident after a month of debate. On the whole, belief prevailed that a general war was not near. That the U.S.S.R. had been "contained" in Europe came to be greatly acknowledged.

United States interest in Asia was renewed as the spread of Soviet influence in China proved to be inevitable. At the opening of the year, the Nationalists still held at least half of China, and Americans, recalling earlier Chinese civil wars, of which they knew little, saw a stalemate and a compromise between Communists and Nationalists. The complete collapse of Chiang Kai-shek was unexpected.

The last year of the first half of the twentieth century was marked by many Americans as a year of great disillusionment. The utterances of the year revealed the final dawning of the realization that the alignment in the long debate between reason and faith was no longer clearly defined. Not only in the natural sciences, particularly in physics, but also in the social sciences, notably psychology, the mood was one of uncertainty if not of actual despair. This did not rise out of failure in research or even in application—that is, in immediate result—but out of a growing certainty that only within sharply delineated limits was man master of his fate. The realignment found an increasing number of churchmen moving toward fundamentalism in theology and toward unity in organization. Likewise, the advocates of reason were forced by the growing apprehensions of mankind to lessen their advocacy of dependence upon intellectual attainment and to emphasize that the factors of chance and
greatest minds—which was sought as an objective. There was a growing conviction that the informed and the trained mind prepared the mature citizen to do his part—not in the school—but in the society of which he was a member. Consequently, increased attention upon adult education was directed to the fundamental, as well as the practical, aspects of the individual in society.

Americans continued, as no other nation in this or any other age, to be interested in peoples and events outside the United States. By newspaper and radio, by lecture and pronouncement of experts the American citizen was informed as to his place in a world of peoples and nations. The world inside his head was at once the repository of a countless array of bewildering new facts, and also a battleground upon which were fought out the issues of the world. That no decisions were reached, and that vast arrays of facts were soon forgotten, did not alter the circumstance that the American had—despite all his traditions and inclinations—become a world citizen.

(E. E. R.)

Education Data in Tables I and II, gathered by the U. S. Office of Education, are taken from the Statistical Abstract of the United States 1948 and relate to the continental U.S.

† Including 1,222,728 veterans receiving a subsistence allowance of $75 a month from the U. S. Veterans' administration.

The above figures cover over 1,650 universities, colleges, junior colleges, professional and teachers' colleges, both publicly and privately controlled. Of 164 universities the oldest are Harvard (Cambridge, Massachusetts, 1636), Yale (New Haven, Connecticut, 1701) and Pennsylvania (Philadelphia, 1740). The largest are the universities of California (Berkeley and Los Angeles, 42,637 students in 1947-48), Columbia (New York, 31,604), Minnesota (Minneapolis, 28,312) and Illinois (Urbana, Illinois, 28,284). Four other universities had over 20,000 students and 16 universities over 10,000.

Education in the U.S. is financed by the member-states or privately and to a small extent by the federal government. In 1943-44, for example, the total expenditure on education amounted to $3,398 million, including $2,453 million on public elementary and secondary schools, $264 million on private elementary and secondary schools, $402 million on public institutions of higher education and $279 million on private institutions of higher education. This explained why the federal budget a relatively small sum was allocated for education and general research ($125 million in 1949-50). Illiteracy dropped to 2-7% in 1949 compared with 4-3% in 1930.

The downward movement in the U.S. industrial production was the natural and inevitable readjustment from the postwar inflationary levels. The production index in manufacturing industries, having reached 181 in Oct. 1948 (1937=100) declined to 150 in June 1949 but was 164 in December. This improvement—as President Truman said in his message to the Congress on Jan. 6, 1950—"confounded the enemies of freedom who wanted eagerly for the collapse of the American economy." On Dec. 21, 1949, in the Stalin birthday issue of Pravda, three members of the Politburo stated categorically that a depression existed in the U.S., Izvestia (Dec. 29) saw the U.S. in the throes of "economic chaos and anarchy."

Foreign Trade The geographic area covered by data in Table IX is the U.S. customs area, which includes Alaska, Hawaii and Puerto Rico (Virgin Islands only from 1935 to 1939).
UNITED STATES TERRITORIES AND POSSESSIONS

**United States Territories and Possessions**

Under this heading are grouped the territories and overseas possessions of the United States. Their total area is 597,370 sq. mi. and the total population (1949 est.) 3,014,300. Certain essential information on these dependencies is given in the table which does not include the smaller Pacific islands administered by the U.S. navy department (Johnston, Kingman Reef, Kure, Midway, Palmyra, and Wake), by the U.S. department of the interior (Baker, Howland and Jarvis), or which are under joint U.S.-Soviet sovereignty (Canton and Enderbury).

**Alaska.** The northernmost territory of the United States, Alaska is separated from Asiatic U.S.S.R. by Bering strait. The boundary line runs between the Big Diomede island, which is Soviet soil, and the Little Diomede island, which is on the U.S. side. These islands are about 4 mi. apart. The population of Alaska is made up of about 60% whites and 40% Eskimos, Aleuts and Indians. Capital (pop., 1940 est.): Juneau (5,748).

The territorial legislature met in a special session of 17 days and a regular biennial session of 60 days in 1949 and enacted the territory’s first basic tax system consisting of an income tax, property tax and business licence tax. The income tax levies 10% of the amount the taxpayer pays the federal government under the internal revenue code; the property tax is 1% of the true and full value, with $200 exemption on personal property; the business licence is $25 for any and all business enterprises, with a graduated levy on all gross receipts of more than $100,000. The legislature created a territorial department of fisheries and department of aviation and established a national guard. It appropriated $17,279,000 for operation of the territory during the 1949-50 biennium. The anticipated revenue for the same period was $19 million.

Construction of defense installations were concentrated at key points in 1949. Late in the year announcement came from the military high command that ground troops would be withdrawn from the Aleutian island chain although the air arm would be maintained. Lack of sufficient funds to rebuild the temporary installations made in the islands during World War II was given as the reason.

**Education.** In 1949 the territory had 26 incorporated school districts and 58 rural schools with 549 teachers and about 12,000 pupils. In addition, the Alaska Native service of the Department of the Interior maintained 85 day schools and 3 boarding schools with a total of 5,000 pupils. The University of Alaska, at College, farthest north U.S. college, had an enrollment of 400.

**Economy.** The 1949 fishery season was one of the best in Alaska’s history. The total pack of salmon was 4,375,147 cases, valued at $100 million. The halibut fishery produced about 50 million lb., valued at $10 million.

Gold production was still down from prewar years, but 1949 production was approximately $8,750,000, about the same as 1948. A new strike was made on the Yukon river northeast of Fairbanks near the Arctic circle in the autumn of 1949, and claims were staked along the river for about 20 mi., hundreds of prospectors staking to the area. The real value of the strike would not be known until spring, as winter had closed down operations. Coal production was about 400,000 tons.

**Hawaii.** The territory of Hawaii consists of a group of eight large islands and numerous islets in the Pacific ocean. It includes Midway, with an archipelago of rocks, reefs and
shoals, and Palmyra, a coral atoll consisting of 55 islets. The largest island in the territory is Hawaii, with an area of 4,021 sq. mi. The capital of the territory is Honolulu (pop., 1949 est.), 267,755, situated on the island of Oahu. The largest single racial group is Japanese (33.8% of the total), the second largest is white or Caucasian (30.8%), and the Hawaiians and part-Hawaiians are third (14%).

Hawaii had been a territory of the United States since 1900. Since that date the territory had made repeated petitions to the U.S. statehood and in a plebiscite in 1940 its electors voted in favour of statehood by a majority of more than two to one. A statehood constitutional convention was to be held in Honolulu in April 1950, with delegates from all of the major islands attending. The constitution drafted at this convention would be submitted to the territorial legislature for approval and then sent on to congress with the request that it be approved by that body.

**Economy and Finance.** Principal production (1948-49) sugar 835,107 short tons; canned pineapple and pineapple juice 20,022,775 cases; coffee about 6 million lb. Fisheries: total catch (1948-49) about 7,000 tons valued at $4-3 million.

Hawaii purchased from the United States in 1948 merchandise valued at approximately $350 million and shipped to the mainland products valued at about $182 million.

Total territorial tax collections on business and otherwise amounted to $64.7 million, compared with $54.2 million in 1947. The net bonded indebtedness was reduced to $7.2 million. The net assessed valuation of real property on the island of Oahu was $2,022,621,000 for the fiscal year ending June 30, 1948, totalled $108.2 million with a $107.6 million in 1947.

**Puerto Rico.** A U.S. island dependency in the West Indies. In 1949 rural population was 64% of the total, urban 36%; 76.5% of the population is white. Chief cities (pop. 1949 est.): San Juan (cap., 237,623); Ponce (74,393); Mayaguez (62,051). Languages: Spanish and English. Religion: predominantly Roman Catholic.

**Education.** In 1949 there were 446,520 pupils in the public and private schools. Enrollment in the public schools was distributed as follows: elementary 300,163, secondary 86,066, vocational 1,292, evening schools 12,625, special courses for veterans 21,479. Teaching staff—public schools 9,375, private schools 1,070. Higher education was carried on by the University of Puerto Rico, the Polytechnic institute and the College of the Sacred Heart. During the year Santa Maria university was opened by the Catholic Church at Ponce.

In 1949 more than 10.9 million tons of sugar cane were harvested, the tobacco crop was estimated at 270,000 cwt., coffee crop at 229,200 cwt. and pineapple production at 1,250,000 crates. Sugar production in 1949 amounted to 1,278,000 tons of sugar. Sugar refining operations in the island yielded 210,000 short tons of refined sugar 96.8%.

The total value of imports into Puerto Rico during 1948 was $362,373,214; of this total 93.3% were shipments from the United States. The total value of exports for the same period was $194,952,728 of which 96.8% were shipments to the U.S.

During the year 1948-49, 55,710 motor vehicles were registered, excluding government-owned cars. The Insular Department of the Interior kept under maintenance (June 30, 1949), 3,437 km. of roads. During 1948-49, 3,130 vessels arrived at the island, with a registered tonnage of 9,916,700. On June 30, 1949, there were 33,312 telephones in service.

**Revenue (fiscal year 1948-49) revenue $260,818,177, expenditure $230,113,948.** (J.L.Ee.)

**Virgin Islands.** The Virgin Islands (D anish West Indies until 1917) have the status of an organized but unincorporated territory of the United States. The three largest islands located some 40 mi. east of Puerto Rico, are St. Croix (pop., 1947 est., 13,000); St. Thomas (16,200) and St. John (800). The chief cities are Charlotte Amalie, the capital, on St. Thomas (9,801), Christiansted (4,495) and Frederiksted (2,498) on St. Croix. About 69% of the population is Negro, 22% mixed and 9% white. Language: mainly English. Religion: Christian (Protestant and Roman Catholic).

The Virgin Islands depended upon the outside world for much of their essential food, clothing and materials. Until this unavoidable expenditure abroad was balanced by the creation of marketable wealth or value in the islands, the economic problem could not be solved. Three approaches, each complementary to the other, were being made to this problem. These included the development of tourism as a major industry, the production of specialty crops for export and the promotion of new industry.

The $10 million federal public works programme was considerably advanced during 1949. The abattoir at St. Thomas was completed and the potable water supply project nearly completed. Several miles of road had been reconstructed in St. Thomas and St. Croix. Work on the new waterfront highway in St. Thomas was expected to begin early in 1950, along with the installation of improved telephone communication in both St. Thomas and St. Croix.

The governor until Nov. 30, 1949, was William Henry Hastie, the first Negro governor, inaugurated by President Harry S. Truman on May 17, 1946. Morris F. de Castro, government secretary, was serving as acting governor until a new appointment was made.

**Guam.** The largest and southernmost island of the Marianas, lying in the Pacific about 5,100 mi. from San Francisco and 1,500 mi. from Manila. Area: 206 sq. mi. Population (July 1, 1949) consisted of 26,744 Guamanians and about 75,000 non-Guamanians, including U.S. military and civil service personnel. The Guamanians are Chamorros and their religion is predominantly Roman Catholic.

Guam is administered by the U.S. navy; however, on July 1, 1950, the U.S. Department of the Interior was scheduled to take over responsibility for the administration of the island. Rear Admiral Charles A. Pownall, who retired on Sept. 1, 1949, was the last naval officer to be appointed governor; on Sept. 3 Carlton Skinner was appointed by the president of the U.S. as the first civilian governor of the island. The Guam congress, composed of a House of Council and a House of Assembly, is a popularly elected legislature. In 1947 the Guam congress received legislative power in lieu of its former advisory power. The congress can also override the governor's veto. Each of the island's 15 municipalities is headed by a Guamanian commissioner elected by popular vote for a four-year term.

**Education.** In 1949 there were 21 elementary and junior high schools and 1 high school with 9,029 pupils and 397 teachers and principals.

Instruction is given in English

**Economy and Finance.** In 1949, 3,000 out of the 8,700 employable Guamanians worked for U.S. government establishments. There are about 80 of paved highways on Guam and about 60 mi. of improved secondary roads. There are no railways, but 5 military airfields.

During the fiscal year ending June 30, 1949, Guam's expenditures amounted to $3,288,991, of which U.S. appropriation, $1,082,380 came from U.S. appropriated, $1,985,824 from local revenues and the balance from the sale of surplus war materials and certain special funds

**BIBLIOGRAPHY.** U.S. Navy Department, Guam: Information Transmitted by the U.S. to the Secretary-General of the United Nations (June 1949)

**Samoa, American.** The Samoan Islands are about 2,700 mi. east of Australia and 2,200 mi. south of the Hawaiian Islands. American Samoa consists of the inhabited islands of Tutuila, Ta'u, Olosega, Ofu and Aunu'u, and the uninhabited coral atoll, Rose Island. Swain's Island, 210 mi. northwest of Tutuila, was made in 1925 a part of American Samoa which is an unorganized U.S. possession governed by a naval officer appointed by the president.

On Feb. 25, 1948, a bicameral legislature was established in place of the old one, the annual Fono. The House of
Representatives consists of 54 members, popularly elected for two-year terms; the House of Alli is composed of the 12 persons who hold the highest-ranking titles in American Samoa. The legislature has only advisory powers. The governor also has an advisory council consisting of from five to seven Samoans. The judiciary consists of a high court, district courts and village courts. Each of the three administrative districts has a native governor appointed by the governor of American Samoa.

Education. In 1949 there were 46 public schools and 7 private schools. Total enrolment was 5,117 and there were 139 teachers, English being the language of instruction. About 94% of the population was literate according to the 1940 census.

Economy and Finance. Principal crops, with estimated annual production (metric tons): copra 1,725; breadfruit 7,700; bananas 19,492; taro 2,900. Imports (1948-49) $886,701, exports $459,056.

Revenues during the year ending June 30, 1949, amounted to $422,739 and U.S. appropriations for American Samoa to $55,000; expenditures totalled $626,775.

UNIVERSITIES AND COLLEGES. In 1949 pressure of student numbers and shortages of staff, accommodation and equipment harassed universities everywhere, although perhaps not so badly as in the previous year. There were many encouraging reports of buildings being erected or repaired and equipment accumulated; nevertheless, the leeway was still terrific.

International Developments. International discussion and interchange of staff and students continued to increase. As examples of the first may be cited the massive convention on the social implications of scientific progress held in April at the Massachusetts Institute of Technology; the first international congress of biochemistry, held at Cambridge, England, in August; and the conference on the educational problems of special cultural groups held by Columbia University in association with the University of London in New York in August-September.

A potentially most important development resulted from a resolution, unanimously carried at the Congress of Europe held at The Hague in 1948, to establish an European Cultural Centre. This proposal was later modified to one for a "College of Europe" at which selected post-graduate students could receive a wide and deep course in European affairs qualifying them, inter alia, for responsible posts on permanent secretariats of European institutions. In September-October the European movement organized at Bruges, Belgium, a three weeks' experimental session, attended by 22 students of 11 nationalities. It was proposed to establish the college permanently in 1950.

The most notable development in interchange was the start of the Fulbright scheme, under which some 1,300 university teachers and students left the United States for teaching, research or study abroad, and an approximately equal number entered American institutions. U.N.E.S.C.O. sponsored many travelling fellowships and university exchanges. The British Council, in response to invitations from governments or universities of 11 countries, made 55 awards to graduates for study abroad for periods of from four months to one year. India and Pakistan reported larger numbers of university students studying overseas than ever before. Exchanges arranged by individual universities and university bodies were numerous. Some of the most fruitful were extra-curricular, as for example the student congress at Lund, Sweden, the British students' debating tour of India, Pakistan and Ceylon and the tour by Oxford musicians to French universities.

Great Britain. In July-August over 500 foreign students, most of the United States, attended the university summer schools (first organized on a large scale in 1948) held at Oxford, London, Edinburgh, Southampton and Stratford-on-Avon. In September the first party of American graduate students (125) and professors (35) selected to study and lecture in Great Britain under the provisions of the Fulbright act arrived. At that date 140 British persons had received Fulbright grants for research or teaching in American institutions.

In April the London University Institute of Education received a grant from the Imperial Relations trust enabling it to appoint in each of the academic years 1949-52 two fellows from each of the dominions of Australia, Canada, South Africa and New Zealand. The fellowships, tenable for a year, were to go to experienced educators likely to occupy important positions in their educational service.

In February and March the chancellor of the exchequer announced revised salary limits for medical and non-medical teaching staffs in universities.

Because of the forthcoming replacement in England and Wales of the School and Higher School certificates by the General Certificate of Education, it became necessary for the universities to re-define their minimum academic requirements for entrance. In January the Committee of Vice-Chancellors and Principals proposed that

1. a candidate must pass in the G.C.E. examination in English language and in either four or five other subjects
2. the subjects must include (a) a language other than English and (b) either mathematics or an approved science
3. at least two of the subjects must be passed at the advanced level
4. Candidates who offer only four subjects in addition to English language must pass at one and the same sitting in two subjects at the advanced level and in one other subject not related to the subjects offered at the advanced level.

By mid-1949 all the universities except Oxford and Cambridge, which had not made public their requirements, had accepted this formula.

At the request of both parties, the secretary of state for Scotland in February instituted an inquiry into the organization of university education at Dundee University college and its relationship with the University of St. Andrews—matters that had been the cause of controversy ever since the Universities (Scotland) act, 1889, provided that Dundee (founded in 1811) should be affiliated to St. Andrews (founded 1411). The investigators' report, published in August, rejected both the St. Andrews proposal for a university organized in four colleges (of which Dundee would be one) and the Dundee proposal for an expansion of the University court to give Dundee equal representation with St. Andrews while at the same time retaining its own College council. It recommended the abolition of the governors, council and education board of Dundee, and the bringing of the whole university under a single University court.

In April was published The Crisis in the University, by Sir Walter Moberly, perhaps the most important study of the functions of the university to appear in Britain since Newman's The Idea of a University (1852). Written by the chairman of the University Grants committee, it represented the fruits of prolonged discussions among Christian university teachers and others, promoted by the Student Christian movement and the Christian Frontier council.

In April was celebrated the bicentenary of the Radcliffe library, Oxford; in May the centenary of Bedford college, University of London, the country's oldest university college for women, and the jubilee of Ruskin college, Oxford, Britain's earliest residential college for working class students: in September the centenary of the opening of Queen's college, now the Queen's university, Belfast. In April the foundation stone was laid of permanent buildings for Nuffield college, Oxford. In September a National College of Music and Drama for Wales was opened in Cardiff castle, donated by Lord Bute to the city of Cardiff.
In April the Duke of Edinburgh was installed as chancellor of the University of Wales, and in May Lord Trent as chancellor of Nottingham university. In June a development fund of £1,000,000 was launched for the latter university (created 1948). (See also CAMBRIDGE UNIVERSITY; LONDON UNIVERSITY; OXFORD UNIVERSITY.)

Commonwealth. In June the first meeting of the executive council of the Association of the Universities of the British Commonwealth was held at Deep Cove, Nova Scotia. It was attended by 16 vice-chancellors (or deputies) representative of all the dominions, the West Indies and other colonies. Freer interchange between universities was the main topic of discussion.

In August the British Council announced that 39 awards had been made for 1949 under the scheme established by the 1948 Universities' congress to facilitate interchange of university teachers and students between the United Kingdom and the other commonwealth countries. The scheme comprised three types of grants: to university teachers on study leave, post-graduate research workers holding research grants who propose to study at another university for at least six months, and distinguished scholars invited to universities for short visits.

Australia. In September the minister for defence (in charge of scientific and industrial research) announced that from the beginning of 1951 the commonwealth government would award annually 3,000 scholarships to enable selected students to undertake university, technical college and other approved professional courses. The scheme, estimated to cost £A900,000 a year, would replace the existing postwar scheme.

On Oct. 24 the foundation stones were laid of the first three buildings of the Australian National university at Canberra: the John Curtin School of Medical Research, the School of Physical Sciences, and University house, a residential college to accommodate the staff and 100 students. The university which was in the first instance to be solely a post-graduate centre for research in medicine, the physical and social sciences and Pacific studies, was expected to start work early in 1951.

Canada. Concern continued lest the greatly increased number of students and the persistent demand that the universities expand their scope should lead to a permanent lowering of academic standards, especially in the humanities. It was, however, asserted that the number of ill-qualified entrants was proportionately less in 1949 than in previous postwar years.

A Canadian-British Education committee was established with headquarters in London, England, to encourage British boys and girls to take university courses in Canada, in the first instance especially at McGill, which in 1948 offered 100 places a year.

India. In Nov. 1948 the government set up a commission to inquire into conditions and prospects of university education and advanced research in India and to recommend a constructive policy related to the needs of the country. The University of Rajasthan, created in 1947 by a federation of the colleges in the larger states of Rajasthan, held its first convocation for the conferment of degrees.

On November 25, the Thomason College of Engineering, Roorkee, was raised to university status and became India's first engineering university. Founded in 1847, it was the oldest institution of its kind in the east and numbered among its former students such distinguished engineers as Sir William Garstnn and Sir William Willcocks of Iraqi and Egyptian fame. Its change of status was intended to herald a general broadening of the curriculum and expansion of laboratory facilities to help meet the country's growing technological needs.

South Africa. In pursuance of its policy of apartheid the government announced that it would not renew state grants to non-European medical students at the University of the Witwatersrand after 1950, because it expected that by then the non-European medical faculty at Natal university (where apartheid is practised) would be opened. Later the prime minister, Dr. Malan, announced the government's intention to introduce apartheid at the Capetown and Witwatersrand universities. The National Union of South African Students re-affirmed its belief in the academic and cultural equality of all students, the Afrikaanse Studentebond its belief in the essential difference between white and coloured races.

In March the ceremonial inauguration of Natal university (incorporated 1948) took place. In August an anonymous European offered £100,000 to endow a chair of Bantu studies, and establish and maintain a native library and museum at the university. In April bequests totalling £100,000 were announced in the will of Mr. Bernard Price for the benefit of the Institute of Geophysical Research and the Palaeontological Foundation, Witwatersrand university, both originally donated by him.

New Zealand. A micro-chemical laboratory, the first in the country, was installed at Dunedin in the University of Otago. Dr. T. S. Ma, who was in charge of the micro-chemical laboratory at Chicago university during World War II, was appointed head.

British East Africa. In January the Makerere College act reconstituted the college to enable it to provide facilities throughout the East African territories of Uganda, Kenya, Tanganyika and Zanzibar for higher education, professional training and research, either directly or through affiliated schools and institutes. The government and administration of the college were vested in an autonomous council. In 1949, 220 students were in residence.

British West Africa. During the first academic year of the university college of the Gold Coast, Achimota, faculties of arts, science and economics were functioning, and research on a dozen Gold Coast languages was begun. A theological faculty was started in the second year. The college opened in Oct. 1948 with 100 students and was planned to increase to 750. Preliminary designs for permanent buildings were submitted late in 1949. Among gifts to the college were £900,000 from the Gold Coast Cocoa Marketing board and £200,000 from the Nigerian Cocoa Marketing board.

During the academic year 1948-49 the university college (incorporated 1948) at Ibadan, Nigeria, increased the number of its students from 104 to 220 and of staff from 13 to 44. Faculties of arts, science and medicine were functioning; extra-mural courses were being developed and research had begun. The college, intended to become the university of West Africa, was controlled and administered by an autonomous council. The Nigerian government supported the college on the five-year block grant system, and started its endowment fund with a first donation of £250,000.

In February the Legislative council of Sierra Leone approved the proposal, made by the secretary of state for the colonies, that Fourah Bay college, the only establishment in the colony for providing education beyond secondary, should be created a university college with three departments: a university department with schools in arts and commerce, a teacher-training department and a technical and vocational training department.

Malaya. In March and April ordinances establishing the University of Malaya were made. In April the chancellor, Malcolm Macdonald, high commissioner for the far east, announced that the British government had allocated

The procession from the Nottingham council chamber to the Albert Hall, May 3, 1949, for the installation of Lord Trent as first chancellor of Nottingham university.
1,000,000 from the Colonial Development and Welfare fund to the university’s building fund, and appealed for donations to its endowment fund. Foundation day was held on Oct. 8, when the chancellor was installed.

British West Indies. In January the British secretary of state for the colonies announced that the King had granted a royal charter to the University college of the West Indies, accepted the office of visitor and appointed Princess Alice, Countess of Athlone, the first chancellor. The college began teaching in the faculty of medicine in Oct. 1948, and in the faculty of natural science a year later. Thirty-two students were admitted for the 1948-49 session, and another 42 for 1949-50. In May the contract was placed for the main building scheme for the college and teaching hospital. Until permanent buildings are available the college would be housed in temporary huts on the permanent site of 700 ac. at Mona near Kingston, presented by the government of Jamaica.

United States. By the beginning of the year reciprocal agreements under the Fulbright act had been signed by 13 countries. They provided for payment of travel expenses, tuition fees and maintenance grants to Americans going to universities abroad and the cost of travel for foreigners coming to U.S. institutions. Equal numbers of students were exchanged. The schemes applied to professors, students (both graduate and undergraduate) and school teachers, except where existing exchange schemes were functioning satisfactorily. In the autumn 1,300 U.S. students and teachers left under the scheme.

In the spring, following the dismissal by Washington university of two professors because of membership of the Communist party, there was widespread public discussion whether Communists should be allowed to teach in universities and colleges. In April, after a student demonstration against a bill proposing to impose an oath of loyalty upon all state teachers, the government of Illinois set up a committee to investigate alleged Communist influences in Chicago university. In the academic year 1948-49 universities and colleges graduated the highest number of students in the history of higher education in the United States. Some 416,000 students received degrees, 95% more than in 1939-40, the peak prewar year. First degrees totalled 366,634, second degrees 50,827 and 5,293 doctorates were awarded.

On Oct. 20 Smith college, Massachusetts, celebrated the 75th anniversary of its opening. Honorary degrees were conferred on 12 distinguished women including Princess Wilhelmina, former queen of the Netherlands, and Mrs. Eleanor Roosevelt. Radcliffe, the women’s college affiliated to Harvard university, celebrated its 70th birthday. In Dec. 1948 Miss H. M. Cam, installed as Radcliffe professor of English history, became the first women member of the Harvard faculty. In October Harvard law school was opened to women.

Notable benefactions included a sum of over $8 million from the Samuel H. Kress foundation to New York university’s Bellevue Medical centre; a sum of $1,500,000 from Myron Taylor to Cornell university; and a block-printed set of the Kagyur (Tibetan sacred books) from the Dalai Lama to Yale university.

On Aug. 10 died Edward Lee Thorndike, internationally famous for his brilliant contributions to educational psychology. From 1897 to 1940 he was on the staff of Teachers’ college, Columbia university, from 1904 with professorial rank. His numerous published works included The Measurement of Intelligence (1926) and The Fundamentals of Learning (1932).

Europe. Czechoslovakia. Early in 1949 reliability tests for university students took place. In March the ministry of education announced that of 47,000 students called for examination, 6,370 had failed, including 2,400 who did not present themselves before the “reliability” committees and had been expelled from the universities. It was not stated on what grounds, but the ministry denied that the tests were a means of political persecution. It was further stated that expelled students might be re-admitted on evidence of good work in the employments to which they had been directed. Seven hundred “workers” were admitted to the universities after special eight months’ courses in place of a secondary school education.

In the autumn the universities were put under the control of a state council, whose powers included the appointment of the teaching staff. Individual study was finally abolished and the study group system made universal. The object of the law was stated to be to produce a “highly qualified and politically conscious intelligentsia.” The secretary general of the Slovak Communist party declared that Marxist-Leninist science was the fundamental line of all scientific and educational activities in the universities.

In October Dr. Jíňa Otáhalová-Popelová was appointed rector of the Palacky university, Olomouc—the first woman to hold such a post in Czechoslovakia.

France. In Aug. 1948 the minister of education made compulsory an année propédeutique, that is, a year of study beyond the baccalauréat, with a further examination at the end, for all students wishing to enter a university. The immediate cause of this innovation was the overcrowded state of the universities; but the fundamental reason, urged since the 1930s, was the character of the baccalauréat curriculum, which, it was argued, demanded such an amassing of factual knowledge as to preclude the absorption of culture. It was not possible by the end of the first year’s experiment to measure its success owing to the shortage of university teachers.

Germany. In March the Technical university of Berlin celebrated its 150th anniversary. It began as an architectural college, developed into a technical high school and was granted university status in 1946. Two new people’s universities were opened, one at Huntstadt, near Celle, and the other at Landau, near Kassel. That at Landau was the first of its kind in Land Hesse.

In June a federation of German university women was founded, with headquarters at Hamburg. The former federation was suppressed by Adolf Hitler.

Greece. Economic difficulties gravely affected the universities. In March the ministry of finance cut the state grant to Salonika university by 620 million drachmai. The senate replied that this would make it impossible for the university to operate efficiently; and as protest a ten-day lock-out of the faculties of mathematics and physics, medicine, agriculture and forestry was staged.

Sweden. In October Madame Gerda Enequist was installed as professor of Geo-Culture at Uppsala university; she was the first woman to occupy a professorial chair in this 300-year-old university.

Switzerland. Geneva university established, within the faculty of social and economic science, an Institut Universitaire d’Administration Maritime, claimed to be the first of its kind. It offered a three-year course, of which the third year is spent on board ship.

Yugoslavia. Organizational and academic changes were carried out in Belgrade university. The medical and technical faculties were separated from it to form the Medical Great school and the Technical Great school respectively, each with university status. Mathematics and natural sciences were separated from the philosophical faculty to form new faculties. The study of Marxism-Leninism was introduced as a compulsory subject in the philosophical, legal, and economic faculties. In March a conference was held at Liubljana of all heads of philosophical faculties to decide
upon the philosophical line to be adopted in teaching. The legal, philosophical, and technical high schools of Skopje were united to form Skopje university.

Asia. China. First-hand unofficial information received during 1949 suggested that conditions in universities were generally better than might have been expected, and in particular that staff and students felt more secure. Some universities and colleges fled before the Communist advance, but others, such as the Yenching university, Peking, Nanking university and the Central China university reported that work was progressing in a very satisfactory fashion. The Communist attitude was stated to be that opposition to their ideology would bring no physical sanctions but militate against promotion in university or professional life. In October, however, Peking radio reported that a committee for higher education had drawn up new curricula for universities and colleges in north China which made dialectical materialism and the "new democracy" obligatory studies for all students and political economy and history of arts and social sciences. Courses in Marxism and Leninism were to replace Kuomintang teaching, and Russian was to be studied.

Palestine. Radical changes in the structure of the Hebrew university of Jerusalem were planned with the aim of making it a centre of culture for Jews throughout the world. Among these were the establishment of faculties of law and medicine and the introduction of a B.A. course. (The existing highly specialized courses led to an M.A. as the first degree.)

Professor S. Brodetsky, University of Leeds, England, was elected president in succession to the late Dr. J. L. Magnes.

South America. Argentina. On June 20 President Perón announced the abolition of all university fees.

Venezuela. Because of the great increase in the number of students (there were over 4,000 in the Central university of Caracas, four times as many as in 1939) it was necessary to appoint temporarily a number of foreign professors. Native teachers were being trained to take their places as soon as possible.

(H. C. D.)

UROLOGY. Elimination or control of systemic sources of male sex hormone was found to be the best method of treating cancer of the prostate gland. The two methods which have been employed for this purpose were castration and the administration of estrogenic substances. A review of a large number of cases in which prostatic cancer was treated by these methods over a period of more than five years showed that the two methods were of equal therapeutic value; it also showed that such treatment was only palliative. Estrogenic treatment was followed by most clinicians.

Although radical perineal prostatectomy for cancer of the prostate gland had been advocated by a number of urologic surgeons, only during 1949 was a large number of cases followed over a post-operative period long enough to give the operation statistical appraisal. Judging from a report from the records of the Johns Hopkins hospital, this procedure had definite clinical advantages over other methods of treatment as far as survival was concerned. Among the patients who underwent operation from 10 to 27 years previously, 28% were living still and without demonstrable cancer. In only 11% of the cases, however, had cancer of the prostate gland observed clinically been found amenable to radical perineal prostatectomy.

The availability of a chemical test for measuring 17-keto-steroids in the urine stimulated more general interest and research in the field of urinary hormonal assays. Tests for measuring estrogens and the glycogenic adrenal corticoids gave promise of more widespread clinical acceptance.

Deaths following transurethral resection might be due to hemolysis with an oliguric syndrome; and the mortality rate had been materially lowered by substituting glucose solutions as an irrigating agent in the place of sterile water.

Experience with several new antibiotic solutions, including aureomycin and chloromycetin, showed their comparative merit in combating infections of the urinary tract. Aureomycin was found to be efficacious in combating certain types of bacteria found with urinary infection which had resisted other antibiotics and sulphonamides. Although aureomycin may cause moderate gastro-intestinal upset, it has the advantages that it can be administered orally and is not toxic in the sense of causing serious anaphylactic reaction or systemic damage such as those occurring with other antibiotics. Chloromycetin was found to possess anti-bacterial properties similar to those of aureomycin and also to cause minimal systemic reaction.

(W. F. Br.)

URUGUAY. A republic in southeastern South America, bounded on the north by Brazil, on the east by the Atlantic ocean, on the south by the River Plate, and on the west by Argentina. It is the smallest country in South America with an area of 72,172 sq. mi. Pop. (mid-1948 est.): 2,330,000. Approximately 10% of the population is of European extraction. Chief towns (pop., 1947 est.): Montevideo (cap., 500,000); Paysandú (50,000); Salto (48,000); Mercedes (33,000). Language: Spanish. Religion: mainly Roman Catholic. President, Luis Battle Berres.

History. During 1949 Uruguayan relations with Argentina remained strained and the dollar shortage continued. At the Inter-American regional conference of the International Labour organization held in Montevideo April 25 to May 7, President Battle Berres in his opening address said that social justice without civil liberty was a lie and, what was serious, it was a dangerous lie. Diplomatic circles considered this an allusion to Juan D. Perón of Argentina and his system. A new government, comprising a coalition of all parties, was formed, including a minority of workers' rights in Peru and Venezuela.

Relations with Argentina were strained further when in mid-June a small bomb was thrown into the Uruguayan embassy in Buenos Aires. The Peronista newspaper Democracia criticized Uruguayan ambassador Roberto MacEachen for his willingness to give refuge to Agustín Rodriguez Araya, who had been expelled from the Argentine Chamber of Deputies. In May, Antonio Richero, a Communist, was expelled from the Chamber of Deputies for insulting a member of the Brazilian cabinet, who was visiting Uruguay.

In August the Junta Americana de Defensa de la Democracia, under the chairmanship of Juan Andrés Díaz, and with former presidents Romulo Gallegos of Venezuela and Eduardo Santos of Colombia among its members, was formed as a rallying point for democratic forces in Latin America. Earlier, in conjunction with Guatemala, Uruguay asked the United Nations to investigate violations of human rights by the Venezuelan junta.

In May the government utility monopoly announced a U.S. $58 million hydro-electric development programme, and in October a loan for power development was concluded with the International Bank for Reconstruction and Development. Through the summer the peso declined steadily, 10% in June alone. Wool was withheld from the market in the hope of more favourable exchange rates, since the price had
UNIVERSITIES AND COLLEGES

£1,000,000 from the Colonial Development and Welfare fund to the university's building fund, and appealed for donations to its endowment fund. Foundation day was held on Oct. 8, when the chancellor was installed.

British West Indies. In January the British secretary of state for the colonies announced that the King had granted a royal charter to the University college of the West Indies, accepted the office of visitor and appointed Princess Alice, Countess of Athlone, the first chancellor. The college began teaching in the faculty of medicine in Oct. 1948, and in the faculty of natural science a year later. Thirty-two students were enrolled for the 1948-49 session, and another 42 for 1949-50. In May the contract was placed for the main building scheme for the college and teaching hospital. Until permanent buildings are available the college would be housed in temporary huts on the permanent site of 700 ac. at Mona near Kingston, presented by the government of Jamaica.

United States. By the beginning of the year reciprocal agreements under the Fulbright act had been signed by 13 countries. They provided for payment of travel expenses, tuition fees and maintenance grants to Americans going to universities abroad and the cost of travel for foreigners coming to U.S. institutions. Equal numbers of students were exchanged. The schemes applied to professors, students (both graduate and undergraduate) and school teachers, except where existing exchange schemes were functioning satisfactorily. In the autumn 1,300 U.S. students and teachers left under the scheme.

In the spring, following the dismissal by Washington university of two professors because of membership of the Communist party, there was widespread public discussion whether Communists should be allowed to teach in universities and colleges. In April, after a student demonstration against a bill proposing to impose an oath of loyalty upon all state teachers, the government of Illinois set up a committee to investigate alleged Communist influences in Chicago university. In the academic year 1948-49 universities and colleges graduated the highest number of students in the history of higher education in the United States. Some 473,000 students received degrees, 95.9% more than in 1939-40, the peak prewar year. First degrees totalled 366,634, second degrees 50,827 and 5,293 doctorates were awarded.

On Oct. 20 Smith college, Massachusetts, celebrated the 75th anniversary of its opening. Honorary degrees were conferred on 12 distinguished women including Princess Wilhelmina, former queen of the Netherlands, and Mrs. Eleanor Roosevelt. Radcliffe, the women's college affiliated to Harvard university, celebrated its 70th birthday. In Dec. 1948 Miss H. M. Cam, installed as Radcliffe professor of English history, became the first women member of the Harvard faculty. In October Harvard law school was opened to women.

Notable benefactions included a sum of over $8 million from the Samuel H. Kress foundation to New York university's Bellevue Medical centre; a sum of $1,500,000 from Myron Taylor to Cornell university; and a block-printed set of the Kagyur (Tibetan sacred books) from the Dalai Lama to Yale university.

On Aug. 10 died Edward Lee Thorndike, internationally famous for his brilliant contributions to educational psychology. From 1897 to 1940 he was on the staff of Teachers' college, Columbia university, from 1904 with professorial rank. His numerous published works included The Measurement of Intelligence (1926) and The Fundamentals of Learning (1932).

Europe. Czechoslovakia. Early in 1949 reliability tests for university students took place. In March the ministry of education announced that of 47,000 students called for examination, 6,370 had failed, including 2,400 who did not present themselves before the "reliability" committees and had been expelled from the universities. It was not stated on what grounds, but the ministry denied that the tests were a means of political persecution. It was further stated that expelled students might be re-admitted on evidence of good work in the employments to which they had been directed. Seven hundred "workers" were admitted to the universities after special eight months' courses in place of a secondary school education.

In the autumn the universities were put under the control of a state council, whose powers included the appointment of the teaching staff. Individual study was finally abolished and the study group system made universal. The object of the law was stated to be to produce a "highly qualified and politically conscious intelligentsia." The secretary general of the Slovak Communist party declared that Marxist-Leninist science was the fundamental line of all scientific and educational activities in the universities.

In October Dr. Jirina Otahalová-Popelová was appointed rector of the Palacký university, Olomouc—the first woman to hold such a post in Czechoslovakia.

France. In Aug. 1948 the minister of education made compulsory an année propédeutique, that is, a year of study beyond the baccalauréat, with a further examination at the end, for all students wishing to enter a university. The immediate cause of this innovation was the overcrowded state of the universities; but the fundamental reason, urged since the 1930s, was the character of the baccalauréat curriculum, which, it was argued, demanded such an amassing of factual knowledge as to preclude the absorption of culture. It was not possible by the end of the first year's experiment to measure its success owing to the shortage of university teachers.

Germany. In March the Technical university of Berlin celebrated its 150th anniversary. It began as an architectural college, developed into a technical high school and was granted university status in 1946. Two new people's universities were opened, one at Hustadt, near Celle, and the other at Landau, near Kassel. That at Landau was the first of its kind in Land Hesse.

In June a federation of German university women was founded, with headquarters at Hamburg. The former federation was suppressed by Adolf Hitler.

Greece. Economic difficulties gravely affected the universities. In March the ministry of finance cut the state grant to Salonika university by 620 million drachmae. The senate replied that this would make it impossible for the university to operate efficiently; and as protest a ten-day lock-out of the faculties of mathematics and physics, medicine, agriculture and forestry was staged.

Sweden. In October Madame Gerd Enequist was installed as professor of Geo-Culture at Uppsala university; she was the first woman to occupy a professorial chair in this 500-year-old university.

Switzerland. Geneva university established, within the faculty of social and economic science, an Institut Universitaire d'Administration Maritime, claimed to be the first of its kind. It offered a three-year course, of which the third year is spent on board ship.

Yugoslavia. Organizational and academic changes were carried out in Belgrade university. The medical and technical faculties were separated from it to form the Medical Great school and the Technical Great school respectively, each with university status. Mathematics and natural sciences were separated from the philosophical faculty to form new faculties. The study of Marxism-Leninism was introduced as a compulsory subject in the philosophical, legal, and economic faculties. In March a conference was held at Ljubljana of all heads of philosophical faculties to decide...
upon the philosophical line to be adopted in teaching. The legal, philosophical, and technical high schools of Skopje were united to form Skopje university.

Asia. China. First-hand unofficial information received during 1949 suggested that conditions in universities were generally better than might have been expected, and in particular that staff and students felt more secure. Some universities and colleges fled before the Communist advance, but others, such as the Yenching university, Peking, Nanking university and the Central China university reported that work was progressing in a very satisfactory fashion. The Communist attitude was stated to be that opposition to their ideology would bring no physical sanctions but militate against promotion in university or professional life. Among these were the establishment of faculties of law and medicine and the introduction of a B.A. course. (The existing highly specialized courses led to an M.A. as the first degree.) Professor S. Brodetsky, University of Leeds, England, was elected president in succession to the late Dr. J. L. Magnes.

South America. Argentina. On June 20 President Perón announced the abolition of all university fees.

Venezuela. Because of the great increase in the number of students (there were over 4,000 in the Central university of Caracas, four times as many as in 1939) it was necessary to appoint temporarily a number of foreign professors. Native teachers were being trained to take their places as soon as possible. (H. C. D.)

UROLOGY. Elimination or control of systemic sources of male sex hormone was found to be the best method of treating cancer of the prostate gland. The two methods which had been employed for this purpose were castration and the administration of estrogenic substances. A review of a large number of cases in which prostatic cancer was treated by these methods over a period of more than five years showed that the two methods were of equal therapeutic value; it also showed that such treatment was only palliative. Estrogenic treatment was followed by most clinicians.

Although radical perineal prostatectomy for cancer of the prostate gland had been advocated by a number of urologic surgeons, only during 1949 was a large number of cases followed over a post-operative period long enough to give the operation statistical appraisal. Judging from a report from the records of the Johns Hopkins hospital, this procedure had definite clinical advantages over other methods of treatment as far as survival was concerned. Among the patients who underwent operation from 10 to 27 years previously, 28% were living still and without demonstrable cancer. In only 11% of the cases, however, had cancer of the prostate gland observed clinically be found amenable to radical perineal prostatectomy.

The introduction of a chemically to the test for measuring 17-keto-steroids in the urine stimulated more general interest and research in the field of urinary hormonal assays. Tests for measuring estrogens and the glycosogenic adrenal corticoids gave promise of more widespread clinical acceptance.

Deaths following transurethral resection might be due to hemolysis with an oliguric syndrome; and the mortality rate had been materially lowered by substituting glucose solutions as an irrigating agent in the place of sterile water.

Experience with several new antibiotic solutions, including aureomycin and chloromycetin, showed their comparative merit in combating infections of the urinary tract. Aureomycin was found to be efficacious in combating certain types of bacteria found with urinary infection which had resisted other antibiotics and sulphonamides. Although aureomycin may cause moderate gastro-intestinal upset, it has the advantages that it can be administered orally and is not toxic in the sense of causing serious anaphylactic reaction or systemic damage such as those occurring with other antibiotics. Chloromycetin was found to possess anti-bacterial properties similar to those of aureomycin and also to cause minimal systemic reaction. (W. F. Br.)

URUGUAY. A republic in southeastern South America, bounded on the north by Brazil, on the east by the Atlantic ocean, on the south by the River Plate, and on the west by Argentina. It is the smallest country in South America with an area of 72,172 sq. mi. Pop. (mid-1948 est.): 2,330,000, mostly of European extraction. Chief towns (pop., 1947 est.): Montevideo (cap., 850,000); Paysandú (50,000); Salto (48,000); Mercedes (33,000). Language: Spanish. Religion: mainly Roman Catholic. President: Luis Battle Berres.

History. During 1949 Uruguayan relations with Argentina remained strained and the dollar shortage continued. At the Inter-American regional conference of the International Labour organization held in Montevideo April 25 to May 7, President Battle Berres in his opening address said that social justice without civil liberty was a lie and, what was serious, it was a dangerous lie. Diplomatic circles considered this an allusion to Juan D. Perón of Argentina and his system. A resolution was adopted citing violation of workers' rights in Peru and Venezuela.

Relations with Argentina were strained further when in mid-June a small bomb was thrown into the Uruguayan embassy in Buenos Aires. The Peronist newspaper Democracia criticized Uruguayan ambassador Roberto MacEchen for his willingness to give refuge to Agustín Rodríguez Araya, who had been expelled from the Argentine Chamber of Deputies. In May, Antonio Richero, a Communist, was expelled from the Chamber of Deputies for insulting a member of the Brazilian cabinet, who was visiting Uruguay.

In August the Junta Americana de Defensa de la Democracia, under the chairmanship of Juan Andrés Ramirez, and with former presidents Romulo Gallegos of Venezuela and Eduardo Santos of Colombia among its members, was formed as a rallying point for democratic forces in Latin America. Earlier, in conjunction with Guatemala, Uruguay asked the United Nations to investigate violations of human rights by the Venezuelan junta.

In May the government utility monopoly announced a US $58 million hydro-power development programme, and in October a loan for power development was concluded with the International Bank for Reconstruction and Development. Through the summer the peso declined steadily, 10% in June alone. Wool was withheld from the market in the hope of more favourable exchange rates, since the price had
dropped 25%. In October, following Argentina's lead, the peso was devalued. The new buying rate was fixed at 1-519 pesos to the dollar and the selling rate at 1-90 to the dollar. Other rates for special trade items were established.

(U. McA.)

Education. Schools (1947), state 1,635, pupils 192,804, teachers 5,735; rural, pupils 52,000. University of the Republic (1940) students 2,670, teaching staff 211

Agriculture. Main crops ('000 metric tons, 1948) wheat 518, maize 99; barley 25, oats 49; linseed (flax grown for seed only) 117; sunflower seed 60, groundnuts 13; tobacco ('metric tons, 1947) 922. Livestock ('000 head). (May 1946) cattle 5,638, sheep (May 1948) 22,000, horses (May 1946) 575. Wool production (on greasy basis, 1948-49) 73,000 metric tons. Meat exports (metric tons) 36,000 in 1947, 58,400 in 1948.

Industry. Establishments utilizing local raw materials (textile factories, tanneries and industrial and edible oil refiners, 1948): value of total production 913 million pesos; number of persons employed 168,400.

Foreign Trade. (Million U S $) Imports (1948) 201-5, (1949, six months) 87 3; exports (1948) 178 9, (1949, six months) 91 8. Main imports (1948) machinery and vehicles (28%), textiles (8%), petroleum and products (6%). Main exports: wool (37%), meat (25%), hides and skins (12%). Leading customers: the U S (28%), the U K. (18%), Belgium (9%), Netherlands (7%) and Italy (7%); leading suppliers: the U S. (34%), the U K. (13%) and Brazil (10%). The German dictations. Roads (1948) 26,000 mi., of which 3,051 mi. paved. Licensed motor vehicles (Dec. 1948): cars 36,200, commercial vehicles 15,700. Railways: 1,874 mi., freight carried (1948): about 8 million metric tons. Shipping (July 1948): merchant vessels 836, home shipping 48, gross tonnage 64,054. Telegraphs (Dec 1947) instruments 71,732. Wireless licences (Dec. 1947) 230,000.

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

VARGA EVGENY SAMUILOVICH, Soviet economist (b. Budapest, Hungary, 1887), was educated at the Universities of Budapest, Berlin and Paris. In 1906 he joined the Hungarian Social Democratic party. On March 21, 1919, he was appointed people's commissar of finance in the Béla Kun Communist government. On Aug. 1 of the same year he fled to Moscow. He became a Soviet citizen, director of the Moscow Institute of World Economics and World Politics, editor of a periodical World Economics and World Politics, and a member of the Soviet Academy of Science. Between the two World Wars he wrote many books on the economic development of capitalist states and on the history and theory of economic crises. In his Changes in the Capitalist Economy Resulting from the Second World War published in 1945 he maintained that capitalist countries in general, and the U.S. and Great Britain in particular, were not facing an economic crisis, that capitalist systems were capable of planning a war-time economy, and that armed conflict between the U.S. and Germany or between their major allies was possible—views regarded as heretical by Andrey A. Zhdanov and his pupil Nikolay A. Voznesensky. At the beginning of 1948 the Institute of World Economics and World Politics was absorbed by the Institute of Economics which was directly under Voznesensky's State Planning commission and Varga's journal was replaced by a new one, Economic Questions. Varga, however, was appointed a member of the editorial board of the new periodical. In Oct. 1948 his book was discussed at a special session of the Institute of Economics and, defending his views, he suggested that a scrutiny of facts was of greater importance than discussions of terminology. Professor K. V. Ostrovitanov, who presided, recommended that "comrade Varga should drop the attitude of an insulted priest of science" and attempt honestly to examine his mistakes and correct them by producing new works in accord with the requirements of Marxist-Leninist science. Varga recanted his views in the April 1949 issue of Economic Questions.

VARNISHES: see PAINTS AND VARNISHES.

VATICAN CITY STATE. A sovereign independent state, situated upon the Vatican hill in the city of Rome, established by the Lateran treaty between the Holy See and Italy on Feb. 11, 1929. The Pope is the sovereign. Area: 0-5 sq. mi., excluding the papal estate of Castel Gandolfo and the basilicas of St. John Lateran, St. Paul's-Outside-the-Walls and St. Mary's Major which also belong to the Vatican City state. Pop. (1948 est.): 800. Governor, Marchese Camillo Serafini.

The main preoccupation of the Vatican City state during 1949 was the preparation for the Holy Year of 1950, which, proclaimed by Pope Pius XII on Ascension day, May 26, in the bull Jubilaeum Maximum, was inaugurated on Christmas Eve. The main responsibility for the arrangements was entrusted to Mgr. Valerio Valeri, wartime nunco to France, as chairman of the Holy Year Central committee. Pope Pius XII, whose sacerdotal golden jubilee on April 2 followed closely after the 10th anniversary of his coronation, broadcast to the world on Dec. 23 a long allocution in which he spoke of the hopes he placed in the Holy Year. Other important addresses by the Pope were that delivered at the secret consistory of Feb 14, denouncing the trial and imprisonment of Cardinal Jozef Mindszenty, and that broadcast to the German Katholikentag on Sept. 4; but the year saw only one encyclical letter, that on the future of Palestine published on Good Friday, April 15, and entitled Redemptoris Nostri.

Important as a moral ruling was the Pope's rejection of artificial insemination when he addressed the 4th International congress of Catholic doctors on Sept. 29, and important also were the careful considerations of "juridical positivism" contained in three complementary addresses which the Pope delivered in November, the first, on Nov. 6, to a conference of Italian Catholic lawyers; the second, on Nov. 13, to the members of the Tribunal of the Rota, and the third, on Nov. 17, to a group of U.S. senators.

There were two canonizations during the year: those of the French B. Jeanne de Lestonnac (a niece of Montaigne) on May 15 and the Italian B. Maria Rossello on June 12. Diplomatic relations between the Holy See and Persia were established in June, and between the Holy See and India in July.

Among the Pope's visitors during the year were a delegation of members of both houses of the British parliament, headed by the speaker, on Jan. 11; Anthony Eden, on March 29; Sir Stafford and Lady Cropp on May 3; and Princess Margaret on May 10. In the latter part of the year there was a series of parties of members of the U.S. congress.

The College of Cardinals lost Cardinal Emmanuel Suhard, Archbishop of Paris, who died on May 30, and Cardinal Francesco Marmaggi, prefect of the Sacred Congregation of the Council, who died on Nov. 2 and was succeeded by Cardinal Giuseppe Bruno. Cardinal Adeodato Pizzad was created Cardinal Bishop of Sabina and Poggio Martito.

Finally, mention should be made here of the historic decree of the Sacred Congregation of the Holy Office, of which the Pope himself is prefect, which appeared in the Acta Apostolicae Sedis on July 13. This laid it down that Catholics cannot join or show favour to the Communist party in any part of the world and cannot publish, read, disseminate or contribute to Communist newspapers, periodicals, books or leaflets, under pain of excommunication. (See also Pius XII; ROMAN CATHOLIC CHURCH.)
VEGETABLE OILS AND ANIMAL FATS

Preliminary reports indicated that the total quantity of vegetable oils and oilseeds available for distribution as oil in 1949 probably amounted, in terms of oil, to about 4% more than the 1948 total and about 7% more than the prewar average. World exports of seeds and oils, in terms of oil, were higher than in 1948 but they were again well below the prewar level.

Groundnut production in 1949 was not expected greatly to exceed the record output of 1948, which was equivalent to about 1 7 million tons of oil. Output fell in the United States, while China’s production expanded only slightly owing to the disturbances in that country. Indian output, on the other hand, showed a decided increase. Official figures of production under the British East African groundnut scheme were not available; it was, however, announced that about 50,000 ac of groundnuts and sunflower seeds had been planted for the 1949 harvest. In British West Africa, seasonal purchases were slightly below the 1947-48 level. Clearance work began in Senegal during March 1949, under a scheme to increase French West African groundnut production by methods of mechanical cultivation. Exports of groundnuts from India showed a further decline in 1948-49, but shipments of groundnut oil were heavier than in the previous year. Groundnut exports from British and French West Africa in 1949 were again fairly large.

Forecasts for cottonseed indicated a further rise in total production in 1949-50 with increased output in the United States and India. Exports of cottonseed in 1949 showed an improvement on those of the previous year, but were again well below the prewar level.

Compared with 1948, production of linseed in the United States decreased by more than 20%, in 1949 and there was a much greater fall in Canadian output. Slightly increased production in Argentina and elsewhere was insufficient fully to offset the decline in North America and it was estimated that world production had fallen by about a tenth. Exports of seed improved considerably in 1949 but shipments of oil were smaller than in 1948.

Reports on other oilseeds crops again indicated no significant change in the total production of soybean, rapeseed, sesame and castor. No information was available concerning sunflower production in the U.S.S.R., but it was estimated that plantings in Argentina—the second most important producing country—exceeded the record acreage of the previous year.

Copro exports from the Philippine Islands were moderately heavy in 1949, although again much lighter than in the peak year 1947. Shipments from Malaya and Indonesia, on the other hand, were the highest recorded by those countries after World War II. There were increased exports of coconut oil in 1949; shipments from the Philippines were considerably higher than in 1948 but they were still well below the prewar level.

Purchases of palm kernels in Nigeria and Sierra Leone were heavier in 1948-49 than in the previous season, and palm oil purchases in Nigeria also increased. Malayan production of both kernels and oil rose in 1949. Shipments from the Belgian Congo were again important.

The 1948-49 output of edible olive oil in the Mediterranean region was estimated at only 362,000 tons, a decrease of about 68% compared with the previous season. Exports in 1949 were on a reduced scale.

Imports of the main kinds of oilseeds into the United Kingdom were considerably heavier in 1949 than in the previous year, only castor bean imports being below the 1948 level. There was very little alteration in supplies of vegetable oils.

Production of animal fats improved in 1949, although available supplies were still below the prewar level. The 1948-49 Australian and New Zealand production figures for butter showed an increase compared with 1947-48 and output rose substantially in 1949 in both Denmark and the Netherlands. A slight fall in Canadian production was more than offset by increased output in the United States, where lard and tallow production also improved. Whaling operations again came under international regulation in 1948-49 and whale oil production showed only a small increase over that of the previous season.

United States. The domestic production of fats and oils in the U.S., including the oil equivalent of exported seeds, in 1949 was forecast at a new record of about 12,010 million lb., compared with 11,786 million lb. in 1948 and a prewar level of 8,696 million lb. Domestic consumption was smaller in 1949 than in 1948 and the excess of production over consumption rose to a new record of 1,400 million lb.

Total U.S. butter production in 1949 was estimated at 1,800 million lb., about 8% more than in 1948. Production of lard and pork fats increased more than 300 million lb. in 1949. Vegetable oil seeds, however, were slightly less abundant; the 1949 cottonseed crop was about 9% above that of the previous year; soybeans were nearly a record crop; flaxseed production declined, compared with 1948 but was 45% above average.

In 1949, the prices of most fats and oils ranged from two-thirds to under half their record postwar levels in 1948. Butter was about 60 cents wholesale and lard between 10 and 12 cents.

Exports of most kinds of fats and oils from the U.S., largely to western Europe, increased in 1949. For the first nine months of the year exports were threefold that of 1948—1,826,200,000 lb.

VEGETABLES. 1949 was the most difficult year for vegetable growers after 1939: it brought a return to the situation in which they were undecided about what crops to grow for a profit. British growers were particularly confused by an implied change of governmental policy for the industry. A taste of what was in store came in the first three months when the prices of the staple income-producing crops dropped sharply. The mean weekly prices of five sample vegetables for Jan. 1 to March 31, expressed as an index of the respective 1948 prices, are shown in Table I.

| Table I—U.K. Prices of Certain Vegetables (Official average 1948 = 100) |
|--------------------------|----------------------|------------------|-------------------|
|                         | Winter | Spring | Total |
|                         | Onions | Onions | Onions |
|                         | Leeks  | Leeks  | Leeks  |
|                         |        |        |        |
| Average                   | 87     | 69     | 75     |
| At Covent Garden          | 93     | 74     | 84     |
| Official average           | 34     | 44     | 47     |

* From Minister of Agriculture’s Agricultural Market Report

Onions and leeks were a particularly bad trade, and it was estimated that 2,000 ac. of the latter crop were never harvested.

Overall acreage of vegetables, greatly expanded during the war, continued to increase after 1945 in response to the national effort for greater agricultural output. In 1948 this acreage was 63% above 1939 level, but the total marketings had not been on the same scale because yields were low. The mild winter of 1948-49 brought on good crops and the latent effect of the large acreage was revealed.

The loss of confidence among producers was reflected in a fall in the British acreage of vegetables from 583,000 to 530,000— at which level it was still 11% above the 1944-45 average. This was noteworthy in view of the government’s declared policy of keeping the vegetable acreage at its wartime level, whilst relying on internal measures such as more widespread grading, elimination of low grade supplies and local association of small growers to provide economic
VENEREAL DISEASES. Incidence showed a steady decline after the peak year of 1946 when in Great Britain alone 17,675 cases of early syphilis and 47,343 cases of gonorrhoea were treated at the various government and municipal clinics. In 1948 early cases of syphilis numbered 10,637 and gonorrhoea 30,312. Reports for 1949 showed that this decline was maintained.

Among the native populations of South Africa, Kenya and Southern Rhodesia the incidence remained high. In Southern Rhodesia alone nearly 600,000 received treatment and subsequent reports indicate that the numbers did not decrease: the diseases were widespread in both urban and rural areas. Efforts were made to bring penicillin into general use in the treatment of all cases of early syphilis; but the supply position prevented the institution of the standard procedure. It should also be noted that the incidence among service personnel in the Mediterranean, East Indies, Singapore and the far east remained high.

In France and Germany the incidence lessened but only slightly. This was probably owing to the fact that many continental venereologists did not use penicillin in the treatment of syphilis and gonorrhoea to the same general extent as was customary in the United States and Great Britain.

In this connection it was interesting to note that no worker in this field in either of the two latter countries reported a definite case in which the infecting organisms of these two diseases were penicillin-resistant.

In Sweden with a population of just under seven million there were 1,026 cases of early syphilis and 10,597 of gonorrhoea in 1948, a fall of 181 and 1,053 respectively compared with the figures for the previous year. There was every reason to believe that this trend was continued during 1949, an observation that applied to all other European countries for which statistics were available.

The incidence of non-gonococcal urethritis in the male, a disease that is commonly venereal in origin, showed a definite increase. However, this could partly be attributed to the fact that in the past many workers considered all cases of urethritis to be gonococcal in origin and therefore noted them in their official returns as gonorrhoea although the gonococcus was never found in the secretions. It was owing to the increasing use of penicillin, which was found to cure all cases of gonorrhoea but to be usually ineffective against non-gonococcal urethritis, that differential diagnosis in such cases became more accurate. Reports showed that non-gonococcal urethritis in its abacterial form was at this time the most common venereal disease, but one upon which very little research had been carried out. The Expert Committee on Venereal Diseases of the World Health organization sitting at Geneva recommended the collection of data on this condition and three memoranda were issued, the first by A. H. Harkness of London, the second by the surgeon general of the U.S. army, and the third by W. E. Coutts of Chile.

It was interesting to note that all cases mentioned in the second memorandum were considered to be bacterial (non-gonococcal) whereas in those of A. H. Harkness and W. E. Coutts no organisms could be demonstrated in the secretions of
a large majority of their cases. In all probability the organisms cultivated in the United States series were the normal saprophytic flora since cultural examinations of the urine of 200 controls not suffering from urethritis revealed similar types of bacteria. Inadequate cleansing before the taking of specimens was the probable explanation of this disagreement on the aetiology of this most prevalent of venereal diseases.

Advances in the treatment of the venereal diseases generally were associated chiefly with the recently discovered antibiotic known as aureomycin which was derived from a strain of Strep. myces aureofaciens isolated from soil. It was shown to have a low toxicity when administered orally in moderate dosage and to be curative in gonorrhoea (H. S. Collins et al., 1948, C. H. Chen et al., 1949); lymphogranuloma inguinale (L. T. Wright et al., 1948, H. S. Collins et al., 1948); granuloma venereum (L. T. Wright et al., 1948, R. B. Greenblatt et al., 1949); chancroid (C. H. Chen et al., 1949); certain types of non-gonococcal urethritis due to the virus of inclusion conjunctivitis (A. H. Harkness, 1949) and possibly pleuro pneumonia-like organisms (H. S. Collins et al., 1948, R. R. Wilcox and G. W. M. Findlay, 1949, A. H. Harkness, 1949). Confirmation was also obtained for the effectiveness of aureomycin in the treatment of syphilis both in its early and later manifestations. (P. A. O. Learby et al., 1948 and 1949) but extensive trials in this field still remained to be carried out. There appeared to be great possibilities in the extensive use of aureomycin in prophylaxis since it had been shown to be effective against six venereal diseases.

Another antibiotic, chloromycetin, was proved by R. B. Greenblatt and his collaborators to be effective against granuloma venereum and there were indications that it might also prove useful in cases of certain types of non-gonococcal urethritis.

After the British wartime defence regulation 33a (providing for the compulsory treatment of venereal disease contacts in certain cases) became void, the tracing and treatment of the spreaders of the diseases was more difficult. A team of social workers, however, carried out excellent work and, thanks to their tact and persuasiveness, many contacts attended the clinics. The Central Council for Health Education also continued its campaign of enlightenment which did much to bring the whole subject out into the open.

**United States.** In the United States, the outlook regarding venereal disease control was generally encouraging in 1949. The total number of syphilis cases (all stages) reported for the year ending June 30, 1949, for civilians in the U.S. and its territories, was approximately 14% lower than for the preceding fiscal year—296,455, as compared with 345,992.

Moreover, declining morbidity reports for the early stages of syphilis were believed to indicate that the incidence of the disease might be decreasing in the U.S. Consistent quarterly declines for almost three years in the discovery rate of primary and secondary syphilis, and later declines in the discovery rate of early latent syphilis, suggested such a reduction in the number of new infections occurring. That these declines occurred in the face of a 30% increase in efforts to find cases of venereal disease strengthened the thesis of diminished incidence.

Reported cases of gonorrhoea were lower in 1949 than for any year since 1945. For the U.S. and its territories, the 1949 total among civilians was 342,856.

The latest data recorded on mortality from syphilis also showed declines from figures previously reported. General syphilis mortality dropped to an estimated rate of 8 per 100,000 population in 1948, while for the same year the rate of infant deaths due to syphilis was estimated at 13 per 1,000 live births. The admission rate to mental hospitals for psychoses due to syphilis (excluding Veterans adminis-

VENEZUELA

A republic on the north coast of South America, bounded on the north by the Caribbean sea, on the east by British Guiana, on the south by Brazil and on the west by Colombia. Area: 532,143 sq. mi. Pop. (mid-1949 est.): about 4,500,000. No official attempt has been made to estimate racial distribution, but major fractions of the population are mestizo, Negro and mulatto. Approximately 10% of the entire population live in the capital, Caracas, and its suburbs; while Maracaibo (150,000), Valencia (65,000), Barquisimeto (60,000), Puerto La Cruz (45,000) and San Cristóbal (40,000) are the other large cities.

**History.** The political tension of late 1948 gradually relaxed during 1949, as it became apparent that an orderly liquidation of the crisis was destined to occur. Decreases provided for the invalidation of the confiscation of private property in the years 1945-48 and for its eventual restoration.
Diplomatic relations with the United States, Great Britain, Spain and other countries were resumed early in 1949. A commission was set up late in 1949 to frame an electoral law by virtue of which a national congress would be chosen with power to revise the constitution. On Nov. 24 an amnesty of political prisoners and municipal elections to be held, at an early date, were decreed.

The year was marked by a determined effort to restore order in public finance and a general overhauling of fiscal administration was undertaken. Venezuela continued to be the foremost exporter and second producer of petroleum products. Early in 1949, temporary market conditions led to a slight falling off in production, but in the second half of the year it rose again and reached a peak of 1,400,000 bbl. per day in the last months of the year. Refinery output by 10 refineries and topping plants in operation in 1948 totalled 43.5 million bbl. Several new refineries, topping plants and pipelines were under construction in 1949.

The year 1949 witnessed substantial progress in the initial stages of the iron mining enterprises of the Bethlehem Steel company and the U.S. Steel corporation south of the Orinoco river. These operations foreshadowed an economic development of the east and south which would hasten the realization of great hydro-electric projects and the utilization of natural gas for industrial purposes.

Venezuelan price levels rose only slightly during 1949. The currency was one of the few in the world whose statutory basis had not been changed in the 20th century. The housing shortage in Caracas was slightly less pressing; in some provincial cities it became more acute. There was no significant unemployment reported during the year.

Government activity in forestry, irrigation, agricultural education, experiment stations and pest control was noteworthy in 1949. The problem of adequate supplies of meat and dairy products was attacked by the Ministry of Agriculture and Corporacion de Fomento, a government long-term financing authority. The activities of the Ministry of Development embraced a wide variety of mining and petroleum interests, as well as industrial promotion in many lines. Some 300 miles of new roads were constructed and old roads were repaired; the programme of school and hospital construction was advanced. In the city of Caracas the construction of a central arterial boulevard, the Avenida Bolivar, was brought close to completion by December. (C. McGill)

**Finance and Banking**

(Million bolivares) Budget (1948-49 actual) revenue 1,962.7, expenditure 1,917.5; (1949-50 est.) revenue and expenditure 1,610.4. Domestic national debt (Dec. 31, 1948) 22.8; there is no external debt. Currency circulation (Nov. 1949, in brackets Nov. 1948) 703 (674). Gold reserve (Nov 1949) U.S $373 million. Monetary unit. bolivar with an exchange rate (in brackets before Sept. 1949) of 9.3-9.4 (13.5) bolivares to the $; a bolivar is valued at U.S. $0-2959 (controlled and free selling rates), but basic petroleum buying rate if U.S. $0-3236

**VETERANS' ADMINISTRATION, U.S.: see War Pensions.**

**VETERINARY MEDICINE.** The year 1949 was a notable one in that the 14th International Veterinary congress was held in London and was attended by over 1,000 delegates from many parts of the world.

Research upon bovine mastitis continued actively. A study was made of the comparative ability of two specially formulated water-in-oil emulsion vaccines to maintain a satisfactory level of penicillin in the bovine mammary gland and to compare them with that of an aqueous vehicle. A single injection of 100,000 units of penicillin showed that levels of the drug were maintained for significantly longer periods with either vehicle than with water, and in one case an effective concentration was attained for up to 72 hr. The results were published of a long-term study, ranging from one to seven years, upon the relationship of age to streptococcal infection of the milk of each cow in 12 Holstein-Friesian herds. The incidence of streptococcal infection of the mammary gland varied from 60-80% in the majority of herds. A regular increase in the incidence of infection occurred with advancing age, particularly during the first four years of lactation, but at different rates in the various herds. The rate of increase of infected animals was correlated with herd management practices, and also with the size of herd, the incidence being high in large herds despite good management. Trials were made of the antibiotic substance, nisin, prepared from *Streptococcus lactis*. Single intramammary infusion was used to treat 72 bovine udders infected with *Streptococcus agalactiae*. With 5,000,000 units per quarter, 35 out of 37 cases were cured, while with 2,500,000 units per quarter, 30 out of 35 cases were cured. Nine out of ten quarters infected with staphylococci were sterilized with single mammary infusions of 5,000,000 units.

Salmonellosis was shown to be a serious disease of adult cattle in certain parts of Great Britain, the associated organism being usually *Salmonella enteritidis var. dublin* which was incriminated in 43 out of 46 outbreaks.

The Stormont test for the detection of bovine tuberculosis was carried out upon a further 300 animals which were subjected to a detailed post-mortem examination. It was shown to be an efficient and reliable test and was believed to be superior to both the single intradermal and the single intradural comparative test for animals of unknown origin and history.

An antigenic substance prepared from killed *Brucella abortus* and dead vaccines consisting of whole organisms suspended in an oily base, failed to equal the efficiency of the living avirulent strain 19 in immunizing cattle against brucellosis.

The mucus agglutination test for the diagnosis of bovine trachomoniass was shown to be capable of detecting a considerably higher percentage of positives among the infected members of a herd than the blood agglutination test.

Foul-of-the-foot was shown to occur in very young calves. A small controlled experiment indicated that the recovery rate in animals treated with sulphonamides did not differ significantly from that in control cattle treated intravenously with 500 ml. of a 40% solution of glucose.

The rapid growth of artificial insemination in Great Britain

---
VIENNA—VITAL STATISTICS

was shown by the fact that no less than 11% of the dairy cattle of the country were inseminated at the Milk Marketing board centres.

An inherited form of cortical cerebellar atrophy in lambs ("daft lambs") in Great Britain was studied. Outbreaks of polyarthritis in lambs (associated with Erysipelothrix rhusiopathiae infection) were found to be a common sequel to serum inoculation or to dipping. An authenticated outbreak of pneumonia in sheep associated with a Pasteurella-like organism was described, and cases were successfully treated with either sulphapyridine or sulphasilazone.

A detailed study was made of a progressive retinal atrophy in Irish setters (Red). The condition was found to be associated with an atrophy of the receptor cells of the retina, with which was associated a reduction of the retinal blood vessels. The syndrome was established as hereditary, and was believed to be inherited as a simple Mendelian autosomal recessive factor. Much research was devoted to "hard pad" disease and, with the apparent concomitant reduction in cases of typical forms of canine distemper, a growing body of veterinary opinion subscribed to the view that the "hard pad" virus was a variant of distemper virus. A specific serum prepared against "hard pad" virus was widely employed with marked therapeutic success when administered sufficiently early. The value of protein hydrolysates for canine patients was established. Three spontaneous cases of the syndrome earlier termed Hepatitis contagosa canis were recorded in dogs in England.

A disease of newborn foals due to sensitization of the dam by an antigen from the red blood cells of the foetus, a so-called iso-immunization of pregnancy, was described, and the diagnosis was established by appropriate serological tests. The disease in the newborn foal was shown to be a haemolytic anemia due to an intravascular hemolysis, and could be treated with appropriate blood transfusion. Experiments were reported upon the treatment of horses with daily one-gramme doses of phenothiazine for periods of a year without toxic symptoms and with a marked reduction in fecal egg counts and in the larval counts of the paddock in which the animals were grazed.

Newcastle disease continued to threaten the British poultry industry and was found to be associated with the importation of frozen carcasses, from the viscera of which the virus was recovered. Legislative procedures to help to deal with the spread of the disease were introduced.

Benzoic hexachloride and chlordane—the latter a byproduct from the synthetic rubber industry—were found to be efficient agents for the control of the tick Boophilus (Margaropus) annulatus var. microplus in Jamaica, while DDT also was superior to the arsenal preparations hitherto employed.

In Great Britain progress was made towards the establishment of university schools of veterinary medicine and the laboratories of the Poultry Research station of the Animal Health trust were opened at Houghton Grange, Huntingdonshire.

VIENNA, capital of Austria and by far the largest city of central and south-eastern Europe. Area: 107 sq. mi. Pop.: (1934 census) 1,874,581; (June 1945 est.) 1,250,000, (June 1948 est.) 1,730,613. Vienna is under quadripartite Allied occupation; besides the four sectors there is the international district in the centre of the city governed each month by a different power. Burgomaster, Theodor Korner (Socialist).

Against a backcloth, still, of war destruction the stage was set in 1944 for the revival of Vienna as the great capital city of central Europe. The tranquility and order were the more conspicuous in contrast with the tension and misery of Berlin, and the declension of its rival, Prague, into a drab outpost of the U.S.S.R. While there were still marks of poverty and suffering, the Viennese population as a whole appeared well-dressed and the chief shops stocked with finely wrought Austrian as well as imported goods. The first instalment of $230 million under the European Recovery programme had worked wonders. And the Four-Power administration maintained its record of harmony.

The city council was largely preoccupied with housing and reconstruction problems. By April the building of 2,000 municipal flats under the 1948 programme was completed and a start was made on a further programme of building and war damage repair. In spite of steady progress the housing situation was still critical and at the end of the summer as many as 50,000 families were seeking accommodation. Repairs to St Stephen's cathedral, so that it could at least be used for mass, made good progress, though the task of restoration would take years. Early in the year the municipality had to admit that there were no funds available for rebuilding the Burgtheater or the State Opera house; but on March 9 a request was put up to the E R P authorities for a sum of Sch 20 million to enable the work to go on. Meanwhile music was reconquering its domain, and the theatre was flourishing, on whatever small stage could be improvised.

The old epitaph of "red" Vienna was no longer applicable. Already weakened in the 1945 elections the Socialists suffered a further blow in the October municipal elections with the emergence of the Nationalist League of Independence. The Socialists retained only a bare majority in the city council, with 52 seats out of a hundred. Only in the Soviet-held factories was there a "revolutionary" nucleus, with a tightly-organized workers' militia against the day when the Soviet forces would depart. (W. H. CTR.)

VITAL STATISTICS. Two important documents, published in 1949, produced a wealth of statistical material on world population trends in recent years. Not only did they provide much data for the postwar period which had previously been unobtainable, but they also made significant additions to the existing material relating to earlier years. The first of these—the United Nations Demographic Yearbook 1948—included data received in answer to questionnaires from 166 sovereign countries, dependencies, non-self-governing territories,trust territories, condominiums and international administrations covering a wide range of statistics. The second document—the Report of the United Kingdom Royal Commission on Population (H.M.S.O., London, 1949) —combined an invaluable collection of all the relevant data with further analysis and recommendations for a population policy.

Births. There was a remarkable degree of uniformity in the movement of crude birth rates in western Europe after World War II. In all countries, the end of the war brought a sharp increase in the number of births registered and by 1947, the peak year in most cases, the percentage increases over average prewar rates varied between 17 and 37. The smallest increases occurred in the non-belligerent countries and the greatest increase in France. Figures for the full year 1948 showed a falling birth rate in all countries except Spain, Portugal and the British and French zones of Germany; preliminary figures covering the first six or nine months of 1949 showed a continuation of this decline for all countries other than France, Germany, Ireland and Switzerland which showed increases on the 1948 figures. During 1948, the highest birth rates in western Europe occurred in Portugal, the
VITAL STATISTICS

Netherlands, Czechoslovakia and Spain: the lowest figures were recorded in Germany, Belgium, Austria, the United Kingdom and Sweden.

In Australia, New Zealand, Canada and South Africa, postwar birth rates followed the same general trend, reaching a peak in 1947 and falling off in the following years. Birth rates in India had fallen steadily since 1911-13, while in Japan a rate of about 34 per 1,000 had been maintained, with few exceptions, since this date.

In the United States the number of births during the year ended July 1, 1949, totalled 3,723,000—an increase of 33,000 on the figure for the previous 12 months, but below the record 1946-47 figure of 3,986,000.

The almost universal increase in the number of births in the previous years subsided and should be regarded, in the main, as a postwar phenomenon. To a large extent these additional births were either "delayed" by the war or were "borrowed from the future" on account of earlier marriages during wartime. Nevertheless, rates were still substantially above average figures for the interwar years.

Marriage Rates. The number of marriages per 1,000 inhabitants fell steadily during 1946-49 in all the principal countries of Europe, in the dominions and in the United States. During the war people tended to marry younger; in a sense these marriages were "borrowed" from the future and the sharp fall in current marriage rates reflected this fact. But figures for the full year 1948 were appreciably above 1932-36 averages and the incomplete figures for 1949 showed a rate lower than in 1948 but in most cases still above the prewar level.

Deaths. Death rates during 1948 established record low levels in all the main countries of the world, although the figures for Australia and New Zealand were slightly above the low prewar level. Incomplete figure for 1949 showed a general rise in the number of deaths except in the United States, Canada, Australia and India. The lowest death rates in 1948 were recorded in the Netherlands, Denmark, Norway, South Africa and New Zealand; and the highest rates in India, Mexico, Portugal, Belgium and France.

The death rate for the United States in 1948 was the lowest in census history. At 9.9 per 1,000 population, it was 2% below the 1947 rate of 10.1, and 1% below the 1946 rate. The leading causes of death remained the same as in 1947; the major diseases associated with advanced age accounted for 63 of every 100 deaths. Figures for the first ten months of 1949 show a further drop on the comparable figure for 1948.

The above charts are based on data contained in the report of the Royal Commission on Population published in June 1949. The commission was set up in March 1944 under the chairmanship of Viscount Simon. He resigned in May 1946 and was succeeded by Sir Hubert Douglas Henderson. The Royal Commission consisted of 16 members; of whom six were women; Lady Dollan resigned in June 1946.

Net Reproduction Rates. In spite of falling death rates, the rate of growth of the populations of western Europe slackened considerably throughout the 20th century. The Netherlands was the only country in north-western Europe in which rapid growth continued. Similarly, in the United States, Australia, New Zealand and Canada the rate of population growth declined. In southern and eastern Europe a recent decline in fertility had been offset by falling death rates, with the result that the populations continued to expand at their former rapid rate. In India and Pakistan population growth was intensified by a decline in death rates unaccompanied so far by any proportionate decline in fertility. The population of China remained approximately stable on account of death rates being roughly as high as birth rates.

Some guide to future population movements was offered by the trend of reproduction rates in various countries. These rates, measured on the basis of current fertility and mortality, the degree to which a nation was reproducing itself or, more accurately, the degree to which one generation of mothers of child-bearing age was reproducing itself. Table V gives the net rates of reproduction in 20 countries before World War II together with the most recent postwar figure where available.

In all countries recent figures were above unity, reflecting the enormous rise in birth rates since 1945. These compared with prewar figures which were, in the case of most western European countries, well below reproduction level. But too much significance should not be attached to this seeming sharp reversal of the downward trend, since to a large extent the higher rate was due to the impact of World War II.

* For notes on table see end of article.

Recent figures for England and Wales showed that, in 1948, the population was still reproducing itself but to a lesser extent than during the previous year. This was the third year in succession in which the effective reproduction rate was greater than unity. There was a striking similarity between the figures during and after the two World Wars.

Age Composition of the Population. The decreasing birth rate evident until the last few years in most of the countries of western Europe led to a persistent increase in the average age in these countries. This movement was strikingly evident in the United Kingdom. In 1871, 36% of the population was under 14 years of age. By 1947, this age group represented only 22%, of the total. At the other end of the scale, only 11% of the population in 1871 was over 55 years of age; the corresponding figure for 1947 was 21%.

The United Kingdom Population Report. Some of the main features of the Report of the Royal Commission on Population are shown graphically on page 665. Apart from summarizing all the available information on the trend of births, deaths and marriages over recent years, the report examined and analysed such-points as the significance of the very high births of recent years; the trend in the size of the average British family over the last hundred years; the variations in size of family between different “social classes.” Finally, by taking three different assumptions about the trend of future family-building habits as a basis, an attempt was made to show possible movements of the British population in the next hundred years.

The commissioners concentrated their study to a large extent on movements in the average size of completed families. In mid-Victorian times the average number of children in each completed family numbered between 5 to 6. Between
Between 1937 and 1947 the world’s population grew from 2,140 million to 2,320 million. In South America the increase was 23%, while in Europe it was only 6%. The increase in Asia was nearly 100 million.

One important factor emerged from this analysis: after falling continuously for half a century, the average size of family has been comparatively stable over the previous 20 years at a figure of about 2.5 children per married couple. This, the report estimates, is some 6% below replacement level.

Turning towards the future, the report discounted the significance of the postwar "jump" in the birth rate. By taking the 1933 marital fertility rates, it estimated the number of births that would normally have been "expected" annually between 1939 and 1948 and compared these with actual figures. Taking the period as a whole, the number of births actually occurring was only slightly higher than the number "expected." But the distribution from year to year was quite different.

* For notes on table see end of article

1865 and 1900 the average size of the family fell by a quarter, and the fall gathered speed as time went on. By 1946 the average completed family had 2.2 children—a reduction of 60% on the mid-Victorian average.

But the decline in family size did not proceed uniformly throughout the community. Among couples married in the first 30 years of the 20th century, the average size of a family of manual workers consistently exceeded that of non-manual workers by just over 40%. Thus, among non-manual workers married after 1920, the average size of family had fallen well below 2, while that of the manual worker had come down to an average of 2.4.

Nevertheless, the very fact that, in spite of the wartime disruptions of family life, the average size of the British family remained as high if not slightly higher than ten years previously suggested the possibility of a small increase in the size of completed families. Figures for recent years also indicated that the size of the family of the non-manual worker had increased while that of the manual worker had fallen.

The report took a fairly optimistic view in considering the future trend of population numbers. If the average size of family were to stay constant at the same level as among couples married between 1927-38, the total population of...

Great Britain by 2047 should number about 45·5 million compared with just over 50 million today. A 6% increase in the size of family would lead to a slow increase in the population to 52·7 million in 100 years. If, on the other hand, the average family size fell to 80% of this level, numbers would fall sharply to some 29·6 million in 2047.

Notes on Table. 1. Annual rate during first nine months of 1949 unless otherwise stated. 2. Annual rate during first six months of 1949. 3. 1946—latest figure. 4. 1921-25. 5. Figures to 1946 refer to former British India; beginning 1947 to Indian Union. 6. European population only. 7. Including armed forces overseas. Blanks—Not available. (See also Marriage and Divorce.) (E. I. U.)

VYSHINSKY, ANDREY YANUAREVICH, Soviet politician (b. Odessa, 1883). Deputy chairman of the council of people's commissars of the U.S.S.R. from March 31, 1940, and deputy people's commissar of foreign affairs from Sept. 7, 1940, he was not among the nine deputy chairmen of the council of ministers (the description people's commissar being dropped) appointed by Joseph Stalin on March 15, 1946. He remained, however, one of the four deputy ministers of foreign affairs. (For his early career see Britannica Book of the Year 1949.)

On March 4, 1949, he succeeded Vyacheslav M. Molotov as minister of foreign affairs. He took part in the Paris session of the Council of Foreign Ministers (May 23-June 20, 1949) and was the head of the Soviet delegation at the 4th U.N. general assembly at Flushing Meadow, New York. His strong protest against Yugoslavia's candidature to the Security council did not prevent its election on Oct. 20. Speaking at a meeting of the U.N. political committee on Nov. 10 he alleged that the U.S.S.R. was using atomic energy for such peaceful purposes as razing mountains and irrigating deserts. On his way back to Moscow he stopped in Berlin on Dec. 14 and called on Wilhelm Pieck, president, and Otto Grotewohl, prime minister, of the German Democratic republic.

WAGES AND HOURS. Meeting early in September, before the devaluation of the pound sterling was announced, the British Trades Union congress re-affirmed its support for the policy of restraint in wage-claims; and the general council re-asserted this attitude with increased insistence after devaluation had been made public. At this time a number of the principle trade unions had important wage-claims under negotiation, including the Confederation of Shipbuilding and Engineering Unions and the Civil Service Clerical association. The National Union of Railwaymen had just had its claim for an all-round advance rejected by the special tribunal to which it had been referred, and there was talk of strike action, or of a "work to rule" movement; but the delegate conference of the union decided to limit its action for the time being to a renewed demand for an improvement in wage rates for the lowest paid grades, for which an offer had actually been made by the British Railways executive before the major issue was referred to the tribunal.

During the first eight months of 1949 wage changes were less than during the corresponding months of 1948. The principal groups to receive advances were the agricultural workers, the cotton operatives, the postal workers and the building trades. The total advances recorded in the official statistics up to the end of August amounted to £765,000 a week spread among 4,415,000 workers, as compared with £2,119,000 and 4,848,000 workers in the corresponding months of the previous year. There were no important changes in standard hours of work. The official index of wage rates (June 1947-100) stood at 109 in Aug. 1949, as against 106 a year previously.

For weekly earnings, as distinct from wage rates, the latest current figures were for April 1949. For the trades covered by the returns the overall average was 119s. 4d., as compared with 114s. in April 1948 and 53s. 3d. in Oct. 1938, which is used as the datum line for reckoning the percentage changes since the beginning of World War II. This gives a rise of 124% in April 1949, and of 114% a year earlier. Over the same period, average hours worked (including overtime) had fallen from 48·5 in Oct. 1938 to 45·3 in April 1949 and the same a year earlier. The reduction in actual hours worked was substantially less than the reduction in the standard working week, as more overtime was being worked. Most trades in 1949 were working a five-day week, with overtime, except where special reasons existed for week-end work. These statistics of wages and hours did not include agriculture, coal mining, railways or the distributive trades, and covered only a minority of transport workers. They were, however, sufficiently representative of manufacturing industries and of most public utility services. Table 1 breaks up the overall averages into separate averages for men, women and young workers.

These general averages conceal both the differences between skilled and less skilled workers and the differences between industries. In all occupations there was a considerable narrowing of the real differentials paid for the more skilled work, especially under time-work conditions. This was mainly the effect of flat-rate advances to all workers in an industry irrespective of skill. In piece-working occupations some, but by no means all, skilled workers were able to increase their earnings enough to offset the decline in relative margins as measured by wage rates; but in some cases less skilled workers were able to increase their earnings more easily than the more highly skilled. There was considerable discontent among a number of groups of highly skilled time-workers, including supervisory grades, where their earnings fell below those of piece-workers ranking below them in the traditional hierarchies.

In April 1949 the industries recording the highest average earnings were, for adult men, automobile manufacture and newspaper printing (both 170s.), and for women, passenger road transport (108s.) and automobile manufacture (97s.). The lowest earnings were, for men, in linen and jute (108s.) and local authority industrial services (114s.), and for women, in linen (61s.) and laundries (66s.). For men, the great majority of industries fell within the range 148s.-127s., and for women, within the range 80s.-70s. After devaluation there was some talk of instituting a minimum wage of 100s.
a week for adult men, with a lower minimum for women workers; but this, if it meant a minimum rate of 100s. for the standard working week, would involve a very considerable rise in the total wages bill. In engineering, which is relatively well paid, the bottom rate was only 92s., and on the railways the average for the lowest grades was 92s. 6d. In 1948, according to the official calculation, wages absorbed 44% of the national income. Salaries 21% forces pay 3% and rent, interest and profits 32%. The corresponding percentages for 1938 were 37, 24, 3 and 27; and for 1947 they were 42, 21, 4 and 33. These figures show the distribution prior to taxation. After taking account of direct taxation the percentages for 1948 were 48, 21, 3 and 28; for 1947 they were 46, 21, 5 and 28 and for 1938 they were 39, 25, 2 and 34. (G. D. H. C.)

* 1941 = 100

Compared with 1948, 1949 was a year of greater stability. Hourly wages continued their upward trend, with the slight decline in average weekly earnings attributable to a reduction in the length of the working week. In conjunction with price trends, the net effect was an increase in real wages. (See also Prices; Wealth and Income, Distribution of.)

**WAKE ISLAND:** see United States Territories and Possessions.

**Wales.** Principality forming part of Great Britain. Area: 8,012 sq. mi. (with Monmouthshire). Pop. (Dec. 31, 1948, est.): 2,552,000.

Early in 1949 the Welsh Assembly of Local Authorities sought the views of 182 such bodies on the government’s proposal to set up an advisory council for Wales and Monmouthshire. Of the 149 local authorities which replied, only 12 approved outright, 67 approved of it as an experiment, 64 rejected the proposal and 6 favoured no action either way.

The prime minister on April 26 announced in the House of Commons 27 nominations and appointed H. T. Edwards, a north Wales trade union organizer with long experience in public service, chairman of the Advisory council. At the first formal meeting held in Cardiff the members of the council were accorded a civic welcome. Subsequent meetings were held in private in north and west Wales; and in the autumn it was announced that specialist committees would inquire into the problems of emigration from Wales, unemployment amongst partially disabled workers and marginal land.

In the annual debate on Welsh matters in the House of Commons (Nov. 24) James Griffiths, minister for national insurance, stated that the Advisory council was only part of a developing policy and should be judged in relation to other things the government had done for Wales since 1945. During the debate there were cries of "Wales wants a republic from the gunners in the Admirals who show Wales on the maps below.

In their speeches several of the Welsh members criticized government policy, particularly on agriculture, war training in traditional beauty spots, and unemployed ex-miners; and there were demands for self-government for Wales.

Considerable opposition arose to the British Electricity authority’s proposed £20 million hydro-electricity schemes for north Wales which embodied the construction of six dams and the flooding of six valleys in districts famous for their natural beauty. There was also some uneasiness over the increasing demands of the Forestry commission on hill-farming land in order to attain its objective of planting on some 14,000 ac. annually in Wales for a 50-year period.

Re-organization of the basic industries went on steadily. Although the number of miners in the south Wales
coalfields decreased by 4,500, increased mechanization and improved relations between managers and men helped to raise output, although the increase of 300,000 tons on the previous year's output was considered disappointing. New developments in open-cast mining in west Wales were expected to yield more than a million tons a year of anthracite over the next six years and to give coal exports from Wales, which rose by some 2 million tons in 1949, an additional fillip.

Wales once again played an important role in the achievements of Britain's steel industry. Production of crude steel and of pig iron showed a substantial advance on the previous year. By the third quarter of 1949 the steel output was at the rate of 3.3 million tons. As in mining there was a dearth of skilled men in the Welsh tinplate and sheet steel industry but output rose steadily and formed a high percentage of the whole United Kingdom yield of these products. What was believed to be the largest strip mill in Europe was nearing completion at Port Talbot, Glamorgan, and the complementary cold reduction plant at Llanelli, Carmarthenshire, was also well advanced. Government spokesmen gave assurances that more new industries would be established in south Wales to absorb some 10,000 men who would become redundant at old plants when the vast new enterprise got under way.

Diversification of Welsh industry continued steadily despite shortage of materials and key labour and devaluation problems. It was announced that in four years work had been provided for 45,000 persons in new government-built factories in Wales. On the other side of the picture was the average unemployment total of some 36,000 mainly disabled men, a considerably higher percentage than that of the workless in England or Scotland. The first regular north to south Wales air service operating between Valley (Anglesey), Hawarden (Flint) and Cardiff, closed down after six months owing to poor public support.

Welsh agriculture made further headway. At the end of September the total cattle at 994,371 head was the highest ever and an increase of 32,200 on the previous year. Sheep and poultry also increased substantially. Acreages under wheat, potatoes and tillage were sustained at practically the previous two years' figures. Milk production advanced once again—milk sales increased by 61.1 million gallons in ten years.

In education the new Welsh Joint committee began its work with H. Wyn Jones, former director of education for Carmarthenshire, as secretary. Cardiff castle, presented to the city by the Marquis of Bute, was re-opened as a Welsh National College of Music and Art. The National Eisteddfod at Dolgelley, a small country town of Merioneth, attracted some 70,000 people and made £4,000 profit. At another small but picturesque north Wales town, Llangollen, the third annual International Music Eisteddfod attracted singers, dancers and instrumentalists from 14 European countries as well as large audiences.

Welsh culture suffered a great loss by the death of Dr. T. Gwyn Jones, scholar, poet and writer of European stature, and Dr. T. Rowland Hughes, poet, novelist and radio feature writer. Exactly a century after the appearance of Lady Charlotte Guest's translation into English of the epic Welsh tales The Mabinogion, another version based on more authentic manuscripts was published after four years' work by Professor Gwyn Jones and Thomas Jones of Aberystwyth university college. (J. C. G. J.)

WAR CRIMES. Europe. The most important war crimes trials of 1949 ended April 14, when a U.S. tribunal at Nuremberg found 19 of 21 former German ministers and government officials guilty of planning aggressive war, war crimes and crimes against humanity. The sentences in this so-called "Wilhelmstrasse trial," which had proceeded for 17 months, ranged from 4 to 25 years in prison but time already spent in captivity was to be deducted from the terms. Otto Messner, chief of the presidential chancellery, and Otto von Erdmannsdorff, ambassador to Hungary, were acquitted. Found guilty were Gottlieb Berger, chief of the S.S. main office; Edmund Veesenmayer, minister pleni-potentiary; Hans Lammers, chief of the Reich chancellery; Hans Kehrl, chief of the armaments and war production planning office; Paul Korner, Göring's deputy for the four-year plan; Paul Pleiger, chairman of the Reich coal association, Lutz von Schwerin Krosigk, Reich finance minister; Wilhelm Keppler, Hitler's special economic adviser; Ernst Wormann, director of the political division of the Foreign Office; Richard Walther Darré, food and agricultural minister; Otto Dietrich, state secretary of the Propaganda Ministry; Karl Rasehe, head of the Dresdner bank; Gustav Steengracht von Moyland, state secretary of the Foreign Office; Ernst von Weizsacker, ambassador to the Vatican; Walter Schellenberg, chief of the combined military intelligence service and S.S. official; Ernst Wilhelm Bohle, chief of the nazi party's foreign organization; Emil Puhl, vice-president of the Reichsbank; Karl Ritter, ambassador for special assignments, and Wilhelm Stuckart, state secretary of the Interior.

The report of the United States military government in Germany for April 1949 described this trial as the "last of the Nuremberg War Crimes Cases." U.S. war crimes tribunals in Europe had tried 1,873 persons, of which 459 had been sentenced to death, 1,110 to prison and 304 acquitted.

The British government announced on May 5 that the charges against Field Marshal Karl von Rundstedt and General Adolf Strauss would be dropped, but Field Marshal Erich von Manstein would be tried. The trial of Manstein opened in Hamburg on Aug. 23. The prosecutor was Sir A. S. Comyns Carr, K.C., British prosecutor at the Tokyo trials. Manstein was defended by a member of the British bar, R. T. Paget, K.C. He was found guilty of having committed nine war crimes while leading German armies in Russia and on Dec. 19 was sentenced to 18 years' imprisonment. There would be no further war crimes trials in the British zone.

No application for extradition of war criminals had been accepted since Sept. 1, 1948, and none for traitors and collaborators since March 1, 1949. British war crimes tribunals in Germany had tried 937 persons, of which 230 had been sentenced to death, 447 to prison and 260 acquitted. The trial of Otto Abetz, German ambassador to the Vichy government, by a French military court resulted in his sentence to 20 years' hard labour on July 22. German courts were henceforth to be responsible for trials of crimes against humanity in western Germany whether involving German, Allied or United Nations persons.

Far East. The Far Eastern commission decided on Feb. 24 that there would be no further international military tribunals in the far east and recommended on March 16 and 31 that any further war crimes trials in national tribunals be decided upon by the end of June and concluded if possible before the end of Sept. 1949. The U.S. state department announced on Jan. 13 that the 11 former enemies of Japan, including the U.S.S.R., had agreed in 1945 to exempt the Japanese emperor from trial for alleged war crimes. The trials of Admiral Soemu Toyoda, chief of the Japanese naval staff, ending in his acquittal on Sept. 6, 1949, and of Osamu Satono, sentenced on Oct. 19, 1949, to five years' imprisonment for beheading, under orders, a captured U.S. airman, were the last U.S. trials in the far eastern area.
Field-Marshall Fritz Erich von Manstein on trial in Hamburg. The trial opened on Aug. 23, 1949, and on Dec. 19 he was sentenced to 18 years' imprisonment.

General Douglas MacArthur announced the end of war crimes trials on that date saying 4,200 Japanese had been convicted by seven Allied nations in the far eastern area and 720 had been executed. About 100,000 suspects had been questioned.

Statistics of Trials. The U.N. War Crimes commission had by the close of 1949 completed its work begun in 1943. It had published 15 volumes of Law Reports of the Trials of War Criminals. The final volume analyses the law and procedure in the 99 cases reported and 92 cases cited in this series. These cases were selected from 1,911 trial records received by the commission. The commission also published its own history with statistical data and critical analyses of the law and procedure developed in its own work and the work of the tribunals. The war crimes tribunals of the United States, Australia and western European countries held more than 2,000 trials about equally divided between the European and far eastern areas. These trials involved more than 6,000 persons resulting in about 1,500 death sentences, 3,500 prison sentences and 1,000 acquittals. Data on trials by the eastern European countries and China were lacking, but the numbers were probably no less. More than 10,000 persons of the axis powers were tried for war crimes and probably 80% were found guilty. The U.N. War Crimes commission examined more than 8,000 charges involving 36,000 persons and issued lists of more than 20,000 persons which it thought should be tried. These lists were probably incomplete and many listed were never tried. Lord Wright, chairman of the commission, expressed the opinion that if 10% of the actual war criminals were tried, the results would not be unsatisfactory.

WAR PENSIONS. The burden of pensions to war disabled, war widows and servicemen's dependants continued to be serious in many countries of the world, World War II having increased the strain on national budgets in this respect. In Great Britain the number of pensions awarded for World War II was less than half that for World War I and in France it was about one-tenth; in the United States, on the other hand, there was a more than threefold increase. In the Soviet Union also the number of war disabled was certainly a great deal larger than after World War I, but no figures were published.

Great Britain. By March 31, 1949, 1,078,469 pensions were being paid, as compared with 1,112,908 a year earlier. Their categories are given in Table I.

The estimated total expenditure of the Ministry of Pensions in the financial year ended March 31, 1949, was £89,914,500 (3 1/2% of the total budget expenditure) bringing the total cost of war pensions since Aug. 4, 1914, to £1,930 million. Expenditure in 1948-49 was £825,982 greater than in the previous year. Details of expenditure and a comparison with earlier years are given in Table II.

* Estimated.

Because, by 1949, the basic pension for a totally disabled ex-serviceman was £45s. a week, only 5s. more than in 1919, the British legion and other kindred associations launched a campaign to double the pensions and bring them into line with doubled prices and wages. On April 26, E. R. Bowen, Liberal member for Cardigan, submitted a motion asking the House of Commons to agree that it is desirable that a royal commission shall be set up to inquire into the present position relating to war pensions and allowances and as to their adequacy under prevailing conditions." The motion was rejected by the house by 307 votes to 149.

On May 24, however, a new royal warrant was issued (Cmd. 7699) making further provision concerning retired pay, pensions and other grants for disabled members of the forces and of the nursing and auxiliary services, and for the widows, children, parents and other dependants of such members who had died in consequence of service after Sept. 2, 1939. Two other royal warrants—of May 30, 1949, (Cmd. 7712) and May 31, 1949, (Cmd. 7711)—extended the new provisions to pensioners of World War I and the Home guard respectively.

United States. In the budget estimates for the year 1950-51 a total of $6,080 million, one-seventh of all expenditure.
War disabled from most parts of England at the second annual rally in July 1949 of the Invalid Tricycle association. Over 500 members attended the rally which was held in Richmond park, Surrey.

was earmarked for veterans' services and benefits. The size of these requirements reflected a five-fold increase since 1939 in the number of veterans and new re-adjustment benefits provided for veterans of World War II, as well as increases in rates of benefit and in general services to veterans. Most of these expenditures were not controllable by the ordinary appropriation process. Expenditure depended largely on how many of the U.S. 19 million living veterans and how many dependants of deceased veterans applied and qualified for aid under some 300 laws. The variable impact of veterans' programmes on the budget was indicated by the fact that expenditure for the year 1949-50 was estimated by December at $1,400 higher than a year earlier.

France. At its general assembly in Paris, on Feb. 5-6, 1949, the Union Française des Associations des Combattants passed a resolution asking the parliament and the government to re-establish the relationship existing between war pensions and civil service pay before World War II and to keep it in line with the cost of living. Another resolution asked for a fivefold revaluation of the ex-serviceman's gratuity (retraite du combattant).

In order to keep up with the constantly rising cost of living, or depreciation of money, pensions had been increased 450% (1938 = 100) in July 1947; further increases in Feb. 1948 had brought the pensions to the index number 600 and in April 1949 to 690. The latter increase meant an additional yearly expenditure of Fr. 3,600 million. French ex-servicemen, however, were not satisfied as the general price index number stood in April 1949 at above 1,700 (1938 = 100).

Established by law on April 16, 1930, the ex-serviceman's gratuity had been fixed at Fr. 530 per annum from the age of 50 and Fr. 1,272 per annum from the age of 55 and there had been no subsequent re-adjustment. On Dec. 8, 1949, the premier, Georges Bidault, told the National Assembly that an increase by 500% would cause an additional yearly expenditure of Fr. 10,000 million. The problem was still being discussed at the end of the year.

In the 1950 budget estimates a sum of Fr.25,659 million (1.16% of the total ordinary expenditure) was earmarked for 1,185,560 war pensions, including 815,863 for the disabled of World War I, 285,696 for those of World War II and 84,001 for disablement caused other than in war operations.

WAR PRISONERS: see PRISONERS OF WAR.

WARSAW, capital of Poland. Area: 54 sq. mi. Pop. (Sept. 1, 1939) 1,289,000; (Jan. 20, 1945 est.) 155,000; (July 1, 1949) 617,949. Budget (1950 est.): revenue Z1,3,497 million; expenditure Z1,6,730 million. President of the city (lord mayor), Stanislaw Tolwinski.

History. Reconstruction of the capital continued during 1949 on a larger scale than in the previous year, employing nearly 50,000 builders. In the centre of the city traditional Polish architecture, mainly 18th century, was being preserved. On June 23, a new railway bridge and a new tunnel under Sikorski (formerly Jerusalem) avenue were re-opened to traffic. The inauguration on July 22 of a new east-west thoroughfare, with a tunnel under the old town, and a modern bridge, was attended by the Soviet Marshal Konstantin Rokossovsky (see POLAND). The construction of a north-south artery on the axis of Marszałkowska street made great progress. Buildings restored during the year included the National theatre, and among monuments which also underwent restoration was that of King Sigismund III Vasa. By the end of the year the total volume of Warsaw buildings was estimated at 44 million cu. m., that is, 43% of the pre-1939 living-space. Of this total 18 million cu. m. represented restored and new buildings. Before World War II there were in Warsaw about 80 cu. m. of building space per inhabitant, including 54 cu. m. for dwelling houses; by the end of 1949 the respective figures were approximately 70 and 50 cu. m.

WASHINGTON, DISTRICT OF COLUMBIA, federal capital of the U.S. Area: 61 sq. mi. Population (mid-1949 est.) 870,000. During World War II and postwar years the population spread in increasing numbers into the neighbour
WATER SUPPLY

states of Maryland and Virginia. Many federal buildings, including the famous Pentagon, were located outside the district limits. The comprehensive plan of Washington, which was to be completed in 1950, treated the entire region. Legislation pending at the close of 1949, would enlarge the National Capital Park and Planning commission to include members appointed by the governors of Maryland and Virginia, and would bring all plans for public buildings and grounds before the Commission at an early stage.

During 1949 enough apartment buildings were completed or under construction to bring some relief to the housing congestion in 1950. The Pan American Office building on Constitution avenue was completed in 1949. The White House had been dismantled and was being rebuilt.

The budget for the District of Columbia, year ending June 30, 1950, amounted to $110 million, of which about $15 million was for city improvements. During 1949 a sales tax of 2% on many commodities came into effect and about $4 million was collected in four months; the estimated total for 1950 was $14 million.

A bill was introduced into the 81st congress to provide for a constitutional amendment under which the residents of the District of Columbia would be permitted to vote for representation in congress, which, under the constitution, was responsible for all legislation for the District of Columbia.

WATER SUPPLY. The summer of 1949 in Great Britain was the driest after 1921 and the sunniest after 1933 and consequently numerous water undertakings experienced difficulty in maintaining a continuous supply of water to their consumers and many found it necessary to introduce restrictions of the use of water. Cattle had to be moved to better pastures and in east London, where a ration of four gallons a person a day was imposed, drinking water had to be sent to the port by sea. Citizens were compelled to use sea water for dish-washing and sanitation and some even experimented with it for cooking purposes.

Although there was a general shortage throughout the country, the most affected areas were southwest and northeast England. In the Tynemouth area, stop taps of consumers were regulated to allow only a small trickle and foreign vessels engaged in shipping on the river Tyne were asked to bring water for their own needs from their home ports. The Tees Valley Water board, in conjunction with Imperial Chemical Industries, carried out rain-making experiments by dropping solid carbon dioxide from aircraft onto suitable cloud formations. Although on two occasions rain was produced, the benefit was found to be slight. Fortunately rain came towards the end of October and the situation was relieved.

Not only in Great Britain but in Europe and in other parts of the world severe drought conditions were experienced. In Africa the effects were serious from the Cape of Good Hope to Kenya and many government feeding schemes were introduced to avert famine.

Many new schemes under construction in Great Britain were retarded because of shortages of labour and materials but good progress was made with the construction of new waterworks for the island of Anglesey, the Claerwen dam for Birmingham, the Digly reservoir for Huddersfield and the Blithfield reservoir for south Staffordshire. Darwell reservoir for Hastings was completed and work began on the construction of reservoirs for Northallerton, Wakefield and Swansea. The proposal by the Metropolitan Water board to construct

The King George VI reservoir at Staines, Middlesex, during the dry summer of 1949. The normal water level of the reservoir, which has a capacity of 4,450 million gallons, is at the top of the banks.
WEALTH AND INCOME

A reservoir in the Enborne valley near Reading was abandoned in October, as investigations on the biological aspects had shown that thermal stratification of the water was likely to occur in the deeper parts of the reservoir which would render the lower stratum unsuitable for the board’s purposes. The Water board consequently decided to proceed with the construction of the reservoirs at Walton, Wraysbury and Datchet, for which powers had previously been obtained. A new method of super-chlorination was introduced by the Metropolitan Water board which led to improvements in the bacterial quality of the water supplied to the London area, in a reduction of colour and in a complete cessation of chlorinous tastes. By eliminating all pre-chlorination in the Thames valley it was estimated that running costs would be reduced by at least £10,000 a year.

The Ministry of Health continued to publish reports dealing with the water resources of various parts of the country to provide a basis of discussion which might lead to the improvement of water supply in those areas. Reports were issued covering south Wales in which it was suggested that 15 boards should be constituted to replace the 51 existing water undertakings. In Norfolk 21 new statutory water undertakings were recommended to replace the 37 existing authorities. New water boards were constituted during the year for dealing with the provision of water for east Shropshire, mid-Northamptonshire, Northallerton and district, Stafford and the adjacent rural area and the new satellite town of Crawley in conjunction with other authorities in east Sussex. Public attention was focused on the question of nationalizing water supplies, particularly in rural areas where the provision of a supply could not be undertaken on an economic basis.

The first general assembly and conference of the International Water Supply association, set up in 1947 by delegates from Great Britain, France and the Netherlands, was held in Amsterdam in September and was attended by delegates from about 20 countries. Agreement was reached between the British and Egyptian governments for the construction of a dam at Owen falls, Uganda, for the control of the Nile waters, as part of a major scheme to ensure a regular supply of water for Egypt and the Sudan. Progress was made in dealing with the problem of water shortage in Malta, involving the repair of reservoirs damaged during World War II, the sinking of boreholes and the construction of underground collecting galleries. The completion of a reservoir in the Waitakere ranges, near Auckland, New Zealand, was announced, which would provide water for a million people. The first stage of Kimberley’s new waterworks came into operation in June, which provided an extra 1,250,000 gal. a day for the city. A new aqueduct constructed at a cost of Rs. 5·5 million and capable of supplying an additional 32 million gal. a day, for Madras, India, was opened in October.

United States. World shortages of water in 1949 represented a continuation of the difficulties experienced in the winter of 1947-48. In many countries the high summer temperatures and rainfall deficiencies of 1949 heightened the problem. Perhaps the most significant evidence of this difficulty was the shortage in the New York metropolitan area, still persistent by the end of the year. With the largest water consumption in the world, somewhat more than 1,000 million gal. a day, the New York area found itself with a reserve which would only last 60 days, if the low rainfall conditions of the autumn continued during the early part of 1950. Less than 35% of the potential capacity of its storage reservoirs was available by the end of the year.

The importance of this phenomenon could not be overestimated, since it pointed to the necessity for setting planning stakes many years ahead in the provision of water supply. The rapid expansion of the nuclear fission industry resulted in the development of new radio-active materials and wastes. There was rapid progress in the understanding and detection of liquid, solid and gaseous wastes from the atomic energy industry and the methods for reducing these wastes. Much research was in progress to develop and improve methods and instruments for detecting radiation in air and in water. The North American National Committee on Radiation Protection was preparing to announce its recommendations on the maximum safe limits of radioactivity in water and air. The International Labour office promulgated tentative permissible limits for radiation. The training of public health engineers in nuclear fission was initiated.

The addition of fluorides to public water supplies for the prevention of dental caries in children was still arousing a great deal of lay and official interest. By the end of 1949 about 17 fluoridation installations were in operation in nine states in the United States. Fourteen additional ones had been approved, and 20 more were under consideration.

WEALTH AND INCOME, DISTRIBUTION OF. In the course of 1949 estimates of the distribution of incomes between persons were published for only four European countries, which publish this material annually: Denmark, Finland, Sweden and the United Kingdom. For Denmark, Finland and Sweden estimates of the distribution of capital between persons were also given.

The distribution of incomes in the United Kingdom for 1947 was given in the White Paper on national income. The official estimates have to be supplemented by an estimate for the number of incomes in the lowest group which could be made with reference to the estimated total number of income recipients; the distribution still suffered from the defect of not giving sufficient detail for the lowest and largest group. The general tendency, in comparison with 1946, was a shift from lower to higher income groups without changing the number of incomes over £1,000. The distribution of incomes after income tax and surtax, also given, was much more even, to about the same degree as in previous years; it must be remembered that indirect taxes, for which no allowance was made, were of a repressive nature. (See Table I.)

The latest Danish statistical yearbook gave distributions of both income and capital for 1947-48. In Denmark also, a general shift from lower to higher ranges of both income and capital was noticeable in comparison with 1946. (See Table I.)

In Finland, the latest statistical yearbook gave more detailed estimates relating to the distributions of both income and capital in 1945 and showed these distributions after tax.

Total: 3,241 thousand Kr.

Notes. £1 = Kr. 14.47. Figures do not add up to the total shown, owing to rounding. Source: Statistik Aarbog for Sverige, 1949.

Both series exhibited the very progressive nature of taxation in Finland. Taxes on income rose from 3% in the lowest group to 30% in the highest, and taxes on capital from 0.2% to 1-8% which also took away a high proportion of the annual return on capital. The heaviest rates seemed to apply to incomes and capital other than those falling under personal taxation. (See Tables III and IV.)

The latest Swedish statistical yearbook gave the distribution of income for 1947. As in the countries previously mentioned, there was in Sweden a definite shift from the ranges under Kr. 5,000 to those above this limit but with a fall in the highest range, above Kr. 50,000. (See Table V.)

The distribution of capital was published for Sweden in 1945—the first time since 1930. The data showed that about two-thirds of the occupied population had no capital, and there were only 271,000 estates over Kr. 20,000 (8% of the occupied population). (See Table VI.) A distribution for estates over Kr. 20,000 was available only for 1947.

United States. A survey of consumer finances in the U.S., published in 1949 by the board of governors of the Federal Reserve system, supplied information on the distribution of income in 1948 and liquid assets in early 1949. Three previous surveys had made similar information available for the period 1945-47. The surveys were based on small field canvasses of consumer spending units, defined as “all persons living in the same dwelling and related by blood, marriage or adoption who pooled their incomes for their major items of expense.” Data on the percentage distribution of spending units according to size of holdings of liquid assets—U.S. government bonds, savings accounts, and checking accounts—are provided in Table VIII.

The 1949 distribution did not differ substantially from the pattern of earlier postwar years. Over the 1946-49 period, however, there was an appreciable increase in the proportion of spending units having no liquid assets. About 14-5 million spending units, or 29% of the total number in the U.S., had no liquid assets in early 1949.

Table VIII summarizes data provided by the four consumer-finance surveys on the distribution of spending units and total money income according to size of income. These data reveal a significant upward movement in the income distribution since World War II. This was an extension of developments in evidence over the war period. The postwar
expansion of total money income was accompanied by a shifting of many consumers to higher income levels. This shifting, it should be emphasized, pervaded the entire income distribution. The surveys found that when the nation's spending units were classed into tenths by size of income there were only slight changes from 1945 to 1948 in the proportionate share of total money income received by each tenth.

*Includes all types of U.S. government bonds, checking accounts, and savings accounts in banks, postal savings and shares in savings and loan associations and credit unions. Excludes currency holdings. Data for 1949 do not include shares in credit unions, but these are relatively small in the aggregate and not likely to affect totals significantly.

A longer-term comparison of changes in the distribution of income is afforded by Table IX. This shows for two pre-war years and the full-employment year of 1948 the percentage of money income going to each fifth of the total number of families and single persons, ranging from those with the lowest incomes to those with the highest.

It was evident that from 1935-36 to 1948 there was a redistribution of income in the United States away from the highest income bracket. The second, third, and fourth income brackets significantly improved their relative positions, whilst the percentage of total money income received by the highest bracket declined from 53 to 47. (See also Budget, National; National Income; Taxation.) (C.F. Sz.)

**WEIZMANN, CHAIM BEN OZER,** Israeli statesman (b. Motol, near Pinsk, in the then Russian part of Poland, Nov. 27, 1874). (For his early career see Britannica Book of the Year 1949).

On May 17, 1948, he announced in New York that he had accepted an invitation from the Israeli provisional government to serve as first president of Israel. On Oct. 1 he surrendered his British passport and took the oath to the state of Israel. Opening on Feb. 14, 1949, in Jerusalem, the first Constituent Assembly (Knesset) of Israel, he emphasized that the new state was being built on solid foundations of freedom, equality, collective responsibility and national self-discipline. On Feb. 16 he was formally elected president of the republic by 83 votes to 15 cast for Professor Joseph Klausner, the nominee of the Nationalist party; 15 deputies returned blank votes. In the spring he visited the United States where on April 23 in a speech at New York he pledged his country to accept the fullest international safeguard for the immunity and protection of the Holy Places in Jerusalem. He also visited Washington and was received by President Harry S. Truman. Later in the year he went to Switzerland for eye treatment. On Sept. 12 he received an honorary degree from the University of Fribourg where 50 years before he had been a student, and was also honoured by the canton and city of Fribourg. He returned to Israel early in October.

**WELLINGTON,** capital of New Zealand, on the southwestern shore of the North Island. Pop. (1948 est.): 131,000 (189,000 with suburbs). Mayor, W. Appleton.

For the city area in the financial year 1948-49, the total revenue was £3,316,146 and the expenditure £3,404,834. The largest items were the municipally controlled milk supply (revenue £1,000,754, expenditure £1,000,958); the transport services (£68,205), (£28,638); and the electricity supply (£68,315, £63,865). Internal loans totalling £346,000, mainly for drainage and housing, were raised or renewed during the financial year. The capital value of the city rose to £51,142,048, and the number of buildings in the city to over 30,000. The volume of trade handled in the port of Wellington (year ended Sept. 30, 1949) was 2,161,048 tons; and shipping tonnage amounted to 3,295,128 tons. The latest figures available (year ended Sept. 30, 1948) valued exports at £34,768,592, and imports at £52,070,439; the main commodities exported were wool, frozen meat, dairy produce and fruit.

Apart from a large residential block for nurses at the Public hospital, Newtown, no large public buildings were opened. Building controls curtailed the erection of other than private dwellings, but some of the leeway in the severe housing shortage was made up.

In May, Victoria University college, Wellington's constituent college of the University of New Zealand, celebrated its golden jubilee.

(R. W. B.)

**WEST AFRICA, BRITISH:** *see* *British West Africa.*

**WESTERN UNION—**the defensive, economic and cultural association established between five western European countries (Belgium, France, Great Britain, Luxembourg and the Netherlands) under the treaty of Brussels signed on March 17, 1948—served during 1949 as the point of departure for the North Atlantic treaty (q.v.) and the Council of Europe (q.v.), but retained a corporate existence independent of either.

The North Atlantic treaty arose out of Western Union negotiations with the U.S. and Canada, which at one time seemed to aim at a transatlantic extension of Western Union. In the end, however, they resulted in the creation of a completely independent and partly overlapping defence system of its own.

Similarly, the Council of Europe arose out of the French and Belgian desire to transform Western Union from a mere alliance between sovereign states into a politically integrated
federation or confederation. The preparatory work for its statute was done by a special committee, meeting under the auspices of Western Union in Paris from Nov. 26, 1948, to Jan. 20, 1949; the decision to establish a Council of Europe, consisting of a committee of ministers meeting in private and a consultative assembly meeting in public, was taken at a meeting of the consultative council of ministers of Western Union in London on Jan. 27-28, 1949. The outlines of the constitution of the Council of Europe were also still drawn up by the permanent commission of Western Union in Feb. 1949. However, the further and detailed negotiation of the actual constitution of the new body passed to the wider circle of countries which were ready to join the Council of Europe without wishing to join Western Union; and all further direct connection between the two organizations ceased.

For the rest, the main achievements of Western Union during 1949 were military. The work of merging the defence policies of the five treaty partners and co-ordinating their armed forces made steady progress. In the early days of the year, the commanders in chief committee appointed in the autumn of 1948 established its headquarters at Fontainebleau (France) and started practical work under the chairmanship of Viscount Montgomery of Alamein. The first joint peace-time naval exercises of the Western Union powers were held in the Bay of Biscay and the English channel from July 4-7, 100 warships and 22,000 men being engaged. After a U.S.-British air exercise over Britain from June 25-July 3 had seen some Western Union participation, the first full-scale Western Union air exercise took place in the Orléans region of France on Oct. 28. Agreement on a common defence plan had already been announced on April 8.

On Nov. 7, the Western Union powers signed a social security convention, under which each of the five countries would treat nationals of the other four like its own nationals in respect of social security benefits and medical assistance. (S. Hr.)

WHEAT. The wheat crop in 1949 was good though in general below the 1948 crop. Only in comparatively few cases, however, did the yields of individual countries exceed the prewar averages, two notable exceptions being provided by Great Britain and Canada, and even here the yield was rather below the 1948 figure. The Italian crop returns for wheat during 1949 showed a significant increase over the 1948 figures but this still did not come up to the prewar average. The reduction in yield compared with 1948 was attributable in part to the abnormally dry conditions that prevailed for such a long period during 1949. This did not lead to such a serious decline as in the case of some crops, wheat being moderately tolerant of drought, but it nevertheless was the occasion of some anxiety to wheat growers, particularly in Australia and South Africa.

Much work on the improvement of wheat varieties was carried out in 1949. In Canada, Australia and to a lesser extent Kenya resistance to rust and in particular to new strains of rust was one of the principal breeder's objectives. Several new rust-resistant varieties were introduced into cultivation. Straw strength was another character that was the object of much attention. Both in Sweden and Kenya, new strains of wheat were tested for strength of straw and in Italy some new varieties with improved resistance to lodging by wind were distributed. Work on the improvement of the overwintering capacity of autumn-sown wheats was principally carried out in Sweden where Finnish wheat strains were utilized; some work along these lines was also done in Canada. Two other problems were tackled in Canada, attack by smut and infestation by the sawfly; in both cases new resistant strains were sought. In India drought resistance remained one of the principal breeding objectives and in New Zealand new varieties combining high yield with greatly improved baking quality were distributed.

Much publicity was given to the claims made in the U.S.S.R. for the spectacularly high yields obtained from a wheat with branched ears. This wheat appeared to be related to a form known for many years past in western Europe as a curiosity capable of producing high yields under garden conditions but of little value under normal farming conditions. Further information about the performance of the Russian wheat under field conditions was desirable before coming to a conclusion as to its economic value.

The hybrids between wheat and grasses of the genus Agropyron, the so-called perennial wheats, were much less in the news in 1949. In the U.S.S.R. the work of Tsitsin, the pioneer of perennial wheat, was criticized as economically valueless. Elsewhere, especially in Canada, South Africa and Italy, wheat Agropyron hybrids were studied extensively: it seemed that although these hybrids might prove of value as forage crops their value as cereals was dubious. (R. H. R.)

- *Revolved estimates by the U.S. Department of Agriculture on basis of incomplete reports from several countries with adjustments for year of harvest and including allowance for missing data and forecasts for crops being harvested.

The world wheat crop of 1949 was estimated at 6,185 million bu., compared with 6,385 million bu. in 1948 and a prewar average of slightly more than 6,000 million bu. in 1935-39. Practically all of the decline, as compared with 1948, was accounted for by North America, particularly the U.S., although the spring wheat crop of Canada showed a substantial decline also.

United States. The U.S. wheat crop of 1949 which amounted to 1,146,463,000 bu. was the sixth consecutive crop of more than 1,000 million bu. Nevertheless, it was a disappointment in that, from a record planted acreage of 84,931,000, about 6 million more than for 1948, the harvest was 13% less than the 1,313,534,000 bu. of 1948. The 76,751,000 ac. harvested gave a yield of only 14-9 bu. per ac., compared with 18 bu. per ac. (on 73,017,000 harvested acres) in 1948, and an average yield for 1938-47 of 16-6 bu.

The 1949 winter wheat crop of 901,668,000 bu. was the third largest on record, exceeded by the 1,007,863,000 bu. of 1948, and the record 1,068,047,000 bu. in 1947. Yields averaged only 16-3 bu., well below the 18-8 bu. of 1948, and an average for 1938-47 of 17 bu.

Spring wheat production, mostly in the northern Great Plains, was estimated at 244,795,000 bu., 20% less than the 305,671,000 bu. of 1948, and 8% below the average of the previous decade. The 21,298,000 harvested acres, the largest since 1932, represented a 9% increase over 1948, and 23% larger than for the decade. Yields were cut sharply by drought and accompanying hazards to an average of 11-5 bu. per ac.,
WILD LIFE CONSERVATION

compared with 15·7 bu. in 1948, and 15·4 bu. average for 1938-47.

The wheat situation at the end of 1949 in summary was: carryover stocks of 305,773,000 bu. plus the 1949 harvest of 1,146,463,000 bu. provided a total supply of 1,452,236,000 bu. (against 1,484,106,000 bu. total supply the year before). Domestic requirements during 1949-50 were estimated at about 700 million bu. (food 487 million; seed 83 million; feed 130 million). Thus, 752 million bu. appeared to be available for export and reserve stocks. It was expected that stocks on July 1, 1950, would be at least 350 million bu. and might be nearer 400 million bu. (See also Flour.) (J. K. R.)

WILD LIFE CONSERVATION. Interest in the conservation of wild life was brought to a focus at the International Technical Conference on the Protection of Nature convened by U.N.E.S.C.O. and held at Lake Success, New York, from Aug. 22-27, 1949, simultaneously with a United Nations Scientific Conference on the Conservation and Utilization of Resources. These two conferences invited the International Union for the Protection of Nature, founded in 1948, to collect from technically qualified people reports on various aspects of the problem of the conservation of nature. One hundred and fifty reports were received containing on the whole an important mass of well informed comment which constituted the basis of the discussions at the conference.

Neither France, Great Britain nor the United States had as yet given official support to the union and were only represented by private organizations. It was hoped, therefore, that by combining the two conferences and thus emphasizing the close connection between the protection of wild life, fauna and flora and the utilization of resources such as soil, water and climate that these and other governments would be persuaded to take a more active interest in conservation than they had previously shown. The conference was also valuable in that it served to sort out to some extent the confusion caused by the multiplicity of national and international organizations working in overlapping fields. Credit for its success was partly due to the ability and enthusiasm of the general secretary, Dr. Jean-Paul Harroy.

The conclusions of the Technical conference were embodied in 23 resolutions, drawing up an ambitious programme of work for the future. The necessity for extensive and intensive ecological studies was emphasized in which each selected area would be treated as a total dynamic ecological situation including all possible factors such as soil, water, food, climate, plants, animals and the people concerned, with special emphasis on their interrelationships. It was suggested that the results should be published not only in technical form for specialists but in popular form in several languages for the general public. Various resolutions were concerned with the need for education, particularly of the young, through schools and youth movements. Several were devoted to the importance of ecological studies in close connection with various projects for the agricultural development of undeveloped land; others urged precaution in the use of insecticides with a view to protecting the equilibrium of nature and preventing the destruction of animal and plant communities and warned against rash experiment, including the introduction of exotic species.

Among the subjects more specifically covered by the resolutions were the protection of species of animals and plants threatened with extinction, an approach to the government of India urging measures for the protection of the great Indian one-horned rhinoceros, another to the government of the United Kingdom suggesting that a further conference should be summoned to report progress under the African convention of 1933, and yet another to the French government requesting that appropriate measures be taken for the protection of the Camargue reserve at the Rhone delta. The conference had no authority to implement these resolutions but hoped that effect would be given, through appropriate channels, to its recommendations.

In British Africa informal conferences between Game departments were held and scientific research into such problems as game-borne diseases continued. Where the policy of national parks had been accepted delay in giving it effect was still caused by difficulties over boundaries and native reserves. In India the existing legislation for the protection of nature was undergoing revision. In Great Britain the Nature Conservancy was founded by Royal Charter to advise the government on establishing nature reserves and to carry out necessary researches in connection with them. The National Parks and Access to the Countryside bill introduced in parliament in March proposed to confer upon the Nature Conservancy considerable powers to acquire land for the creation of nature reserves. The bill received the Royal Assent on Dec. 16. (H. G. M.)

United States. In March, the Fourteenth North American Wildlife conference met in Washington, D.C.; there was a record attendance of 1,147 from 47 states, Alaska, the District of Columbia, Canada, Mexico and Argentina. The transactions, published by the Wildlife Management institute, sponsor of the conference, comprised some 65 papers, most of which were reports of studies and investigations, and constituted an outstanding symposium on the status of wild life in North America.

In June the Fish and Wildlife service of the U.S. Department of the Interior reported a compilation of state estimates of big-game numbers for 1947 including inventories on national forests, parks, and refuges, showing a total of 7,758,000 in the United States and a reported total of 891,200 taken by hunters.

A special report on The Moose and Its Ecology issued in Dec. 1949 by Dr. N. W. Hosley of the service estimated that there were approximately 19,000 of these animals in eight or nine northern states—as compared with an estimated 12,000 in 1944 and 17,900 in 1947. Alaskan estimates showed that there were approximately 30,000 in that area, while it was speculated from United States and Alaskan densities and from Canadian conditions that moose in Canada might number about 146,000.

Upland-game birds were discussed in a session of the North American Wildlife conference. The wild turkey was reported to be doing badly west of the Mississippi and only slightly better in a few eastern states. The bobwhite quail was reported to be steadily decreasing in all the states where it is important as a game species. In a majority of the 26 states studied, the number of pheasant was once again increasing.

Intensive investigations of waterfowl were continued by the Fish and Wildlife service. A wintering grounds inventory (Jan. 11-14) indicated a 12% increase in the number of duck over the previous year, a 12% increase in geese, a 39% increase in brant and a 20% increase in swans. A 56% decrease in coot numbers, however, resulted in a 1% decrease in total waterfowl. Numerical totals were not reported. Drought conditions later in the year adversely affected important sections of the breeding grounds in the short grass prairie regions of Saskatchewan and Alberta and made the 1949 increase not as large as was expected. Nevertheless, it was such as to lead to a 10-day lengthening of waterfowl shooting seasons.

The number of hunting licences sold in the United States reached a new record in the year which ended on June 30, totalling 12,758,698 as compared with 11,391,810 in the year 1947-48.

Sales of federal migratory bird hunting stamps also rose...
to a new record of 2,127,598 for the year ended June 30, 1949. Congress increased the price to $2 and also enacted that not more than 25% of any refuge area acquired with funds under a new law might be administered for public hunting in the discretion of the Fish and Wildlife service.

Under the federal aid programme for wildlife restoration projects in the states, an appropriation of $11,276,687 from excise taxes on arms and ammunition was made available during the 1949 fiscal year—the largest ever made—and a record number of projects (612) were approved for the 48 states, Alaska, Hawaii, Puerto Rico and the Virgin Islands.

Significant progress was made by the Fish and Wildlife service's office of river basin studies under the 1946 Public Law 732 in surveying the biological aspects of proposed flood control, irrigation, hydro-electric and other development projects, 231 such projects having been reported during the year. (H. Z.)

Canada. The Dominion Wildlife service reported that 30% of the wild ducks examined by fluoroscope carried shotgun pellets. Fearing that use of aircraft would reduce sportsmen to hunting rabbits and squirrels, it recommended that pilots be made honorary enforcement officers, that large game areas be closed to air-transported sportsmen and that provincial game wardens be supplied with aircraft for patrol purposes. Parliament increased the services funds for 1949-50 to $259,520.

The Northwest Territories council decreed that all trap lines should be registered as a conservation measure. The beluga, a milky-coloured sea mammal of Hudson bay, was brought under protection by the federal government, and only Indians, Eskimo and Royal Canadian Mounted Police could kill them without licence. The federally-controlled Arctic reindeer became so numerous that ear-tagging was planned to maintain control. (See also NATIONAL PARKS.)

WINDWARD ISLANDS—WINES. The British Windward Islands (in the Caribbean sea) comprise the four islands of Dominica, St. Lucia, St. Vincent and Grenada—each ranking as a separate colony for internal administration—together with the Grenadines, which lie between St. Vincent and Grenada and are associated partly with the one and partly with the other. Total area: 829 sq. mi. Total pop. (1946 census): 251,776 (Dominica 47,624, Grenada 72,387, St. Lucia 70,113 and St. Vincent 61,647); the great majority of the population is Negro. Chief towns: St. George's (capital of Grenada and seat of the governor, pop. 5,774), Roseau (capital of Dominica, pop. 9,751), Castries (capital of St. Lucia, pop. 7,056) and Kingstown (capital of St. Vincent, pop. 4,831). Governor, R. D. H. Arundell.

History. It was announced in April 1949 that the secretary of state for the colonies had agreed to certain constitutional changes including the introduction of adult suffrage (subject to a single literacy test only) at the next elections for the Legislative Councils and the removal of the property qualification for a candidate, subject to further examination of the existing arrangements for deposits which candidates were required to make.

The rebuilding of Castries, capital of St. Lucia, which was wiped out by fire in June 1948, was entrusted to the Colonial Development corporation and work began in April. A town plan was published. Public funds were made available to the government of St. Lucia to the amount of £700,000 in addition to bank loans for the financing of private building.

In Dominica it was announced that the secretary of state had approved additional assistance for development of $2,160,000 (of which $1,248,000 were expected to be a free grant and $912,000 a loan) over and above the original Colonial Development and Welfare grant of $1,627,000: and that the Colonial Development corporation had completed plans for the establishment of a group project involving investment of over $960,000.

Principal exports: lime juice, cocoa, sugar, cotton, copra and arrowroot. (J. A. Hu.)

WINES. The first wines to be made in 1949 were, of course, those of the Southern hemisphere, South America easily first as regards both the quantity (Argentine) and quality (Chile), with Australia and the Cape province of the Union of South Africa tying for second place. The vintage in all such vineyards as well as the much smaller ones of Uruguay and Brazil takes place in February and March under climatic conditions that are so much more constant than those in the northern hemisphere that there are no such variations between different vintages as are common in France and Germany.

In Europe, the vintage of 1949 would long be remembered as one of the driest and sunniest on record which was not the same as saying that it was the best that vinegrowers could have desired. The best wines are those in which both the sun and the rain have co-operated best, the sun being responsible for the sugar, hence the alcohol in the wine, and the rain for the various acids from the soil which give different wines their distinctive bouquet, flavour and charm. In the making of Sherry, Port, Madeira, Marsala and all wines of a high alcoholic strength, a year such as 1949 was likely to prove a very good one; the same might be said for Sauternes, Palatinate and Tokay wines, in which any excess of sugar content is welcome since the chief appeal of all such wines is their sweetness. On the other hand in table wines, the beverage wines, both red and white, of which Bordeaux and Burgundy

Baroness van Boetzelaer van Oosterhout, wife of the Netherlands ambassador to France, receiving the order of "Knight of Tastevin" in the cellars of the Château du Clos de Vougeot, Burgundy, Nov. 1949.
WOMEN'S ACTIVITIES

are the two prototypes, grapes which are too rich in sugar content and deficient in acidity are far from being the more desirable.

There was, fortunately, a break in the drought, in the Bordeaux district, early enough in September to give at the last moment the help which the grapes sorely needed, and both the red and white wines of Bordeaux were expected to be well above the average in quality. In Burgundy and in Champagne there were storms with heavy downpours and exceptionally hot weather, conditions only too favourable for turning ripe grapes into rotten ones, and it was probable that the quality of both the Burgundy and Champagne wines of 1949 would be uneven in quality: there would be some excellent wines made from carefully selected grapes, and there would also be some poor wines made from grapes that were not chosen with due care as to their soundness. In the northernmost vineyards of the Rhine and Moselle, from Alsace to Coblenz, the exceptionally fine summer was responsible for white wines of very fine quality, but the quantity vintage was well below the average. (A. L. S.)

### WORLD PRODUCTION OF WINE—1948 AND 1949

![Table showing production of wine in various countries for 1948 and 1949.](table-image)

WOMEN'S ACTIVITIES. In 1949 the need for a widening contribution by all citizens to the life of the community afforded women in many countries new opportunities. Recognition of woman's rights continued, however, to lag behind acceptance of her work. Twenty-seven countries still refused equal franchise and, by some, women were excluded from certain professions and from the enjoyment of full educational facilities. Economic disabilities often persisted even where electoral freedom had been conceded. When, therefore, the United Nations commission on the status of women met at Beirut in March for its third session many urgent matters of reform were indicated in its agenda.

Constituting the first permanent international body to tackle the question of women's rights, the women delegates represented Australia, China, Costa Rica, Denmark, France, Great Britain, Greece, Haiti, India, Mexico, Syria, Turkey, the United States, the U.S.S.R. and Venezuela.

In the diplomatic field the year saw fresh acknowledgments of the qualifications which women are able to bring to the management of international relations. Mrs. Vijayalakshmi Pandit, already the new dominion of India's ambassador to Moscow, was appointed in New Delhi on March 24 to be ambassador to the U.S. On June 21 the appointment of Mrs. Perle Mesta, a prominent Washington hostess, as U.S. minister to Luxembourg was announced, and on Oct. 12 Mrs. Eugenie Andersson, of Red Wing, Minnesota, became the first woman to reach ambassadorial rank in the American diplomatic service when she was nominated U.S. ambassador to Denmark. Miss Jean McKenzie, who arrived in England on Aug. 28 on her way to open a legation in Paris, was the first woman to be given diplomatic status by the government of New Zealand: she was to act as chargé d'affaires with the personal rank of counsellor. The announcement on Nov. 11 that Mrs. Josephine McNeill would be minister at The Hague marked the appointment of Ireland's first woman envoy, while in the same month Miss Grace Rolleston left England to become third secretary at the British legation in Budapest.

A notable part in contemporary affairs continued to be played by the Associated Country Women of the World which with its five million membership linking the rural groups in the various countries was one of the largest international organizations of women. Apart from its general work of promoting friendly and helpful relations between country women's and homemakers' organizations and of stimulating interest in international questions, it was concerned also with the larger world problems, having representatives on the Economic and Social council, on the Food and Agriculture organization and on U.N.E.S.C.O. A women's food petition signed on behalf of nine international women's organizations, whose total membership numbered more than 65 million, was presented to the fifth session of the Food and Agriculture organization on Nov. 21 by Mrs. Raymond Sayre, of Ackworth, late president of the Associated Country Women of the World. This emphasized the imperious necessity for a new and systematic policy of giving priority to human need in respect of food regardless of all other considerations. Food, health, education and the status of women were among the subjects discussed at the fifth conference of the Pan-Pacific Women's association held in Honolulu from July 20 to Aug. 3 and attended by delegates from China, Japan, the Philippines and Korea, as well as from the mainland of the U.S., Hawaii, Australia and New Zealand.

Great Britain. In the first estimates of civil population compiled by the registrar general since the 1931 census, which were published in Oct. 1949, it was disclosed that women outnumbered men in England and Wales by more than two million, 22,268,000 of the estimated total civil population of 42,156,000 being females. Their increasing role in public life was amply demonstrated by an analysis of available election figures on a national basis made by the National Women's Citizens' association. This revealed that the number of women councillors in England and Wales in the first quarter of the year was 3,297, nearly double the figure for 1939. With 20 women—three as many as it had in 1939—Birmingham led municipal corporations, and among county councils Middlesex topped the list with 22. At the ninth conference of women members of local government authorities held at Caxton hall, London, on Oct. 28 the care of children apart from their parents was among the subjects discussed. The Mothers' Rest association and the Family Service union were responsible for carrying out an
WOOL

exhaustive survey in industrial areas during the year which showed that wows of professional and business men were the hardest worked but that breakdowns of health were more prevalent among working-class mothers.

An important organization for encouraging the education of women for citizenship, the National Union of Towns-women's Guilds, received grants aid from the Ministry of Education, the Scottish Education Department and the Carnegie trust, for experimental work and the expansion of educational activities among women. The number of guilds increased during the year from 1,015 to 1,170, representing a total membership of approximately 120,000. Outstanding in the 1949 programme of the National Federation of Women's Institutes, which reached a membership of 438,000 during the year, was a campaign to improve countryside conditions in England and Wales in regard to water supply and sewerage. A village questionnaire circulated among the 7,282 institutes of the federation was designed to provide information on a national scale as to other conditions calling for reform. Though this had been completed by the end of the year, the results had not yet been summarized. At the 29th annual meeting held in London on June 14-15, the minister of education underlined the need for every housewife to a full life of her own so that she might be of greater value to the family and the community.

Recruiting for the needs of civil defence was a renewed branch of Women's Voluntary services work in 1949 and this organization consolidated and developed the many other activities which since its foundation in 1938 had made it an integral factor in public welfare. Care of the aged was an increasing concern of the W.V.S. which since the war had opened for them 17 residential clubs accommodating 420 people. Irrespective of its widespread activities and cooperation with government departments and local authorities at home, the W.V.S. were also helping in various ways in Germany, Italy and among the families of the groundnuts workers in Tanganyika. At the end of the year W.V.S. centres in England, Scotland and Wales numbered 1,200.

Individual distinctions achieved by women during the year included the appointment, announced on March 30, of Miss J. M. Woolcombe, director of the Women's Royal Naval service, to be an honorary aide-de-camp to the King, this being the first occasion on which such honour was accorded to a woman. At the same time Miss O. H. Franklin was appointed King's honorary nursing sister. On Oct. 10 Miss J. Burbidge became the first woman to act as a spokesman at the Foreign Office.

Commonwealth. For the first time in Australia's history a woman was admitted to cabinet rank when Dame Enid Lyons was included in the coalition government formed on Dec. 18, 1949. Dame Enid, the 52-year-old widow of the former Australian premier Joseph Lyons, and mother of 11 children, was also her country's first woman M.P. As vice-president of the executive council in the new cabinet she would represent the government. In Canada, Mrs. Nancy Hodges became the first woman speaker in the Commonwealth when on Dec. 12, 1949, she was appointed speaker of the British Columbia legislative assembly. Born in London in 1888, she was elected to the assembly as Liberal member for Victoria in 1941 and was re-elected in 1945. In the New Zealand parliamentary election on Nov. 29 Mrs. Ratana, widow of the representative for Western Maori, became the first Maori woman member of parliament by winning her late husband's seat. While on a short visit to London in April and May the Begum Liahquat Ali Khan, wife of the Pakistan prime minister, pointed out at a press conference that there was an increasing tendency for purdah to be discarded by her fellow countrywomen. She paid tribute to the All-Pakistan Women's association, which existed for general welfare and cultural development, and the Pakistan Women's National Guard, which assisted the medical services during times of emergency service and encouraged civic responsibility among the women of the country. (D. A. C.)

WOOL. During 1949, persistent demand for wool kept prices at high levels, the average price level for the year being higher than in 1948. An easier tendency which developed in the summer months was rapidly reversed after the devaluation of sterling in September, and in the later months of the year considerable price advances were registered in all qualities, but more particularly in crossbred wools which reached levels not previously touched since 1920. Valuable statistical data on the world supply and consumption position were furnished by the International Wool Study group, which met in London in November. The group computed the world production for the 1948-49 season to have been 3,758 million lb., which was within 1% of the average annual production for the period 1934-39. The major wool producing countries, Australia, New Zealand and South Africa, all registered slight increases compared with the 1947-48 season, whereas both Argentina and the United States experienced appreciably lower production.

The apparel wool portion of the total world production was 2,957 million lb., whereas world consumption of apparel wool amounted to some 3,547 million lb. The deficiency was made good out of accumulated wartime stocks, mainly held by United Kingdom-Dommon Wool Disposals, Ltd., and the United States Commodity Credit corporation. By June 30, 1949, the stocks held by the government-owned organizations amounted to no more than 640 million lb. and, being composed largely of the less attractive types of wool, these stocks had lost most of their former market significance. Thus the considerable stocks which in 1945 seemed likely to require many years for their liquidation, had been largely disposed of in an orderly manner within four years of the end of World War II.

Activity in the wool consuming countries was generally well maintained with the notable exception of the U.S.A. and, to a lesser extent, Belgium.

In the United Kingdom, new postwar high levels were reached in both the size of the labour force and volume of production, particularly in the later months of the year. Two noteworthy developments were the termination in October of the ten-year-old Wool control, and the submission by the National Farmers' union of a Producers' Marketing Scheme for British Wool under the Agricultural Marketing acts.

In the United Kingdom also, a technical development of outstanding importance, known as the Ambler Superdraft system of worsted spinning, was announced. This was believed to be the most important technical advance in wool processing for many decades, as it saved approximately two-thirds of the labour and machinery normally used in the preparatory processes of worsted spinning.

The wool textile industries of France and Italy maintained the high levels of production of 1948 in spite of increased difficulties in export markets. With a large potential home demand caused by the war and its aftermath, a more stable currency system, and the benefit of the European Recovery programme, the wool textile industry of Western Germany made considerable advances. The Japanese industry registered some progress during 1949 but the volume of production was still small compared with that of prewar years. (F. HL.)

United States. The Commodity Credit corporation, a U.S. government agency, reported on Sept. 30, 1949, that its stock pile of wools totalled 88 million lb., compared with 120 million lb. on Sept. 30, 1948. At the end of the third
quarter of 1949, 48% of the wools owned by the Commodity Credit corporation were the 1949 clip, 25% were 1948 wools, 11% were 1947 wools and 16% were 1946 and older wools. Imports of apparel wools were considerably reduced during 1949. In the first eight months only 76 million clean pounds were entered for consumption, compared with 284 million lb. in the first eight months of 1948, and 250 million lb. in the same period of 1947. This drastic decline in U.S. wool imports caused a sharp contraction in wool stocks and it was estimated that on Dec. 1 apparel wools in the United States represented about 168 million clean pounds, compared with 274 million lb. on Dec. 1, 1948, and a peak of 488 million lb. on Dec. 1, 1946. Conversely, wool stocks in Argentina tended to accumulate, because of the relatively small amounts which were exported.

Consumption of apparel type wools fell sharply in the U.S. but elsewhere there appeared to have been more activity in wool textiles. For the greater part of the year, prices in the U.S. were above the government support level, which factor accounted for less government buying than in the preceding year. Prices of domestic wools in the U.S., after some firmness during the first quarter, entered a slow decline from an average of around $1.52 a clean pound in the Boston wool market to $1.38 in October. A better demand in the final quarter lifted prices slightly.

Using Australian wools as an example for foreign wool prices in the U.S., fine Australian wools, duty paid in Boston, American yield, began the year at $2.18. Less demand, rather than replacement values, caused Australian wools to decline in price in the Boston market, with a substantial drop to $1.45 in late September, following currency de-valuations. Thereafter, signs of steadiness in Boston coincided with rising prices at the wool sales in Australia. The year closed with fine Australian wools quoted in Boston around $1.60. (See also Textile Industry.) (S. L. L.)

WORDS AND MEANINGS, NEW. The words and meanings given below are a selection of those first noted in the year 1949. Those that have also been found earlier have the earlier date added in brackets after the definition; but several of the words are such as may well occur at earlier dates than have been found for them.

GREAT BRITAIN

antricyde. A drug in the form of a white crystalline powder which protects cattle from the effects of the bite of the tsetse fly when injected hypodermically as an aqueous solution (1948).

arrestor rod. A rod of moderating material in an atomic pile.

Aspatron. A small atomic pile designed at the A.S.P. Chemical Company's laboratories for the production of radio-active isotopes for medical and research purposes.

Bepo. British Experimental Atomic Pile at the Ministry of Supply's research station at Harwell, Berkshire, which is used for the production of radio-active isotopes for medical and research purposes (1948).

blend up. To improve the quality of by blending.

bonusable. Ranking or qualifying for a bonus.

breed. To produce additional fissionable material by interaction, e.g., of uranium 235 and uranium 238 (1948).

career industry. An industry that provides workers with life-long employment and prospects of promotion.

century storage. Storage of commodities, especially water, on a scale sufficient to tide over several years of less than normal supplies.

continuation (short for continuation-school). Education for persons between 15 and 18 years who have left school.

corrugated. Of roads, full of ruts; corrugation, n.

denationalize. To restore a nationalized industry to private ownership; denationalization, n.

disincentive. A deterrent, especially to patriotic behaviour.

dis-saver. One who diminishes instead of increasing his savings; dis-saving, n.

dose. The amount of radio-active contamination received by a person, implement, or other object employed on or used in atomic energy research or utilization.

down-turn. A reduction or falling-off in amount, etc.

early bird. An early morning traveller on a British air route who receives a 10% reduction in his fare. Colloq. ferricillin. A ferric salt of penicillin which remains active in the body much longer than pure penicillin.

first-footer. One of the earliest visitors to an exhibition or the like.

four-track. To enlarge a railway to four tracks.

Fritalux. A proposed name for an economic and customs union including France, Italy, and Benelux. Alternatives Fibenel and Finebel have been proposed.

functionalist. One who uses or advocates the use of functional methods or agencies.

goslow. Characterized by working at a speed much slower than the normal, as a means of bringing pressure to bear on the employers of labour.

hitch. To hitch-hike.

hivc off. Of firms, to assign the production of goods scheduled for, or exempted from, nationalization to subsidiary companies in order to avoid complete nationalization.

impermeabilize. To make impermeable, e.g., to water.

interventor. A person appointed to intervene in and, if possible, settle a dispute.

liberalization. A freeing from controls.

lifetime. A period of activity or efficiency of anything; tenure of office.

muted. Of lighting, subdued.

network. Any system of related but not necessarily interconnected units; e.g., a network of naval bases.

pace-maker. A preliminary or experimental instance.

pattern. The basic structure or composition of any complex entity, especially when it is undergoing, or is expected to undergo, change.

polio. A person affected with or incapacitated by poliomyelitis or infantile paralysis.

rebound. To re-mark the boundaries of.

red petrol. Rationed commercial petrol containing diphenylamine or some similar red dye for purposes of identification (1948).

redundantize. To declare, or dispose of as, redundant.

reticulate. To distribute over an area by means of a network of channels or conductors.

revolvement. A changing round, especially the systematic renewal of ageing stocks.

rheumatology. The scientific study and treatment of rheumatism.

sub-ration. To ration a commodity at the distribution or wholesale level but not at the retail.

Titosism. The brand of Communism developed in Yugoslavia by Marshal Tito (Josip Broz), independently of the Soviet Union and the Cominform; Titolst, a. and n.

type. To assign to a particular type, identify; typable, a. untypable. That cannot be assigned to a definite type.

Welfare State. A state in which the government aims at providing security and happiness for all.

yellow-band. Of streets, having the lamp-posts marked with yellow bands as an indication that waiting is not permitted.

UNITED STATES

A.P.F. Abbreviation of "Animal Protein Factor," a vitamin.
complex in which vitamin $B_6$ is a dominant factor.

banthine, n. A synthetic drug to relieve peptic ulcer.

beefcake (Imitation of cheesecake), n. Humorous. The exposure of men's chests.

Benthoscope (Gr. benthos "sea-depth" + skopein "to look at"), n. A strong, steel sphere, large enough for a man, for deep-sea diving and observation (1945).

B.N.B., B.N.P. Insecticides, both of which were reported to be safer (5) and more powerful than D.D.T.

bracer (Sp.), n. A Mexican contract labourer (1945).

canasta (Sp.), n. An Argentine card game with some features of rummy.

chucks, n. Teen-age slang. Something humorous.

cold rubber. A synthetic rubber made at a low temperature (41°F) and characterized by strength and toughness (1948).

depth interview. A lengthy, "qualitative" interview in which the interviewer considers the subject from all points of view and endeavours to explore the subconscious of the person interviewed (1948).

Dixiegop (Dixicrat + G.O.P. "Grand Old Party"), n. Coalition of Dixicrats and certain Republicans in opposition to some of President Truman's measures, especially civil rights.

dollar gap. The shortage in dollar-exchange existing when a country's essential imports from a dollar area, such as the United States, exceed its exports to that area.

Earth Satellite Vehicle Program. Project of the United States for the study of guided missiles (1948).

economy house. A very small house.

Fair Deal. The policy of social improvement of President Truman outlined in his message to congress, Jan. 1949.

five percent. A contract broker charging 5% for his services; specifically, a person promising to obtain a government contract for a business man for a fee of 5%.

freeze-drying, n. Quick-freezing followed by heat-drying in a vacuum cabinet.

Howdy Doody. A popular doll puppet, first used on a television show (1948).

hunter-killer, adj., Mil. Pertaining to that which stalks and attacks with destructive intent (1945).

hydrogen bomb. The theoretically possible atomic super-bomb estimated to be a thousand times more powerful than bombs using plutonium, with heavy hydrogen as the most important ingredient (1948).

hypersonic, adj. Faster than 2,700 m.p.h. (1946).

Inductive Telephone. A radio telephone for trains (1946).

Jetliner, n. A jet-propelled airliner.

killer ship. A hunter-killer (see above) ship, a surface craft to spot and sink enemy submarines.

me-tooism, n. Term used to describe the acquiescence of some Republicans in policies of the Democratic party.

no-day (work) week. Cessation of work; euphemism for a strike.

nuclear reactor. See reactor below.

paranurse, n. A nurse trained to parachute to the spot where first aid is needed (1948).

peddler of influence. See five percent above.

pitch-out, n. Football. A short lateral pass behind the line of scrimmage, usually from the quarterback to another back (1947).

Point Four. The fourth point in President Truman's Fair Deal programme, namely, aid, technical and otherwise, to economically underdeveloped countries. 

RATO. Rocket assist for take-off (1945).

reactor, n. An atomic pile, in which the production of atomic energy can be controlled (1947). Often called a nuclear reactor (1946). The breeder reactor produces more atomic energy than is required to operate it (1948). (I. W. RL.)

WORLD COUNCIL OF CHURCHES. The World Council of Churches is comprised of some 150 Christian bodies throughout the world, being "a fellowship of churches which accept Our Lord Jesus Christ as God and Saviour." The council was formally inaugurated at the first assembly held at Amsterdam, the Netherlands, from Aug. 22 to Sept. 4, 1948. The Roman Catholic Church does not participate in the council nor, for primarily political hindrances, do most of the churches in the U.S.S.R. and eastern Europe.

From July 9 to 15, 1949, the central committee met at Chichester, Sussex. This body is the governing committee of the World Council of Churches between the meetings of the assembly, which is the sovereign organ composed of officially elected representatives of all the participating churches and normally meets every five years. The central committee consists of 90 members chosen by the assembly, and meets annually. Its officers for the period 1948-53 were: chairman, Dr. George K. A. Bell, bishop of Chichester; vice chairman, Dr. Franklin C. Fry of the Lutheran Church in the U.S.; secretary general, Dr. W. A. Visser 't Hooft (Netherlands).

The 1949 meeting of the central committee had a large agenda, mostly to report the progress of activities inaugurated by the assembly. Its main activities were: (1) after a long discussion on contemporary issues of religious liberty, to publish an officially agreed statement on the subject; (2) to discuss Christian action in international affairs, resulting in resolution: (a) recommending the Churches' Commission on International Affairs to develop a study on racial questions with special reference to South Africa, (b) supporting the proposal for a period of silent prayer at the United Nations assembly meetings, (c) welcoming the U.N. declaration of human rights, (d) drawing attention to the plight of 12 million expelled people and refugees in Germany and to the serious effects upon them of the policy of dismantling; (3) to rename its reconstruction department as the department for inter-church aid and service to refugees in order to indicate that a permanent mutual help must supersede the emergency post-war reconstruction; (4) to authorize the study department to begin planning the subject matter for discussion by the 1953 assembly.

Reports on the youth department, the Occumenical Review, the secretariat for evangelism, the Oecumenical institute and the enquiry on the work of women in the church were also received and their various programmes endorsed. (O. S. T.)

BIBLIOORAPHY — The official Report of the Amsterdam assembly and the Minutes of Central Committee, 1949, are obtainable from the London office of the council.

X-RAY AND RADIOLOGY. Important advances were made during 1949 in angiography of the cardiovascular system of the chest and of the brain.

Angiocardiography, the visualization of the thoracic blood vessels and the heart through the use of X-ray photographs, had been established as a practical method of diagnosis in 1938 by G. P. Robb and Israel Stemberg. During 1949 Steinberg, along with C. T. Dotter, published the results of 11 years' experience with the method. It had added materially to accuracy in diagnosis of intrathoracic disease. Along with cardiac catheterization it proved invaluable for accurate diagnosis in congenital heart disease, especially since many congenital anomalies could be corrected by surgical operations.

Cerebral angiography, used in diagnosis of intracranial lesions, was originated in 1927 by Egas Moniz (q.v.), of Lisbon. Advances which took place in angiography during 1949 consisted in the provision and improvement of methods and apparatus. Two devices were perfected which greatly
facilitated the roentgenographic technique, one called the seriograph and the other the roll film cassette.

The seriograph consists of a cassette magazine mounted in a portable cabinet adjustable in height to adapt it to various table heights. The cassette changer holds six specially designed cassettes, each with intensifying screens and each backed by a thin layer of lead to provide protection of underlying films during exposure. An exposure-activating device and an automatic cassette-shifting device operate in such a way that following each exposure the cassette is removed and an unexposed one shifted into position for the next exposure, the series continuing until completion of the six exposures. The device provides that the successive exposures are made at predetermined intervals—0·7 sec. for cerebral angiographs and 2·5 sec. for angiocardiographs. The exposure time for each film is set at 0·1 sec. or less, the total elapsed time for the six films being 4·5 sec. This apparatus serves to make films during the successive opacification of the arteries, capillaries and veins of the brain.

The roll film cassette consists of two main components—a motor base plate and a detachable roll film magazine. The capacity of the magazine is 75 ft. of film, 34 in. wide, and sufficient for approximately 75 exposures. Operation is accomplished automatically and continuously in conjunction with the X-ray tube control at the rate of two exposures per second. The film is automatically advanced in the magazine when the motor circuit is closed; and when the film is in proper position for exposure it is automatically compressed between two intensifying screens. A Bucky grid is in constant motion during the exposures.

Two important papers were published in 1949 which pointed to new possibilities in the application of radiation to the treatment of cancer. They dealt with the use of the betatron in the production and utilization both of free electrons and of roentgen rays at high voltages. The betatron is a machine by which electrons produced from a tungsten filament are injected into a vacuum chamber between the poles of an alternating current electromagnet and by the energy of the increasing electromagnetic field finally reach an energy of 20 million electron volts. If it is desired to produce roentgen rays, the electrons are directed against a tungsten target. By removing the target it is possible to obtain a beam of electrons which can be controlled and directed outside of the machine and which at the high voltage of 20 million ev. can penetrate tissues to a depth far beyond that which is possible with the electrons produced by the voltages hitherto used for productions of roentgen rays. They have an important advantage over roentgen rays in that their highest concentration of energy is not at their source but at the end of the beam. A beam of free electrons can therefore be applied in such a manner that its greatest energy is exerted in the tumour itself instead of in the skin and superficial tissues. While much experimental work was still necessary before this new agent could be practically and safely applied in the treatment of cancer, it offered hopeful possibilities for progress in this field.

It was not only in the production of free electrons that the betatron offered possibilities of advance but in the production of roentgen rays with the tremendous penetrating qualities afforded by the 20 million ev. energy. H. Quastler and his co-workers described the treatment of a single case of cancer of the brain by roentgen rays produced by the betatron at 20 million ev. As was the case in the use of free electrons this treatment was still in the experimental stage. (See also CANCER.)

YACHTING. The most important event of 1949 and one which would have profound influence on the future of yachting was the International Yacht Racing union (I.Y.R.U.) conference held in London in October. The 5-5 m. class was adopted as the largest international pure racing type, the rules of which would produce a boat smaller, of lighter displacement and cheaper than the existing international 6 m. class.

In place of the larger international classes, more utilitarian types were adopted for inshore racing and new Cruiser-Racer classes of 8, 9, 10 and 12 m. rating would be governed by a formula which would produce cruisers with good cabin accommodation. The new types would rate well under both Royal Ocean Racing club (R.O.R.C.) and Cruising Club of America (C.C.A.) handicap rules and would thus also be suitable for offshore racing.

A new one-design Sharpie for racing upon European lakes, 18 ft. 3 in. in length, a great improvement upon any then in use, was also adopted. Changes in the I.Y.R.U. racing rules were sanctioned which brought them very near the North American Yacht Racing union (N.A.Y.R.U.) rules, except as regards the regulations governing "right of way."

Overshadowing all international racing events, the British-American cup series of team races, held in the Solent and sailed in international class yachts with teams of four a side, ended in a victory for the United States. Passage racing greatly increased in popularity, and offshore racing went from strength to strength. The most important event was the 600 mi. Fastnet race in which competitors started at Cowes and rounded the Fastnet rock to finish at Plymouth. A gale played havoc with the fleet of 29 starters, which included Dutch, French and Argentinian entrants, and only ten yachts completed the course. The race was won for the second time by Captain J. H. Illingworth's "Myth of Malham." A new race for small yachts (class III) run concurrently with, and on a similar course to, the Fastnet but rounding the Wolf rock, was won by Major R. Scholfield's "Blue Disa," one of a very successful new class of 24 ft. L.W.L. one-design offshore racers.

The international Dragon cup was won by the Danish boat "Snap." The European championship of the star class held at Monaco was won by A. Staurazzo, Italy.

Dinghy racing reached new heights of popularity in England, the premier award in the 14 ft. international class being won by Stewart Morris for the third time running and the seventh time in all. (E. F. Hk.)

United States. The winning of several major ocean and long coastwise races in different parts of the world by yachts of relatively light displacement type was a feature of the 1949 yachting season. On the Pacific, "Kitten," a 46 ft. overall PCC class sloop owned by Fred W. Lyon, California, won the 2,225 mi. Los Angeles-to-Honolulu race. A sister ship to "Kitten," Dr. Philip R. Smith's "Gossip," Seattle, won the Tri-Island series of three long distance races in the Puget sound area.

In addition to the ocean races mentioned, long distance sailing events were numerous. In Florida waters Palmer Langdon's Rhodes-27 class sloop "Tiny Teal" won the St. Petersburg-Havana and Lipton Trophy races and took the Florida Governor's cup as the outstanding yacht in the five races of the "southern circuit."

Among international class champions were Harry G. Nye, Chicago, Star class; Richard Bertram, Miami, Lightning class; Ted Wells, Wichita, Kansas, Snipe class; and Howard Lippincott, Riverston, Delaware, Comet class. Charles Currey, British dinghy skipper, won the Princess Elizabeth trophy for 14-footers in a Bermuda-Canada-England-U.S. series held at Bermuda. (W. H. Tk.)

YEMEN. An independent state in the southwestern tip of the Arabian peninsula, between Saudi Arabia to the
north, the British Aden protectorate to the southeast, and
the Red Sea to the west. Area: c. 31,000 sq. mi.; pop.

History. The isolation of Yemen during 1949 was greater
than it had ever been. After the overthrow of Abdullah Ibn Ahmed al-Wazir's regime in 1948 and the numerous executions of leading men which followed, the new Imam did not return to San'a but set up his capital at Taiz. Conditions continued unsettled. A revolt of Rasasi tribesmen broke out in February and was crushed by the Imam, who was reported to have executed 33 tribal leaders. R.A.F. aircraft from Aden were reported to be making bombing raids on border forts early in March owing to violations of British territory by the tribesmen. On Sept. 2, after giving due warning, R.A.F. bombers destroyed a fort which was being erected by Yemenis in the territory of the western Aden protectorate.

Yemen took very little part in the proceedings of the Arab League (q.v.). Trade negotiations were carried on with Egypt and with India by Qadi Muhammad Ibn Abdullah al-Imari, a special envoy of the Imam. A trade agreement with Lebanon was signed in February. Relations with Great Britain were discussed with the Imam at Taiz in Nov. 1948 by the governor of Aden, Sir Reginald Champion, who in Feb. 1949 personally conveyed to London Yemen's requests for British technical and medical assistance. In March it was announced that Sir Reginald would be British representa-
tive in Yemen as well as governor of Aden. The Imam underwent an operation in March, an Italian surgeon having been brought by air from Asmara. In November it was reported that most of Yemen's remaining Jews had been evacuated through Aden to Israel.

Foreign Trade Principal imports are manufactured goods. Principal exports are coffee, barley, wheat, millet, hides, charcoal, raisins. Finance. The monetary unit is the Maria Theresa dollar, called the riyal, nominally - Rs.1 (Indian).

(C. Ho.)

YORK, ARCHBISHOP OF (GARBETT, CYRIL FOSTER), 90th archbishop of York, primate of England (b. Feb. 6, 1875), was educated at Portsmouth grammar school, Keble college, Oxford, and Cuddesdon theological college. For 20 years he worked at Portsea as curate (1899) and vicar (1909). He was rural dean of Portsmouth, honorary canon of Winchester (1915-19) and proctor in convocation (1918-19). In 1919 he was consecrated bishop of Southwark, translated to Winchester (1932) and became archbishop of York in 1942. Dr. Garbett became well known to the general public for his pronouncements on the Church and social problems and he published a number of books on this subject. In 1939 he was appointed chairman of the Canon Law commission which later issued its report together with proposals for a revised body of canons under the title The Canon Law of the Church of England (1947). At the end of 1948 he visited 27 rural deaneries in the diocese of York in preparation for an evangelistic campaign. In 1949 he put out some proposals for the future reform of the Prayer Book. He visited South Africa (1934), India, Kashmir and Ceylon (1938). He visited Tehran, Moscow and Cairo (1943); Canada and the United States (1944 and 1949); Belgium, Holland, Italy, Greece and Malta (1945); Palestine, Egypt, Ethiopia, the Sudan and North Africa (1946); Germany

The start of the first race for the British-American cup off Cowes, Isle of Wight, July 1949. Nearest the camera is "Goose" (United States).
YOSHIDA—Y.W.C.A.

YOUNG MEN'S CHRISTIAN ASSOCIATION.
The World's Alliance of Young Men's Christian Associations continued its work with displaced persons in Germany and Austria and with refugees in Palestine and Syria. The southeast Asia area conference was held in Bangkok in August and the European area conference in Florence in September. The Y.M.C.A./Y.W.C.A. week of prayer and world fellowship was again celebrated in November. World membership rose to more than 2,750,000 in 70 countries. John Forrester-Paton of Scotland continued as president and Dr. Tracy Strong of the U.S. as general secretary.

Great Britain. During 1949 the British Y.M.C.A.s, with a membership of over 96,000, maintained and extended their religious, cultural, social and physical activities in some 460 local centres throughout the British Isles. Similar programmes served the needs of the British armed forces in over 300 centres and hostels at home and in 14 countries overseas. Twenty-six German Y.M.C.A. leaders spent a month studying British Y.M.C.A. methods; in Germany further Christian Youth Leadership courses for the services and Control commission personnel were held. Community services still served some thousands of British and European workers in industry, agriculture and forestry, as well as engineering apprentices and horticultural students. Over 900 town boys were trained for agricultural work and 84 Volunteer Agricultural camps were run by the Y.M.C.A. The special educational projects at Cheshunt college, Cambridge, at the Y.M.C.A. college for adults at Kingsgate, Kent, and at the Y.M.C.A. Youth college, Rhose, Glamorgan, provided many courses, especially for boys and young men in industry. More than 1,000 young volunteer leaders carried on their part-time training in local associations. Sir Frank Willis continued as secretary of the National council, and K. Dickson as secretary of the Scottish National council. (R. W. J. K.)

United States. By Aug. 31, 1949, $5,599,163 of the $8,650,000 World Youth Fund for Reconstruction and Advance, related to needs in war-occupied and devastated lands, had been raised. The national Youth and Government programme was carried on in 1949 in 22 states; model state legislatures were held; the first national conference of boy governors was held in June in Washington, D.C.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. In Great Britain 1949 was a year of consolidation. Centres operated for service women turned over to civilian work and nine new hostels were opened. In addition to hostels operated for industrial, business and professional girls, hostels were managed for government departments and private firms. The international hostel in London housed 22 nationalities and plans had to be made for operating hostels for European volunteer workers throughout the country. Clubs continued to grow, particularly mixed youth clubs. Outstanding among the drama work was The Turning Wheel, a pageant written and produced by members in Birmingham, which demonstrated the continual work of the association and the performance of Truth Unchanged, which illustrated parables and their application to present day problems.

Centres for servicewomen, Control Commission staff and the families of service men abroad still continued in Germany, Austria and the middle east, as also the work for displaced persons. Under the Mutual Service committee of the World's Y.W.C.A. the association's activities in West Africa, India, Iraq and China were given financial support and staff were trained for work in these areas. Representatives were sent to a training institute organized by the World's Y.W.C.A. for two months during the summer and attended by 26 nationalities. The course attempted to define the place of the Y.W.C.A. as a Christian world-wide movement. (R. W.)
United States. The Y.W.C.A. of the United States of America was founded in 1858 to build a fellowship of women and girls dedicated to the pursuit of Christian ideals; in 1949 this organization included 1,045 Y.W.C.A.s conducting programmes for women in the following fields: business, professional, industrial, agricultural, teen-agers, college and university students and home women. Emphasis in the Y.W.C.A. programmes was on the promotion of physical, health and mental, and spiritual growth. In early 1949 the Y.W.C.A. constituency included 3 million women and girls; the 1949 convention voted to change the Y.W.C.A. of the U.S.A. to a membership organization.

YOUTH ORGANIZATIONS. The need for research into the problems and needs of youth had for some time been recognized by the King George's Jubilee trust, and on April 1, 1949, it appointed a Standing Research and Advisory committee. The committee consisted of 16 members and two assessors—one from the Ministry of Labour and one from the Ministry of Education—and had as its principle term of reference: "To promote and direct research bearing on the welfare of the younger generation undertaken either on the initiative of the committee or at the request of any other organization or authority and to co-ordinate such research. The research will be focused primarily on the adolescent period but will also be extended so far as is considered relevant into the years before and after adolescence."

The committee met for the first time on April 28 and during the year agreed that the most important problems in the field of youth service were the recruiting and training of youth leaders, the "wastage" in membership and the "unattached" youth. The committee requested the University of Bristol to extend its research on the subject of youth leadership to include comprehensive research on the provision and training of youth leaders. It was also agreed that the committee should sponsor research into wastage and the unattached.

In the ten years since its last full report the trust had made grants of £422,468, of which £38,968 was authorized in the year ended March 1949.

A survey of the leisure interests of boy members of mixed clubs was undertaken by the National Association of Girls' Clubs and Mixed Clubs and published under the title Hours Away From Work. The membership of the association was 166,385 boys and girls in 2,405 clubs. This membership comprised 35,271 girls in girls' clubs, 64,038 girls in mixed clubs and 67,076 boys in mixed clubs. The association received a gift of £95,000 from the South African Aid to Britain fund (see Britannica Book of the Year 1949) and this enabled it to purchase and equip Fernhill castle, Argyllshire, to equip Avon Tyrell, Hampshire, and to purchase Kilvrough manor, south Wales. Avon Tyrell was opened by Princess Elizabeth as a national holiday house and conference centre on July 1. Mrs. Walter Elliot retired after being chairman of the association for 10 years and was succeeded by Miss Vera Grenfell.

The National Association of Boys' Clubs, of which the Duke of Gloucester was president, had a membership of 200,000. Amongst its activities during 1949 was a joint money-raising effort with the girls' clubs and mixed clubs and a fourth tour of its travelling theatre. For reasons of economy the Arts Training centre at Cranbrook, Kent, was under sentence of closure before the end of 1949 but it was reprinted for at least one year.

The Outward Bound trust, an organization caring for the spiritual and moral well-being of young people, acquired Gate house, Eskdale, for use as a "mountain school." For three years the trust's sea school at Aberdovey had provided character training courses, and the new school at Eskdale would help relieve the strain on the sea school. A national appeal was launched to raise £100,000 for the work of the trust.

The national training centre for officers and leaders of the Boys' Brigade in England and Wales at Felton lodge, Hertfordshire, was opened by the Duke of Gloucester in October. The centre was made possible by a grant from the South Africa fund. A training centre for the Girls' Guildry at Fernhill, Rutherglen, was opened in April. The Junior Red Cross celebrated its 25th anniversary in November with an impressive pageant at the Albert hall, London.

The British Schools Exploring society undertook an expedition to northern Norway. The party, which included 10 leaders and 67 schoolboys, explored an area of some 80 sq. mi. at the south end of Lake Risvann under the instruction of two officers of the Royal Engineers. The King George's Jubilee trust contributed £1,000 towards the expenses of the expedition.

A world forum for youth was organized in May in conjunction with the Council for Education in World Citizenship. Representatives from 13 countries took part. A similar forum was held in New York in March. In January, 34 students from 17 European countries arrived in the United States and undertook a nationwide tour before returning to New York for the Forum for High Schools.

In Northern Ireland the youth committee continued to stimulate public interest in youth work and on its recommendations the Ministry of Education made grants of £47,000 in the financial year 1948-49. The Central Council for Members of the Scottish delegation to the World Festival of Youth and Students which was held in Budapest, Aug. 1949.
Physical Recreation extended its activities to Northern Ireland and this was welcomed by the youth committee. An experiment in international fellowship was made near Aberystwyth, when a communal holiday was held for young persons from Scotland, Ireland, the Isle of Man, Cornwall and Brittany interested in the revival of the Celtic language.

**International.** The council of the World Assembly of Youth (W.A.Y.) met for the first time in Brussels in August. Founded at the International Youth conference held in London in Aug., 1948, W.A.Y. held a provisional council meeting at Ashridge, Hertfordshire, in Feb., 1949. For the August meeting in Brussels, at which 28 countries were represented, the Service National de la Jeunesse made the arrangements. The Council decided on a number of projects for the first year. Among these were a centre of information and documentation of all youth problems and a survey of national and international institutions concerned with travel for young people. This latter project was already partially covered in Britain by the Central Bureau for Educational Visits and Exchanges which in 1949 published a comprehensive handbook, *Educational Travel Survey of British Organizations.*

Also in August a World Festival of Youth and Students was held in Budapest. This was organized by the World Federation of Democratic Youth, from which federation a number of non-Communist organizations withdrew during 1949, and was followed by the second World Youth congress which opened in the Parliament buildings, Budapest, on Sept. 2. The opening of the festival in the Ujpest stadium was attended by more than 100,000 persons including 800 from Great Britain, 132 from China and 500 from the Soviet Union. Eighty nations were represented.

**Other Countries.** A youth council was established in Singapore representative of 15 voluntary organizations, and in Hong Kong the youth club movement operated under the aegis of a co-ordinating association. In Bermuda and Mauritius youth organizers’ posts were created and the Colonial Social Welfare advisory committee set up a sub-committee to study the question of future youth work. An advisory council was established in the Seychelles. After the stabbing of G. D. Stewart, governor of Sarawak, on Dec, 3, the Malay Youth Movement in Sarawak was banned.

In India the National Cadet corps, the purpose of which was to train the youth of India in the rudiments of soldiering, had 57,000 members. The corps was organized in nearly all the provinces and states. A girls’ division of the corps was opened.

In the Soviet Union the Lenin Young Communist league held its 11th congress—its first for 13 years. President N. M. Shvernik presented the Order of Lenin to the league at the final session of the congress. It had previously received the Order of Lenin during World War II and on the 30th anniversary of the founding of the league in 1948, and the Order of the Red Banner of Labour in 1928. (See also *BOY SCOUTS; GIRL GUIDES; YOUNG MEN’S CHRISTIAN ASSOCIATION; YOUNG WOMEN’S CHRISTIAN ASSOCIATION.*)

**YUGOSLAVIA.** A federal people’s republic of southeastern Europe, bounded on the N. by Austria, on the N. and N.E. by Hungary and Rumania, on the E. by Bulgaria, on the S. by Greece and on the W. by Albania, the Adriatic sea and Italy. Area: (1940) 95,983 sq. mi.; (1947, including newly acquired territory of Julian march, Zara and the islands 2,843 sq. mi.) 98,826 sq. mi. Pop. (1940 est.): 15,703,000. Federal republics (pop., March 15, 1948 census): Serbia (with the autonomous province of Vojvodina and the autonomous Albanian region of Kosovo-Metohija) 6,523,224 Belgrade (388,246)
Croatia 7,749,039 Zagreb (290,417)
Montenegro 1,389,084 Herceg Novi (7,127)
Bosnia and Herzegovina 2,561,961 Sarajevo (118,158)
Croatia and Montenegro 376,573 Titograd (12,206)
Macedonia 1,152,054 Skopje (91,557)
Total 15,751,935

Other towns (pop., 1948 census): Subotica (112,551); Novi Sad (77,127); Rijeka formerly Fiume (72,130).

Languages: Serbo-Croat, Slovene and Macedonian; Albanian, Hungarian and Italian are also spoken by the minorities. Religions (1931 census): Greek Orthodox 48.7%; Roman Catholic 37.5%; Moslem 11.2%. Chairman of the presidium of the people’s assembly, Dr. Ivan Ribar; vice-chairmen, Moşa Pijađe (Serbia), Filip Lukuš (Croatia), Josip Rus (Slovenia), Djuro Pucar (Bosnia and Herzegovina), Marko Vujacić (Cragora) and Dimitar Vlahov (Macedonia); prime minister, Marshal Josip Broz (Tito) (q.v.); deputy prime minister and minister of foreign affairs, Eduard Kardelj (q.v.).

History. During the year Yugoslav-Soviet relations continued to deteriorate. When the Paris conference of the Council of Foreign Ministers (q.v.) reached an agreement in June on the settlement with Austria which denied Yugoslavia her territorial claims in Carnthia, the Yugoslav government protested to the four powers. On June 22 the Soviet government rejected the Yugoslav protest in an angry note, which accused Yugoslavia of having conducted secret negotiations with Great Britain on the Austrian question in 1947, “behind the back” of her Soviet ally. A further Soviet note of Aug. 11 described in detail these alleged negotiations and concluded that Yugoslavia was behaving “not as an ally but as an enemy” of the U.S.S.R. It also alleged that some strong and secret ties bound the Yugoslav government to the “camp of the foreign capitalists.” On Aug. 18 the Soviet government accused the Yugoslav government of maltreating Soviet subjects and stated that, if this continued, it would “have resort to other more effective means” to protect its subjects. The Yugoslav reply to this note drew a further reply from Moscow which included a long lecture on how Marxists ought to behave, illustrated with examples from the history of the Russian Bolshevik party. The Soviet press and radio in the following months hurled abuse at Tito and his colleagues, calling them apes, parrots, dwarfs, hyenas and by other similar epithets. Following the Rajk trial in Budapest (see HUNGARY), the Soviet government formally denounced on Sept. 28 its treaty of alliance with Yugoslavia (signed on April 11, 1945). Hungary and Poland denounced their treaties with Yugoslavia on Sept. 30, Rumania on Oct. 1, Bulgaria on Oct. 3, and Czechoslovakia on Oct. 4. The economic boycott of Yugoslavia by the Cominform countries was tightened during the first six months of 1949. The Soviet-Yugoslav trade agreement of Dec. 1948 reduced the volume of mutual trade for 1949 to one-eighth of that of 1948. In June and July trade between Yugoslavia and Czechoslovakia, Poland and Hungary—the three Cominform countries whose exports were of greatest importance for Yugoslav economic planning—was brought to a standstill. In all three cases, the procedure was to demand impossible economic conditions for the continuance of trade and, when these were refused, to suspend all further deliveries. Thus the rupture was represented as resulting from economic difficulties but its true motive was in each case clearly political.

The Cominform boycott compelled the Yugoslav Communist leaders, with obvious reluctance, to seek greater trade, and to request credits, in the west. A short term trade
agreement with Great Britain was signed in Jan. 1949, providing for an exchange to the value of £15 million up to Sept. 30, after which a more far reaching agreement was to be made. On Aug. 4 an agreement was made with Italy, by which the value of mutual trade in 1949-50 was to be more than double that of the previous year. In August the United States government permitted the sale to Yugoslavia of a large steel plant and the International Monetary fund sold Yugoslavia $3 million in return for the equivalent sum of Yugoslav dinars—which in effect amounted to a dollar loan. On Sept. 8 the U.S. Export-Import bank gave a credit of $20 million, of which $12 million were to be spent on American equipment for the rehabilitation of Yugoslav mines.

Yugoslavia's economic situation remained critical during the year. Official statistics gave the usual optimistic percentage figures for the achievement of the Five-Year plan targets. But in fact the achievement was much smaller than the figures. Much of the construction consisted of factory buildings containing no equipment, and the new home-produced machinery displayed with such pride in exhibitions consisted of prototypes made by skilled craftsmen, which there was still no means of putting into mass production. More even than her "popular democratic" neighbours, and no less than the U.S.S.R. two decades before, Yugoslavia, lacking both machinery and a skilled labour force, had to rely for her plans on an army of directed unskilled labour. What could be produced by one skilled worker with a machine must be produced by five or ten pairs of strong bare hands.

The need for manpower in factories, public works and mines was the main motive behind the collectivization of agriculture which had made more rapid progress in Yugoslavia than in any other country of eastern Europe. Collective farms, with their managing committees controlled by the Communist party, provided a more efficient central control of the state bureaucracy over the peasant masses than had ever yet existed. During the first six months of 1949 the number of collective farms ("peasant labour co-operatives") rose from 1,300 to 4,500. In August about 20% of Yugoslav agriculture was collectivized, and in the richest agricultural province—Vojvodina—the proportion was nearly 40%. Yugoslav collectivization was fiercely denounced by Cominform propaganda because it was not accompanied by a thorough "class war" against the kulaks in the villages. The reason for the comparatively mild treatment of the more prosperous peasants who, in contrast to the rule in Cominform countries, were allowed in Yugoslavia to join collective farms, was that Tito's government, faced with external threats and internal economic crisis, was understandably eager to minimize the discontent.

There was absolutely no political liberalization. The Serbian and Croatian peasant party leaders were still in prison. The wishes of the non-Communist masses were ignored as before. Anti-Communist opinions were crushed no less ruthlessly than Cominformist Communist opinions. Tito counted on the patriotism of his people to back him against the external threat even if they disliked his regime. In the short term he was probably right, but he succeeded at the cost of a low national morale which might later be a source of weakness.

The most important action in Yugoslavia's own foreign policy was the decision to close the frontier with Greece, announced in July. Official Yugoslav spokesmen insisted that this action was directed equally against the Greek rebels and the Greek "monarcho-fascist" government. In practice, it operated in favour of the government. Ideological factors prevented friendship between the Yugoslav and Greek governments. But at least the Greek government was doing no direct harm to Yugoslavia, whereas the leaders of the Greek rebels, after the dismissal of Markos Vafiades in Jan.

Voluntary workers marching to work in Belgrade. The photograph was taken in the autumn of 1949 in Balkan Street in the capital.
1949 (See Greece), began to support the Bulgarian-sponsored agitation for a united Macedonia to be liberated from both Greece and Yugoslavia. The closure of the frontier put an end to Yugoslav help to the Greek rebels and greatly diminished the usefulness of Albania as a base for the rebels. Albania was now isolated from the outside world. Both her land neighbours, Greece and Yugoslavia, were her enemies; and the great powers of the Mediterranean had no reason to be well disposed to her. The negative rapprochement between Greece and Yugoslavia, resulting from the closure of the frontier, not only contributed to the defeat of the rebels by Greek national forces during the summer but provided the Soviet Union with a further motive for hatred of Yugoslavia. The only remaining Soviet vassal on the Adriatic, Albania, was linked with the Cominform world only by occasional Soviet, Rumanian or Polish ships which had to pass through the Turkish straits or through the Baltic and Gibraltar. The strategic importance of Macedonia in Soviet eyes increased, as it was a link not only from north to south—from central Europe to the Aegean—but also from west to east—from Adriatic to Black seas. (See Macedonian Problem.)

At the end of the year Yugoslavia's position was dangerous but not impossible. Tito and his colleagues were experts both in guerilla warfare and in police terror. It was unlikely that rebellion in Macedonia would hold great terrors for them. Nor had they much reason to fear the attack of their satellite neighbours. In October there was a serious frontier incident on the Hungarian border. Machine-gun fire—for which each side blamed the other—continued for some hours, but it did not appear that anyone was hurt. But despite a barrage of insults, and a violent protest by A. Y. Vyshinsky when Yugoslavia was elected to the U.N. Security council on Oct. 20, there was no sign that the U.S.S.R. planned invasion. The attitude of the western powers in the event of invasion was also uncertain. (H. S.-W.)

Education. (1947-48) Schools: elementary 12,052, pupils 1,616,002, teachers 23,889; secondary 942, pupils 310,185; technical 1,307, pupils 121,137; teachers' training colleges 53, students 16,145; universities 5, students (1948-49) 54,421. Illiteracy (1931): 45.2%.

Agriculture. Main crops: ('000 metric tons): maize (1947) 4,000; wheat (1946) 1,803; barley (1946) 1,803; barley (1946) 194; oats (1946) 154; rye (1946) 170; potatoes (1947) 800; sugar, raw value, (1948) 95; cotton, ginned, (1948) 3; hemp (1947) 34; flax (1947) 3; tobacco (1945) 13. Livestock ('000 head, Dec. 1946): cattle 2,493; sheep and goats 6,355; pigs 2,763; horses 20,844. Agriculture ('000 metric tons): copper ore (1947) 30; lead (1947) 50; bauxite (1944) 150; zinc ore (1947) 30.

Finance and Banking. Budget ('000 million dinars): (1949 est.) balanced at 161,953; (1950 est.) balanced at 173,746. Monetary unit: dinar with an official exchange rate of D.140 (201.50 before Sept. 18, 1949) to the pound and D.50 to the U.S. dollar.

YUKAWA, HIDEKI, Japanese physicist (b. Tokyo, Jan. 23, 1907), was educated in Tokyo and at Kyoto university where his father was professor of geology. He graduated in 1929, and in 1932 became a lecturer at Kyoto. He was at Osaka university from 1933 until 1939 when he returned to Kyoto as professor of physics. During World War II he remained in Japan and for a time was concurrently a professor at Tokyo and at Kyoto. In 1948, at the invitation of J. Robert Oppenheimer, he went to the Institute for Advanced Study at Princeton, New Jersey, to work with a group of nuclear physicists, and in July 1949 was appointed visiting professor of physics at Columbia university for the 1949-50 academic year. In 1935 he published a series of equations in which he forecast the existence of a fourth basic particle of matter, the meson (in addition to the proton, the electron, and the neutron). The Royal Swedish Academy of Science awarded Dr. Yukawa the 1949 Nobel prize for physics "for his prediction of the existence of the meson based upon his theory of nuclear forces." He received the prize in Stockholm on Dec. 10 and the subject of his Nobel lecture two days later was "The Meson Theory and its Developments.

ZAFRULLAH KHAN, SIR MOHAMMAD, Pakistani statesman (b. Sialkot, Punjab, Feb. 6, 1893), was educated in Sialkot, at the Government college, Lahore, and at King's college, London. He was called to the bar in 1914 and from 1919 to 1924 was a lecturer at the Law college, Lahore. He was a member of the Punjab Legislative Councils 1925-35, and from 1935 to 1941 served on the governor general's executive council in charge, successively, of the portfolios of commerce and railways, industries and labour, law and war supply. Until the creation of the dominion of Pakistan on Aug. 15, 1947, he was a judge of the Federal Court of India. On Dec. 27, 1947, he was sworn in as minister for foreign affairs and commonwealth relations in the newly formed Pakistani government. He was president of the All-India Moslem league, 1931-32, was leader of the Indian delegation to the League of Nations assembly, 1939, was agent general for India in Chungking, 1942, and led the Pakistani delegation to the general assembly of the United Nations, which on Sept. 30, 1947, admitted Pakistan to membership. He again led the Pakistani delegation at the U.N. general assembly in 1948 and attended the Common-wealth prime ministers' conferences in Oct. 1948 and April 1949. He was present at the conference on Indonesia held in Delhi, Jan. 1949. In 1949 he led the Pakistani delegation at the United Nations fourth general assembly. In October he made a brief visit to Ottawa.

ZAHARIADIS, NIKOLAOS, Greek politician (b. Izmit, Turkey, 1902). After studying in the U.S.S.R., 1920-23, he was sent to Piraeus, Greece, where he was active as a Communist youth organizer. In 1929 he was a student in Moscow at the Comintern School for Eastern Studies.
ZAPOTOCKY—ZOOGICAL GARDENS

He was appointed secretary general of the K.K.E. (Kom- munistikon Komma Ellados, or Communist Party of Greece) in 1931. Three years later he joined the executive committee of the Comintern and in 1935 became secretary of the Balkan Communist Federation bureau. In 1936 he was elected to the Greek Chamber of Deputies, but soon afterwards was exiled by the government of Ioannis Metaxas to the island of Corfu. Transferred in 1940 to a prison in Athens, he was found there by the Germans and sent to Dachau concentration camp. On his release in May 1945 by the U.S. army, he returned to Athens and was reconfirmed as secretary general of the K.K.E. He took the leading part in organizing the 1946 Communist rebellion. On Jan. 1, 1947, he publicly admitted the existence of a "Democratic army" in the mountains and on July 12, 1947, he announced that a "free Democratic government inside Greece" was about to be formed. The composition of the "government" was announced on Dec. 24, 1947, with Markos Vafiades as prime minister and c. in c. On Feb. 4, 1949, however, Markos was relieved of his duties and sent to Moscow. Zahariadis set up a new Politburo of the K.K.E. and assumed the high command of the rebel army. (See also Greece.)

ZANZIBAR: see British East Africa.

ZAPOTOCKY, ANTONIN, Czech politician (b. Zákolyany, Dec. 19, 1884), prime minister from June 14, 1948. (For his early career see Britanica Book of the Year 1949).

In Dec. 1948 and Jan. 1949 he led the Czechoslovak delegation at the Moscow conference that decided to form the Council of Mutual Economic Assistance. On June 22, 1949, he warned the Roman Catholic hierarchy that his government would not allow it to "violate" the freedom of the individual to fulfill his civic duties. Speaking in Prague on Nov. 7 he admitted that there were uranium deposits in Czechoslovakia and that the Czech people were proud to supply ore to the U.S.S.R. On Nov. 12 his first play entitled New Heroes Will Arise was produced at the Vinohrady theatre in Prague. At the trade union congress in Prague, on Dec. 11, he admitted that the introduction of Soviet Stakhanovite methods to speed up production had created tension in the factories.

ZEELAND, PAUL VAN, Belgian economist and statesman (b. Soignies, Belgium, Nov. 11, 1893), was educated at the universities of Louvain and Princeton. He joined the Belgian National bank in 1919 and was its vice governor in 1934, when King Leopold III (q.v.) appointed him minister without portfolio in the cabinet of Count Charles de Broqueville. On March 25, 1935, he formed a national government in which he assumed the portfolio of foreign affairs. During his administration King Leopold announced on Oct. 14, 1936, that Belgium was returning to the pre-1914 neutrality policy. He resigned on Oct. 25, 1937, and the following year was appointed professor of international economic science at the University of Louvain. After the German invasion of Belgium he left for the U.S.A. As president of the Belgian Commission for the Study of Post-War Problems (1942-44) he visited London many times. He returned to Brussels in 1944 and was appointed Belgian commissioner for reparations (Oct. 1944-Oct. 1945). In March 1945 he was elected a member of the Senate. He founded in Brussels the Independent League of European Co-operation which in 1947 joined the International Committee of the Movement for European Unity. On Aug. 10, 1949, he was appointed minister of foreign affairs and foreign trade in the cabinet presided over by Gaston Eyskens (q.v.). Six days later, in Paris, he succeeded Paul-Henri Spaak (q.v.) as chairman of the O.E.E.C. He stated at Brussels, on Nov. 13, that the United Nations had proved a greater failure than the League of Nations.

ZOOGICAL GARDENS. In spite of the difficulties and anxieties of a troubled and quarrelsome world progress in the rehabilitation and development of zoological gardens was, at least in Europe, maintained during 1949, and judging by the numbers of visitors, zoos were as popular as ever. In the British Isles the records of attendance were high, partly owing to the prolonged and brilliant summer. By the end of September nearly 2,225,000 visitors had entered the gardens at Regent's park and nearly 500,000 had, in spite of continued difficulties of transport, made their way to Whipsnade park which, for the first year in its somewhat chequered history, seemed likely to pay its way without recourse to the general exchequer of the Zoological society of London.

Both in London and at Whipsnade progress in re-stocking and expanding the collections was well maintained. The outstanding event of 1949 at the London zoo was the arrival —the kindness of the Belgian government—of a female okapi. She was a strong, healthy young animal. Thus for the first time the society possessed a pair of interesting animals, believed to be the only pair in captivity, at any rate out of Africa. As they were on excellent terms with one another there was a reasonable hope that in course of time an okapi might be born in London. Another interesting arrival was a party of seven young giraffes, six reticulated, the seventh Baringo, which were exhibited with the earlier group of young ones acquired in 1947. It was intended that four of the youngest should later go to the Dublin zoo, which was showing itself in many directions to be as progressive as ever. A number of greater birds of paradise were also acquired and thus a start was made in the filling of a serious gap caused through the loss during World War II of what had been a strikingly varied collection. There were many other interesting arrivals and the London zoo could undoubtedly claim to display the most representative collection of animals in any zoo. In particular, it owned the most remarkable collection of monkeys, diurnal birds of prey, owls and small mammals ever exhibited. The aquarium was unequalled as regards both the range of its collection and its technique of display.

At Whipsnade also progress was well maintained though there were no spectacular developments. It was a good breeding year, especially among birds. Two young Manchurian cranes did well, about a dozen red-breasted geese were hatched in an incubator and grew to maturity and there was a late-hatched brood of the Kenya crested guineafowl believed to be the first to be hatched away from their native country. A serious loss was sustained through the death of two cows of the society's small herd of the white-tailed gnu or black wildebeest, representatives of a species dangerously near extinction. An exhibit which attracted much interest was a pair of hippopotamis in a large open pond which were guests from Hanover zoo. Other animals from Hanover and Hamburg had also enjoyed the hospitality of Whipsnade, notably a young elephant, various cranes and some flamingoes, but owing to improved conditions in Germany they were returned to their respective zoos. Indeed, throughout Germany, rehabilitation of the numerous zoos went steadily forward though financial conditions made re-stocking very difficult.

There was nothing of outstanding interest to report about other non-commercial zoos of the British Isles. The old-established zoos of Dublin, Edinburgh and Bristol maintained their high standards and the Glasgow zoo made good progress.

As regards Europe, reference has already been made to the steady though difficult rehabilitation of zoos in Germany.
Elsewhere progress was made in restoration. The Antwerp zoo was fully restored and well stocked, that at Copenhagen maintained its usual high standard and the Rotterdam zoo, which had only just been completed before war broke out, was now completely stocked and was a thoroughly up to date model zoo. The various zoos of India, Burma and elsewhere in Asia were up to normal standards. In Indonesia the Sourabaya and other zoos were endeavouring to re-stock, but local conditions outside the towns were such that the collection of native animals in the islands was attended by almost insurmountable difficulty.

(H. G. M.)

ZOOGY. During 1949 there were no very outstanding events in this field, although a certain number of international meetings were held, mainly in the form of symposia on special topics. One of the more successful of these was a symposium on "Physiological Mechanisms in Animal Behaviour," arranged jointly by the Society for Experimental Biology and the Association for the Study of Animal Behaviour and held at Cambridge, July 8 to 22. The range of topics and the large attendance indicated the wider interest taken in this branch of the subject. The 14th Cold Spring Harbour Symposium on Quantitative Biology, June 8 to 16, was devoted to "Amino Acids and Proteins," with special reference to the composition of cell nuclei and chromosomes. A discussion on "Induction in Embryonic Development" was arranged by the International Union of Biological Sciences and took place at Berne, Switzerland, during the summer. The United Nations conference on the "Conservation and Utilization of Natural Resources" was held at Lake Success, New York, Aug. 17 to Sept. 6. Other gatherings of interest to zoologists included a symposium on "Science Théorique sur les Problèmes de l'Evolution," in Paris, Oct. 10 to 15; and the 10th international ornithological congress, at Washington, D.C., Dec. 16 to 18. The proceedings of the 8th International Congress of Genetics held in Stockholm during 1948 were issued in 1949 as a supplementary volume of Hereditas. The wide range of papers gave some idea of the rapid advances that were being made in this branch of zoology.

Publication and Research. The number of publications listed in vol. 83 of the Zoological Record (dealing mainly with the literature of 1946), published early in 1949, remained in the neighbourhood of 12,000. Among the more important general publications were two further volumes of the Traité de Zoologie prepared in Paris under the direction of Professor Pierre-Paul Grassé of the Sorbonne. Volume 6 dealt with the Arthropoda, exclusive of Crustacea, Myriapoda and Insecta, and was mainly concerned with Spiders and Scorpions. In the general account of the Arthropoda, by A. Vandel, it was noted that about 80% of the known species of animals belong to this group, and the complicated social organization of certain of the insects appeared to indicate a high development of intelligence or mentality. Volume 9 was the first of three volumes to be devoted to insects and contained a most interesting account of termites.

Among books on special groups, Karl Lang's Monographie der Harpacticiden (Stockholm, 1948), comprising 1,682 pages, 607 figures and 378 charts, was by far the most detailed account of the group. A third volume of J. R. Ellerman's The Families and Genera of Living Rodents (London, Brit. Mus.) was issued during the year; it contained additions and corrections to the two previous volumes and also a list of named forms (1758-1936) by R. W. Hayman and G. W. C. Holt. The general reader had a wide range of books on natural history from which to choose, but the New Naturalist series included a number of books of special interest to British zoologists. The Sea Shore, by C. M. Yonge, was one of the most important recent additions to this series.

A male king penguin sitting on an egg at the London zoo. The egg was hatched on Oct. 21, 1949—the first king penguin egg hatched at the London zoo—but two days later the chick was found dead.

The vexed question of torpidity in birds, dating from classical times, has always been regarded with some scepticism by most zoologists, but an undoubted case of hibernation in the American Poor-will, Phalaenoptilus nuttallii, was recorded by E. C. Jaeger (Condor, vol. 51, p. 105). The bird hibernates in crevices in rocky cliffs or the Allouer desert, California, and was observed to remain in holes for as long as 85 days. As in the case of hibernating mammals, it also showed a marked drop in body temperature, down to 18°C.

In more academic branches of the subject a new field was opened by the use of radio-active tracer elements, and a symposium on the subject was published by the University of Wisconsin. A good general account was also given by G. C. de Hevesy, Radio-Active Indicators (New York), which dealt with the use of isotopes in biology and medicine. Other publications on the same subject included Advances in Biology and Medical Physics, edited by J. H. Lawrence and J. G. Hamilton (New York).

"The study of a generalized marsupial (Dasyergus cristicua, Krieff)," by F. Wood Jones (Trans. Zool. Soc. Lond., vol. 26, part 5) was an important contribution to our knowledge of this rare animal. One of the surprising features of this carnivorous marsupial was the great variation in the size of the adults ranging in length from 125 to 220 mm. There were also similar variations in the dimensions of the feet, tail, ears and other parts of the body.

The hemoglobin of Aesaria and other nematodes were studied by H. E. Davenport, (Proc. Roy. Soc., vol. 136, pp. 255-290). Two distinct kinds are found in the perienteric fluid and body-wall respectively. When kept under anaerobic conditions the latter becomes de-oxygenated but no change could be found in the perienteric fluid hemoglobin. Further studies by H. Munro Fox et al. on the hemoglobin content of Daphnia (Proc. Roy. Soc., vol. 136, p. 388) showed that this animal synthesizes blood hemoglobin under conditions of oxygen deficit. (See also Endocrinology; Entomology; Genetics; Marine Biology; Paleontology; Physiology; Zoological Gardens.) (E. Hin.)
